AGRICULTURAL JOURNAL

IS THE
LARGEST AND THE LEADING
FARMERS' AND GRAZIERS' NEWSPAPER,

PUBLISHED EVERY MONDAY EVENING IN TIME FOR POST.

ROGERSON & TUXFORD, 265, STRAND, LONDON.

May be had of all Booksellers and Newsmen throughout the Kingdom, price Sevenpence, or £1 10s. 4d. per annum.

The New Monthly Belle Assemblée,

BEAUTIFULLY EMBELLISHED WITH HIGHLY FINISHED STEEL ENGRAVINGS
PORTRAITS OF THE NOBILITY, ETC.

Published Monthly—Price One Shilling.

PUBLISHED BY ROGERSON & TUXFORD, 265, STRAND, LONDON.

May be had of all Booksellers.

POPULAR MEDICAL WORKS,
PUBLISHED BY MANN, 39, CORNHILL, LONDON.

Post Free, 12 Stamps; Sealed Ends, 16 Stamps.

DR. CURTIS'S MEDICAL GUIDE TO MARRIAGE: A PRACTICAL TREATISE ON ITS PHYSICAL AND PERSONAL OBLIGATIONS. With instructions to the Married and Unmarried of both Sexes, for removing the special disqualifications and impediments which destroy the happiness of wedded life, founded on the result of a successful practice of 30 years.—By DR. J. L. CURTIS, M.D., 15, ALBEMARLE STREET, PICCADILLY, LONDON, W.

And, by the same Author, for 12 stamps; sealed ends, 20.

MANHOOD: A MEDICAL ESSAY on the Causes and Cure of PREMATURE DECLINE IN MAN; the Treatment of Nervous Debility, Spermatorrhœa, Impotence, and those peculiar infirmities which result from youthful abuses, adult excesses, tropical climates, and other causes; with Instructions for the Cure of Infection without Mercury, and its Prevention by the Author's Prescription (his infallible Lotion).

REVIEWS OF THE WORK.

"Manhood.—This is truly a valuable work, and should be in the hands of young and old."—*Sunday Times*, 23rd March, 1858.

"The book under review is one calculated to warn and instruct the erring, without imparting one idea that can vitiate the mind not already tutored by the vices of which it treats."—*Naval and Military Gazette*, 1st February, 1856.

"We feel no hesitation in saying that there is no member of society by whom the book will not be found useful, whether such person hold the relation of a PARENT, PRECEPTOR, or CLERGYMAN."—*Sun*, Evening Paper.

Manhood.—"Dr. Curtis has conferred a great boon by publishing this little work, in which is described the source of those diseases which produce decline in youth, or more frequently premature old age."—*Daily Telegraph*, March 27, 1856.

Consultations daily, from 10 to 3 and 6 to 8. 15, ALBEMARLE STREET, PICCADILLY, LONDON, W.

ASK YOUR GROCERS OR CHEMISTS FOR
GEYELIN'S TAPIOCA BEEF BOUILLON,

A most delicious and nutritious Soup for 2d. a Pint, or for Thickening Broths from any Meat.

SOLD IN CANISTERS, containing 5 portions, 1s. ; 12 ditto, 2s. 3d. ; 25 ditto, 4s. 6d. ; 50 ditto, 8s. 6d. ;
100 ditto, 16s. Each portion will make a pint of Soup.

Sole Manufacturers--GEYELIN & CO.,
Produce Merchants, Manufacturers of Granulated Tapioca, International
Mustard, and Rizina,
Belgrave House, Argyle Square, King's Cross, London, W.C.

FOUNDED A.D. 1844.

Empowered by Special Act of Parliament, 25 & 26, Vict., cap. 74.

**THE GREAT BRITAIN
MUTUAL LIFE ASSURANCE SOCIETY,
101, CHEAPSIDE, LONDON.**

CHAIRMAN—LORD VISCOUNT NEWRY.

SPECIAL ADVANTAGES TO ASSURERS.

The entire profits divided amongst the holders of participating policies.

The profits applied first in extinguishing the premiums at a given date, and afterwards in making the policy payable during life: this important advantage being secured without the payment of any additional premium.

ANDREW FRANCIS, SECRETARY.

EUROPEAN ASSURANCE SOCIETY.

EMPOWERED BY SPECIAL ACTS OF PARLIAMENT, FOR LIFE ASSURANCE, ANNUITIES,
AND GUARANTEE OF FIDELITY IN SITUATIONS OF TRUST.

Chief Office—17, Waterloo Place, Pall-mall, London.

ANNUAL INCOME, £300,000.

CAPITAL, subscribed by more than 1,600 Shareholders, nearly £800,000.

DIRECTORS.

CHAIRMAN—General Sir FREDERIC SMITH, K.II., F.R.S.

The Rev. A. Alston, D.D.

A. R. Bristow, Esq.

Edmund Heeley, Esq.

E. Hamilton Ainslie, Esq.

R. M. Carter, Esq., M.P.

Reginald Read, Esq., M.D.

This Institution offers every advantage of the modern system of Life Assurance.

The European is specially authorised by Parliament to guarantee the fidelity of Government officials.

The New Prospectus contains the Table for complete Life Policies, which are not forfeited by the non-payment of the Renewal Premium.

Prospectuses, Forms of Proposal, and every information may be obtained on application to the Society's Agents, or at the Chief Office.

HENRY B. PARMINTER, Manager.

PRICE'S BENZODYNE.—Cough; Consumptive Chronic Cough—Bronchitis, &c., immediately relieved and permanently cured by PRICE'S BENZODYNE, an ethereal extract of Benzoin, the healing properties of which are time-honoured. Price's Benzodyne possesses a peculiar mechanical power of putting a sudden stop to all wasting diseases as Cholera and Dysentery, and should be in every Hospital, Surgery, and Rectory throughout the world. Prepared only by Mr. Price, Analytical Chemist, 2, Lower Seymour Street, Portman Square, London, W.

ROGERSON & TUXFORD'S AGRICULTURAL WORKS

PRICE ONE SHILLING EACH,

Neatly Bound in Foolscap Octavo,

EACH VOLUME CONTAINING from 130 to 190 PAGES OF LETTERPRESS,

WITH NUMEROUS ILLUSTRATIVE ENGRAVINGS,

RICHARDSON'S RURAL HAND-BOOKS.

New Editions Revised and Enlarged

WHEAT: ITS HISTORY, CHARACTERISTICS, CHEMICAL COMPOSITION, and NUTRITIVE PROPERTIES. By "THE OLD NORFOLK FARMER," Author of "Agriculture, Ancient and Modern," &c., &c.

THE AGRICULTURIST'S WEATHER-GUIDE AND MANUAL OF METEOROLOGY. By HENRY C. CRESWICK, Assistant Observer in the Magnetical and Meteorological Department of the Royal Observatory at Greenwich, Author of several papers on Meteorology.

FLAX: ITS CULTIVATION AND PREPARATION, and BEST MODE OF CONVERSION.—By JAMES WARD, Author of "The World and its Workshops," &c.

RURAL ARCHITECTURE: a SERIES OF DESIGNS FOR RURAL AND OTHER DWELLINGS. The Ground Plans, Elevations, and Specifications by JAMES SANDERSON, Burgh Engineers' Office, Liverpool.

THE AGRICULTURAL INSTRUCTOR: or, YOUNG FARMER'S CLASS BOOK.—By EDMUND MURPHY, A.B.

DOMESTIC FOWL: THEIR NATURAL HISTORY, BREEDING, AND GENERAL MANAGEMENT.

THE FLOWER GARDEN.—By GEORGE GLENNY, F.L.S., Author of "Properties of Flowers," &c.

THE IMPLEMENTS OF THE FARM.—By R. SCOTT BURN, C.E.

HORSES: THEIR VARIETIES, BREEDING, AND MANAGEMENT.—Edited by M. M. MILBURN.

DOGS: THEIR ORIGIN AND VARIETIES.

PIGS: THEIR ORIGIN AND VARIETIES.

COWS AND DAIRY HUSBANDRY.—By M. M. MILBURN, Author of "The Sheep," &c. The Dairy Department Revised by T. HORSFALL.

SHEEP AND SHEPHERDING: embracing the History, Varieties, Rearing, Feeding, and General Management of Sheep; with Treatises on Australian Sheep Farming, the Spanish and Saxon Merinos, &c. By M. M. MILBURN, Author of "The Cow," and various Agricultural Prize Essays.

THE HIVE AND THE HONEY BEE.

PESTS OF THE FARM. A New Edition. By M. M. MILBURN, Author of "The Sheep," &c.

LAND DRAINAGE, EMBANKMENT, AND IRRIGATION.—By JAMES DONALD, Civil Engineer, Derby.

SOILS AND MANURES, with INSTRUCTIONS FOR THEIR IMPROVEMENT.—By JOHN DONALDSON, Government Land Drainage Surveyor.

THE POTATO: ITS HISTORY, CULTURE, AND NATIONAL IMPORTANCE.—By S. COPLAND.

In the Press, in continuation of the same Series,

London: Houlston & Wright, 65, Paternoster Row; Rogerson & Tuxford, 246, Strand, W.C.
Dublin: J. McGlashan, Upper Sackville Street. And all Booksellers.

Yours faithfully
Walsingham

PLATE I.

LORD WALSINGHAM,

PAST PRESIDENT OF THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND AND OF THE SMITHFIELD CLUB.

Lord Walsingham, of Walsingham, in the county of Norfolk, fifth Baron, was born on July 6th, 1804; succeeded his father in 1839; married, in 1842, Augusta Louisa, eldest daughter of Sir Robert Frankland Russell, by whom he has issue the Honourable Thomas de Grey, M.P. for West Norfolk since 1865. This lady died in 1844, and his Lordship married, secondly, in 1847, the Honourable Emily Elizabeth Julia Thellusson, eldest daughter of Lord Rendlesham, by whom he has a numerous family.

Lord Walsingham was elected a Member of the Council of the Royal Agricultural Society of England in 1855, and a Vice-President of the Society in 1861. He filled the office of President in 1860, in which year the annual Show was held at Canterbury. He joined the Smithfield Club in 1851, and was elected President of the Club for 1863. His Lordship has been President of the Wayland Agricultural Association, the meetings of which are held at Watton, near Merton, for the last thirty years.

As an agriculturist, Lord Walsingham is chiefly famous for his Southdown flock, for some years past the most successful of any in the country. On the Home Farm, at Merton, which has been much improved of late by marling and scientific cultivation, there is a Southdown flock which dates back for about forty years. The sheep, however, were originally small: and when Lord Walsingham first began to think of exhibiting, he was told that the soil was too poor, and that animals from it would always be beaten by those which came from better lands; as this at first was the case. But some success came in 1851, at the Norfolk and Yorkshire shows; while since then, Lord Walsingham has continued to improve his position, until at length, for six times in seven years, he has won the Gold Medal or Cup at the Smithfield Club, culminating his honours last Christmas with the Champion Cup for the best pen of sheep "of any age or breed" in the Hall. The foundation of the improvement in the Merton flock traces back to Jonas Webb, of Babraham; but constant resort has been had to the **OLD SERIES.**

stocks of the Sussex men themselves, such as Messrs. Rigden, Hart, Turner, Ellman, and Boys.

At the dinner of the Wayland Society, last autumn, Lord Walsingham said: "I may say, because I have a right to say it, that I have attended for a great many years, practically and personally, to the improvement of agriculture on my estate. I trust I have done so not without some little general benefit to the neighbourhood; but as to the success of any efforts of mine, I must leave others to judge of them. With respect to one point, I must most gratefully acknowledge that I owe my success mainly to the skill of that able and practical man who has brought my sheep to that perfection at which they have now arrived—I mean my agent, Mr. Woods. With respect to that I may, perhaps, claim a very little credit for myself. A person who, like myself, has many irons in the fire must engage the assistance of able men to see that those irons are always kept hot, and, above all, must supply the fuel which is necessary to heat the furnace. Passing from my own concerns, I wish to say that I have, since I have known the neighbourhood, seen many improvements in it. I remember when a great portion of my estate was nothing but a rabbit warren; and I may say, as of a person who makes two blades of corn grow where only one grew before, so also perhaps a person who has made several blades of corn grow where none ever grew before, must be considered in the light of a benefactor."

Lord Walsingham's precepts are well supported by his practice. At the time he succeeded to the Merton property, a considerable portion, about 4,800 acres, was held in large rabbit-warren farms, one consisting of as much as 2,100 acres. His Lordship's first object was to get rid of the warren as the leases fell out, and that was effected in the course of a few years. This step necessitated the building of farm-houses and premises, and the subdivision of the land; and the holdings here now range from about 600 to 700 acres, while great pains have been taken to reduce the rabbits. Hares were not considered to do

so much harm as rabbits, but they were destroyed with similar care, and their number is now reduced to a very low ebb. The main improvement necessary was to strengthen the staple of the sandy soil by marling or claying, for which there existed every facility. This proceeded slowly in the hands of the tenants, and large tracts were consequently taken in hand by Lord Walsingham himself, who at one time occupied in all about 3,500 acres. Large portions have now been marled or clayed at the rate of from 80 to 100 loads per acre, or, in some instances, much more, and the arable lands divided by

fences. Enough already has been effected to show that, by liberal but not necessarily very expensive cultivation and careful farming, good crops may be grown on land where formerly the produce was but little more than rabbits.

It is good to try a man by his character about home; and we have said enough to show that Lord Walsingham's repute does not rest merely upon his doings in public. They are rather famous for prize landlords in Norfolk, but our sample may take honourable rank amongst them; as, further a-field, the Merton triumphs may live in story with the Holkham shearings.

PLATE II.

THE AYLESBURY DAIRY COMPANY.

THE START FROM ST. PETERSBURGH PLACE, BAYSWATER.

A great revolution is just now taking place in the London milk trade. Mainly owing to the facilities afforded by the railways, a new branch of business is springing up that threatens gradually but certainly to supersede the objectionable system of keeping cows in a crowded metropolis. On the face of it, the health alike of the provider and consumer would seem to be better consulted by bringing milk fresh up from the country, rather than by encouraging its production from establishments in town, which, as the veterinary professors assure us, are very hot-beds of impurity and disease.

At the head of these "importing" houses stands the Aylesbury Dairy Company—Limited—which was originated by Mr. G. M. Allender, a gentleman who farmed for some years in Buckinghamshire, where he was famous for his breed of Berkshire pigs. Hence, from old associations, we may trace the title of the Company, although the supply of milk is not drawn alone from the Aylesbury grass grounds. Berkshire, Wiltshire, and Oxfordshire are also contributaries, while contracts are about being entered into for other districts. Nothing, indeed, in the management of such a concern could look to be more desirable than the plan of appropriating "fresh fields and pastures new," or a breakdown some fine morning on some favourite line might act like the temporary stoppage of a Bank, and seriously damage the stability of the business.

The Aylesbury Dairy Company now distributes between five hundred and six hundred gallons of milk a day, and before half-past eight o'clock in the morning, the "serving men" have called at some thirteen hundred houses. There is an afternoon delivery at two o'clock, the start for which we have caught in the photograph. Nothing can be more orderly than the system here employed. Some fourteen or fifteen carts are backed up to be loaded from the dairies, the milk being packed in sealed cans, and precisely as the clock strikes two does the first cart turn out of the yard. Each driver, with his guard at his side, has as orthodox an uniform as the mail-coachman of other days; and, indeed, the establishment at St. Petersburg Place is altogether something to see. There is a capital

built cottages for the men and their wives on the other. There is a Secretary's house communicating directly with the dairy, and a reading-room for the people, where without any absurd or impolitic restrictions, a man may not only see the paper, but smoke his pipe and take his drop of beer, without any need to look in at the public house. The milk is warehoused in a cool, roomy range below, where fountains are playing, and into the shade of which it was very grateful to retreat from the blaze of the mid-day sun. In fact, the whole place is delightfully "tempered" in this way, as the shop where you can set a glass of milk over the counter is fashioned like a grotto, with stone and rockwork, ferns, flowers, and gold-fish, which seem to have found a happy home at last. Then, the very clerk who books your order to send twice a day is no clerk at all, but a modera rendering of a veritable milkmaid. Dorcas, or Phoebe, or honest Maudlin herself, who sang Master Izaak Walton a song and promised him a syllabus:

A gown made of the finest wool,
Which from our pretty lambs we pull;
A belt of straw and ivy-buds,
With coral clasps and amber studs;
And, if these pleasures may thee move,
Come, live with me, and be my love.

Some short time back the Society of Arts offered a Gold Medal for a can which should bring milk up to town in the best condition, and the award was in favour of Mr. Allender's invention, the great merits of which are simplicity and freedom from angles and corners, thus rendering its cleansing an easy matter, while the can is provided with an inner lid or stopper, that alike serves to stay any tampering with the contents and to keep out the dust. There are, however, some who still maintain that the quality of the milk is injured in the transit, but this we are inclined to think is a mistake. Country milk, well managed, has a better flavour, and will keep longer after its arrival than London milk just drawn.

There was a time, and not so long since, when his spare milk was often in the way of the farmer: he really did not know what to do with it. Here, however, is a ready-money business open to his hand, that may be conducted with far less trouble than the manufacture of butter, cheese, or pork.

page of glibbling on one side, a row of comfortable well-

H A Y.

BY CUTHBERT W. JOHNSON, F.R.S.

The produce of our grass lands varies in amount in different districts to a greater extent than perhaps any of our ordinary field crops. For those variations we must chiefly assign the widely different amount of moisture of our spring months. Thus in the last six years the rainfall at Croydon in March, April, and May has been in inches as follows:

	1865.	1866.	1867.	1868.	1869.	1870.
March ...	0.82	1.65	2.44	0.81	1.31	1.44
April ...	0.37	1.90	1.95	1.72	1.04	0.38
May	3.36	1.63	1.55	0.78	3.47	0.72
Total.	4.55	5.18	5.94	3.31	5.82	2.54

We see, then, that in the three chief hay-producing months, we had in Surrey a rainfall in 1869 of about 582 tons of water per acre—and this was a great hay year. In the present year to June the 1st, we had only in these months a downfall of about 254 tons per acre, or not half that of 1869; our hay crop therefore is this season miserably deficient (an inch of rain is about 100 tons per acre). We are all well aware how much the amount of rain influences the mode of farming in different portions of our island; that our grass-producing or western counties are those where the rainfall is the greatest, whilst cereals are chiefly cultivated in our drier or eastern counties. This rainfall differs to a much greater extent than is commonly understood. Thus in the month of April in the present year we have noted that our Surrey rainfall was only equal to about 38 tons of water per acre. But in the western districts the fall during this month per acre was 174 tons at Barnstaple, 291 at Bodmin, 172 at Derby, and 238 at Manchester. The amount of water which our water meads receive, and the largeness of their produce tend to illustrate the same fact, that it is the deficiency of moisture to which our bad hay seasons are owing. The sewage-irrigated meads bear similar testimony. We find at Croydon that unless we annually apply to these meadows from 4,000 to 6,000 tons of sewage per acre, the greatest advantage from these is not derived. Now this is only equal to a rainfall of from 40 to 60 inches, an amount which only equals the downfall of some of our western grass-producing districts. It is true that other explanations of the beneficial results of irrigating grass land have been suggested, but they none of them obviate the necessity of a very large supply of water. I have in another place briefly referred to some of these explanations.

The good effect produced upon the grasses by the use of certain waters is well known. The reason why other springs are of little or no advantage in irrigation is not so well understood. Various theories have been propounded, to clear up the difficulty; but none of these appear to be of general application. More than half a century since, the celebrated Davy applied himself to the question. In his fishing days on the banks of the Berkshire Kennet and the Hampshire Itchin, he had noted the noble meads in their valleys, watered by only the bright springs issuing from the chalk formation. Here he found water producing the most luxuriant growth of grass—water in which he found but slight traces of organic matter. It abounded with carbonate of lime and carbonic acid gas; but, then, Davy noted that the soil it irrigated rested on the chalk formation. The chemical composition of the water, therefore, afforded Davy little aid in explaining its fertilizing power. This great philo-

sopher, however, carried his thermometer with him; he found that the temperature of the soil beneath the irrigating water was commonly eleven degrees higher than the surface of the water, even when that water had a thin covering of ice. The water, therefore, concluded Davy, keeps the grasses warm—preserves them from the effects of low and rapid transitions of temperature. This good effect, it is very probable, may be produced by the waters issuing from the chalk, which Davy was used to haunt in his days of fly-fishing, for the temperature of some of the springs of that formation is very considerable and uniform. The water of the Surrey Wandle, for instance, is of the temperature of about 50 degrees in all seasons; its stream in consequence never freezes. The temperature, therefore, of such waters may reasonably be expected to produce considerable benefit to the grasses over which they flow. But, then, we find that even these waters are materially increased in their irrigating value by the admixture of foreign substances. The bright chalk waters of the Itchin become sensibly more valuable to the irrigator after they have passed through the city of Winchester; and the same remark applies to other streams. In the case of the Clipstone meads, below the town of Mansfield, we are told by Mr. J. E. Denison, when describing the valuable water meadows formed by the Duke of Portland (*Jour. Roy. Ag. Soc.* vol. i., p. 362), "Soft water is the best; mineral water and water from peat, mosses, and bogs, are found to be injurious. After strong rains, the washings of streets and sewers of the town of Mansfield, which discharge themselves into the Mann, give great additional efficacy to the water. It will sometimes deposit a sediment, in one watering, of the thickness of a sheet of paper." The same remark applies to the water of the Wandle. Its fertilizing power is very greatly increased as it flows through a well-inhabited district towards the Thames. All natural waters, indeed, contain foreign substances. The water of the Holy Well from the Malvern Hills was found by Phillips to contain about 14.61 grains per gallon of various salts; even in rain water we detect ammonia and nitric acid. It is of great importance that these facts should be generally understood, and the water meads of our country extended. The enormous amount of grass produced upon the water meadows is too little known. And this great produce, let us remark, is not confined to the sewage-irrigated meads of Edinburgh, Croydon, and Mansfield. It is true that on those meadows more than thirty tons of grass per acre are annually produced; but then some of the watered lands of our Southern chalk formations yield nearly as much, although the water is bright and colourless. A Wiltshire farmer, Mr. J. Coombes, of Tisbury, long since described their produce, when he was remarking (*Farm. Mag.*, vol. xlvii., p. 217) upon "what may be considered the average produce of the water meadows in South Wilts." In doing so, he observed, "I will take a meadow of 20 acres, depastured in spring by sheep. The spring feed of this meadow, as fed in April, will keep 400 couples of sheep 25 days, during which time these 400 couples will fold ten acres of arable land, and it will after this yield in the first and second cuttings of grass, about 40 tons of hay. As I have said, this may be considered the average produce of these water meadows." These are facts which I would earnestly commend to the consideration of the landowner. They involve questions of the most vital importance to our agriculturists—the

increased production of animal food. I need hardly remind the reader that this, the most profitable branch of English farming, is not likely to become less remunerative as our population increases, and skilled labourers more numerous.

Upon the Croydon sewage-irrigated meads at South Norwood (which are on the London basin clay) the following is the length in inches of crops of Italian rye-grass grown there in the year 1867:—

1st crop.....	35
2nd do.....	40
3rd do.....	42
4th do.....	32
5th do.....	24
6th do.....	14

187 in., or 15 ft. 7 in.

In some experiments, carried on in 1867 by Mr. J. C. Morton on the farm of the Metropolis Sewage Company at Barking, some equally important results were obtained (*Bath and West of Eng. Soc. Jour.*, 1868). In one of these great operations, to 56 acres of Italian rye-grass about 300,000 tons of sewage were applied. From these 56 acres 2,488 tons of grass were cut.

It is a question of considerable importance to have decided, the comparative value of the grass produced upon lands irrigated, and not irrigated. This was ascertained by Mr. J. B. Lawes. He observed (*Jour. Roy. Ag. Soc.* vol. xxiv., p. 80): "It was obviously of great importance to determine the proportion of dry or solid substance contained in the produce cut, weighed, and given to the animals, in a green and very succulent condition; to determine the difference in composition due to the application of sewage; and also that of the successive crops taken at different periods of the season. To this end samples of 2½ lbs. of the unsewaged, or 5 lbs. of the sewaged grass, were taken from every load as soon as it was weighed at the homestead, the samples from each plot respectively being mixed together day by day as taken, until the cutting of the plot was completed. Each such mixed sample was exposed on sheets of canvas in the open air until sufficiently dry. It was then stored in sacks, and finally cut into coarse chaff, well mixed, weighed, and a weighed portion of the mixture taken for the purposes of analysis. 50 ounces of the coarsely cut chaff were taken in each case, and each of these samples was carefully divided into 4 equal parts; two of which were fully dried at 212 deg. F. to determine the absolute dry substance, and then burnt to determine the mineral matter, and a third was finely ground, and a portion of it sent to Professor Way for analysis.

"It should here be remarked that there are many practical difficulties in the way of getting accurate results in regard to the amount of dry substance in large bulks of green produce such as those in question. Cut in the morning, as the crops always were, the grass generally held a good deal of superficial as well as other moisture, and, with equal conditions of weather, the heavier the crop the greater the amount of water so retained. Again, if the weather were dry and hot, the grass would lose moisture considerably between the time of cutting and that of weighing and sampling at the farm bridgings; or, if rainy, the grass would be more or less saturated with water. To add to these difficulties, which are almost inseparable from such an inquiry, the taking of the samples, and their partial drying and preservation, were necessarily left in the hands of those unpractised in such work.

"It will be obvious from the above considerations, that the exact figures given which relate to or involve the question of the proportion of dry substance in the produce must be accepted with some reservation; though it is believed that at any rate the direction and more general

indications of the results on the point may fully be relied upon. The results given of the analyses of the dry substance itself will, of course, be much less affected by the irregularities referred to; and the differences in its composition according to the difference in the conditions of growth are points well worthy of a careful consideration in a hitherto untrodden field of inquiry.

"The following table then shows the mean composition (per cent.) of the dry substance of the grass produced without and with sewage, and in each successive crop in the season of 1861:

	Un-sewaged.	Sewaged.		
	Plot 1.	Plot 2.	Plot 3.	Plot 4.
Number of Analyses } giving the means ... }	5	7	9	9

The chief point of remark is, that the solid matter of the much more luxuriant and succulent sewaged grass contained a considerably higher proportion of nitrogenous substance than that of the unsewaged. It also contained somewhat more, both of the impure waxy or fatty matter extracted by ether, and of mineral matter which may be taken to indicate a less advanced or ripe condition at the time of cutting. But, owing to the generally less ripe and more succulent condition of the sewaged than the unsewaged grass, it is highly probable that a larger proportion of its nitrogenous substance was in an immature condition; and, so far as it was so, it would be less available for the formation of the nitrogenous compounds of flesh or milk. It would at any rate be unsafe, without further evidence on the point, to attribute the higher milk-yielding quality of the dry substance of the sewaged grass unconditionally to its higher proportion of nitrogenous substance."

Having thus noted the effect of water of varying degrees of impurity alone upon our grass land, next let us examine how their produce may be increased by artificial dressings where water for irrigation is not available. How can this produce be improved in quantity and quality? "A few years since," observes Mr. Bowick (*Jour. Roy. Ag. Soc.*, vol. xxiii., p. 60), "it was hardly allowed that these are pretty much in the farmer's own hands. Put on ammoniacal manures, and you get a strong bulky produce, in which the ranker grasses predominate. Apply phosphatic dressings, and the clovers and finer grasses presently appear. Prepare a combination of the two, and a desirable result should follow. Our manure manufacturers of repute, who have characters to lose, do this ready to our hand; and there can be no great hazard in putting on from 20s. to 30s. worth of such dressings per acre—in damp weather in February or March—whilst the prospect of a profitable return is highly encouraging. This refers to grass land which receives such applications regularly, or which is otherwise in good condition; with exhausted soils, more liberal treatment is required. The following plan has been tried here extensively, and invariably with satisfactory results. Draw out a dunghill about Christmas, containing 300 yards of good yard-manure. Throw up in a heap six feet high, and mix with one ton of Peru-

vian guano, two fous half-inch bones, and two tons of salt. Turn a time or two, till the whole becomes a rich saponaceous mass. Then cart on the turf not later than February; apply to twenty acres; spread, chain harrow, and spread again. After a week or two little will be seen of it; but at hay-time, as well as on the after-math, the results are readily visible. Similarly, by the application of hot lime at from one to two tons per acre on pieces of sour grasses or under trees where the *Dactylis glomerata* abounds in all its coarse luxuriance, much improvement in the herbage is produced." If farm manure is not to be had, then 1 cwt. of guano, 1 cwt. of nitrate of soda, and 2 cwt. of common salt per acre, is a good dressing for artificial grasses. We have long contended that our grass lands have never obtained that share of the farmer's attention which they will sooner or later obtain. This remark is not confined to those pastures to which nature has been bountiful, but extends to those poor yearly more-and-more-impooverished upland grass lands that the holder is so wont to plough up. It was at the conclusion of a debate on the breaking up of our pastures that the chairman of the Dorchester Club reminded his brother-farmers (*Farm. Mag.*, vol. liii., p. 265) that they had hitherto looked at the question principally from a tenant's point of view, but he thought they should hardly bid adieu to it without taking a landlord's view of the subject; and he would say this, that in breaking up these lands they were turning rabbit land into land for the use of the human kind, so that the landlord must stultify himself if, seeing the benefit that would result to himself, to his tenants, and to the community at large, he should oppose the judicious cultivation of such land as they had under review. But there was no doubt it was also a serious consideration to them, because landlords were aware that if land was broken up and injudiciously managed, considerable crops might be drawn from that land for two or three years, and after that it was impooverished for generations. Therefore there were two or three considerations of importance to the landlord. He should certainly not have a moveable tenant, or a tenant likely to move in a short time; secondly, he should take care to have a skilful tenant, and one who knew how to do the business and afterwards cultivate the land aright; and thirdly, he should take care the tenant was a man of capital—a man who had all his other land in good cultivation, and had a little extra money to go to work with in the cultivation of an increased quantity of arable land.

Having produced our grass—next as to its conversion into hay. Now, as I have in another place remarked, this operation is often too long delayed. In a valuable prize essay on hay-making, by Mr. T. Bowick, of Stoneleigh, in Warwickshire, he observes (*Jour. Roy. Ag. Soc.* vol. xxiii., p. 48.):

"Of course the weather is almost everything in hay-making. Thus, referring to the four years 1858, '59, '60, and '61, there were in Warwickshire:

	Rainy days.		Depth of rain.	
	June.	July.	June.	July.
1858	4	8	2.51	2.48
1859	11	8	2.45	2.95
1860	27	12	5.70	1.95
1861	18	25	3.01	4.30

Of the value of machines in haymaking, during these years, Mr. Bowick observes: In the two dryer years hay was well and easily got; while in the two latter the operation bore a complete contrast to our earlier experience. In 1860, in particular, the chief difficulty was how to make hay in cloudy weather alternating with pouring rain; and the chief lesson learnt was, that a strong staff of hands is essential. We managed, with one of Burgess and Key's implements, to dispense with half-a-dozen able-bodied mowers, while another half-dozen were also fre-

quently taken from their work on pressing occasions. As regards the mowing-machine in that unfavourable season, although there were many annoyances arising from stoppages among tangled and heavy crops, yet we never lost an hour's carrying by keeping it at work, while it gave us a power over the whole operation which could not otherwise have been obtained. Improved machinery, as the haymaker, horse-rake, and mowing-machine, has tended greatly to diminish the amount of manual labour needed. The former implement has been more or less before the public for the past fifty years. Though many improvements have been made, its principle still remains unchanged. Scarcely second in importance for extensive crops is the horse-rake. Even where it is not employed for windrowing, there is a great saving of labour by dispensing with hand-rakes for clearing the ground. The use of carts, instead of waggons, in hay-carrying, is a great advantage, for one strong horse will take nearly as much on an old-fashioned broad-wheeled dung-cart (furnished with suitable gearing) as many folks choose to place on a waggon drawn by two or three horses. The cart can be left beside the rick, while the horse returns for another load, by having three props, one fastened to each shaft, and the other at the tail of the cart. It is a good practice, for hay that has been injured by rain in harvesting, to add a peck of salt to a ton of hay. Mr. Bowick prefers adding to the hay a mixture, which many have tried, both in making the ricks in summer and in using them in winter. The point aimed at is to give an aromatic flavour which shall be intrinsically good and safe in itself, and which shall at the same time render the hay or clover palatable to the stock fed upon it. This is accomplished by strewing a little of the following mixture in the rick, while in the process of erection:

Fenugreek, powdered	112 lbs.
Pimento	4 "
Aniseed	4 "
Carraways	4 "
Cumine	2 "

An outlay of 2s. 6d. per ton will afford a sufficient application in the majority of cases. And that horses or cattle will consume the compound in preference to better lots not similarly treated, we have had repeated and lengthened observation. An inquiry being made as to how it affected the health of the animals fed upon it, we were able last season thus to reply: 'Our beasts, numbering 170 head, came out with more than average bloom in spring; and the cow doctor's bill, from November to April inclusive (the hay-consuming months), has not run over three-pence per head.'" The great object, it must be remembered, in haymaking, is to preserve in the hay all the saccharine and other soluble matters of the grasses; to dry in the juices; to avoid the ill effects of drenching rains. The process adopted around London has been well described by Mr. R. Smith, in his prize essay on grass land (*Jour. Roy. Ag. Soc.*, vol. ix., p. 20). "There the mowers perform their task by the acre, the haymakers being paid by the day. On an average five (boys, women, and men) is a fair proportion to each mower; much, of course depends on the weather. The course in fine weather is: *First day*—All grass cut before 9 o'clock is carefully 'tedded' out, and, if possible, is moved again before 1 o'clock; then it is 'hacked' into small rows; then they return to the first mowed, and place it in small 'grass cocks.' On the *second day*—All the grass cut after 9 o'clock on the first day, and before 9 o'clock on the second day is 'tedded;' and then they shake out the grass cocks of the first day into small rows; the hay is then moved once or twice before dinner; after dinner the more forward hay is raked into small double 'winrows;' then, after attending to other portions of the hay, it is made into small cocks. On the *third day*—After attending to

the hay in less advanced stages, the forward hay is shaken out again into round patches, or winrows, if a heavy crop, and again moved over before 1 o'clock, after which it is carried. Care is taken in all cases not to have a preponderance of mowers; in fact, not to have more hay down at any one period than can be managed upon the established process. The 'haymaker' has now partially superseded manual labour; it expedites the work; but in wet seasons fine spreading of the hay exposes it more to the ill effects of the rain. The cheapest way to get hay," adds Mr. Smith, "and to insure the greatest value out again, is to harvest it quickly, by a sufficiency of labour." Those who rely entirely upon the sun never have good weather." Such is the mode of making hay near the metropolis—a very different system is adopted in our northern and western counties, and in Scotland. For there, the haymaking season is commonly much more rainy than with us. At a recent meeting of the Morayshire Farmers' Club, Mr. Walker (Leuchars) remarked, that "he had perhaps more experience in the way of making hay than any gentleman present. The way they made hay in the county of Fife, so far back as forty or fifty year ago, was to cut it and let it lie for two or three days, the time depending upon the strength of the hay. When hay was left in the swathe as cut, it would stand a great deal of rain, but if they turned it over and over, it was easily spoiled. After lying for two or three days in the swathe, he would turn it over with the handle of a fork, then put it into cole and it would stand two or three good showers; then put three or four of the small coles into one, and allow it to stand till it could be put into stack. They could not in this country depend upon weather for making the hay, as in England." The expense of cutting the grass was estimated by the chairman of the Club, to be in Morayshire 4s. 6d. an acre by the scythe, and about 2s. 6d. by the machine.

The nutritive quality of our hay is, of course, a primary consideration. Meadow hay was some little time since laboriously examined by Professor Way. His examination of the natural grasses was made after they had been dried in a temperature of 212 degrees. The results which he obtained must therefore be, as he observed, somewhat modified, when we regard them as in the state of hay; for however dry it may appear, no grass can be made absolutely dry without artificial heat, the usual proportion of moisture in well-made hay being about 16 per cent.; and a grass which has been artificially dried, will in the air

absorb from it about this degree of moisture. From the per-centage of albuminous or fatty matter in the dry specimens, therefore, about one-sixth is to be deducted to ascertain the quantity present in the hay. With this deduction, the following table will give the lowest, highest, and the average quantities per cent. in the specimens of about 22 natural grasses, which he examined:

	Low.	High.	Average.
Flesh-forming principles	6.08 ...	17.29 ...	10.93
Fat-producing principles	2.51 ...	3.67 ...	3.05
Heat-giving principles	38.03 ...	57.82 ...	45.57

In about 15 dried artificial grasses he found:

	Low.	High.	Average.
Flesh-forming principles	10.34 ...	24.60 ...	19.03
Fat-producing principles	2.51 ...	4.77 ...	3.65
Heat-giving principles	33.15 ...	49.65 ...	41.29

The ordinary varieties of hay, dried at 212 deg., analyzed by various chemists, yielded the amount per cent. of ash annexed to their names in the following table, and the composition of that ash per cent. I have also added in the subjoined columns:

	Meadow.	Clover.	Sainfoin.
Ash per Cent. ...	8.7	11.17	6.36
Sand and silica ...	25.1	2.6	3.2
Potash ...	19.9	16.1	31.9
Soda ...	7.8	40.7	—
Lime ...	8.2	21.9	24.3
Magnesia ...	2.0	8.3	5.0
Alumina ...	—	—	—
Oxide of iron ...	1.9	0.5	0.6
Chloride of potassium...	4.7	—	6.2
Common salt ...	13.1	4.7	0.8
Phosphoric acid ...	14.4	4.1	9.4
Sulphuric acid...	3.4	1.1	3.3
Carbonic acid ...	—	—	15.2

These facts are full of interest to the haymaker. And it is no objection to their value that I refer to them in an extraordinary season, when owing to the dryness of the spring months there has been hardly any grass to cut, or, if there was, a very limited growth; it was nearly hay before it was mown. I have shown that in Surrey we had only 2.54 inches of rain in March, April, and May of the present year, and I may add, that not any fell from the 16th of May until the 16th of June, and then the amount was only 0.09 of an inch; and not any has fallen from that day till the time I am writing (the 24th of June).

NEW FOREST FARMING.

There is an agricultural enigma which, although continually under discussion, does not even in this advanced age appear to be approaching to anything like a satisfactory solution. So surely as any observant gentleman speaks to our position or prospects so certainly does he refer to the millions of acres of land in this country that are still suffered to lie in waste. He then gradually goes on to show that, were this neglected soil only brought into cultivation, such a course would be attended with every advantage to those mainly concerned in the business. And here of course arises a very startling paradox. The competition for farms is becoming keener than ever; the emigration schemes are gradually extending, and yet the landlords in the face of all this obstinately refuse to increase their rent-rolls. Would they only map out more farms neither the tenant nor the labourer need be driven to seek an occupation elsewhere.

During the last few months this argument has been pointed in one particular direction. Meetings at short

intervals have been held at Botley, Lynton, Romsey, and back again to Botley, all with an eye to the New Forest; while it is scarcely too much to say that this agitation has originated over the experience and enterprise of one man. If not so continually seeking the public gaze, a Mr. William Dickinson is almost as famous, and in much the same way as Mr. Mechi. After a lengthy career in business in London he has taken as bodily to farming on the Forest, where from time to time he has given the world the results of his experiments and investigations, which he may be said to have summed up in a challenge that he sent to this Journal early in March last. In this he said, "The amount of rent I pay the Crown for 430 acres of land is £816 per annum—that is, for rent and interest upon capital expended in improvements by the Crown, at my request. The staple of many thousand acres round the two farms I hold, four miles apart (mostly planted with fir trees), is as fine for agricultural purposes as is usually found in any

county, very superior to that round London, and the climate superior to any I have hitherto met with in any other part of England. The land wants nothing but simple honest farming, by resident farmers. I say resident farmers, because both farms I hold were farmed by the Crown up to the time I took them, and produced, I am told, very little indeed. They now produce heavy crops of the finest grain of all kinds, the finest roots; and growing grass 2 feet 9 inches high was shown at the fat cattle show at Christmas at Mr. George Gibbs' stand dug up from the open field and sent there. I have no objection to show the last year's produce of the New Forest Farms (swedes only excepted, they are eaten), white wheat, red April wheat, barley, oats, both kinds of mangolds, and carrots, against the produce of any farm in England, not for a money wager, but the benefit of the public. The highest quotation for last year's wheat in the London market, on the 21st ult., was 48s. per qr. or £12 per load (being five qrs.); the highest price at Southampton was £11 5s. per load; my last sale-return from Guildford on the 21st was £13 15s. per load. My barley is equally good, but has not yet been offered for sale. My red and yellow mangolds both got second prizes at Birmingham, and my carrots were commended." About this same time the Botley Club, the members of which had previously paid Mr. Dickinson the high compliment of declining to enter into competition against his roots, after a long sitting decided that woods, plantations, and commons "would pay to break up and cultivate," that all the remaining lands of the New Forest "should be offered to public competition," and so forth. At a second meeting of the same Club, it was resolved to draw more attention to the millions of acres lying waste, with a view to its cultivation, "as a means of employing our surplus population;" as at Lymington it was declared that the condition of the New Forest was "not satisfactory," that "it should be enclosed and cultivated as speedily as possible," and that the Government be "memorialized to that effect." At Romsey only last week some further conference took place, the result of which was the expression of an opinion that "it would be conducive to the public good that the New Forest should, after the rights and privileges of the commoners and others are fairly satisfied, be brought gradually into the market for sale, reserving such portions as may be required for public recreation;" while a more direct proposal that the Forest be enclosed and set out in large and small farms, on long leases, fell to the ground for want of a seconder.

Reports of these meetings have from time to time appeared in our columns, as, however much or little the resolutions actually adopted might infer, the chief speakers, like Mr. Blundell, Captain Maxse, and Mr. Dickinson, looked to carry all before them. At the last meeting, however, at Romsey, a report of which appears in our paper of this day, the proposal to attack the New Forest forthwith was by no means so unanimously espoused. The landlords, like Mr. Beech, the chairman, and Mr. Cowper Temple, the present representative of the Palmerston property in this county, were by no means so sanguine, while some of the leading farmers, like Mr. Trask, were more directly opposed to any scheme which should compel either owners or occupiers to break up their waste lands. One of the chief means to the end would, according to Captain Maxse, be the re-establishment of the small-farm system, although nothing, under the preliminary difficulties consequent on such an undertaking, would threaten to break down so readily. Our own solution of the case, or rather perhaps trial of the experiment, would start from an exactly contrary direction. It has so happened that within the last few days we have driven through the New Forest, and that we have paid a visit to that New Park which has been cut, as it were, fairly

out of the thick of it. The approach to this is park-like indeed, as no man could well wish for a nobler entrance to his home. There is an expansive range, old timber in clumps or single sticks, all belted by the woodlands, as in fact the very realization of a country gentleman's demesne. And it is here that good Mr. Dickinson has settled himself down to grow great cuttings of rye-grass, to increase tons on tons his crops of turnips and mangolds, and to cultivate corn that shall take the first prizes at the shows, and make the best prices in the market. But still, the impression from this visit, pleasing as it was, did not go to rank the tenant of New Park as a farmer—that is, as a man who lived by his business. There was something rather of the tone of the philosopher, of the experimentalist, who in his retirement devoted himself to researches which, if they succeeded, might become a public good, and which, if they failed could be of no great consequence to the gentleman who busied himself about them. It is in this light that we would regard the New Park farm; it is properly the home-farm of a Park, and as such, and as nothing more would we in the outset make it an example. The Crown could do nothing with the place. Mr. Dickinson has done much with it; but even he, perhaps, could scarcely say at how great a cost. Mr. Beech, the other day, speaking on behalf of the labourer, said "it was evident that the time was coming when the New Forest must share the same destiny that had overtaken some other forests. But he did not desire that it should follow the same course as Epping Forest, because there they saw a large tract of country, which formed the delight and enjoyment of the inhabitants of London, converted into private parks and private residences, and he was not sure that, if the Crown looked to making the most money out of that portion of the Forest which came to them, it would not find it better to sell it to a number of rich people, who would make parks and gardens, than to allow it to be sold for agricultural purposes." Nor, are we so sure but this would be in every way the best thing that could be done. Let thousand-acre plots be laid out; let New Parks be multiplied; let the wealthy and enthusiastic be in the first instance invited to take up the cultivation of the Forest, and the labourer will profit far more than he will suffer from the intrusion. As Mr. Trask puts it, "there is a considerable amount of land not growing corn at the present time which might be improved so as to become capable of growing it; but at the same time there is a vast amount of land now growing corn which pays nothing at all." There are many patriots who would be well pleased to play Columbus here, even if they wearied after a while and gave over the new country to their followers.

TREATMENT OF GALLED BACK.—The celebrated veterinary surgeon, George H. Dadd, gives in the *Prairie Farmer* the following: So soon as an abrasion is discovered on the back of a horse, the animal should be excused from duty for a few days; the abraded parts should be dressed twice daily with a portion of the tincture of aloes and myrrh. This simple treatment will soon heal the parts. Should there be no abrasion, but simple swelling, attended with heat, pain, and tenderness, the parts should be frequently sponged with cold water. Occasionally the skin undergoes the process of hardening (induration). This is a condition of the parts known to the farriers of old as "siftast," and the treatment is as follows: Procure one ounce of iodine and smear the indurated spot with a portion of the same twice daily. Some cases of galled back and shoulders are due to negligence and abuse, yet many animals, owing to a peculiarity of constitution, will "chafe," as the saying is, in those parts which come in contact with the collar and saddle, and neither human foresight nor mechanical means can prevent the same.

THE BATH AND WEST OF ENGLAND SOCIETY, AND SOUTHERN
COUNTIES ASSOCIATION.

MEETING AT TAUNTON.

"It will not be necessary to detail the reasons which have caused the Society, in the 75th year of its existence, to hold, for the first time, its annual meeting in the summer at a distance from the city in which it was originally founded. Another opportunity may present itself for giving some account of the past history of the oldest agricultural Society in England. It may suffice to say, on this occasion, that the present plans of operation bid fair to fulfil the original purpose of its establishment more completely than ever. Actuated by this conviction, the members of the Society as originally constituted decided to take into consideration a plan for extending the operations of the Society by holding a summer meeting for the exhibition of breeding stock and implements at different places in successive years." And, again, "The towns of Taunton and Bridgwater promptly and liberally responded to the proposal to hold the meeting at one of those places. It was decided that the Society's first meeting should be held at Taunton." So says the Official Report from the Committee, as read at the Annual Meeting of the Bath and West of England Society on the show-ground at Taunton, on Wednesday, June 9, 1852. It is amusing enough now to note the pride with which the Council on broaching this peripatetic experiment spoke of the prizes as "amounting in the whole to £484, distributed in the following manner—viz., £148 for cattle, £99 for sheep, £30 for pigs, £40 for horses, and £167 for implements, which last item includes a prize which is a new and striking feature in agricultural exhibitions, peculiar to this Society, being the prize of £20 for the most economical collection of implements suited to tenants occupying arable land not exceeding 100 acres. It has been responded to by the implement makers, and it is hoped that it will be productive of much practical utility, especially to those whose funds for the purchase of implements is necessarily limited." Then the Judges' Committee went on to report how "the names of 126 exhibitors have been entered for competition, consisting of 77 exhibits of stock and 49 exhibitors of implements. There are 238 entries of stock, and the entries of implements are upwards of 400." And how in the whole "the number of head of cattle amounts to 379."

Bearing in mind the time which has elapsed, and the agricultural improvement which has been going on in this time, it is doubtful whether the second visit of the Bath Society to Taunton is altogether so satisfactory and encouraging as might have been anticipated. Considering the calibre and scope of the now united West and Southern Societies, the entries are curiously small; nor save in some certain exceptional cases, is this limited competition counterbalanced by any very remarkable merit. Testing the meeting, indeed, by our three leading breeds of cattle, little or no progress is observable save with the Herefords. There are actually one third less of Devons, and scarcely half-a-dozen more Shorthorns exhibited at Taunton in 1870 than there were to be found here eighteen years previously. Against this, however, it may be argued that experience in the interim has taught breeders to send into public only such as are really superior animals. But it is not so. A strong proportion of the stock is decidedly inferior, and it frequently happened that the winning

beasts fairly placed themselves. According to the prize list, the judges were very liberal in their commendations; but many of these could only have been bestowed upon a comparison with something still worse, rather than from any close approach to the prize standard of excellence.

The Devons threaten so far to offer no great front during the show season, and the Somerset Devons more especially are quite out of force. In fact, it is hard to understand how Mr. Farthing's royal heifer *Pretty Maid* could have been kept in at Falmouth the other day, as one of the best on the ground, so lumpy and unsightly has she become in her quarter, so sadly has she trained off as to be no longer worthy of her name. Whereas, Lord Falmouth's *Narcissus*, also first in his class at the Cornwall Meeting, goes more to realize his title, having fine character, a bloodlike head, and a somewhat wild expressive eye. Then he has a deep, massive frame, with plenty of substance, at no sacrifice of quality. There was not much against him, the *Stowey* high commendation being a particularly plain beast; nor was there any competition to speak of amongst the yearlings, where Mr. Davy won with one of his high-bred animals, the second best being a long slack-framed young bull that requires a deal more time. Mr. Smith's second cow, neat, clean, and pure, was much more entitled to a place, while *Actress*, at over ten years of age, was made up very fat, although even her high patchy condition could not quite disguise her blood-like bearing, nor carry one away from that sweet head and deer-like glance; but still she is fast getting out of public form. There were two or three more nice cows in this class, and Mr. Dorsetshire Smith's two-year-old, if not so weighty, was far more sightly than the *Pretty Maid* placed before her. The pick and pride, however, of the Devons was Mr. Davy's yearling heifer *Tempress*, a half-sister to the prize cow—so level, so admirable in the rounding of her frame, and so full of breeding, that she had placed herself long before the judges had arrived at her second. The class, in truth, was otherwise only moderate enough, and *Duchess*, at best, but a bad second; but the judges bestowed upon it a general commendation.

"We shall probably not err very materially if we should rest our opinion of the Shorthorns as now, more than ever, the dominant breed of cattle in this country, upon the exhibition which is made of it in 1870, as compared with that in 1852 in the very home of the Devon." So said our contemporary the *Gardeners' Chronicle* in an article calling attention to the Taunton Show in connection with the merits of Shorthorns, as published on the Saturday previous to the opening of the meeting. The result, however, hardly went to maintain, in this instance at least, any such ascendancy for "the dominant breed," as had been inferred. As we said last week, it was numerically the weakest represented of the three national breeds, and, with the exception perhaps of Mr. Stratton's second prize yearling heifer, there is not an animal in the entry that should promise to make any great mark at Oxford. Lord Sudeley's white bull has gone off since last season, as all bulls will do when their show condition is brought into use, and he so looks to stand more out at his shoulders than ever; but there is still

a deal to like about Mandarin, what with his long straight frame and fine quality, and we quite expect to see him beat the Churchill Butterfly if they meet at Oxford. This beast has the better forehead, but, as a set-off, he is very bad and vulgar about his quarter, as he lacks much of the style of the other, and is, indeed, a commonly fair bull, of some size, and seemingly of more constitution than the other; but then he is half a year or more the elder. There was nothing else worthy of mention in the class; and, of the three or four two-year-olds, there was nothing beyond the winners to look at. Bythis has gone on well, and Majesty, with a good coat and nice touch, has the makings of a good bull about him, while the judges must have travelled very much out of their way to highly commend such a thing as they did. There were four cows in all entered, every one of which received some notice, while it was a nice point between Mr. Garne and Mr. Stratton for first, although we quite go with the award. Pride of the Heath, handsome, lady-like, long, roomy and light of bone, is already well known about the country, having during last season taken the chief prizes in Worcestershire, Warwickshire, and Northamptonshire. Beyond this she is nearly two years older than Coriander, who, having never been out before, was quite fresh and blooming. She is a useful, well-covered animal, looking of course more square and trim, but wanting something of the refined feminine character of her rival. Another first appearance from Burderop is the two-year-old Peersess, a long, deep heifer, of great substance and good flesh, that had no difficulty in disposing of La Belle Hélène, who shows but little advance on her yearling form, which was never more than second-rate. There is, on the contrary, however, a vast improvement observable in the best Royal calf, Flower Girl, who has dropped to her leg, and is now growing into a really stylish charming heifer, so that the Manchester award would seem to be gathering confirmation. Not that the judges here by any means held to it, for they placed Gertrude, from the same herd, and a merely commended calf at Manchester, first, while, as second to her, they put Flower Girl the best of all at Manchester. Gertrude is some months older than the other, as she is level enough, but short and vulgar forward, and so far as the two be concerned, there can be little question but that the Royal reading was the better one. The Yorkshire entry, Lady Highborn, also commended at the Royal, is ripening into a very nice heifer, but Lord Sudeley's Ceres, then in so much favour, now commanded no attention, and was altogether passed over in the liberal allowance of commendations appended to the award.

Manifestly the Shorthorn man and the Hereford man who were called on to act in company over these two breeds did not get on very well together. Mr. Savidge, it may be assumed, had it very much his own way with the Shorthorns; but although Mr. Yeomans was said to have had his son in the ring with him! the differences over the white faces were on reference given in favour of the Shorthorn judge. And there was something to differ over, as, for example, in the capital show of yearling heifers, about the best lot of Herefords we have seen got together in one class for many a day. And these were probably too much for the judges, for smart, bloodlike, and wealthy as is Mr. Thomas' Sunbeam, there were many would have it that Mr. Allen's second, from Mr. Rogers, of the Grove, was a better, or Mr. Tudge's highly-commended Lady Brandon a better than either of those placed before her. Lady Brandon was the best calf at Manchester, where, however, neither of the other two were entered; while it was sufficiently manifest at Taunton that Mr. Thomas Thomas must have established in Glamorganshire a very superior herd of Herefords. His best of all the

bulls, Sir John the Third, is as magnificent a specimen of the breed as we have ever seen. He is full of style and quality, backed by good size, a great back, and so forth; then he has a fine coat, is of a good colour, fashionably faced with white, and instead of being a sleepy, sluggish, over-done brute, is as lively as a kitten, and as fierce as a bulldog; his temper, in fact, was almost his only drawback, and it was a service of some danger to look him over. Mr. Baldwin's second is a son of Lady Asford, and Mr. Arkwright's commendation showed a deal of breeding; but the judges qualified the compliment by also noticing two or three very indifferent bulls, one of which, in the face of no competition, took a prize at Southampton; and they coupled with him the "Royal" Stow, never an animal of much pretensions in good company. We spoke after Hereford Fair to the merits of Mr. Turner's "nice thick, high quality yearling Trojan," who has since been doing well, and, barring being a little narrow behind, promises in every way to be the best of his year; but the class was not a strong one, although sundry commendations, as usual, were tacked on to the award. The Hampton Beauty is a rather delicate-looking cow, and it is a question whether Mr. Thomas should not have been first again here with a very good serviceable cow, while Mr. Allen matched his last year's entry with one of the Westonbury Fairies, although with not so successful a result. The prize heifer Silver Star has trained off sadly from her yearling form, as she is growing very gaudy and patchy, and it was so far fortunate that she had but one to meet and beat at Taunton. Noticeably strong as was the show of Herefords, many of the best of these were bred away from Herefordshire. The best man, indeed, does not go direct to Hereford for his blood, as Mr. Thomas' Sir John the Third was bred by Mr. Rawlings in Shropshire; and Mr. Thomas' Lizzie, at home at Cowbridge; while the best heifer, Sunbeam, is the produce of Sir John the Third and Lizzie, the first prize bull and second prize cow. What capital proof this is!

The Sussex beasts offered, as might have been expected so far from home, but a poor front of it. Both the bulls were very moderate, but the two prize cows were good, and the Heasman's sent in a pair of fairish heifers. The best Jersey bull was a wonderfully good one at all points, and the second best quite good enough to win in good company. These were backed by some nice cows, the neatest of which was put second, but happily without any of that unseemly disturbance which attended the placing of the Islanders at Southampton. In fact, the Devon and Sussex judges pulled very well together, whereas the Shorthorn and Hereford couple scarcely succeeded even in satisfying each other.

As we were enabled to report last week, the strong point of the Taunton Meeting is no question the capital entry of Somerset and Dorset horned sheep, where in every way some praiseworthy progress is observable. Indeed, those who know the breed best were by no means prepared for the extraordinary improvement shown in these sheep. So long as they managed to get a bit of fat on the loin and to have them ready early as house-lamb, little more was sought after. Now, however, they unite more size with more symmetry, set off as they are by those grand curling horns; and at Oxford, if we may augur from this home-show, the Dorsets and Somersets will well maintain their right to that distinction as a breed which the Royal Society has at length accorded them in the arrangement of the classes. Noticeably enough, at Southampton last year, although as handy, there were not in all a dozen entries of these sheep, whereas at Taunton there were upwards of twenty shearing rams in competition, with numerous commendations appended to the actual awards. Mr. Henry Mayo, who

has given much attention to his flock, clearly understands not merely how to breed a sheep, but how to show him; and his rams were very artistically turned out. Smart, however, as is the winning shearling, Mr. Herbert Farthing's second was almost equally good; and in the smaller class of old rams, a sheep from Nether Stowey of fine character and size had a long way the best of it. There was a time when Mr. Danger was altogether too strong for his friends and neighbours, but his flock now in the hands of Mr. Bond can reach no higher than seconds or commendations. Mr. Farthing's pen of ewes had also more spread and use about them; and in a capital class, where everything came in for some compliment, they were unmistakably the biggest and best. In truth, generally good as the three classes were, they were thought to have been very properly appraised; as were the smaller and more active Exmoors, also in greater force, and really running into something like competition. But, when enforcing a certain economical arrangement, the West of England Society, as we have already shown, calls upon two men of different tastes to judge Shorthorns and Herefords, as it entrusts horses of all kinds to one agricultural and one "nag" authority, so it puts a Southdown fancier in couples with somebody nearer home to get through the Horns and Downs. And here more particularly the system broke down. If there were little or no complaint amongst the Dorsets and Somersets, the Sussex breeders fairly stood aghast over the capricious and altogether inexplicable reading of a Southdown, as here delivered. First of all the judges took a very neat, true shearling from Buckland, and this they placed first. They next selected a sour headed, lop-eared animal, as all over one of the worst sheep the Heasmans have ever entered, and this they placed second; and then they commended and highly commended three rams of Mr. Rigden's, standing close along-side, any one of which for Down character, style, or quality, was better than their second prize. In fact, Mr. Rigden should have been first, if not first and second, and after him Sir William Throckmorton. All the Heasmans' sheep were below their standard, and Mr. Neville-Grenville, Mr. Harding, and Mr. Brook had nothing that could come into competition with the Southdown-bred rams. Amongst the older sheep, it was, alas! only confusion worse confounded. Sir William Throckmorton's first prize in an excellent class of old rams at Manchester was now merely commended, although at three years old he does not seem to have suffered much from wear-and-tear. On the contrary, Mr. Rigden's two-shear, second at Southampton, has done well in the interim, there being considerable improvement on his first-year's form; and he got the turn of fortune's wheel as first and best. But then, to separate these two famous sheep the judges did precisely as they had done in the previous class, that is they selected one of the very worst sheep in the entry as their second prize! This was Lord Portsmouth's happily named No. 2, a significant title that must have gained him no. 2 place on the prize list, to which he could have in such company no other claim, for a plainer meaner sheep at most points has seldom been seen. A very bloodlike, if not very large ram of Mr. Penfold's was highly commended, and then hired for Lord Walsingham; but as a matter of consistency, Mr. Woods should have also hired, or if possible, have bought outright the renowned No. 2, whose merit altogether passeth show. Mr. Rigden did not send his ewes, and Mr. Grenville's pen was accordingly pronounced to be superior to that of Sir William Throckmorton.

Barring Mr. Morrison's shearling, a very moderate one, and not to compare with his last year's specimen, Mr. Rawlence took all the prizes from Hampshires, of which there was a short and indifferent show; and the Shrop-

shires, as might have been expected, were in no force although here occurred one of the sensations of the meeting. Lord Falmouth's entries, which had been winning last week in Cornwall, were disqualified, as unfairly shorn, and certainly the appearance of the two-shear ram, more especially, went far to condemn him. He is otherwise a great grand sheep, and a long way the best, not of his class, for there was no class, but of the breed. The best shearing was a useful sheep of some quality, and Lord Chesham's still very neat rams are getting more Shropshire character, the more especially about their heads; but the ewes are still all of the Downes, as they are certainly of a very different type to Mr. Horton's black faces, which in a class, reduced to three entries, came all the way for a commendation. The inspector drew out his pruning knife again in the following section of Oxford Downs, where he disqualified the Burghfield pen of ewes, much to Mr. Milton Druce's astonishment and disgust, and in this case an appeal was straightway lodged after the following fashion:—"To the Secretary of the Bath and West of England Society, Show Yard, Taunton, June 7, 1870. SIR,—With reference to my pen of Oxfordshire Ewes, No. 305, 'unfairly shorn,' I beg to say that my certificate of entry is perfectly correct, and I can bring evidence to prove it. I will thank you to lay this letter before the Council. I am, Sir, your obedient servant, A. F. Milton Druce." Otherwise the Oxford Down classes were of but little mark, the breeders evidently holding back the strength of their hands for Oxford, for which there is an extraordinary entry, one man having, as it is said, between 20 and 30 nominations in the shearing class. Mr. Wallis' old sheep distinguished himself at Leicester and Manchester, and Mr. Charles Gillett's ewes were very good indeed.

The Messrs. Gould took all the first prizes for Leicesters, and they also exhibited in the Devon Long-wool classes, where the sheep pretty generally seemed to be Leicesters, or Leicesters once removed; and straight-way the rumour of a protest got about. But Mr. Bartholomew would know that down his way there are breeders who exhibit Leicesters and also Lincolns, the inference being that two distinct flocks are maintained; and certainly the Poltimore Leicesters are of a finer type than the Devon Long-wools, which look, beyond a certain rough coarse character, to have no remarkable merit as either a new or an old breed. The highest-bred Leicester as it struck us was Mr. Tremaine's second-prize shearling, the first at Falmouth the other day, and that on the score of style and quality might have been first again here. The Hill-men still hold off; and almost the only good Cotswolds were those supplied from the late Mr. Gillett's flock. Otherwise, in so small an entry there were never perhaps so many bad sheep; as certainly there should not be at a show of such calibre as that of the old West of England Society.

The exhibition of horses was much after the same fashion—that is, the classes were mainly made up of two or three good and the remainder as decidedly bad. And yet where horses went far to judge themselves, never did two old hands so potter about as Messrs. Howard and Thurnall. Great as are the attractions of the ring-side, people got weary of watching, and went away and came back again, only to find these slow-tops now walking, now trotting, now cantering, and now stripping some wretched animal that might have been drafted at half a glance. This is a very conscientious way of proceeding no doubt; but we believe that a man may bother his own eye by dwelling so much, and towards the end of the day, when the judges seemed to be really as tired of it as the spectators, some of the awards gave anything but satisfaction. There were three

or four particularly nice hunting horses, at the head of which was a Pontifex three-year-old, called Splash-water, an airy, sweet stylish horse, with the "manners" of a park hack, and altogether delightful riding action. The Lincolnshire judge bought him forthwith, as it was said for Mr. Chaplin, and Splashwater, no doubt, will be seen again in the ring. The three four-year-olds placed were again all very good; the winner being worth the most as a matter of weight, but the grey is the neater nag of the two, and Mr. Michelmores's three and four-year-olds, both worth looking after. In fact, had the filly been ridden she should have been put second to the Yorkshire horse, as Mr. Battams' Irish chesnut is a vulgar, servant's sort of animal, neither remarkable for looks nor action. There was a deal of talk over another Irish nag, Hunting Horn, that, as a raw colt, took a prize at Southampton, while he was here pronounced to be the best of the all-aged class. He is a narrow high horse, but a slashing goer, and with such upright shoulders, rather to be commended as a second-class steeplechaser than as a pleasant horse to ride. Mr. Battams had a couple of useful horses in this class; but the competition was by no means keen, and the whole lot might bear a mediocriter mark. A half-brother to Splashwater was entered amongst the yearlings, and another bloodlike promising colt he is, with the walk of a race horse and the makings of a Leicestershire hunter. And over his head the judges put a quick varmint hackney thing, with a bob-tail, that could no doubt move a bit; but in a class of hunting colts or fillies a more extraordinary mistake was never committed. It is only to be hoped that the judges may be induced to write their own report for the Society's *Journal*, and so take the opportunity of explaining what so far looks like an inexplicable award. Mr. Battams' big chesnut cob is cut out to carry an alderman or a banker, and the London dealers should look him up forthwith; and so most assuredly they showed Mr. Ballard's pony—a very perfect little horse by Hospodar, standing some thirteen hands and a-half high. He has a beautiful lean head, a clean neck, fine shoulders, a round barrel, and famous thighs and quarters. In fact, he is as full of style and fashion as he can be, whether you throw the rein on his neck and let him stand still, as well he knows how, or set him going. The only thing against the Cowbridge pet is that he is ridden in a very severe long ported bit, against which he looked to bore a little in his faster paces. Of course he was first, as was a merry little high-stepping chesnut in the next class; but neither of their seconds was well selected, and no doubt there were better amongst the remainder. Mr. Trot's bay poked his head out in a ring-saffle, but in Mr. Ballard's bridle, and with Mr. Ballard to ride him, he would have shown very differently, and at three years old, with plenty of time to make him, was the most serviceable pony of his class; and he was not placed even second.

The best cart stallion was a long way the best of the lot—a deep weighty good-looking grey, that could move; while the second prize was a very moderate beast, and none of the others of such mark. Mr. Tice's brown two-year-old also showed to great advantage in the ring, being, indeed, a very taking colt of a capital colour, with good ends and plenty of liberty for a cart horse. The best looking, if not, indeed, the only good looking, cart mare was Mr. Gollidge's Wiltshire brown, but she was lame, and so straightway disqualified, as we trust from some hereditary defect, for unsoundness in a brood mare is otherwise of little or no detriment. The world, however, for a wonder was heartily sick of the horse-ring by the time the turn came for the cart horses, and the blaze of the afternoon sun left the twain moving them

here and there, and there and back again, like an over-played game at drafts.

The pig show, taken right through, was decidedly good, and the judges occasionally commended whole classes. As usual, however, the big pigs did not tell much; and of the two classes of boars, the first in each alone claimed any particular attention. The Bedford pigs certainly seem to be doing and showing better and better; although, whether the credit of this be due to the breed or the management, we will not stay to discuss here. The prizes and the commentary thereon would run much the same with the large sows, saving that Mr. Dove fairly beat both Bedfordshire and Lincolnshire in the couples with two very admirable young white sows, bred by Mr. Rake, of Bristol; who, however famous he may be this time, we confess to have never heard of before. In the small breeds, Mr. Ware, from Cornwall, took first and second prizes for old boars with own brothers, and two of the very best pigs on the ground. They are of the improved Essex breed which would seem to have taken fresh root further west, and to have wafted the fame of Fisher Hobbs to the very Land's End. The younger class of small boars was by no means so good; but the small sows, in both classes of which the awards went precisely the same way, had much merit, the elder single entry sows being one of the very best in the show. And at the head of this stands Messrs. Duckerings' Lily, half sister to Little Queen, about the most renowned pig of her era. The Berkshires had this year a section to themselves, and they proved how thoroughly they deserved the compliment; for some of the best pigs, and the very best farmer's pigs, were to be found here. The advantages of Science with Practice were further pointed by far away the best boar having been bred and reared at the Cirencester College. Giving, as a racing man would say, Mr. Heber Humfrey and Sir William Throckmorton "lots of weight" in the way of age, for he was only a day too old for the younger class, Sambo's superiority as a high-quality but still true Berkshire was very manifest. His awkward age let in Mr. Stewart for both premiums amongst the juniors, where the College and Mr. Humfrey had again some very good entries, but Mr. Stewart enjoys an established repute for Berkshires. The whole class of sows was commended, and when the judges had reduced their field to five they were still in something of a difficulty, so altogether admirable was the entry. Very noticeably the winner turned up in a sow with rather too much white about her, shown by the Duckerings but bred by Mr. Griggs in Essex; and thus from thirteen entries eight prizes go to Lincolnshire, of four entries from the Britannia farms, three are returned as winners, while Mr. Stewart takes precisely a similar proportion, three prizes and one blank. There was no competition in the class of young sows in couples, for Mr. Bailey, of Swindon, who had made some entries, did not care to send on.

The non-prize system of the West of England Society would seem to be fast bringing the implement business to a crisis. Either on the ground or at the trials it is scarcely possible to imagine the indifference which was displayed by the visitors to so important a section of the show. Although the field was within a stone's throw of the entrance to "the yard," as it is called in contradistinction, very few people beyond the exhibitors or their staff cared to give even a passing visit, and as neither the rye for the reapers nor the grass for the mowers afforded much opportunity for the display of good work, the trials, as a contemporary has it, were "somewhat mild." Certain of the manufacturers positively refused to cut into such poor crops, but Woods had out a new reaper that was said to have not made much mark, and the Howards, the Hornshys, and Burgess and Key were also represented in

the field. The ploughing was more interesting, and Pirie, shepherded by Fowler and Co., was declared to have achieved some noticeable improvement even on the very perfect implement we have already in use. Of course, some of the great houses, like the Rausomes and the Howards, also had a bout or two; but only imagine a ploughing match without prizes! a salad without the dressing, an opera without the orchestra, or a battle fought with blank cartridge. As one straightforward fellow told us with a significant smile, "of course we did the best work, sir," and no wonder if the Society has quietly dropped out these trials from its own official report. They were certainly never so tame as at Taunton; but, only let the Council offer, say, £100 in premiums, for novelties on the stands or in the field, and a new spirit would be infused into these proceedings. We gave in our last week's number a list of the agricultural implement makers exhibiting, and these, without any such incentive or attraction, had to vie with premiums not only for cattle and sheep, but for poultry and flowers, and lucky numbers in the Fine Arts lottery.

The following is a list of the exhibitors of implements :

Afleck, Swindon; Amies, Barford, and Co., Peterborough; Andrews, Melksham; Ashby, Jeffery, and Luke, Stamford; Baker, Wisbech; Baker, Compton, Newbury; Baker, Bristol; Bamlett, Thirsk; Bayliss, Jones, and Bayliss, Wolverhampton; Beach and Co., Dudley; Beale, Taunton; Bentall, Maldon; Bell Brothers, London; Beverley Iron and Waggon Company, Beverley; Beare, Liverton, Newton Abbot; Belcher, Gee, and Co., Gloucester; Boby, Bury St. Edmunds; Boulton and Co., Norwich; Bradford and Co., Manchester; Brenton, Polbathic, Cornwall; Bristol Implement Company, Bristol; Bristol Waggon Works Company, Bristol; Browne and Co., Bridgwater; Brock, Bristol; Brown Brothers, Lyme Regis; Brown and May, Devizes; Burman, Taunton; Burgess and Key, London; Cambridge E. and Co., Bristol; Carson and Sons, London; Carson and Toone, Warminster; Carter and Co., London; Clayton and Shuttleworth, Lincoln; Coleman and Morton, Chelmsford; Colthurst, Small, and Co., Taunton; Colthurst, Symons, and Co., Bridgwater; Corbett, Shrewsbury; Cranston, Birmingham; Cullingford, Stratford; Davey, Devonport; Davis, London; Day, Bridgwater; Day, Crewe; Day, Son, and Hewitt, London; Dear, Southampton; Deuing and Co., Chard; Denton, Wolverhampton; Dodge, London; Duffield, London; Eddy, Kennford, Exeter; Fisher, Taunton; Follows and Bate, Manchester; Fowler and Co., Leeds; Fox, Walter, and Co., London; Fuller, Bath; Gardner, Gloucester; Garrett and Sons, Saxmundham; Garton and King Exeter; Gibbons, Wantage; Gliddon, Taunton; Goss, Plymouth; Gray and Co., Glasgow; Haward, Tyler, and Co., London; Hardon, Manchester; Hayman and Co., Exeter; Haynes and Sons, London; Headley and Son, Cambridge; Heard, London; Heap, Manchester; Hellard, Taunton; Hill and Smith, Brierley Hill; Hindley, Bourton, Dorset; Hilton and Co., London; Hill, Yeovil; Hobbs, Basingstoke; Hoobes and Son, Norwich; Hornsby, Grantham; Howard, Bedford; Hudspeth, Haltwhistle; Humphries, Pershore; Hunt, Earls Colne; Hutchings, Exmouth; Huxtable, Ottery St. Mary; Inman, Stratford; Jaque, Abergavenny; James, Cheltenham; Johnson, London; Jones, London; Jones, Gloucester; Kallend and Son, Taunton; Kiddle, Salisbury; King, London; Larkworthy and Co., Lowesmoor; Le Butt, Bury St. Edmund's; Lee, Gloucester; Lewin, Poole; Lewis and Hoole, Shrewsbury; Lyon, London; Main and Co., London; Major and Co., Bridgwater; Marshall, London; Marshall, Sons, and Co., Gainsborough; Marshall, Upton Pyne; McNaught and Smith, Worcester; Menuel and Co., London; Milford, Kenn; Milburn and Co., London; Milford, Thorverton; Mitchell and Co., Manchester; Moule's Patent Earth Closet Company, London; Nell, Harrison, and Co., London; Newham and Son, Bath; Nicholson, Newark; O'Hanlan and Co., Bristol; Page and Co., Bedford; Parnall and Son, St. Thomas, Exeter; Parham, Bath; Peace, Bridgwater; Penney and Co., Lincoln; Perkins and Bellamy, Ross; Perman, Salisbury; Petter,

Yeovil; Phillips, Newton Abbott; Picksley, Sims, and Co., Leigh; Piggott Brothers, London; Plowman, Bridgwater; Powis C. and Co., London; Powis J. and Co., London; Priest and Woolnough, Kingston-on-Thames; Ramsbottom and Co., Leeds; Ransomes, Sims, and Head, Ipswich; Reading Iron Works, Reading; Reeves, Westbury; Rendle, London; Richards, Wincanton; Richmond and Chandler, Salford; Roberts and Sons, Bridgwater; Robey and Co., Lincoln; Robinson, Wembdon; Rollins, London; Ruston, Proctor, and Co., Lincoln; Samuelson and Co., Banbury; Savery, Taunton; Sawney, Beverley; Silvester, London; Simpson and Co., London; Simpson and Son, Melksham; Smith and Sons, Chard; Smith and Grace, Thrapston; Southwell and Co., Rugeley; Spong and Co., London; Standfield and Crosse, Exeter; Stiles, London; Sutton and Sons, Reading; Tasker and Sons, Andover; Thomas, Bridging; Thomson, Perth; Thompson, Brothers, Bridgwater; Tipper, Birmingham; Tuck and Son, Bath; Turner, Ipswich; Tuxford and Sons, Boston; Vezey, Bath; Waide, Leeds; Wallis and Steevens, Basingstoke; Watson, Andover; Wensley, Mark; Winter, Wiveliscombe; Wise Brothers, Bristol; Wood, London; Woods, Cocksedge, and Warner, Stowmarket; Woofe, Bedford; Worssam and Co., Chelsea.

PRIZE LIST.

CATTLE.

DEVONS.

JUDGES (and for Sussex and Channel Islands Cattle):—

J. Piteher, Hailsham, Hurst-Green.
R. Warren, Childokeford, Blandford.

Bulls, exceeding two and not exceeding four years old.—First prize, £20, Viscount Falmouth, Tregothnan, Probuss (Narcissus); second, £10, J. Howard Buller, Downes, Crediton; highly commended, Walter Farthing, Stowey Court, Bridgwater (Duke of Gotthelney); commended, J. Davy, (Duke of Flitton 4th).

Bulls, not exceeding two years old.—First prize, £20, J. Davy, Flitton Barton, North Molton (Duke of Flitton 5th); second, £10, W. Smith, Hoopern, Exeter (Pennsylvania); highly commended, J. Jackman, Hexworthy, Launceston; commended, J. A. Smith, Bradford Peverell, Dorchester (Duke of York).

Cows, in calf, or in milk.—First prize, £15, J. Davy (Actress); second, £13, W. Smith, Hoopern (Musk); highly commended, J. A. Smith (Daisy); commended, J. A. Smith (Pet).

Heifers, in calf, or in milk.—First prize, £15, Walter Farthing (Pretty Maid); second, £10, J. A. Smith (Picture).

Heifers, not exceeding two years old.—First prize, £10, J. Davy (Temptress 2nd); second, £5, W. Smith (Duchess) highly commended, T. Hawkes Risdon, Washford, Taunton, (Alexandra). The class commended.

SHORTHORNS.

JUDGES (and for Herefords):—

M. Savidge, Sarsden, Chipping Norton.
W. Yeoman, Stretton Court, Hereford.

Bulls, exceeding two and not exceeding four years.—First prize, £20, G. Garne, Churchill Heath, Chipping Norton (Royal Butterfly 20th); second, £10, Lord Sadeley, Toddington, Winchcomb (Manderin); highly commended, Rev. R. B. Kennard, Marnhull, Blandford (Oxford Duke).

Bulls, not exceeding two years.—First prize, £20, Lady Emily Pigot, Branches Park, Newmarket (Bythis); second, £10, R. Stratton, Burderop, Swindon (Majesty); highly commended, G. Hitchman, Long Ashton, Bristol (Chancellor).

Cows, in calf, or in milk.—First prize, £15, G. Garne (Pride of the Heath); second, £10, R. Stratton (Coriander); highly commended, O. Ilosegood, Dillington, Ilminster (Ursula 15th); commended, J. Dove, Hambrook House, Hambrook (Cherish).

Heifers, in calf, or in milk.—First prize, £15, R. Stratton (Peeress); second, £10, Lady Emily Pigot (La Belle Hélène); highly commended, W. H. Hewett, Norton Court, Taunton (Violet).

Heifers, not exceeding two years old.—First prize, £10, R. Stratton (Gertrude); second, £5, R. Stratton (Flower Girl); highly commended, Rev. R. B. Kennard (Oxford Duchess), J. Webb, Fladbury, Pershore (Bella), J. T. Robinson, Leckby

Palace, Asenby, Thirsk (Lady Hightborne), and Lady Emily Pigot (Mautilina 2nd); commended, J. Dove (Bankeia Rose), and W. H. Hewett (Annette 3rd).

HEREFORDS.

Bulls exceeding two and not exceeding four years.—First prize, £20, T. Thomas, St. Hilary, Cowbridge, Glamorgan (Sir John 3rd); second, £10, J. Baldwin, Ludington, Stratford-on-Avon (Lord Ashford); highly commended, J. Gifford, North Cadbury, Castle Cary (Brigadier) and N. Benjafield, Short's Green Farm, Motcombe, Shaftesbury (Theodore); commended, J. H. Arkwright, Hampton Court, Leominster (Sir Richard) and J. Morris, Town House, Madley, Hereford (Stow).

Bulls not exceeding two years old.—First prize, £20, P. Turner, The Leen, Pembridge, Leominster (Trojan); second, £10, H. N. Edwards, Broadward, Leominster (Sir John); highly commended, J. Harding, Bicton, Shrewsbury (Count Fosco).

Cows in calf, or in milk.—First prize, £15, J. H. Arkwright (Hampton Beauty); second, £10, T. Thomas (Lizzie); highly commended, J. D. Allen, Tisbury, Salisbury (Fairy 3rd).

Heifers in calf, or in milk.—First prize, £15, W. Tudge, Adforton, Leintwardine (Silver Star); second, £10, P. Turner (Livia).

Heifers not exceeding two years.—First prize, £10, T. Thomas (Sunbeam); second, £5, J. D. Allen (Lovely); highly commended, J. Harding (Dahlia), W. Tudge (Lady Brandon); commended, P. Turner (Butterfly), J. H. Arkwright (Lively), J. Morris (Chignon), T. Fenn, Stonbrook House Ludlow (Duchess of Bedford 6th).

SUSSEX.

Bulls not exceeding two years.—First prize, £20, J. Turvill, Hartley Park Farm, Alton (Young Martin); second, £10, G. Jenner, Parsonage House, Uddimore, Rye (Young Taunton).

Cows in calf, or in milk.—First prize, £15, Tilden Smith, Knell, Beckley, Ashord, Sussex (Fagz); second, £10, J. Turvill (Rose); highly commended, Tilden Smith (Fatty).

Heifers in calf, or in milk.—First prize, £15, Messrs. J. and A. Heasman, Augmering, Arundel (Southampton); second, £10, J. and A. Heasman (Beauty); commended, G. Jenner (Young Cooke).

CHANNEL ISLANDS.

Bulls, not exceeding four years.—First prize, £10, G. Digby Wingfield Digby, Sherborne Castle, Sherborne (Sir Jerry); second, £5, H. Compton, Manor House, Minstead, Lyndhurst (Prince); highly commended, R. C. Priddle, North Stoneham, Southampton (Briton); commended, W. C. Drake Esdaile, Burley Manor, Ringwood (Marquis), and W. Gibbs, Tynesfield, Bristol (Red Knight).

Cows in calf, or in milk.—First prize, £10, W. Gibbs; second, £5, H. Compton (Ada). The class commended.

SHEEP.

LEICESTERS.

JUDGES (and for Other Long-wool Sheep):—

W. Bartholomew, Waddington Heath, Lincoln.

T. Brown, Martram, Downham Market.

Yearling rams.—First prize, £10, J. and A. E. Gould, Poltimore, Exeter; second, £5, J. Tremain, Polsue, Grampound, Coruwall.

Rams of any other age.—First prize, £10, J. and A. E. Gould; second, £5, G. Turner, Bramford Speke, Exeter; highly commended, J. Tremain.

Pens of five yearling ewes.—First prize, £10, J. and A. E. Gould; second, £5, J. B. Corner, Longforth, Wellington.

COTSWOLDS.

Yearling rams.—First prize, £10, the executors of the late T. Gillett, Kilkenny, Faringdon; second, £5, the executors of the late T. Gillett.

Rams of any other age.—First prize, £10, the executors of the late T. Gillett, Kilkenny, Faringdon Oxford; second, £5, T. B. Browne, Salperton Park, Andoversford; commended, J. Williams, Caerady, Cowbridge, Glamorganshire.

Pens of five yearling ewes.—First prize, £10, the executors of the late T. Gillett; second, £5, J. Williams; commended, T. B. Browne.

DEVON LONGWOOLS.

Yearling rams.—First prize, £10, R. Corner, Torweston, Williton, Somerset; second, £5, R. Corner; highly com-

mended J. and A. E. Gould, Poltimore, Exeter; commended, R. Corner.

Rams of any other age.—First prize £10, Elizabeth Gibbings, Higher Brenton, Kennford, Exeter; second, £5, R. Corner; highly commended, G. Kingdon, Rodmore, Devon.

Pens of five yearling ewes.—First prize, £10, J. B. Corner; second, £5, J. B. Corner.

SOUTH-DOWNS.

JUDGES (and for Short-wool Sheep):—

F. Budd, Hatchwarren Farm, Basingstoke.

H. Woods, Merton, Tretford.

Yearling rams.—First prize, £10, Sir W. Throckmorton, Bart., Buckland, Faringdon, Berks; second, £5, J. and A. Heasman, Augmering, Arundel; highly commended, W. Rigden, Hove, Brighton; commended, W. Rigden (for two more rams).

Rams of any other age.—First prize, £10, W. Rigden; second, £5, the Earl of Portsmouth, Hurstbourne Park, Whitechurch, Hants; highly commended, Sir W. Throckmorton and H. H. Penfold, Selsey, Chichester; commended, Sir W. Throckmorton.

Pens of five yearling ewes.—First prize, £10, R. Neville-Grenville, M.P., Butleigh-court, Glastonbury; second, £5, Sir W. Throckmorton.

HAMPSHIRE DOWNS.

Yearling rams.—First prize, £10, A. Morrison, Fonthill House, Tisbury; second, £5, J. Rawlence, Bulbridge, Wilton, Salisbury.

Rams of any other age.—First prize, £10, J. Rawlence; second, £5, J. Rawlence; commended, J. Moore, Littlecott, Pewsey.

Pens of five yearling ewes.—First prize, £10, J. Rawlence; second, £5, J. Rawlence; highly commended, J. Barton, Jun., Hackwood, Basingstoke.

SHROPSHIRE.

Yearling rams.—First prize, £10, H. Wood, Pucknall Farm, Romsey; second, £5, Lord Chesham, Chesham, Latimer, Bucks; commended, Lord Chesham.

Rams of any other age.—No award.

Pens of five yearling ewes.—First prize, Lord Chesham; second, £5, H. Wood; highly commended, T. Horton, Ilanage Grange, Shrewsbury.

OXFORDSHIRE DOWNS.

Yearling rams.—First prize, £10, C. Gillett, Cote House, Bampton, Oxfordshire; second, £5, C. Gillett.

Rams of any other age.—First prize, £10, G. Wallis, Old Shifford, Bampton, Faringdon; second, £5, C. Gillett.

Pens of five yearling ewes.—First prize, £10, C. Gillett; second, £5, E. Gillett, Upton Down, Burford.

SOMERSET AND DORSET HORNS.

Yearling rams.—First prize, £20, H. Mayo, Coker's Frome, Dorchester; second, £5, H. Farthing, Nether Stowey, Bridgwater; highly commended, H. Mayo, J. W. James, Map-powder Court, Blandford, A. J. Pitfield, Eype, Bridport; commended, E. Gapper Legg, Coombe Down, Beaminster.

Rams of any other age.—First prize, £10, H. Farthing; second, £5, A. Bond, Huntstile, Bridgwater.

Pens of five yearling ewes.—First prize, £10, H. Farthing; second, £5, J. Culverwell, Classey Farm, Bridgwater; highly commended, R. Welch, Stocklinch, Ilminster, A. Bond, Huntstile, W. B. Peren, Compton House, South Petherton; commended, H. Mayo.

EXMOOR AND OTHER MOUNTAIN SHEEP.

Rams of any age.—First prize, £10, J. Quartly, West Molland, South Molton, Devon; second, £5, J. Davy; commended, J. Quartly.

Pens of five ewes of any age.—First prize, £5, Sir T. Dyke Ackland, Bart., Holnicote, Minehead; second, £3, W. Smith, Hoopern.

INSPECTOR OF SHEARING:—H. Bone, Avon, Ringwood.

HORSES.

JUDGES:—F. C. Howard, Temple Brewer, Sleaford.

H. Thurnall, Royston.

FOR AGRICULTURAL PURPOSES.

Stallions foaled before 1868.—First prize, £25, J. Hitchcock, Chitterne All Saints, Heytesbury, Wilts (Lion); second £15, J. Joyce, Great Wadham, South Molton (Young

Matchless); highly commended, William Pocock, Edington Burtle, Bridgwater (Young Invincible).

Stallions foaled in 1868.—First prize, £20, W. Tyce, Westonzoylead, Bridgwater (Young President); second, £10, J. Hitchcock (The Brown Duke). Highly commended, H. L. Heath, Weare, Weston-super-Mare (Farmer's Glory).

Mares and foals or in foal.—First prize, £15, J. Hutton, East Breat, Weston-super-Mare (Blossom); second, £5, Mrs. Elizabeth Burbidge, South Wraxhall, Bradford-on-Avon, Wilts (Blossom); commended, E. Gibbs, Chitterne, Heytesbury.

HUNTERS.

Mares or geldings, foaled before the 1st January, 1866.—First prize, £25, C. Champney, Theale, Wells (Hunting Horn); second, £10, G. B. Battams, Kilworthy, Tavistock, Devon (Seneschal); commended, G. B. Battams (Dartington); N. Chichester, Newport, Barnstaple (Privateer).

Mares or geldings, foaled in 1866.—First prize, £25, G. B. Battams (Epicure); second, £10, G. B. Battams (Grimaldi); highly commended, J. Michelmore, Berry Pomeroy, Totness (Lady Maud).

Fillies or geldings foaled in 1867.—First prize, £10, J. T. Robinson, Leckby Palace, Asenby, Thirsk (Splashwater); second, £5, G. B. Battams (Tophorne); commended, E. Ashley, Honiton (Harkaway).

Colts or fillies foaled in 1869.—First prize, £10, J. Joyce, Great Wadham, South Molton; second, £5, J. T. Robinson (Bellringer); commended, E. Ashley.

HACKS.

Mares or geldings, not more than six years, nor exceeding 15 hands.—First prize, £15, G. B. Battams (Gladiator); second, £5, W. B. Peren, Compton House, South Petherton (Comet).

PONIES.

Mares or geldings, not exceeding 14 hands.—First prize, £10, J. S. Ballards, The Verlands, Cowbridge (Chicken Hazard); second, £5, W. S. Gibbs, Pitminster House, Taunton (Banker); commended, Rev. T. H. House, Anderson Rectory, Blandford.

Mares or geldings, not exceeding 13 hands.—First prize, J. Thomas, Cardiff (Minnie); second, £5, J. Louch, Langport (Feggy); highly commended, J. Trott, Southill, Barton (Collumpton); commended, J. Copins, St. Cleer's, Taunton (Little Joe).

PIGS.

JUDGES:—J. Coate, Hammoon, Blandford.
J. Smith, Henley-in-Arden.

LARGE BREED.

Boars above one year and not exceeding two.—First prize, £5, J. and F. Howard, Britannia Farms, Bedford; second, £3, R. E. Duckering and Son, Northorpe, Kirton Lindsey, Lincolnshire.

Boars not exceeding one year old.—First prize, £5, R. E. Duckering and Son; second, £3, R. E. Duckering and Son.

Breeding sow in farrow, or with litter.—First prize, £5, J. and F. Howard; second, £3, R. E. Duckering and Son. The class highly commended.

Pens of two breeding sows, not exceeding nine months old. First prize, £5, J. Dove, Hambrook; second, J. and F. Howard.

SMALL BREED.

Boars, above one year old, and not exceeding two.—First prize, £5, W. M. Ware, Newham House, Helstone, Cornwall; second, £3, W. M. Ware. The class highly commended.

Boar, not exceeding one year old.—First prize, £5, T. R. Cornish, Wolfsgrove, Bishop's Teignton, Teignmouth; second, £3, R. E. Duckering and Son; highly commended, T. Taylor.

Breeding sows in farrow, or with litter.—First prize, £5, R. E. Duckering and Son; second, £3, T. Taylor, Pool, Taunton. The class highly commended.

Pens of breeding sows, not exceeding nine months old.—First prize, £5, R. E. Duckering and Son; second, £3, T. Taylor.

BERKSHIRES.

Boars, above one year old, and not exceeding two.—First prize, £5, R. Swanwick, Royal Agricultural College Farm, Cirencester; second, £3, H. Humfrey, Kingstone Farm, Strivenham.

Boars, not exceeding one year old.—First prize, £5, A.

Stewart, Saint Bridge House, Gloucester; second, £3, A. Stewart.

Breeding sows in farrow, or with litter.—First prize, £5, R. E. Duckering and Son; second, £3, A. Stewart. The class highly commended.

Pens of two breeding sows, not exceeding nine months old.—First prize, £5, R. Swanwick; second, £3, H. Humfrey.

HORSE SHOEING.

First prize, — Sawyer; second, J. Batten; third, B. Tucker. Commended: T. King, G. Humphries, and G. Ayres.

THE ANNUAL MEETING

Was held in the Council Tent on Wednesday. Sir Stafford Northcote, M.P., President for the year, who only arrived in England from Quebec on the previous day, took the chair.

Mr. GOODWIN, the secretary, then read the following

REPORT.

The steady progress and financial prosperity of the Society afford legitimate ground for congratulation on the occasion of its 93rd anniversary meeting. The funded stock, which during the year has been augmented by the purchase of £576 8s. additional three per cent. consols, now amounts to £5,500, invested in the names of Sir John Thomas Buller Duckworth, Bart., Mr. Thomas Dyke Acland, M.P., and Mr. Jonathan Gray, the trustees of the Society. The Council have to lament the removal, by death, of several valued members, including Lord Taunton, who, so recently as the year 1865, filled the office of president, and who evinced a lively interest in promoting the Society's second visit to a locality with which he had long been honourably associated; but they have the satisfaction to report an encouraging addition to the list of subscribing members. There are at present on the Society's books 82 life members, 142 governors subscribing £2 or upwards annually, 648 members subscribing £1 annually, and 225 members subscribing 10s. annually. The past year has witnessed the termination of the long-pending suit of *Byrne v. Wintle*, which involved a collateral issue whether the Society was entitled to receive in full an annuity of £25 from the late Mr. Slack, of Bath, and the Council regret to report that as the pure personality of the testator proved insufficient to meet the demands with which he had charged it, the Master of the Rolls has ordered the transfer of £49 14s. 7d. consols to the Society in full settlement of its claims. The costs of the society as allowed on taxation, have, however, been paid out of the testator's estate. It is to be hoped that the contemplated meeting at Guildford during the ensuing year will firmly cement the union recently contracted between the Western and Southern counties, and tend to the development of the agricultural and commercial resources of the two great districts, which, though geographically remote, have in many respects a community of interest.

The Council congratulate the members on the very encouraging auspices under which the Society for a second time visits the town of Taunton, where its first migratory meeting was held eighteen years ago; and a comparison of the entries of stock and implements on the two occasions may be satisfactorily cited in illustration of the advantage of changing the place of meeting from year to year.

At the Taunton meeting in 1852 there were 241 entries of stock, and the implements enumerated and described in the catalogue were 486 in number. At the present meeting there are 520 entries of stock, the largest number ever made for the Society's own prizes; whilst there are 175 exhibitors of implements, and not less than 2,965 articles, including 50 steam engines.

In order to encourage pictures of higher merit than those usually shown at the Society's meetings, the Council have this year granted the sum of £100 to enable the Arts Committee to render the Art Union more popular and attractive by the offer of prizes of greater value than the unassisted proceeds from the sale of Art Union tickets would justify. As every member of the Society who has complied with the regulation published in the Society's official programme is entitled to a chance, it is hoped that this arrangement will prove generally satisfactory.

With the commencement of a third series of the Society's Journal it was thought desirous to publish two parts or volumes annually, and the volumes published in accordance with this resolution have been forwarded in due course to all members entitled to receive them. The arrangement, however, is too costly to permit of its continuance, and it is proposed after the present year to limit the publication to one part or volume only. In accordance with this arrangement, the second volume of the Journal, 3rd series, will be published as soon as possible after the Guildford meeting in 1871; but it is hoped that reports of the Taunton meeting, published separately but corresponding in type, form and size with those of the Journal itself, may be in the hands of members within a brief period after the termination of the meeting.

The Council, having regard to the usage of the Society that the President for any year shall be non-resident in the county wherein the annual meeting is held, recommend that the Right Hon. the Earl of Cork and Orrery, Lord-Lieutenant of the County of Somerset, be elected President for the year ending with the Guildford meeting. They also recommend that the Right Hon. Sir Stafford Northcote, Bart., and Edward Brydges Williams, Esq., M.P., be elected vice-presidents. And they further recommend that the following members of the Society, whose names have been conspicuously published in the showyard in accordance with the bye-laws of the Society, be appointed members of the Council to supply vacancies occurring by retirement, rotation, and other causes:—

EASTERN DIVISION.

Bush, Clement, Weston, Bath.
 Danger, Thomas, Rowford Lodge, Taunton.
 Duckham, Thomas, Baysham Court, Ross.
 Gray, John, Kingweston, Somerton.
 King, J. Webb, West Everley, Marlborough.
 Knollys, J. E., Fitzhead Court, Taunton.
 Poole, Gabriel S., Brent Knoll, Weston-super-Mare.
 Stratton, Richard, Burderop, Swindon.
 Williams, Herbert, Stinsford, Dorchester.

WESTERN DIVISION.

Boscawen, Hon. and Rev. J. T., Lamorran, Probus.
 Brent, Robert, Woodbury, Exeter.
 Davy, John Tanner, Rose Ash, Southmolton.
 Daw, John, Exeter.
 Daw, R. R. M., Exeter.
 Gordon, Charles, Wiscombe Park, Honiton.
 Kennaway, J. H., M.P., Escott, Ottery St. Mary.
 Hole, James, Knowle House, Dunster.
 Holly, J. H., Oaklands, Okehampton.
 Thynne, Rev. A., Penstowe, Stratton, Cornwall.

SOUTHERN DIVISION.

Dickinson, W., New Park, Lynton, Hants.
 Grenfell, Arthur, Shalford, near Guildford.
 Portal, Wyndham, Maltranger, Basingstoke.
 Rigden, W., Hove Farm, Brighton.
 Shackel, George, Erleigh Court, Reading.
 Simmonds, W. B., M.P., Abbot's Barton, Winchester.
 Spiers, R. J., Oxford.
 Stebbing, J. R., St. Andrew's Lodge, Southampton.
 Turner, J. S., Chyngton, Seaford.

ELECTED WITHOUT REFERENCE TO DISTRICTS.

Allen, James D., Pyt House, Tisbury.
 Druce, A. F., Milton, Burghfield, Reading.
 Robertson, Henry, Over Stowey, Bridgwater.
 Vidal, E. U., Cornborough, Bideford.
 Williams, E. W., Herringstone, Dorchester.

Mr. ACLAND, M.P., moved the adoption of the report.

Mr. MURCH seconded the resolution, which was carried unanimously.

Mr. JONATHAN GRAY proposed as President for the current year the Earl of Cork and Orrery.

Mr. KNOLLYS seconded the resolution, which was carried.

The proposed Vice-Presidents and members of Council were also elected, and certain formal votes of thanks passed.

THE BATH AND WEST OF ENGLAND SOCIETY'S SHEEP SHOW.

TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR,—In answer to my protest, I received the following letter from the secretary of the Bath and West of England Society. I am, sir, your obedient servant,
 Burghfield, June 18, 1870. A. F. MILTON DRUCE.

[COPY.]

Show-yard, Taunton, June 7, 1870.

To A. F. Milton Druce, Esq.

Dear Sir,—The inspector of shearing has reported to the disqualifying committee that your pen of ewes (No. 305 in the catalogue) are unfairly shorn, not as to time, but the mode of shearing; and the council, having given their best consideration to the matter, feel bound to support the decision of the inspector and disqualifying committee.

I am, dear sir, yours obediently,
 JOSIAH GOODWIN, Secretary.

We, the undersigned, do hereby certify that we saw the shearing ewes exhibited by Mr. Druce at the Taunton Show early in the month of April, and that they were all fairly and barely shorn. Witness our hands this 17th day of June, 1870:

(Signed) William Cooper, Burghfield.
 Richard Wm. Keep, Burghfield.
 Levi Hancox (working bailiff).
 Joseph Collett (shepherd).

Mr. Francis Budd, one of the judges of shortwool sheep at Taunton, writes against our remarks on the placing of the Southdowns. He commences his letter with an absurd attack on a gentleman who had no more to do with our criticism, knew no more of what would appear, and was no more consulted upon the sheep show than Mr. Budd himself. We omit only the opening of his letter, which runs on in this way:

"Had the remarks in your paper emanated from a person who really understood anything about what a sheep should be, it would have given me pleasure to prove that the sheep at Taunton were judged by the hand as well as by the eye, which may account for your not being able to understand why the prizes were given to the animals you condemn. To practical men it does appear a burlesque on agricultural writing that persons who are well known to have no experience in the things they write about should feel themselves qualified to impugn the judgment of men who, if they do not, ought to know something about their business. Too often, as it may probably be in your case, the remarks do not originate with the writer, but with disappointed exhibitors. Comparisons are generally odious; but I would ask you to look at the report of the Bath and West of England Society's exhibition in the *Bell's Weekly Messenger* of this week, which is written by a practical man, and mark the difference between his report and your own.

I am, sir, your obedient servant,
 "FRANCIS BUDD.

"Hatch Warren, Basingstoke, June 16."

We thoroughly agree with Mr. Budd in his remarks as to "men who if they do not ought to know something about their business;" while as to our criticism "originating with disappointed exhibitors," so far as we remember, we scarcely exchanged a word with any of the exhibitors whose sheep were so curiously set aside, and certainly not a syllable with Mr. Rigden, who, as we maintain, was one of the chief sufferers in this way. But what warranty here has Mr. Budd, who, according to his own account, judges sheep blindfold, for his assertion as to persons writing of things of which they have no experience? If this impertinence is intended to apply to ourselves, we may say that for nearly twenty years we have attended all the chief agricultural shows, and that during that period we have been continually invited to act as judge in certain classes—at the West of England Meetings amongst others—although we should not, perhaps, judge a Southdown after the manner of Mr. Francis Budd, of Hatch. In order, however, to do Mr. Budd every possible justice we give side-by-side the reports of *Bell's Weekly Messenger* and the *Mark Lane Express* on the Southdown show at Taunton.

BELL'S WEEKLY MESSENGER.

In the aggregate the Southdowns were notably good, nearly all the specimens exhibited being entitled to the application of that adjective, while many deserved it in the comparative and some in the superlative degree. Among the best were the entries of Sir William Throckmorton, Mr. Rigden, Mr. Neville-Grenville, M.P., and Messrs. J. and A. Heasman. Sir W. Throckmorton's first prize shearing ram was indeed one of immense excellence—so true in mould, with so completely the Down character, that it would be almost equally difficult to single out merits or discover faults. It would be perfectly true to say that he has a beautiful head, or that he is good in any particular point of structure; but as he is so evenly good all over, we should scarcely know where to begin. We are glad to see exhibitors in many instances giving as much of the pedigree of their sheep as may be necessary to afford a clue to sources whence the blood has been derived; and it is but fair to the breeders of the nearer progenitors that they should have their share of the credit when prizes are won. The catalogue entry shows that the splendid sheep in question was by Mr. Henry Webb's No. 33, dam by Sexton—a description which doubtless will make Southdown breeders sufficiently acquainted with his blood. Mr. Rigden's first prize ram, a two-shear, in the aged class, was not in form quite so near perfection as his younger neighbour, but he was an unquestionably fine sheep, with a perfect head, masculine, and at the same time characteristically Southdown. A slight failing in the mid-rib did not debar his pretensions to first-class merit. Neck, bosom, and neck-vein were as good as could be desired, and his general style was most attractive. The Earl of Portsmouth had also a good-handling clever sheep in this class, not perhaps so immediately taking to the eye as Mr. Rigden's, or as some others, exhibited by Messrs. Heasman, Mr. Penfold, and Sir W.

THE MARK LANE EXPRESS.

If there were little or no complaint amongst the Dorsets and Somersets, the Sussex breeders fairly stood aghast over the capricious and altogether inexplicable reading of a Southdown, as here delivered. First of all the judges took a very neat, true shearing from Buckland, and this they placed first. They next selected a sour-headed, lop-eared animal, as all over one of the worst sheep the Heasmans have ever entered, and this they placed second; and then they commended and highly commended three rams of Mr. Rigden's, standing close along-side, any one of which for Down character, style, or quality, was better than their second prize. In fact, Mr. Rigden should have been first, if not first and second, and after him Sir William Throckmorton. All the Heasman's sheep were below their standard, and Mr. Neville-Grenville, Mr. Harding, and Mr. Brook had nothing that could come into competition with the Southdown-bred rams. Amongst the older sheep, it was, alas! only confusion worse confounded. Sir William Throckmorton's first prize in an excellent class of old rams at Manchester was now merely commended, although at three years old he does not seem to have suffered much from wear-and-tear. On the contrary, Mr. Rigden's two-shear, second at Southampton, has done well in the interim, there being considerable improvement on his first-year's form; and he got the turn of fortune's wheel as first and best. But then, to separate these two famous sheep the judges did precisely as they had done in the previous class, that is they selected one of the very worst sheep in the entry as their second prize! This was Lord Portsmouth's happily named No. 2, a significant title that must have gained him no. 2 place on the prize list, to which he could have in such company no other claim, for a plainer meaner sheep at most points has seldom been seen. A very bloodlike, if not very large ram of Mr. Penfold's was

Throckmorton, but one that will bear inspection and improve upon acquaintance. For one-year-old ewes (pens of five) Sir W. Throckmorton took second to Mr. Neville-Grenville.

highly commended, and then hired for Lord Walsingham; but as a matter of consistency, Mr. Woods should have also hired, or if possible, have bought outright the renowned No. 2, whose merit altogether passeth show. Mr. Rigden did not send his ewes, and Mr. Grenville's pen was accordingly pronounced to be superior to that of Sir William Throckmorton.

It is only to be hoped that all these Southdown sheep may come together again at Oxford, where Mr. Budd may learn something from men who "know something about their business." As he asks for it, our impression is that Mr. Budd was never even selected as a recognised judge of Southdowns at Taunton, where, if he attempted any great lead in this way, he probably only bothered his colleague, who should really know something about this branch of their business.

JUDGING BY POINTS.

The following letter has been addressed by Lord Kinnaid to the Highland Agricultural Society:—

Dear Mr. Menzies,—I wish you would ask the directors of the Highland Society, at their first meeting, if they would agree to appoint a small committee of gentlemen who have acted as judges to consider whether it would not be possible to frame a set of rules for the guidance of judges at their shows, according to *points*, after the manner in which prizes are accorded in rifle-matches. It might be tried first with the Shorthorn class. The plan would, I am sure, give very general satisfaction. Certain points being specified, the judges would have to report their opinion on each individual point, rather than their impression of the merits of the animal generally, and by this means the exhibitors would be satisfied on what grounds their animal was rejected or approved of.

I do not like generally to question the decision of judges, and I know how difficult it is to obtain the services of experienced hands, owing in many instances to their having some interest in the stock exhibited; but still this difficulty can be overcome. Witness the judging at Inverness, Aberdeen, and Dundee, where it was at once seen by the way the judges set to work that they were well qualified for their duties. How different was the case in Edinburgh! There the gentlemen evidently had no experience in judging. There was scarcely a decision which was in accordance with the opinion of the many good judges in the yard. I should prefer not bringing my own ease forward, but it was so singular and so much to the point, and being naturally better acquainted with my own case than any other, that I must mention it.

Mr. Young, the manager for Sir W. Stirling-Maxwell—and there is not a better judge of Shorthorns in Scotland—volunteered to tell me before the judges went round, that his heifer was fairly beaten by mine; and I will venture to say, though the surprise of those looking on was great, no one could have been more surprised than Mr. Young himself at finding his heifer placed before mine. I may say *ex uno disce omnes*. I am certain that a small committee of practical men would find no difficulty in fixing the relative value of the different points in a Shorthorn; and a schedule attached to these rules, very good, good, indifferent, or bad, with relative numbers, each judge filling these up in the schedules, would lead to very satisfactory decisions, and allay much of the dissatisfaction which prevailed, to a very great extent, at the last show in Edinburgh, among the fanciers of Shorthorns.—KINNAIRD.

ON THE GROWTH OF ROOT CROPS.

BY THE NORTHERN FARMER.

The absolute necessity of having a liberal supply of winter food compels stockowners to devote a very large amount of attention to the cultivation of those root crops which suit their situation and soil, and, as a rule, the farmer's prosperity is proportionate to the quantity grown and to the success which he attains in their cultivation. The whole of the after-crops in the rotation—corn, hay, and grass—are materially affected by the treatment given to the field when preparing for seed; and in green crop, if deeply stirred and thoroughly worked, and the manure applied with no sparing hand, the succeeding crops require no care, growing with extreme luxuriance. It is easy to know the crop that is growing on a congenial soil, full of the elements of nutrition; and, on the other hand, there is no mistaking the imperfectly worked and poorly-manured soil, by the stunted and miserable appearance of the crop at every period of its growth, however favourable may be the character of the season. Fully recognizing the beneficial results to themselves which can be secured by a judicious and liberal outlay for labour and manure at this stage of their rotation, we find the most spirited and, as an almost unerring consequence, the most successful farmers in every district making the most strenuous efforts to manure well, supplementing the contents of their own yards and dung-hills by large quantities of purchased manure, frequently drawing it great distances at enormous expense. The return for such a heavy expenditure cannot possibly be immediate, but must be waited for through every year to which the rotation extends, each season's crop being benefited in proportion to the original outlay, and returning as surely its share of the profit. While not affecting to despise the efficacy of artificial manures, or the good which accrues to the crop from their use, we yet invariably find the thoroughly practical man placing his chief dependence upon farmyard dung, considering no amount of labour too great or too expensive which has for its object the collection, carriage, or application of such an invaluable material. Taking this manure as the base, success in root-growing will be most readily achieved by a combination of manures, one or other of the popular phosphatic fertilisers, now so extensively manufactured, taking second place, and to render it quicker in its action a portion of nitrogenous manure mixed with it, say a third or fourth, and for which purpose pure Peruvian guano suits admirably. Speaking experimentally, so highly do we approve of a phosphatic manure, slightly dashed with another, the constituents of which are chiefly ammoniacal, that, however abundant might be the supply of farmyard manure, we would not consider the crop had been done justice to unless a dressing of this mixture had been given in addition. When dung alone is used the rootlets cannot possibly extract nourishment until of considerable strength, and in unfavourable seasons the plants in consequence linger so long before coming to the hoe, that much time is unavoidably lost; and in the case of turnips the fly is extremely apt to cause serious injury in the earlier and most critical period of their existence. When an auxiliary manure, such as we have described, has been used, the plants, if the character of the season is such as to give them the slightest chance, grow rapidly, and forced on by the quickening influence of the ammonia speedily outgrow all danger from the attacks of the fly.

The phosphates now becoming assimilated the plants assume the hue of health and vigour, and spreading a net-work of roots through the dung are comparatively little affected by the most lengthened drought, eventually returning the heaviest crop which the nature and capabilities of the soil permit it to yield.

The earth gives its increase in exact proportion to the treatment which it receives from the husbandman, as surely as the animal system grows and strengthens or becomes stunted and enfeebled in accordance with the supply of food, whether sufficient in quantity and rich in quality or the contrary. To stint the supply of manure, therefore, is to reduce and lower at its very source the amount of available plants, food; weakening not only the crop to which it is immediately applied, but every succeeding crop of the rotation; rendering the young plants of the turnips, &c., less able to stand the vicissitudes of the weather; and the inevitable result to the farmer is a heavy pecuniary loss. The actual expense of preparing an acre of land for green crops in first-class style is not so very much greater than what it costs to perform the same operation in a niggardly or negligent manner; the small sum saved bearing no comparison to the superiority and extra value of the crop grown on the land which has been properly attended to. To manure poorly effects no reduction on rent, taxation, or labour; all remain exactly the same; and the whole difference lies in the value of a few loads of dung, or cwts. of guano or superphosphates to each acre. The additional expenditure looks so small when this view of the matter is taken, that it appears at first sight rather surprising there should be so much land put out of hand each season imperfectly nourished. Such a very apparent mistake cannot altogether be the result of either carelessness, apathy, or ignorance on the part of agriculturists, the principal reason we believe being the want of sufficient capital to embark in a business which to command success involves a very large outlay.

It is but reasonable to suppose that there are few men who would grudge a little extra expenditure if they possessed the cash, when they are perfectly well aware that by so doing their receipts from the soil thus treated would be little short of doubled, and on some land even more than doubled.

The preparation for green crop commences in autumn, and should be proceeded with immediately on the removal of the corn, as the dryness and friability of the soil in September and October offers many facilities for successful culture, which are completely lost when the operation is delayed until a later period. Ease in working, and the destruction of weeds by the sun, which is still powerful, are two advantages of considerable importance, and well worthy of a little attention on the part of the cultivator to secure. Land worked during winter, after having become sodden by heavy rains, is not only more laborious for both horses and men in the first instance, but also greatly increases the labour of preparation at seed time. Not only is money lost, but time, at the busiest season of the whole year, and in catching weather the delay occasioned by giving the extra ploughing or grubbing, according to the implement used, may be sufficient to lose the only opportunity afforded for getting the crop in seasonably; and with the land in good condition, it is now almost universally con-

ceded by agriculturists that the grubber is, of all others, the implement most suited to prepare the soil for the reception of green crops. When powerfully worked, it loosens the soil to a considerable depth, without bringing up the poisonous subsoil; by its peculiar action, the whole stratum of earth coming under its influence is thoroughly broken up and disintegrated, and all roots of weeds are loosened, brought to the surface, separated from the adhering soil, submitted to the sun's heat, and finally got rid of. There is now such a wide field to choose from, that no difficulty need be experienced in getting a form of grubber which will work satisfactorily on any kind of land, and if one form of implement has an advantage over another, we think that it more especially rests with the mode in which it clears itself from the accumulated soil, weeds, and stubble. That which clears itself by a backward movement we consider greatly preferable to one which lifts straight up, the former disengaging itself much quicker and more effectually than the latter, and with less exertion on the part of the operator. Whatever form of implement may be selected there is one essential point in connection with the whole of them when they come to be used, viz., the necessity of having the motive power sufficiently strong to keep up a considerable rate of speed. If the horses are not powerful enough to keep up a continuously steady pull much of the advantage that might reasonably be expected from the operation will be lost, as the tines will slip through the ground without breaking it up, and the farmer will be in some danger of condemning the whole system as futile and unsatisfactory before he has had an opportunity of being able to judge of its merits. On land of moderate texture, four strong horses will usually be sufficient, but if, after being a few hours at it, they appear fatigued or distressed, a fifth should be added, and continued as well from feelings of humanity as from motives of economy.

The extra power shows at once, the implement now spinning along, smashing up and displacing the soil thoroughly, and altogether performing the work with so much speed and efficiency as to much more than compensate for the increased expense. When five horses are used, it is more convenient to put three abreast in front with equalizing bars, the draught chain getting down between the pair behind so as to be attached directly to the head of the grubber. A mistake is sometimes made in having the tines of the implement so light in substance as to render it utterly unable to catch such a hold of the soil as to be able to break it up properly, the fault seldom however being with the original maker, but rather through neglect in getting them relaid after having being worn down from work. They ought not to be less than an inch and a quarter square, and worked with the square side to the front instead of the angle, which is frequently done, apparently with the object of lessening the draught, which probably it does, but the work in that case is not so well done. When the grubber is powerfully horsed the two operations of broad-sharing and cultivating may be combined and both objects attained to perfection. To do this it is quite unnecessary to use the broad or duck-footed shares usually affixed when the eradication of weeds is solely desired. We look upon them as useless incumbrances to a highly valuable implement, and quite obsolete in the requirements of modern agriculture.

The ordinary grubbing shares sink at once to the full depth, are not so liable to be clogged, materially lighten the labour on the horses, and, while tearing the soil to pieces, shake out the weeds at the same time most effectually. A cross stroke of the grubber, mounted in this way, will render the land both mellow and clean, the harrow following to level the surface and spread the weeds to the sun's influence, leaving the entire field ready for the plough. One furrow will, of course, be amply suffi-

cient, the land being so well softened previously, but however soft it may be the ploughing should not be omitted, as it is of great service in burying the roots of all weeds that may have had possession of the soil, and by it a small portion of fresh soil can be brought up to be aerated and prepared by the frosts and rains of winter to enter into new combinations and so aid in the growth and healthy development of future crops.

When spring comes round, and a commencement is made to prepare the land for the seed, the good effects of autumn culture become at once apparent. Assuming that the precaution has been taken of working only when the land was dry, it will now be found in exactly the condition in which it was left six months before, dry, friable, soft, and mellow, and above all as thoroughly free from root-weeds as if such things had never had existence on that field.

On most lands light of surface the plough need not now be used at all, a double turn of the grubber being all that is necessary to put the surface in first-rate order for drilling. To the farmer this is a great boon, as it enables him to get over the work quickly, saving both time and labour. This, however, is but the least of the advantages it affords him, as the grubber stirring every particle of soil, but not exposing it to the parching influence of the sun, enables it to retain the winter sap, so necessary for the rapid and even germination of the seed, and the crop gets a start which in some seasons it will keep and plainly show during the entire period of growth. The excessive and unavoidable evaporation which at once takes place on land when turned over by the plough in spring and early summer, ought to be sufficient inducement to all farmers holding light land to forego its use as much as possible, giving the grubber the preference in every instance where the business in hand can be accomplished by it.

The roots most popular with agriculturists are the mangel and turnip as cattle food, and for horses the carrot is largely grown in some districts, forming a very useful article of diet. By its use a considerable saving in corn is effected, and being in season during the most of the time when the working animals of the farm are necessarily very much restricted to dry and binding food, a daily feed of this root aids materially in preserving them in healthy vigour. We restrict ourselves to a few leading points in connection with the uses and cultivation of these crops, considering that when successfully grown they put the farmer in possession of such abundance as to render him quite independent of any other source for his supply of green winter food. With white turnips and kindred varieties ready for use by the first of September, the yellows and swedes following in succession, and carrying the stock on to the middle of March or first week in April, with a store of mangels in proportion to the number of animals kept, house-feeding can be sustained with ease until the beginning of July, leaving but two months of the year unprovided for.

Mangel-wurzel, when the conditions for its growth are favourable, is, from its extraordinary keeping qualities and capability of returning a large amount of produce, a great acquisition to the large stockholder. A benign climate, strong and fertile loam, deep culture, thorough pulverization, and abundant manure of good quality, are all essentials for complete success; and when combined, so grateful is this plant for kind treatment, that sixty tons, and even over it in some exceptionally favourable instances, may be raised from the statute acre. On medium soils from twenty-five to thirty tons constitutes a good crop, and to have the latter weight the treatment must be liberal. With but ordinary care the weight per acre is from twelve to twenty tons to the acre, the roots, however thick they may be in the ground, weighing but little in the aggregate when of small size. Such a light crop of

mangel is not profitable, and the swede may with great propriety be substituted, as this crop on light land will with an equal expenditure of manure give better results than the other. There is now a larger number of varieties of the mangel to choose from than there was formerly, and are classed as "Long," "Intermediate," and "Globe." The "Improved Long Red," or "Elvetham," is a capital variety to grow, as food for milking cows—not imparting such a strong taste to the butter as some of the other sorts. To be grown successfully it requires rather a deep and free soil; yet, with abundant manuring it can be brought to a large weight per acre on soils of but very moderate quality. The "Orange Globe," and the "Oval" of the same colour, are both excellent varieties, growing to great perfection on the shallower soils, and are in consequence very popular with agriculturists. For purely feeding purposes they rather excel the "Reds," and succeeding so universally, and moreover being such abundant croppers, are yearly rising in estimation.

While it is quite possible to give turnips an over-dose of manure, and by so doing injure their feeding and keeping qualities to a very serious extent, it is scarcely possible to do the same to mangel wurzel, roots of 28lbs. weight when split open being as sound at the core as specimens of half that size. Its capability of standing a large amount of forcing on rich land, and with rich manure, combined with its well-known immunity from disease, render it doubly valuable to farmers who are fortunate enough to hold land of first-class quality, such men being rendered nearly independent of all other forage crops. If necessary, a sufficient quantity can be grown to serve the whole year, as with care it will keep perfectly sound for fifteen months after being lifted. Thirty tons of well-rotted sappy farm-yard dung, with the addition of 7 cwt. superphosphate, or its equivalent in money-value of any other suitable fertilizer, will in general prove an excellent dressing for a statute acre. The plant being able to assimilate such a large amount of food, ought to be a strong inducement to manure heavily, a few extra cwt. of portable manure paying their own cost over and over again, by the increased weight of roots. The seed may be sown any time, from the 15th of April to the same time in May, the latter period proving quite as good as the former, when the newly-planted seed is favoured with seasonable and refreshing showers. The true seed of the plant being contained within a capsule of rather rough exterior, creates a difficulty in delivering it regularly when attempted to be sown by the ordinary turnip machines, however ingeniously they may be arranged or altered for the purpose. The cup of the corn-drill lifting it up, and emptying into the hopper with unvarying regularity, and without risk of stoppage from the seeds clogging together, is a superior plan to any of those that force it through a hole in the side of the seed-box, with the aid of a revolving spindle or brush. Those who possess a corn-drill can manage easily, whether grown in drills or on the flat, and save themselves both trouble and annoyance, the time required for the actual sowing of the seed being scarcely worth mentioning. When a few acres only are grown, they may be dibbled or sown in a continuous line, in a rut formed by the counter of the turnip sower, a little earth being drawn over them before rolling. Either plan does very well for small occupancies, and is much better than trying to manage with the turnip-sower, which leads only to disappointment. From four to six pounds of seed is ample to secure a good braird, with sufficient plant; but as there is sometimes a difficulty in doing this, many farmers sow from eight to ten pounds to the acre when using the machine. The mangel is very susceptible of frost, and in consequence should be lifted early, the occurrence of sharp frosts early in November

acting as a warning to store, if possible, about the first week of that month. Frosted mangels are not only unwholesome, but, as our readers have lately had convincing proof, absolutely poisonous, to sheep and cattle. A strong effort should be made to store in time, and to cover up in such a way as to render them impervious to the severest frosts.

Although mangel-wurzel enables cows to give a large supply of milk, it is of a poorer quality than when they are turnip-fed, and not nearly so productive of cream. The butter made from it has also a slightly acid taste, not so powerful as that of turnips perhaps, but much more difficult wholly to remove, or even to obviate to a passable degree. The thinness of the milk, when wholly mangel-fed, and this unpleasant taste, make it imperative to feed with bran, grains, crushed corn, or a portion of cake during the whole time this root is being used with milch cows. Farm-horses eat it with great apparent relish, and thrive well on it; and by its use a moderate saving in oats can be effected. When grated and mixed with chopped hay, a very agreeable and appetising mess is formed, both filling and nourishing, and highly conducive to the health of the animals. If grating is objected to on the score of extra trouble, the whole roots, thrown into the feeding-box with the cut hay, do almost equally well, the saliva of the horse and abundant sap of the root itself moistening the chaff abundantly.

The Carrot, on soils favourable to the growth of this root, becomes the crop, of all others, capable of returning the largest amount of cash to the grower. This can be accomplished by liberal treatment, and to some extent adopting the garden culture of the plant—viz., by lessening the distance between the rows, and using hand instead of horse labour for stirring the intervening spaces and keeping down weeds. In this way a very large crop can be obtained; and, carrots always bearing a much higher value than mangels or turnips, the money that may be realised from an acre is something enormous.

With the usual field culture, the drills being 28 inches apart, 12 tons of white Belgian carrots may be regarded as a very fair crop, and 15 tons as a really good one. Supposing them to be sold at 40s. a ton, from £24 to £30 will thus be realised from an acre, either sum being considerable, and certainly quite sufficient to clear all the expenses of cultivation and leave a handsome profit besides. The carrot delights in a deep sandy loam; but on most soils of average character, provided they are fresh and moderately free from stones, it may be grown very successfully. It is pretty generally considered that the manure for carrots should be placed on the land and ploughed in late in autumn or beginning of winter to ensure its decay, and thereby prevent it from interrupting the growth of the roots or making them fork, which is very injurious, and lightens the crop to a serious extent. Although good in theory, this method is apt to be troublesome in practice, and its advantages can be fully met by turning the dung which is to be applied to them a couple of times so as to have it well rotted before being put in the drills, and all danger from injury may be thus completely obviated. The ground should be well worked and rendered as friable as possible for this crop, as the young plants are rather delicate in the earlier stages of their growth. A little extra attention in this way will be well repaid by the superiority of the roots when they come to be lifted. From four to five pounds of seed is ample for an acre; there is not the slightest advantage to be gained in giving more, as it only adds to the labour of thinning, and, even with the quantity named, there will be a superabundance of plants if the necessary conditions for ensuring a successful hit have been attended to. Mixing with damp sand for a week or ten days previous to sowing hastens germination, and enables the distribution of the

seeds to be effected with regularity and conveniently. There is no necessity for using a machine when sowing carrot seed, as an active man will sow it nearly as fast as he can walk, after a very little practice, and so evenly that not a single blank will be found in the rows when it appears on the surface. As soon as it can be done with safety, the hoe should be brought into requisition, as much to break whatever crust may have formed as to check the growth of annual weeds; for both reasons this operation should not be neglected. The thinning of carrots requires to be gone about with some judgment, as what might otherwise have been a capital crop may easily, by injudicious and untimely thinning, turn out an almost total failure. It should not be attempted until the plants have attained considerable strength; and, however urgently they may appear to require thinning, it should never be done in dry weather. The pulling up of the plants opens the soil for the admission of air and heat to the yet weak and tender rootlets, and this, combined with the loosening of the soil, gives them a check at the most critical period of their growth, which the most favourable weather afterwards is seldom able to overcome. Again, when the carrot is thinned early, it is extremely apt to be cut by the wireworm—an enemy which it altogether escapes when the season is a little advanced. We prefer delaying this important operation even as late as the first week in August, if July happens to be a very dry month and affords no chance of a few days of moist or wet weather, the result invariably being a good crop, the plant having still three months to mature and perfect its growth. Unless on land highly favourable to the growth of this crop, the plants need not be set farther apart than from four to six inches, the best roots being frequently those that are close to, or, in fact, crushing each other. When grown solely for home consumption the usual application of the carrot is as food for the farm-horse, a daily feed saving corn and gives a fine gloss to the skin, besides keeping the animals in good condition. From 14 to 21 lbs. in a single feed is a liberal allowance, anything over the latter quantity being apt to affect the kidneys and induce excessive staling. They may be given grated or cut into strips, but there is no danger in giving them whole, and it saves trouble.

In giving carrots to milch cows, the only recommendation they have is the absence of all unpleasant taste in the butter, as the milk is neither so abundant in quantity nor so rich in quality as that obtained from turnip-feeding. Some years ago we instituted a series of experiments with different roots, the whole extending over a period of about four months, and the conclusion we came to after such a lengthened trial was exactly that which we have here recorded. In storing the carrot, from four to five feet is wide enough for the pits, tapering to a point at the height of about four, the whole neatly thatched and bound tightly down, no other covering being required, frost doing it, apparently, no material injury. When stored dry, and thatched so as to be impervious to rain, the roots will keep good for six months.

The Turnip.—This plant grows freely in most soils. Even heavy clays can be made to produce good crops, when improved by drainage and subsoiling; and on this account it is regarded by all farmers as their principal mainstay for the supply of winter food. It is brought to greatest perfection on light friable soils, and delights in a warm and rather moist climate. These favourable conditions being available, it remains with the farmer himself to ensure complete success by adding an enlightened system of cultivation and liberal treatment. In the spring preparation of the soil for this crop it is highly essential that it should be made exceedingly fine before the seed is sown, as it is thus brought into close connection with the seed, moisture is retained, and germination hastened.

The gritty fineness attained by mechanical means is altogether different from the soft, velvety tilth which is the result of autumn culture and timely exposure to atmospheric influence; and every effort should be made to have the land in this condition at the period of sowing. Long strawy dung is not suitable for placing in the drills, as it keeps the soil too loose and open, admits air and light, and in every way exercises an injurious influence on the plants in the earlier stages of their growth. In general, one turning will be sufficient to secure the necessary amount of decomposition in the farmyard manure, and when applied to the land in a state of fermentation, the heat evolved during the further progress of putrefaction must to some extent raise the temperature of the soil, and thereby hasten germination. Unlike the mangel, the turnip will not bear an unlimited amount of forcing, the bulbs decaying in immense quantities when forced beyond a certain point by too large a supply of manure, or when grown on very rich land. On ordinary land, however, they are seldom overdone, more frequently suffering from insufficient nourishment than from too great a quantity. A one-horse load of dung, weighing say 12 cwt., divided into three heaps, each heap 16½ ft. apart, the whole spread over seven drills, amounts to as nearly as possible 53 loads to the statute acre, a quantity of manure when of good quality able, with the assistance of a little portable manure, to grow a splendid crop of turnips. Bone superphosphate is a capital auxiliary to the dung, and will always pay for itself by the rapidity with which it pushes on the young plants, hastening their development into the rough leaf, and greatly lessening the danger from fly. For the latter purpose nothing can be better than Peruvian guano, but the very high price which must now be paid for it amounts almost to prohibition, and actually compels farmers to look out for cheaper substitutes, however favourably they may view the article as a high class fertilizer. Superphosphates have the very important advantage over guano that they are, as sent out by the best houses, invariably worth considerably more in net cash than is charged by the manufacturer, a fact which consumers are by no means disposed to overlook. With the amount of dung we have indicated, 5 cwt. of superphosphate, costing at present quotations 32s. 6d., forms a very liberal dressing for an acre. No preparation is required further than to pass through a fine riddle, break the lumps and apply to the land. Mixing with decayed vegetable mould, as used to be done with excellent effect when guano was largely used, is not now necessary, the auxiliary manures now in vogue being bulkier and easier distributed. When spread over the dung it will be quite near enough the surface, the counter of the machine sinking so deep as to all but lay the seed on the top of it. Some care is necessary in reversing the drills, not to lay on too much earth, as in that case the plants must struggle for weeks before the roots can reach the food which has been placed underneath, and on the other hand it is highly necessary that a thin covering of soil should be over the manure to retain the moisture, and to prevent the dung from being torn up by the operation of sowing, always a most unsightly thing, and to some extent a loss of material. Various opinions are held as to the quantity of seed most desirable to sow to an acre, many advocating thick sowing on the ground of securing immunity from the attacks of insects, considering that when a thick plant is obtained as many may possibly escape as will stock the ground, however numerous may be their enemies. This object, however, is not always attained, and when it happens that the plants get on without a check they weaken each other, the roots becoming intertwined, and the trouble of thinning is greatly increased unless it is done very early, a probability which cannot always be

calculated on. We consider 2½ lbs. to the statute acre ample seeding, and a machine that will sow a thin uninterrupted line is a very valuable one to the farmer. The one which was awarded a silver medal last year at the Manchester show seems to overcome this difficulty better than any that has yet come under our notice. The seed conveyed to the down pipe by the revolution of a grooved cylinder pours down in an uninterrupted stream without the slightest risk or chance of failure, and the amount per acre can be regulated with the greatest nicety. The minimum quantity of seed being used, the thinning process is wonderfully accelerated, and the plants from having acquired a hardness of habit and suffering no injury from the earth being disturbed about them push on without the slightest check.

The seed-time of the turnip varies very much in different climates and soils, the first week of May being perfectly safe on heavy land wherever situated, and the 15th of June not too late on light land in southern dis-

tricts enjoying a genial climate. If too early sown far south they are extremely apt to mildew early in the season, become affected with dry rot, and keep over the winter badly. The very opposite is the case as we go north, early sowing being necessary to ensure success, both as to obtaining a large crop and having the roots sound and of good keeping quality.

The after-culture consists in keeping the surface well stirred by both hand and horse-hoes until it can no longer be done without injury to the roots and foliage. By strict attention to this material point all the advantages of a bare fallow are secured, and a valuable crop besides. We have set no stress on the eradication of weeds, considering that if the land has been properly and seasonably prepared, and the drill culture begun sufficiently early, they will never succeed in getting a firm hold; so that the mere cleaning of the soil becomes a matter so easy and simple as to be altogether unworthy of serious consideration.

STERILITY IN SOILS.

At the last monthly meeting of the Hexham Farmers' Club, Mr. H. R. GODDARD said: Of course, the terms fertility and infertility are only relative; at different times and in different places their signification may alter much, and therefore it may be necessary just to state the meaning we wish to place upon them. Simply, and without attempting a laboured definition, a soil may be said to be unfruitful when its produce is below an average, even when ordinary care has been bestowed upon it in preparing it for and in getting in the seed. The causes of infertility may be divided into two classes: those that are natural and those that result from the course of management, or rather mismanagement, pursued. Among the natural causes of infertility we shall find some that at first sight we should say were beyond our power to remedy—situation as influencing the climate, for instance; but it is surprising how much climatic influences may be modified. We often hear complaints of the lateness of a district retarding the ripening of the corn, until autumn weather renders the harvest precarious and spoils the quality of the grain. Highlying land may be protected and materially sheltered by plantations judiciously placed, but the effect that high farming alone has is wonderful. I was over an estate some time since, and had frequent opportunity of observing two farms—one lay in a hollow slightly falling to the south, and sheltered on all sides; the other consisted of poorer land, over 100 feet higher, and with a much worse aspect. Any one would have classed the first as an early and the other as a late farm; the latter was taken in hand by the proprietor, well farmed, and the corn top-dressed; the other was badly farmed, and the consequence was they changed places, and the corn was safely stacked on the exposed land; while on the other it was still standing in the field. Again, the temperature of a district will be affected by the rainfall and by the facilities existing for passing the water off the land; undrained land, where the water is retained by beds or bands of clay, and rendered stagnant, will be found colder than the same will be when properly drained. In both these particulars large woods or forests have an injurious effect; they both increase the rainfall of the district and prevent the water from evaporating from the surface, or being carried off by the wind. Cases have been recorded where springs, never known to have failed, have become dry when neighbouring plantations have been removed, and have re-

mained so until a fresh growth has covered the land. The removal of large forests is calculated to make a country both warmer and drier, and for this reason in naturally humid climates much wood is not a thing to be desired. Other natural causes of infertility may be found in the soil itself, and before passing to these it may be as well just to glance at its composition and functions. We know that the soil is the source from which plants derive all their inorganic or mineral as well as a portion of their organic constituents, and therefore what we find in the plant we may rest assured of finding in the soil. The ashes of all plants seem to contain variable quantities of the following substances: Potash, soda, lime, magnesia, oxide of iron, silica, phosphoric acid, sulphuric acid, and chlorine, all being found in compounds more or less complex, none of them being uncombined. Now, by careful experiment it has been found that plants cannot thrive if any one of these substances be wanting in the soil, and consequently that a soil cannot bear a productive crop, unless all the constituents wanted by the plant are present in sufficient quantity and in such a form that the plant can absorb them. Potash, for instance, might exist in the soil in the form of felspar or mica, but not being present in a soluble form, the plant would not derive any benefit. Thus we see that it is not merely necessary that all the constituents of the plant should exist in the soil, but also that they should exist in an available form; and it is for this reason that analysis cannot give us always a correct idea of the comparative fertility or infertility of a soil; for, though it will reveal the absence of any substance, it cannot always show whether they are present in such a form that the plant can make use of them. We see, then, two causes which might render an otherwise fertile soil unfruitful—viz., the absence, or the comparative absence of some necessary constituent, or its presence in an unavailable form. Again, infertility may be due, not to a deficiency of anything, but to the presence of something in the soil which has an injurious influence upon vegetation. If organic matter be present in an active state of decomposition, it prevents the healthy growth of plants, and vegetable acids are produced, which often have a most injurious effect; these are often found inland, where an excess of water keeps the air from permeating it. Decaying matter absorbs oxygen, and for this cause a large quantity of it is not a desirable thing. Iron, too, present in its lowest form of combination with oxygen has a very deleterious effect, and it is often found in peaty soils, or in a subsoil of blue clay. Things of this sort may often be noticed in soils which have been newly broken up. I saw a crop of oats last year upon a

marsh adjoining the Thames, the largest I ever saw; plenty of the straw was nearly the size of my little finger, whereas the year before, the field being fresh ploughed out, the oats had completely failed. This might be due to the presence of some deleterious substance, which disappeared when the soil was laid open to the action of the air. In cases of this sort lime seems to be of great benefit; it neutralises any organic acids which may exist in the soil, and it assists the decomposition of vegetable matter, and with efficient tillage generally succeeds in removing these injurious substances. But one thing which may be said more than any other to affect the fertility of a soil is the presence of stagnant water, no matter whether it comes from above or rises from below, and this from many reasons. The temperature of the soil is cooled, not only by the constant evaporation from its surface, and the growth of the plant retarded, but all the pores of the soil being filled, the atmosphere has not the power to penetrate to act upon the substances there, and prepare them for plant food. It not only acts directly as a poison on the plant, but, by keeping out the air, tends to promote the increase of protoxide of iron and organic acids. The herbage found upon wet grass land is sufficiently characteristic. On tillage lands the furrows, often bare, or at best covered with spindly corn, show the injury produced; but who can estimate the harm done by working such land in a wet state, as is often almost necessary, or the amount of manure wasted by its being washed off the land? Land naturally fertile may be rendered unproductive by over-cropping; all that is readily available for the use of the plant may thus be removed, but the soil itself aids and assists those who give it an opportunity to recover. The soil is not a dead, inert mass, as we are apt to think; it is highly complex in its structure, and its insoluble parts are perpetually being acted upon by atmospheric and other causes, which prepare them for the plant. Tillage, besides, being necessary in suiting the mechanical condition of the soil for the reception of the crop we destine for it, is thus instrumental in preparing its nourishment, by enabling the air to gain access to all its pores, and to effect those chemical changes which are necessary. Too much importance cannot be placed upon all tillage operations being efficiently carried out. We sometimes find land worn out by over-cropping, possessing a good depth of soil which has never been turned over. Deep ploughing brings this to the surface, it becomes mixed with the impoverished soil, and materially assists in its improvement. Lime, too, may advantageously be applied to land in this state; it seems to act upon the constituents of the soil, and helps to render them available for the use of the plant. Thus we may say that it assists the soil to elaborate from itself what otherwise we should have to bestow. I have heard of land being overlimed, and can easily imagine where it has been continuously applied and then discontinued that the soil would feel the lack of the stimulus it gave, unless supported by an increased supply of manure. But this should be no argument against the application of lime; for by increasing the crops it gives the material for the manufacture of that manure which is necessary to sustain the land at its increased standard of fertility. Rain and dew have a great influence, and a considerable manurial value. In their fall they bring with them from the air ammonia and nitric acid, which are absorbed by the soil of a clayey, loamy, or peaty character. The quantity, though not large in itself, yet becomes important when we consider the amount of rain and dew constantly falling; and the effect upon the crop of any nitrogenous manure we all know. They bring with them, too, carbonic acid absorbed from the air, and many things insoluble in pure water are thus to a certain extent made soluble. Water charged with carbonic acid in contact with bone earth or insoluble phosphate of lime can even take a portion of this into solution. Drainage is, I think, the first improvement on poor and wet lands, and not merely for the reasons stated above, but because so much manure is wasted or washed away when applied to land undrained. Draining is necessarily an expensive process, and it is of the utmost importance to do it thoroughly, so as to avoid any risk of having to do it over again. I have seen a great deal of drainage rendered inefficient by attempting to keep in the old furrows, which are seldom at regular distances, often varying from 8 or 10 to 14 yards. Outfalls are often left in such an unprotected state that they become stopped, and a great portion of the labour and expense rendered useless. Every farmer should, for his own interest, see that they are gone through at least once a year. Rabbits frequently enter

them when not grated. Last summer on one farm I had three main drains taken up stopped in this way. There are great varieties of soils; we speak of clayey, sandy, peaty soils, and there are endless modifications of these. Either of them pure would be absolutely infertile, not merely from its chemical, but from its mechanical condition. Nothing could thrive in an absolutely pure clay, even if it possessed all that the plant required; we, therefore, endeavour to modify soils which contain an overwhelming amount of either clay, sand, or peat by the admixture of what will alter its texture and improve its composition. There are soils so suited as to have the means for improving them in close proximity. The poor sandy land of Norfolk has been wonderfully improved through the application of the marl, which lay almost close to the surface, and this has been used to an enormous extent through Kent, Berkshire, Lincolnshire, and Cheshire; in fact, wherever the marl was to be found, and the soil seemed to repay its application. Peat land in Lincolnshire has been thus improved, trenches being dug, sometimes to considerable depth, and the subsoil laid upon the surface. Perhaps the most wonderful instance of the improvement of a barren soil took place in the north of Scotland, on the estate of, I think, the Marquis of Tweeddale. The soil was a useless peat. The proprietor having discovered a good soil underneath, made canals thoroughly intersecting the land; into these the peat was thrown and floated away, and the productive soil was rendered available for cultivation. No matter how fertile a soil may be, it cannot be continually cropped without adequate manuring, and it is of great importance that all land should be provided with sufficient and suitable accommodation for the manufacture of manure. The position of the land with regard to obtaining manures from other sources has a great effect upon the degree of fertility to which it will be raised. Proximity to a large town, or direct and speedy communication with one, affords great opportunity for improvement. Perhaps there never was a time when greater facilities were available for making improvements general. The theory and practice of draining is better understood, we have more efficient implements of tillage, while steam is lending her mighty power to enable us to plough and to subsoil in a way which could not before be done. Supplies of manure are now being brought from the other side of the world to take the place of what is not returned to the soil. Never was there a greater amount of attention bestowed upon this subject, not merely in obtaining from abroad, but in manufacturing at home. We hear of refuse from our manufactories of all sorts being brought to the aid of agriculture, while even the primeval ocean seems to be rendering up its deposits. The potash which is largely obtained from the salt mines of Germany must have been deposited there from the sea, to which it had been carried down in the constant washings from the land. Thus we see that we derive benefit from what was robbed from the ancient lands, and we know not what changes may yet take place to render available for future generations the vast quantity of alluvium and sewage constantly being carried to the sea. Geologists hold that the same causes which have resulted in the formation of the land we now inhabit are still at work. We have streams and rivers carrying to the ocean, to be deposited in its bed, the elements of future soils which only need the action of those volcanic agencies which are so actively at work in some parts of our globe, and to a less extent even here, to raise them above the sea, and thus render them available for cultivation. Though this may be the case, and though the sewage now descending into the sea may not be ultimately lost, if one takes a broad view of the thing, still we personally should be benefited if the difficulties could be overcome of collecting, concentrating, and rendering it economically available.

The CHAIRMAN said Mr. Goddard's paper exhibited a considerable amount of knowledge of the subject, and much care in its preparation. He told an agriculturist, the other day, that Mr. Goddard was to read a paper on wet lands. He believed almost any land could be made fertile by a sufficient amount of manuring, but then the question always came before them, "Will it pay?" It was the consideration of that question that was the most important—in what way could they fertilise these very poor soils without throwing their money away? The cause of sterility should be carefully noted down, so that, bearing these in mind, they could go the right way about restoring the fertility of the soil. Steam cultivation, which was beginning to be appreciated in this

neighbourhood, was of great advantage. The result, as it seemed to him, was to bring to the surface the poor subsoil by ploughing deeper than usual, and thus lessen the produce of the first crop. But the autumnal digging by steam cultivation broke the soil thoroughly up, and still left the surface-soil on the top to be exposed to the winter's frosts, winds, and rains; and in spring, instead of coming to work a hard and disagreeable soil, they would find it quite mellow, and would scarcely think it was the same field as before. The atmosphere was made to do the work for them during the winter, instead of waiting till spring, and having to work the land over and over again, because, being exposed to the air, the atmosphere did the work for them, which they would otherwise have to do at great expense. In that way they got the full value of the ammoniacal qualities to be derived from the atmosphere, and from the rain which brought it from the atmosphere. As to liming, Mr. Goddard did not think they could overlime land; but he had seen land thoroughly exhausted by a bad farmer by liming. That farmer merely used the lime as a sort of pickpocket for robbing the land of the little that was left in it. In good farming, where a proper use was made of the produce, and justice was done to the farm, a judicious use of lime would naturally increase the value of the land.

Mr. EDWARD ROWELL said the question appeared to him to be, What was the condition of the soils they had to operate upon in this district or county? In many instances they were in a very exhausted state; but whether the fault was in the system of cultivation adopted by the agriculturists of Northumberland, or from the imperfect application of manure, it was not for him to say. The fact, however, was patent to them all, as they passed through the country, that many soils were in such an exhausted condition that the question arose whether, considering the high wages they had to pay, and the taxes that were laid upon them, it was really worth cultivation or not. He held that land, though liberally supplied with dung, would become exhausted. On Tyneside, thirty years ago, they could get a good crop of turnips without any application of artificial manures; but they could not now secure the crops of turnips which once ornamented and beautified the fields on Tyneside. Yet there must be some cause for this. Some of the most important constituents must have become exhausted. The question was, What was the best plan to be adopted to render that soil as fertile as it was formerly? There was no question but that the expense in the cultivation of land was much greater now than it was thirty years ago on Tyneside. In referring to this matter, he might state that the ever-esteemed founder of their club, the late Mr. John Grey, introduced in this neighbourhood, though among an unwilling and prejudiced tenantry, the five-course system of husbandry. In his humble opinion, it was a well-matured thought, worthy of his far-seeing mind; and by adopting this system, and allowing the land to lie one year in grass, it gave it an opportunity of resuscitating itself as it were—of regaining some of its exhausted properties. The soil, in his opinion, had been exhausted of some of its important constituents, and the five-course system should be improved upon, the land not only being allowed to lie in grass a single year, but for four or five years. Artificial manures simply act as stimulants: in themselves they did not contain that amount of organic matter that would add materially to the fertility of the soil, but they stimulated the soil, and pushed it so as to make it grow that which it was not naturally capable of growing. Artificial manures were exhaustive in their effect; and there was no principle which they could adopt which would invigorate the land and restore it to its original condition so thoroughly as to allow it to rest, and to depasture it with sheep and cattle.

Mr. JOSEPH LEE, as to over-liming of land, had seen land in his own neighbourhood so impoverished by it that it could not be restored to its original fertility. But on soils, not accustomed to lime, he believed nothing paid so well as lime. Land limed from generation to generation, however, got exhausted of vegetable matter and the other things so necessary for the growth of good crops; but if used judiciously, lime was of great advantage. From his own experience of thirty years upon his farm, he might say that a portion of it, which lay at a distance from the steading, had never had a particle of manure upon it, and yet it was in much better condition than the other. The land is always three years in grass; and for the sake of keeping his farm in condition, he generally let it

lie two years in grass, and some parts of it five, six, or seven years in grass. He has had experience, as a farmer, of very unfertile soil. If they applied manure or dissolved bones to the amount of £4 per acre, they would produce turnips at a cheaper rate per ton than they could by only expending £3 per acre on manures.

Mr. TROTTER, the secretary, said that Messrs. Lawes and Gilbert, of Roddamstead, grew wheat and barley, each upon the same land, for a period of between twenty and thirty years, by simply using artificial manures, and the crops were increasing, instead of going back. It was not absolutely necessary to let the soil lie in fallow, in order that it might refresh itself. He thought the true theory of farming was to begin by taking the water and the large stones, if there were any, out of the land; for, so long as there were large stones in it, they would never get the land thoroughly ploughed; and until they got deep tillage, and the bottom of the soil manured, as well as the top, they would never have good crops. With respect to allowing land to lie at rest, he believed they got better crops on the four-course than they did on the five-course system; invariably he got better crops of oats after the land only lay one year than when it lay two years. A very good theory went to prove this: When clover grass was well up in height, the roots went well down into the soil, and there were few better manures of the soil than roots of clover. When the land was allowed to lie two years in pasture, whickens grew upon the land, and they got a double crop; they ploughed it for oats, but the whickens got among the oats, and robbed them of part of their nourishment, and lessened the value of the crop.

Mr. GODDARD said there was some little misapprehension respecting what he stated about liming land. Land could be over-limed, but what he meant to say was, that after the land had been limed and increased crops of oats and straw obtained, a larger amount of manure should be applied to the land, so that it would not have cause to suffer much. Providing manure was not returned, it would afford the best opportunity of deteriorating and depreciating the value of the land.

Mr. DRYDEN said that if poor land had been limed and drained, and its surface not broken up, it would have been worth double the value it was now. There was no difficulty in reclaiming land on the general principles laid down by Mr. Goddard; but would it pay? Many improvements might be carried out if the tenants had long leases or compensation for such improvements. On not only poor soil under cultivation, but grass land in the higher districts, hundreds of acres might be rendered of greater value in many ways were it not for obstacles thrown in the way, for purposes he need not refer to on this occasion, but of which they were well aware. These lands could be improved at much less cost, and made better land than the poor, exhausted soils to which reference had been made; and if the owners of this land felt the proper philanthropic spirit, they would see to the improvement of it for the good of the community at large.

The CHAIRMAN stated that he was not in favour of allowing land to rest, as he believed it was merely a matter of calculation, "Will it pay or not?" Poor land, once drained, might be forced to grow crops by the proper application of manures.

Mr. CHRISTOPHER GRAY said he had had some little experience in the management of poor lands, and he agreed with Mr. Rowell as to the advisability of allowing it to rest in grass. It would naturally refresh itself, and when ploughed up again they would get better crops of anything with the application of lime and proper management. But he happened to have a different kind of soil as well on his farm, which would not refresh itself by lying in grass. By letting this land lie in grass two years he got, as Mr. Trotter said, a worse crop of oats. Had not the late respected receiver of the Greenwich Hospital Estates allowed him to adopt the four-course system, the best management he could have afforded would not have brought the crops up to the mark. He farmed other portions of his farm on the five, six, and seven-course system; for he found by this means he got better crops on these light soils, and better grass afterwards. The four-course system was the best for poor soils that would not refresh themselves, but the five, six, and seven-course system was better where the land, if allowed to lie in grass, would refresh itself.

A vote of thanks was carried unanimously to Mr. Goddard.

FARMING COVENANTS.

A Paper read by Mr. E. P. SQUAREY, of Salisbury, at the Institution of Surveyors.

The principle which ought to govern farming covenants would seem to be, that the tenant should have the freest and most unrestricted use of the lands and premises, consistent with the maintenance and yielding up of the freehold at the end of his tenancy in an unimpaired and uninjured condition. The interest of landlord and tenant coincide in this abstract formula, but its application is interfered with in practice through various reservations by the landlord, and by the endeavour to define and limit the use of the land in such directions as may consort, not with the conditions of greatest production, but the prevention of deterioration of the soil. It would be an obvious waste of time to describe, however concisely, the various forms of agreement, with their almost illimitable number of covenants, which prevail, and control cultivation in various parts of England and Wales. Those whom I address need no description of present conditions of tenancy; but rather that, however incapably, I may indicate the relaxations and modifications, in whatever direction, which appear likely to conduce to increased production without injuriously affecting the interests of the landlord. I propose, therefore, to deal with the separate questions of rent, covenants as to cropping, repairs, and entries between outgoing and incoming tenants. The payment of rent is obviously all-important. Under all forms of tenancy at rack-rent it is prudent to reserve it quarterly; and in the last year or half-year of the tenancy, to reserve the last quarter's rent in advance. This is a protection against a dishonest tenant, and need not be enforced against a good one. The payment of the tithe rent-charge and the consequent letting of farms to the tenants free of tithes has some advantages, inasmuch as the landlord is protected from the contingency of loss by the failure of the tenant to pay the current tithes on his occupation. Where farms are let tithe-free, care must be taken to deduct the tithe rent-charge in arriving at the assessment of the farms for poor-rate and property-tax, so long as the rental of lands is adopted as a basis of rateable value. The payment of land-tax, fire insurance, quit rents, and other exceptional charges, are matters of agreement; but, as a rule, they are best payable by the landlord. How far the preferential position of the landlord over other creditors for rent due is really beneficial to the interests of either party, is open to grave doubt; less care in the selection of tenants doubtless arises under this system, and a thrifty, hard-working tenant is sometimes impeded in obtaining further capital by this special exception in favour of the landlord. One ill consequence is clear—a failing tenant is allowed by the landlord to remain longer on a farm, to its probable deterioration, than if all parties stood on an equal footing. Covenants as to management vary so completely in almost every district of England and Wales, that my remarks must necessarily be confined to the broad principles which should influence their application. Where leases for terms beyond twelve years are granted to tenants of undoubted character and capital, I venture to think that no covenants as to cropping are necessary until the last four years of the term. It is a matter of experience that excessive continuous cropping, without the assistance of large quantities of artificial manure, or the fattening of cattle and sheep on extraneous food, is unprofitable to the occupier; hence, with a moderately long interest, a tenant may be reasonably trusted to pursue such a course of management as not to unduly impoverish his land for occupation in the last four years of his tenancy. During this period of free action, some limitations, dependent on the character of the soil and its locality, may be insisted on for the consuming proportions (to be governed by circumstances) of the hay, straw, fodder, root, and other green crops, on the demise. Assuming these conditions, the management of the last four years should be simple, yet stringent in the extreme. The cropping should be limited to two-fifths, half, or two-thirds of the arable land to corn, as the case may be, with moderate proportions of pulse to be harvested. The green and root crops should be con-

sumed on the premises, except under special conditions; and an entry and quit, on convenient and equitable terms, should be clearly defined. The land should be given up clean and in good order; and herein lies the key to the position, if the liberal policy I have indicated is carried out: The covenants of the last four years of the term should be stringently enforced; and compensation for breach of these, or the terms of quit, or of proper and thoroughly cleanly management of the land (not according to custom of country, but according to the best rules of husbandry) should be distinctly insisted upon. In some of the best farmed districts of England these conditions are recognized by landlord and tenant, whilst in other localities it is the exception for a farm to be given up in proper condition; and in these latter cases, if the condition and management form the subject of arbitration, the whole matter is too frequently adjusted on terms which are lenient, and highly favourable to the outgoing tenant. At an institution of great importance and consideration, "The Farmers' Club," a paper has recently been read by Mr. Masfen on "Farm Agreements," which, highly valuable and suggestive in itself, has elicited more valuable conclusions in the resulting discussions. I earnestly commended a perusal of this paper and discussion to the members of the Institution of Surveyors. The lecturer refers to, and discusses with much acumen, the farm agreement of Mr. Cadle, for which the Royal Agricultural Society's prize was given in 1868, and the valuable opinions of my friend Mr. Randall, of Chadbury, on the same subject, elicited by a discussion at the Midland Farmers Club. Mr. Randall has the courage to suggest a new principle for the adjustment of entries between outgoing and incoming tenants, which, like all suggestions from him, deserves the highest consideration. His view is, that no land should be given up to an incoming tenant in a condition of uncleanness, which would cost more than £2 10s. per acre to properly clean. If, in the opinions of the valuers, the cost would be less, the outgoing tenant would be entitled to receive the difference from the incomer; if more, the incoming tenant would be credited with such difference. I am hardly prepared to adopt a datum of £2 10s. per acre, or any larger or less sum, dependent on soil and locality, or to recognise that a tenant should be paid a premium for giving up lands in simply good condition, and thus fulfilling his covenants; but I fully concur in enforcing the severest penalties on the outgoing tenant, whose covenants, whether in the direction of clean farming, cropping, or general dilapidations, have been broken. The application of this sterner discipline would greatly conduce to improved farming and increased production over an immense area of England and Wales. It is with some hesitation that I include in this paper an outline of the cropping which is adopted on the various soils of England and Wales, inasmuch as the variety of soils and climate produce important and infinitesimal modifications of each course, which are yet further affected by the proportions of arable, pasture, and meadow land on each farm. On very light soils a five-field course prevails, viz., two-fifths corn, one-fifth roots or green crops, two-fifths clover and ryegrass; and where the old ley is broken up, a portion is sown to rape or turnips before wheat. No pulse crop to be harvested in this course. It is usually within the discretion of the farmer in what order the two-fifths corn crops shall follow. On lands possessing more staple and of greater depth, the four-field course is almost universally adopted—viz., one-half corn, one-quarter roots, and one-quarter clover and pulse; the proportion of pulse which may be permissible fluctuates according to the quality of the land from one-eighth to one-twelfth. In this case, also, the sequence of corn and green crops should be at the option of the tenant. The three-field course, with its modifications converting it in some cases to the six-field shift, applies to the rich, deep, strong soils which, alas! are exceptional over the broad area of England. Its ordinary formula would be two-thirds corn, one-ninth clover, one-ninth roots or fallow,

one-ninth pulse. It will be obvious that these forms of cropping are merely the skeletons of management, which permit endless modifications of catch crops between corn and roots. With the views previously propounded, it is clear I have only introduced the preceding paragraph to be some guide to the farming of the last four years of a reasonably long term. It is now to be considered how far this elasticity in cropping, which I have ventured to suggest, where long leases are to be granted, may be extended to tenancies determinable by 6, 12, or 24 months' notice. In discussing these conditions, I must dismiss, with much regret, the actively operative but apparently sentimental consideration of "good feeling and good understanding" which, however esthetically unreliable and unsound, has, over very many large estates in this country, co-existed with excellent farming and large and expensive improvements. It is obvious that, under a yearly or two-yearly tenancy, it would be a most unwise liberality which would concede perfect freedom of cropping or application of all produce to the tenant. In these cases any relaxation of the ordinary covenants as to cropping, or sale of produce ordinarily consumed on the farm, must be coupled with special stipulations as to return of manures or extraneous food to be consumed by the stock. A system of Tenant Right, however valuable for the protection of the occupier under these contingently short tenancies, leaves the landlord's interest dangerously exposed, if any general concession as to cropping without limitation or stipulations is made; hence, the landlord or agent of an estate where short tenancies exist must exercise a continuous surveillance of the property, if the remotest departure from rule-of-thumb cropping and covenants is to be permitted. On the other hand, I do think that the cultivation and production of farms under these shorter tenancies may be greatly improved by the concession of a Tenant Right for oilcake and artificial manures applied to green crops within a reasonable period of the termination of a tenancy: I do not suggest the details of such Tenant Right; but the experience of Lincolnshire and other counties would be a valuable reliable foundation for the extension of the practice over our country. But, as I conclude this portion of my subject, before me rises the recollection of various localities in England and Wales to which the most sanguine of improvers would scarcely apply the liberally elastic conditions I have suggested. The thin, poor, wet clays, often of considerable elevation, in the damp climates of a line of country extending from Cornwall, through Wales, to Lancashire, Westmoreland, and Cumberland; the weak, hot, burning gravels, and the occasionally incompressible sands, where situated in an inhospitable and unattractive district, command, unfortunately, no class of tenants to whom these liberties may be safely granted. New capital will not be drawn to these places. I say "new capital," because it happens often enough, that, through long years of thrift, tenants are found on these farms who have money; but they progress not by producing, but by saving. The average tenant of these districts lives from hand to mouth, and could not, if he would, supply the conditions which alone justify the relaxation of his ordinary management. It has been suggested to me, that the further growth of wealth may and will beneficially affect these neglected districts, as it has others, heretofore, seemingly as desolate. I venture, if not to ignore, at least to depreciate this influence in these special cases. The competition will be keener for what is desirable, but will very remotely affect the areas which I have described in such gloomy colours. An advance of the cost of manual labour, and a permanently lower range of corn prices, may and ought to modify the character of produce of these farms. In these cases every aid should be given by the landlord and agent to develop such changes; in these directions it may be possible to concede greater freedom of management. The ordinary covenants for the keeping a defined number of sheep or cattle on a farm, should obviously be as elastic as the covenants for cropping, which I have indicated in the foregoing remarks. With equal stringency, the maintenance of a full proportion of live stock must be enforced during the last four years. The management of dairy farms can scarcely be affected by any of the foregoing considerations, except that a reasonable Tenant-Right should be given to the occupier of strictly grass farms for oilcake or other artificial food which he may have consumed during the last two years of his tenancy. Further, the consumption of oilcake or other kindred food during any period of his tenancy should justify the sale

of a certain quantity of hay. Repairs are a large and important feature in farm agreements, and probably lead to more questions, troublesome of solution, between the landlord and tenant, than any other condition of tenure. The ordinary arrangements are—1. Where all repairs are borne by the landlord; 2. Where all are borne by the tenant; 3. Where the landlord provides the materials and the tenant pays the labour; 4. Where the landlord finds the materials and shares with the tenant the cost of labour. It is obvious that these varied conditions proportionably affect the rent which is payable, and theoretically it would seem to be of little importance by whom the necessary reparation is made; practically, however, it is far otherwise. Left to themselves, and without any liability to make good the wear and tear which inevitably happens to farm buildings, the tenant is too frequently careless of the cost of these repairs, and permits waste and injury to his premises, which, had he an interest in their economical maintenance, would never arise. On the other hand, when the entire onus of repair is thrown on the tenant, he is too much disposed to evade, as far as possible, his liability; hence things go undone which, falling in themselves at the outset, by the end of a long occupation assume very serious proportions. Arbitrations or legal proceedings are frequently necessary for their settlement, and it is exceptional if, in such cases, the tenant is not relieved of a portion of the liability which, directly or indirectly, should properly fall upon him. For myself, I am inclined to the belief, that the fourth adjustment of the liability, *i. e.*, the division of the cost of labour by the landlord and tenant, most fairly meets the difficulties of the case. The tenant's proportion of expenditure is limited to an amount which is more than balanced by the comfort and advantage of the maintenance, in proper condition, of his premises; and to avoid the large liability which is certain to result from neglect of prompt repairs, he will certainly be continually pressing on his landlord or agent the necessity for keeping things in good order. Let me suggest, as exceptions to the materials to be provided by the landlord, straw for thatching, and glass and leadwork; further, the tenant should be bound to do the carriage of materials for repairs within reasonable distance. As with land, so with buildings, dilapidations at the termination of a tenancy, should be more strictly enforced than is now the usual custom; but it is clear that the tenant should be only liable for a legitimate and necessary reparation, and not for restoration or reinstatement. The periods and conditions of entry on farms, and the power to hold over certain portions of the premises after the expiration of the term, by the outgoing tenant, and the right of pre-entry to prepare for turnips and wheat, by the incoming tenant, are singularly varied over England and Wales. It would be a waste of your time to describe them in detail; but I rejoice that the energy of some members of this Institution has led to the collection of information upon these points from the body generally, which, when collated and digested, will be as valuable as interesting. It is, however, within the province of this Institution to direct their efforts to a modification of some of the tedious, inconvenient, and expensive conditions by which many entries are now hampered. As an extreme instance of tediousness, I may mention that in some of the west country Lady-day entries, it is fifteen months after the expiration of a tenancy before the incoming tenant has entire possession of the occupation. I need not again enlarge on the costly character of the Surrey, Sussex, and Kent entries, which really uselessly absorb no inconsiderable portion of a tenant's capital. Where it is possible, there can be no doubt of the wise policy of the purchase by the landlord, of a large proportion of the items of these expensive entries, and thus reducing the cost of entry and securing the application of the tenant's capital in more profitable directions. It is obvious that tenants will usually pay at least 5 per cent. in the shape of rent on the capital thus economised; from a variety of causes, it happens that few landlords are disposed to deal broadly with the purchase of these rights. It is, however, for our consideration whether, in granting long leases, it may not be desirable to make some effort to extinguish a portion if not the whole of these outrageous conditions. It is clear that the best entry is that which permits the incoming tenant to set himself down in his occupation at the least possible expenditure of capital without prejudice to the interests of the outgoing tenant. The Wiltshire Michaelmas entries, for instance, appear to involve these conditions; the incoming tenant has

a pre-entry given him for turnips and wheat of defined date and area, which he tills at his own discretion, without charge for rent, rates, or taxes. Even in these cases, however, a question of Tenant Right crops up. Where the land on which a crop of turnips has been consumed is given up to an incoming tenant, as an entry for his wheat crop, custom has, during the last few years, established the payment of half the value of the tillages and artificial manure of such preceding crop to be paid by the incoming-tenant. It is a matter of regret that the value of oilcake, or other artificial food, does not, without special agreement, come into the same category; but I am sanguine that custom, in this direction, is being quietly but certainly established. It is with some hesitation that I introduce game; but the reservation is so usual and important a feature in the ordinary agricultural lease and agreement, that it may not properly be left unnoticed. The political and moral aspect of this question is scarcely within the province of our Institution. Apart from this, I regard the preservation of game and the rights of sporting as a simple matter of agreement between the landlord and tenant. It is, however, to be regretted that the preservation of ground game and rabbits is occasionally carried to such an extent as to be utterly inconsistent with good cultivation, and too frequently productive of misunderstanding and quarrels between landlord and tenant. I may

now shortly summarise the results which I venture to anticipate from the adoption of more liberal covenants. Chief amongst them, I am certain of great general increased production of all farm produce, from the conviction that, with perfect liberty of action, a farmer will only sow his land when it is in the fittest and ripest condition for perfecting a crop; the conditions incident to such fitness involving the growth of large proportions of green crop, and the consequent maintenance of a great stock of sheep or cattle. 2. The probability of more permanent occupations of farms by the same tenants: Once free to manage his lands in the fashion which he thinks most profitable, the tenant will be most unwilling to be reduced to the four corners of his cropping covenants in the last years of his term. He will make every effort to remain on his occupation by the payment of the most extreme rent, consistent with his getting a living, before the strict covenants as to cropping in the last years of his term would come into operation. I believe that the adoption of these suggestions would necessitate great care in the selection of men of capital and experience as tenants; but I am sanguine enough to believe that it would tend, not only to the benefit of the State, but to the increased income of the landlord, and certainly to the comfort and prosperity of the occupier.

ON THE PREVENTION OF CATTLE DISEASES.

At the meeting of the Cirencester Chamber of Agriculture, Professor McBride, of the Royal Agricultural College, introduced the subject of cattle disease. Mr. Edmonds presided.

Professor McBRIDE said agriculturists have, from the earliest times, until a very recent period, looked upon the diseases of the lower animals as a necessary evil, and one over which they had little or no control. In fact, they resembled much the "peculiar people" of the present day, who quietly stand by and allow disease to destroy life without the least attempt to protect themselves or their families from its devastating effects. Happily for the stock-owners of the present day the sun has thrown its last rays on the good old times when men gloried in being ignorant under the plea of being practical. In those days men were content with the education inherited from their fathers, and as a result never ventured to supplement it. The nineteenth century, however, is a progressive, age, and it indicates true progress when any body of men acknowledge a necessity for further information. I am happy to say that this Chamber, although young, is thoroughly imbued with the true spirit of inquiry; this statement can be verified by looking at the immense amount of original work done by your committees under the able management of its office-bearers. The subject I have chosen is of paramount importance to the nation at large; to the consumer as well as the producer. The prosperity or ruin of hundreds of stock-owners depends in a great measure upon a thorough knowledge of this subject. Sooner or later cattle diseases must be recognised as a public question. You are doubtless aware that no country in the world can compete with us in raising the quality of cattle exhibited at our annual shows; and further, I have no hesitation in saying that there is no country so lax as our own in staying the progress of preventable diseases. We throw away millions of money yearly, having little or no return; a loss that would not be tolerated in any other branch of industry but agriculture. Perhaps you may think I have used the wrong words—"thrown away"—because some, while allowing the gold coins to slip through their fingers, grasp a few shillings as the salvage of diseased animals, and allow them to pass into the hands of some unsuspecting individual who, in a short time, sends them elsewhere amongst healthy stock, thus supplying the disease with its hundreds of fresh victims, and insuring its rapid and sure distribution over the length and breadth of our isles. Is this not worse than "thrown away?" This is no imaginary picture. I could give many such facts from my own experience, and in not a few cases the biter has been bitten. What else could he expect when he encouraged such a system of traffic? This is not as it should be. Why is it so? The answer is simple. You have not availed yourselves of a science which is economic in

all its bearings. One would have thought that the enormous amount of cash invested in live stock in this country would, at least, have secured as large a share of science in its treatment as that of the crops, but such is not the case. We rarely hear of agricultural societies experimenting upon diseased animals or tracing the causes of disease or their results. A superficial observer would imagine that the preservation of live stock was foreign to the interests of agriculture by the little interest such societies take in this matter. These are plain truths, and however difficult they may be to digest they are worthy of some attention. Perhaps a few of you present may think that my statements as to the great losses too general, or fanciful, or that the pictures are overdrawn. If such be your opinion you cannot have the slightest idea of the great mortality amongst our domestic animals. I will give you statistics to show that animals do die in large numbers from preventable diseases which you may prove at your leisure, and I have no doubt that you will find matters even worse than I have depicted:

1. At a recent meeting of the Derbyshire Agricultural Society, Dr. Hitchman stated that in Derbyshire $16\frac{1}{2}$ per cent. animals perish annually from pleuro-pneumonia.

2. Professor Ferguson, of Dublin, in 1866, stated that 46 per cent. of dairy stock died, or had to be sold, on account of being affected with pleuro-pneumonia; and in 1867, when supervision was exercised, it was reduced to $17\frac{1}{2}$ per cent.

3. At Glasgow, in one dairy, where cows were kept to the extent of 1,600, the annual loss from pleuro-pneumonia was on an average 25 per cent.

4. Statistics collected by Professor McCall, of Glasgow, show that in that city alone the loss from preventable diseases was £77,999—the loss in the above dairy was excluded.

5. Mr. W. Smith, M. R. C. V. S., in a paper upon "the Cattle Plague in Norfolk," which he read at the recent meeting of the British Association, states that, during the prevalence of the disease in that county, "when the movements of cattle were restricted by licences, and close inspection was maintained, the lung disease was held in abeyance, and the mouth-and-foot disease, except at the outbreak of the pest, quite disappeared, but very soon after the checks to the propagation of the disease were removed our old enemies re-appeared."

In evidence of this he placed before the meeting the following figures, which he had compiled from the books of the Norfolk Farmers' Cattle Insurance Company. The stock insured by that office during its twenty years' career had been valued at more than £2,000,000; the experience of the company Mr. Smith therefore regarded as "valuable and reliable."

The table exhibits a percentage of loss "upon the whole number of neat stock insured." In 1858 the loss from pleuro-pneumonia amounted to 63½ per cent.; in 1859, to 45 per cent.; in 1860, to 47½ per cent.; in 1861, to 47¼ per cent.; in 1862, to 46½ per cent.; in 1863, to 35 per cent.; in 1864, to 35 per cent.; in 1865, to 26 per cent.; in 1866, to 1 per cent.; in 1867, to 8 per cent.; and in 1868, up to August 17, to 30 per cent. As soon as the movements of cattle were restricted, and fairs and markets prohibited, this hitherto incurable and most destructive of diseases almost disappeared. But at the present time, when "the free movements of beasts are again permitted, pleuro-pneumonia is once more asserting its malignant supremacy"—malignant indeed, when we find that in less than eight months of the present year, nearly one-third of the animals insured have perished, while the average loss of 1866 and 1867 was only 4½ per cent.

6. *The Fifth Medical Report of Privy Council.*—The statistics being principally compiled from Insurance books, which must be understated from the fact that great risks were refused, and animals showing the least symptoms of disease were rejected.

The number of cattle which die annually in North Britain is thus discovered to be 47,893, and the money value of them to exceed £500,000, a large number and large sum, and evidently too large to pass unnoticed as it does. Above one-half of the total number lost is by pleuro-pneumonia, a disease which was unknown in this country before 1849. But, compared with England or Ireland, the loss in Scotland is small. For the sake of calculation assuming it to be correct, and taking the rate of mortality from our Scotch tables, which are low rates for Ireland, we find the annual loss to be £1,132,687 7s. 5d. In these two kingdoms, therefore, we have an annual drain upon agricultural capital amounting to £1,642,771, or taking the real value of Irish cattle, close upon two millions each year. If in 1860 the whole of the United Kingdom had (as I believe it at least to have had) the same rate of mortality as Scotland, in that year there died of disease, in Great Britain and Ireland 374,048 horned cattle, having a total money value of £3,805,939 8s., and if the Mid-Lothian experience of the causes of death be applied to this matter, we may infer that more than half the loss was due to the pleuro-pneumonia—in round numbers may be estimated, £3,805,939 a year; £317,161 a month; £79,290 a week; and £11,327 a day. This is under the proper estimate, as taking six years, we find an annual loss of four millions. The number of cattle imported in 1860 was 104,569, and their value may be estimated as £36,552. The deaths from pleuro-pneumonia represented considerably above twice the value of these imports. As one year cannot be considered a sufficiently fair estimate, we may give the calculations for the six years ending 1860. The value of animals lost amounted to a grand total of £25,934,650. Of this number there died from pleuro-pneumonia considerably above one million during the six years, and these represented a value of about twelve millions sterling. The loss by disease was four times the number imported, and by pleuro-pneumonia it exceeded twice that number. In large towns the mortality of cows very greatly exceeds any proportion which I have stated—it has amounted to more than 50 per cent. The reports of 88 Edinburgh dairies ordinarily containing about 1,839 cows, out of which, in one year, 791 diseased cows were sold to butchers, and slaughtered for human food, and 284 were sold as food for pigs. It will be seen that of the total number of cows kept in Edinburgh, 58½ per cent. were sold diseased, of which 43 per cent. were sold to butchers for human food, and 15½ per cent. as food for pigs. The total value of the 1,075 diseased animals when first bought, at the very moderate average of £13 10s. each, is £14,712 10s. There was realised by their sale, calculating the value of the 791 sold to butchers at an average of £5 each, and the 284 sold for pig feeding at 10s. each, the sum of £4,097. The net annual loss for diseased cows in Edinburgh alone may therefore be estimated at £10,415. In Dublin the average losses for 20 years ending the 1st July, 1862 (viz., since the very first appearance of pleuro-pneumonia in the United Kingdom), amount to 51.11 per cent. on the 12,000 cows kept. Further, in London and its suburbs there is an annual loss of at least £80,000. The time at our disposal is so limited that I can only hope to consider one of the great classes of disease. I had, however, intended to describe epizootic and enzootic—the latter being those dependent upon local causes; but as the

first class is of the greatest importance to this Chamber, I am reluctantly compelled to omit epizootic disorders till a future time, when we may have opportunity for its discussion. I shall endeavour in this lecture to describe—1. What is meant by the term epizootic. 2. How introduced, and why retained in our country. 3. Are we safe from further outbreaks of cattle plague? 4. The prevention of such diseases. I shall hope to point out what agriculturists must do before the Legislature can reasonably be expected to assist you; and further suggest what this Chamber should do as a pioneer in this great movement. Epizootics are defined by our greatest authority upon this subject as "that class of diseases which spread from one country to another without regard to climate, soil, breed of animals, or any circumstances except those of favouring or impeding the communication of a special virus, the propagation of a living entity from a diseased animal to a living, healthy one." Such being the definition of this class, it will further our object much if we consider briefly how introduced. It is truly a mortifying spectacle to behold one of the greatest nations in the world, rich in science, thus allowing only four diseases—viz., pleuro-pneumonia (lung disease), epizootic aptha (foot-and-mouth disease), cattle plague, and variola ovina (small-pox in sheep)—to be our every-day terror, and drain our pockets to the extent that they do. What weakness to permit even for one day the introduction of such diseases as are foreign to our soil. Before 1842 our cattle and sheep were not devastated by such diseases, and it was only when Sir Robert Peel thought it necessary to increase the supply of meat for the people that he allowed free trade in cattle. By so doing he unwittingly introduced foreign diseases, which have ever since been a curse to the agricultural interests. These disorders were new to the stockowners of this country. They would not believe they were either infectious or contagious. The causes given were numerous, such as the filthy condition of cow-houses; excessive heat or excessive cold; dry weather, wet weather; and some very wise men, even so recently as the late outbreak of cattle plague, declared it was something in the air. Few would allow that such disorders were due to specific poisons, and not indigenous to our soil, but of foreign growth. Twenty-eight years have wrought wonders—it has educated the agricultural community, but at what a cost! This is one of the benefits of compulsory education. There can be no doubt that your experience has been the most ample and the most expensive mode of learning the true nature of these plagues. The outbreak of 1865 not only enlightened the ignorant, but it confounded the prejudices of those who denied its contagious nature. Our instruction has been costly, and we should be deserving of the severest censure if we neglected to make use of our acquired knowledge for the purpose of protecting our interests. No doubt we have had a few occasional complaints, but they have been drowned by parties interested in the traffic. It has been said by agriculturists that our profession has done little to aid stock-owners in eradicating such diseases from their herds and flocks. Many veterinarians have drawn the attention of those interested to this subject, but none to the extent of Professor Gamgee, or with the same originality of thought. Since 1858, till the cattle plague appeared, he never failed to point out what must ultimately be the result of the traffic in foreign cattle. Strange to say, one of the most influential agricultural bodies in this country would hardly listen to him; they put him down as an enthusiast, a theorist, an idle dreamer. When he told them that if they persisted in introducing foreign stock we should be certain to have a visit from the dire destroyer, cattle plague, he was laughed at. In fact, he was said to be suffering from a peculiar form of madness—his hallucination being that this country would soon suffer from a plague which would destroy nearly all our cattle. Agriculturists said it could not occur—it was sensational—a myth—a mere shadow; and, further, when he informed you how cattle plague could be stayed, I firmly believe if Lynch law had been an English custom, the cattle dealers and others interested would have made an example of one who was, and is still, your best friend. Such has been the recompense that one of the most talented members of our much-abused profession received at your hands; and why? Because he knew more than his contemporaries, and because stock-owners were not sufficiently educated to receive the truths he communicated. I take this opportunity of saying that he is the most original man of his time; and that he has the most comprehensive view of all

that pertains to epizootics. What did he do for Wiltshire? Stopped small-pox. I am not aware of anyone, who has written or lectured upon this subject, advancing anything that he did not advise years ago. They but echo his words without giving him the honour of being the first to suggest such measures. Government adopted his suggestions for cattle plague, after the loss of millions, but neither agriculturists nor the government have either recognised or remunerated his valuable services. Every profession has had its martyrs, and I expect ours is no exception to the rule. However, gentlemen, it is satisfactory to know "that it is never too late to mend." I should hope there are none present who believe in the *non-contagious* nature of these maladies. To those who do, I will not attempt to prove its nature, as the time has passed for its discussion—it is known to every cow boy. I will, however, place a few facts before them. 1. The ports from which we receive our foreign supplies suffer much from such maladies. 2. Such diseases were never known in England until foreign stock were introduced. 3. Such diseases always radiate from centres, such as cattle markets along the lines of cattle traffic. 4. Breeding districts are entirely exempt. 5. The practice of selling animals suffering from such disorders, although detrimental to your best interests, proves clearly that you are afraid of its spreading. 6. While cattle plague was playing havoc with our herds, pleuro-pneumonia (which is contagious) disappeared. And why?—The traffic in animals was stopped. Read the history of epizootics on the continent, how they pass to Britain, and from it to America, Australia, and Norway, and if any further doubts exist in your minds, invest in one animal suffering from pleuro-pneumonia, place it amongst your healthy stock, and the result will be conclusive evidence of its nature. Let me assure you it is impossible in this country to produce this class of disorders by any combination of causes such as heat, cold, food, moisture, filth, bad ventilation, or anything short of the introduction of the specific poison into the system of the living animal. Any of you may as well try and generate cholera amongst the members of this Chamber within an hour. There is little doubt that such causes may increase the virulence of the attack, but nothing more. It is very unpleasant to recall the results of the late outbreak of cattle plague, but the question naturally arises in one's mind—Are we in any danger of its re-appearing amongst our stock? It must not be forgotten that it occurred once, and may occur again under like circumstances. This peril is even increased by the large extension of railways, forming a complete network to the centres of disease on the natural habitats of these plagues. If prices be high in our markets it will further favour its introduction. Therefore we have reason to apprehend danger from the increased facility of transport together with the unscrupulous character of many of those engaged in the traffic of such animals. This critical state of matters loudly calls for some stringent measure by our Government for the protection of the public health and the prosperity of agriculture, as the present system cannot possibly be tolerated without disregard to long established and warmly-cherished principles of our social economy. I trust I have been successful in showing you that the annual loss due to the great mortality amongst stock is greater than many like to acknowledge. I have also endeavoured to show you the primary cause of your losses, and how such losses are increased by your recklessness in purchasing animals; and I hope I have succeeded in calling your attention to the liability at any moment to another outbreak of cattle plague amongst your stock. It is nothing short of folly to wait for further evidence of its destructive nature, and the blame must rest with yourselves and not with us if you are not fully protected from its ravages. You thoroughly apprehend the primary cause of epizootics—it is the free trade in cattle; and we have much reason to congratulate ourselves that it is so, as we can without much difficulty apply a remedy for which our insular position offers every facility. Gentlemen, I have hardly patience with those who advocate free trade in cattle. Their great idea is that this liberty is good for the country. How can it be so when it permits the systematic introduction of diseased animals by jobbers into our markets? We lose by pleuro-pneumonia alone about twice the value of our foreign imports. Sir Robert Peel never intended to give any such licence to traffic in that which is dangerous to the health of the public and ruinous to the owners of stock. We shall now consider the means of preventing disease.

The inspection of foreign stock at British ports.—After some experience of this mode of preventing disease, I am compelled to say that at the best it is of doubtful utility. Every one knows that the results obtained from the examination of animals which have been at sea are very unsatisfactory, as the excitement produced by bad ventilation between decks, over-crowding, and the cruel manner in which they are treated in landing, are sufficient to obscure the signs of disease. No doubt bad cases may be observed, but even this cannot be done in all instances without danger to life or limb. Inspectors cannot possibly recognise disease during its incubative stages. These vary—extending to forty days in pleuro-pneumonia, in cattle plague six days, and in epizootic aphtha ranging from twenty-four hours to five days. Now it is quite possible that a cargo may be passing through this stage and yet be reported healthy by the inspector. They are then permitted to be exposed in our markets to propagate disease. The inspector may limit the number of animals suffering from the acute form, and in this particular may be of some little service. But it must be evident that it can be no protection to our home stock. Quarantine has been recommended for all foreign cattle. I believe that it is impracticable in this country, because it would never be so efficiently conducted as to secure us against the spread of such maladies; in fact, it would resemble our sanatoriums during the cattle plague, and would merely be a centre for the spread of such disorders. The advantages to be gained by this procedure would be so few that it would never compensate for the expense incurred. It would meet with very much opposition from its impracticable character. Imagine an old Dutch cow retained in quarantine for six weeks; it is simply absurd. No doubt this measure would have this advantage, that it would soon put a stop to foreign supplies altogether. What I would suggest for your safety would be, that all foreign cattle and sheep should be slaughtered when they arrive at our ports, and sent as dead meat to our central markets. Sheep, if allowed to be exposed in our markets alive, would be capable of propagating all the epizootics to our home cattle. There should be no half measures. Government should be compelled to restrict this traffic and encourage our home trade. If the British farmer offered animals for sale knowing that they came from a diseased stock, and that they were suffering from the disease in a latent form, he would be punished. Why then should Government allow salesmen to dispose of foreign cattle when they are known to come from infected districts? Indeed, this fact often leads to an increased supply of such animals to our markets. Foreign cattle dealers know we will give good prices even for stock capable of propagating disease in the shortest possible time. This shows the inequality of our English laws, foreigners being allowed to go scot-free for the same offence that you would in all probability be imprisoned for. Why should you suffer from any defect in the laws of free trade in cattle? I can assure you if the same thing was even attempted to be done to any other section of the community the statute would be at once repealed. In fact the more seldom that either sheep or cattle are permitted to leave our ports alive, the less likely are we to have a repetition of the calamity of 1865, which proved so fatal to your interests. It is one of the most characteristic features of epizootics that they tend always to become extinguished in places remote from those wherein they seem to have a spontaneous origin. The influences which affect this extinction are difficult to determine; perhaps one reason is that the contagious matter requires other conditions besides the mere presence of animals before it can establish itself permanently in a country. As these conditions, however, exist nowhere excepting in those countries wherein such diseases spontaneously arise, their absence in our own land may be one cause of those disorders undergoing a gradual extermination. Again, these diseases, from being transmitted through several generations, lose much of their virulence, and animals become much less susceptible to the influence of their contagious principles. It is well known, for example, that neither pleuro-pneumonia nor epizootic aphtha is so deadly now as when it appeared first amongst us, and it is just as certain that each of these diseases would ultimately disappear if it were not for the continued introduction of virus from abroad.

How to Treat Home Stock.—I should advise you to place newly-purchased animals from public markets in isolation houses for at least six weeks. You will never regret doing so, as it will prevent the spread of such diseases as pleuro-pneu-

monia. Should this disorder break out among your stock, what should be done? Kill at once all those suffering from the malady, separate the rest of your stock into small lots, and be certain that each herd is thoroughly isolated from the other. Then put them all under tonic treatment, sulphate of iron being the best. By this procedure you will invigorate them to such an extent that they will probably withstand the action of the specific poison. Be careful that those attending diseased animals do not come in contact with your healthy stock. Such measures will tend to confine disease to the districts in which it has first broken out, and at the same time stay its progress. It is at all times wise to use antiseptics. This treatment, in its entirety, would not apply to epizootic aphtha, as its period of incubation is so short that it would be difficult to prevent its spread. It is not deadly, but it leads to great waste of meat and milk. Fat stock may sink £3 per head in value, while with dairy stock it is simy rumous. This disease has during the past thirty years robbed our people of not less than between two and three million tons of animal food. A practical farmer has stated the money lost at £250,000,000. Let us now consider what should be done before you can reasonably expect Government to assist you. Show your annual losses. Be in a position to place in the hands of your members of Parliament statistics. If this be done you will command the attention of Government, and at the same time secure that great element public sympathy; and with both these the result is evident. Measures would soon be adopted to prevent further loss. It will appear to the most sceptical that statistics emanating from agricultural chambers would be a powerful lever, as the evidence you could adduce would be so overwhelming as to ensure your carrying the day in any political struggle for your long lost rights. The shackles which the Peel Government forged for you in 1842 would drop off, and thus relieve you of your great danger in purchasing stock. This would not be all; it would ensure a supply of hundreds of tons of food for the public, together with an increased account at your bankers. How can statistics as to the mortality of stock be best secured? Simply by the appointment of registrars in different parts of the country, whose duty it would be to ascertain the diseases in particular districts. These reports should contain: 1, Name of disorder; 2, Its causes; 3, Its nature, whether contagious, infectious, or otherwise; 4, Its duration; 5, The number of deaths. This would tend to instruct us concerning the special influences of certain districts in producing disease, and at the same time would give us precise knowledge of the loss incurred by the whole country. Let me here advert to the absurd idea that many farmers have of opposing any measure that requires statistics from them. They think that Government wants to know too much of their private affairs, and tax them accordingly. Such was not the case in reference to the statistics obtained during the cattle plague. Indeed, if Government had not received such information no measures of prevention could have been adopted. It is essential in the present instance that the Government should be in possession of all the facts of your losses, before you can hope to have the law of free trade in cattle corrected. What should this Chamber do as a pioneer in this great movement? Communicate with other Chambers of Farmers' Clubs in the county, and suggest to each member that he should be his own registrar for six months. When the statistics are collected and arranged you will be very much surprised to find that even in Gloucestershire the loss is so heavy. Since writing the above, I see from our journals that cattle plague continues to destroy the cattle in large numbers in Eastern Europe. It is of such a virulent type that it has spread to several fresh districts in Poland and Hungary. Pleuro-pneumonia increases in our own county. 33 counties are affected, showing 132 distinct centres. Foot-and-mouth disease, 55 counties with 863 centres for its rapid spread. Such then is a brief sketch of this class of diseases, and the true remedy for their cure. Gentlemen, I leave the matter in your hands, knowing that—

“Wise men ne'er sit and wail their losses;”

and that “a word to the wise is sufficient.” You must be up and doing: “the cattle upon a thousand hills will continue to be as it was of old, the symbol of wealth and honour.”

Mr. EDMONDS (the President): There was one point in the lecture which I noticed particularly, and that was as regards the obtaining of statistics of the diseased cattle—the number diseased and the money value—in order to place these statis-

tics in the hands of our members. I think that a material point, and a very good idea. I hope some gentleman will continue this discussion, and if any one wishes to ask a question of Mr. McBride, I am sure he will answer it.

Mr. McBride signified his assent.

Mr. E. BOWLY said: I forget the law—they are obliged to slaughter fat cattle are they not now?

Mr. McBride: After they have travelled into our markets. They are not destroyed at the wharves, they travel through London and other large towns before they arrive at the markets, and propagate disease through the country. What should be done is—they should be killed at the wharves. Also store cattle; we know they can travel anywhere they like—they are not killed.

Mr. E. BOWLY: Surely they undergo some quarantine?

Mr. McBride: None whatever; no quarantine.

The President: They did at one time.

Mr. McBride: They are passed by the inspector. If there is one or two diseased of course the whole cargo can be condemned.

Mr. BOWLY was not aware they could come inland.

Mr. McBride: The disease is as bad in Ireland as in Germany, yet the Irish cattle can travel wherever they please. The Irish have plenty of pleuro-pneumonia, which has, I believe, caused more loss than the cattle plague, because it has been continued through at least thirty years.

Mr. BOWLY: I think it an important subject, and one for action for a club like this. We know what restrictive measures have done—we saw their efficacy during the time of the cattle plague, for whilst there were restrictive measures the foot-and-mouth disease and pleuro-pneumonia almost disappeared. We cannot give many statistics here, for we never have it. Even when it was in the country a hundred years ago I think the Cotswold Hills were exempt then. I am sure I should be glad to do anything I can to strengthen our members' hands, and to obtain restrictive measures. I should have liked to have seen a larger meeting here. I feel rather warmly upon the subject myself.

Mr. McBride: We have here about twelve agriculturists present representing the Cirencester Agricultural Chamber on such an important subject as cattle disease—how can they expect Government to take an interest in it, when they do not take an interest in their own affairs?

Mr. E. RUCK said: As one of the agriculturists of Gloucestershire, I may say that I believe we suffer less than any other of the counties. Sheep are the principal stock in this district, not cattle. I agree with the lecturer—we should have been pleased to have seen the whole of the farmers here to have listened to his interesting lecture; but still we must remember that this district is not so interested in cattle as other counties.

Mr. McBride: It shows their selfishness when they won't assist those who require a little help.

The President: I am thankful to say that we know nothing of the cattle plague in this district, neither have we known much of the pleuro-pneumonia. I have no doubt that arises from the fact that we do not trade in cattle. With regard to the foot-and-mouth disease, I can give a practical illustration of its bad effect. Many years ago we had it among our dairy cows, and the effect was exactly described by Professor McBride. In 1865 we had some cattle at a farm in Berkshire—about twenty. These cattle were divided into two lots, one came to my own farm, the other ten went to a meadow near the turnpike road, and I have no doubt that through cattle travelling along that road those in the meadow were attacked by this disease, and at Christmas their value was not so great by £5 a-head as those in the lot that came home; whereas at the time they were parted, in the beginning of September, they were equal in value as near as possible. I will just say with regard to the point Mr. McBride spoke of, the real fact is, the gentlemen of the neighbourhood say they can read and study these papers on the next Saturday morning, and they are anxious to get home from market on the Monday evening, so they leave it to a few.

Mr. E. BOWLY: I think the matter very important. I think the best thing would be to appoint a committee to communicate with other chambers. We have heard the lecturer read the enormous losses our brother farmers incur, and we do not know how soon we may suffer. I hope it will be taken up generally by Chambers of Agriculture, and impressed upon Government. I believe I am correct in saying

that the foot-and-mouth disease and pleuro-pneumonia are increasing every day.

The PRESIDENT: Mr. Bowly proposed a committee; will any gentleman second it?

Mr. SNOWSELL seconded the proposal.

Professor CHURCH, after some conversation with Mr. Bowly, said he proposed an amendment—that the existing committee should take the matter in hand.

Mr. BOWLY: I have no objection at all; I am only anxious it should not be lost sight of.

The amended resolution was taken as carried, the meeting being unanimous, and Professor McBride was added to the existing committee.

Professor WRIGHTSON asked the lecturer what are his views with regard to inoculation for pleuro-pneumonia?

Mr. MCBRIDE: So far as my own experiments go I do not believe in inoculation; they require to be extended, but so far as they go I do not believe in inoculation for pleuro-pneumonia as any preventative.

Mr. BOWLY: It is not so fatal as cattle plague?

Mr. MCBRIDE: We lose a great many by it—about 30 per cent.

Mr. BOWLY: I mean that of those attacked by pleuro-pneumonia a greater number recover than of those attacked by cattle plague.

Mr. MCBRIDE: About 20 per cent. of the cattle plague recover.

Mr. BOWLY: I was not aware it was so many.

Mr. MCBRIDE: It was not at first, but towards the end of the time that number recovered. The virus of disease is seldom so fatal after it has been transmitted through a number of living beings.

Mr. H. RUCK: The lecturer has told us that we cannot quite look after our own business; he has also told us the disease has come from abroad, and I think one of his points was that all cattle should be destroyed at the port. If we should advocate that, it would be preventing the transmission of food over the country—that would be protection. I don't think our Government would quite join with Mr. McBride in slaughtering the cattle. I think his remarks very good indeed—that farmers should register their stock. I beg to propose a vote of thanks to Mr. McBride; we are much indebted to him.

This was seconded and carried.

THE BREEDING AND REARING OF HORSES.

At the last meeting of the Lavenham Farmers' Club, Mr. G. D. BADIHAM read the following paper: 1st. As regards horses for riding. We constantly hear the remark, "Breeding nags does not pay." Why does it not pay? Simply because we breed amiss. Do we not put mares without any known pedigree, and too often with some hereditary defect, to any stallion which happens to come near us? If we wish to improve our cattle, sheep, or swine, the services of a good male animal are secured, and sometimes we go even further, and purchase some good females; but we take no trouble with our horses, and frequently the one we use is hardly looked at. Certainties in horse breeding are fallacious, yet we must be guided by general rules, and the breeder who carefully studies the selection of both sire and dam will far outstrip the reckless breeders. Our great object should be to produce an animal as near perfection as possible; for this end the sire chosen should be possessed of those points in which the dam may be deficient. There is in my opinion but one true shape for a horse, whether it be a cart horse or a hunter, and depend upon it the sloping shoulder is as necessary for the one as the other, for if he has a straight shoulder he cannot walk, and the old story about not being able to draw with a sloping one is sheer nonsense. Breeding and rearing the noblest animal in the whole creation is, and ought to be, the delight of man; but beside the pleasure we derive from it, we ought also to obtain some profit, which cannot be done unless we combine judgment with it. You must, if you wish to succeed, give up using the half-bred horses, except upon thorough bred mares; if you have the alloy in the dam you do not want it in the sire. The modern hunter or hack must be thorough bred on one side, and I should like to see the same rule in our Agricultural Society in Suffolk as they have in the North, where no animal is allowed to compete unless the pedigree show at least two crosses of blood. The great improver of his species is the thorough bred horse, and if we wish to succeed in breeding a modern hunter or hack we must select a mare free from hereditary ailments, and put her to a horse with plenty of stout blood in his veins. In the best hunting counties, such as Leicestershire, Northamptonshire, and many others, the cocktail stallion is unknown, and more will be found in the Eastern Counties than in any part of England. The selection of a good mare is of the greatest importance. I have scarcely ever seen a bad horse of any class from a really good mare, and there is scarcely an instance of extraordinary merit but the prevailing points of excellence could be traced in some way to the dam. At the same time we must not overlook the importance of good sires, for without these we shall assuredly fail in our attempts to breed a good animal. How does the chance breeder proceed in the choice of his sire? Does he look for one which has all the points good in which his mare is defective?

If he did, half the evils might be avoided; but chance is again trusted to, and all the anxiety he evinces in the matter is the cost of the horse's services; while in other cases it is the one which passes the gate, or is close at hand, which is chosen. He may have every defect to which horse-flesh is liable, but this is no matter to the chance breeder; a foal is all he wants, and I once heard a breeder say, "A foal was a foal, and it could not be a calf." He never pictures to himself the cost of rearing a colt up to three, four, or five years old, and then finding the animal has a spavin, a curb, or a ringbone. The systematic breeder never allows any chance-work to creep into his concerns. Whether he breeds racers, hunters, carriage, saddle, or cart horses, he selects with deep anxiety the animals he intends to breed from, of both sexes, and those which he can trace back to blood of unquestionable family in their class. Breeders of this description are not numerous in these counties, but there is nothing to prevent their becoming so, and they will generally succeed best by confining themselves to breeding only one class of horse, though of course there are exceptions to this as every other rule. One I remember, some years ago, in the eastern parts of this county; I remarked that all his colt foals were sent away as sires, and his fillies became first-class mares, and were always winners at the Suffolk Agricultural Shows; and before he let his home farm, he offered to show his five mares with any five in the county; the challenge was accepted by the late Mr. Catlin, who was beaten by him; the same gentleman bred also a few hunters and hacks, and in these he was just as successful; his carriage horses were bred by himself, and they had not their equal in the county, and one of his hacks I shall always remember. I mention these facts to show it is not so difficult as people fancy to breed good animals if you only set about it in the right way, for "like breeds like." Temper, power, endurance, spirit, generally follow the dam; form, action, &c., the sire. Without losing sight of the power, the more breeding a hunter can have the better, for they are often called on to perform extraordinary acts of gameness, and from the thorough-bred comes all the pluck and courage to stay a distance, and by their blood-like action to give their riders a comfortable seat in their saddles. It is not necessary for a mare to have been a fine performer herself, but there are a few points indispensable, viz., a sloping shoulder, deeper girth, short cannon bones, a good back, big quarters and thighs and hocks, with her hind legs in the proper position under her. As I have before said, temper, spirit, and endurance are all very essential in the dam. Mares to breed carriage horses need not be so well bred as those for breeding hunters, but they must have plenty of knee action, with good heads, necks, and shoulders, and should be put to a thoroughbred sire if you wish to breed first-class animals. The same thing applies to hacks, and it

is impossible to breed a modern hack except in this way. As regards horses for agricultural purposes, there is nothing will interest you more as a body of advanced practical farmers, than what we want to constitute a good draught brood mare, and there is nothing connected with agriculture of greater importance to the farmer than his horse-power, with the exception of manual labour. It is true that steam is largely employed where formerly horse-power was used, both in cultivation and thrashing; but horse-power still is, and must always be, the principal means by which a farmer gets through his work, and steam becomes more of an auxiliary than a *real* power. Such being the case, is it not our interest to have this great power of the most approved class? and in order to effect this the same attention must be paid both sire and dam as in breeding horses for the field or road. A pedigree of undoubted authority is absolutely necessary; if you see two horses with all that you want in a sire, but no pedigree, or only an imperfect one, and another with some faults, but with a pedigree, select the latter, as you are more certain to get an average foal, but with the other it is all chance; you may get what you want, or you may not. The all-important point of soundness is now to be considered. It is the essential one in the brood mare for all purposes. It is a notorious fact that there are certain diseases to which parents are the subjects, and which will descend in the progeny. Ring-bones and sidebones are hereditary in almost any form. Indeed ringbones will come out after many generations. Blindness, a special disease of horses, is certain to follow breeds; and on no account would I recommend breeding from either sex affected with it. A mare may lose an eye or become blind from accident; but though this would not be hereditary, it unfits her for that office which nature has destined her—to protect and shield her offspring from injury, besides it makes her clumsy, and she is liable to tread on the foal. Diseases of the respiratory organs, as roaring, whistling, broken wind, and thick wind, are all, I consider, hereditary diseases. Diseases in the feet should be carefully avoided. Sand-crack I have seen follow in families, and seedy-toe also. In conclusion, I may add that it is most important to have both sire and dam in a healthy condition, as the progeny of sickly-framed animals are sure to inherit some of their failings. Perfect conformation and soundness in both sire and dam are of the greatest importance. Before I conclude I will make a few remarks upon the treatment of foals and yearlings, &c. Having bred a good animal, the next thing we have to attend to is his being well cared for. I will suppose you are breeding animals of the right sort, and such as will bear a little increased expenditure to be bestowed upon them. I will begin with the foal; get them early as possible, and give the dam bran, corn, and hay. Corn should be continued a good part of the summer, if you intend having a good yearling, and three feeds should be given to the foal daily, when it is weaned; during the following summer, and, indeed, till the animal is rising three years old, no corn will be necessary, but at that age it should be brought into the stable and commence its education; this course requires good management; but I would on no account allow it to be taken off the farm, to be what is termed broken; if you must employ a person for the purpose of getting the animal in a fit state to be ridden, by all means have it done at home. And I strongly advise all breeders to have their foals haltered and tied now and then, when they are sucking upon the mares. The greatest care is necessary with stock of this description; it is quite possible to avoid accidents in a great measure—at all events we should try to avoid them; allow only a very careful man, who uses your animals gently, to have anything to do with them, and I feel sure you will find accidents much less common than heretofore.

Mr. W. BIDDELL (the chairman) said the great aim in breeding hunters was to obtain good weight-carriers. There was a gentleman in the room who had one of the best he knew, and that gentleman had reasons to be proud of it, as he not only bred it himself, but he rode it well, and generally occupied a good position. He alluded to Mr. Edgar.

Mr. EDGAR said his experience was something like that of Mr. Hawkins—he had bred so many horses that he was rather sick of the business. As far as cart-horses were concerned he had got on very well from Chester Emperor, and had bred every horse he was using on his farm; but he never succeeded in getting more than one good nag, and that was a very good

one. He had bred several in the same way, but none of them had turned out so well. He had kept some of them up to five years old, and then found they were worth about £10. The animal the Chairman had referred to was really a good one—he never knew a day too long or a fence too big for her. He had now turned all his female animals over to Mr. Hustler, and perhaps he would tell them how he was getting on with them; he was afraid he was following in his (Mr. Edgar's) steps. He thought he should begin again, and not be quite so duck-hearted as Mr. Hawkins. He was afraid the sire he used was not all he ought to have been. It was a professed thoroughbred, but he did not think he was quite.

Mr. HUSTLER said Mr. Edgar had given such a glowing description of the animals he had handed over to him that he did not think it was necessary for him to say much. At any rate he had not put them forward as a very profitable sort to keep. He thought some of Mr. Badham's remarks applied very much to the animal that he and Mr. Edgar bred from; he did not think the dam was perfectly sound—whether by accident or hereditary disease he could not say—and he believed her progeny inherited her defects. That was one of the causes why they bred amiss. He had not yet given up hope, and thought some of them might yet turn out right. He thought it was quite right for farmers to breed their own cart-horses. Grazing bullocks did not pay them very much, and he thought if they paid a little attention to the horses they would pay as well as the cattle, besides enabling them to keep a good supply of young horses to work on the farm; for he believed it was best to sell the horses that had reached eight or ten years old, and put colts in their places. The difficulty they had in breeding nag horses was that they did not get many good sires in the neighbourhood, and people had some diffidence in sending mares to a distance, as there was some uncertainty about getting a foal that would pay them.

Mr. BADHAM believed the breed of the Suffolk horse was as pure as the blood horse; and it was much to be regretted that they had not a stud book of the Suffolk breed. They had not the guide they ought to have; but animals that had been prize-winners for generations had their pedigree pretty well established.

Mr. TALBOT agreed with what Mr. Badham had advanced, particularly as to the importance of having true-bred animals on both sides; and, undoubtedly, those points which were deficient in the dam should be particularly looked to in the sire. Suffolk, as they were all aware, was not a nag-breeding county; but if they went into many counties—Yorkshire, for instance—they would see strings of nag and carriage horses, worth from £80 to £100 each, that were being sent up to the London market. They had been picked up at different places, and an intelligent dealer would always manage to get together a number of such horses. Why was it that Yorkshire and some other counties should be so successful in nags, hunters, and carriage horses? Simply because more attention was paid to their breeding than was the case in Suffolk. Here it was too much the practice to use any horse that might be travelling, without regard to shape or make, or how it would mate with the dam. It might certainly be said that Suffolk excelled in cart horses, and there was as much difference between a Suffolk cart horse and a Yorkshire cart horse as there was between a Suffolk and a Yorkshire nag, and for the reason that more attention was paid to the breeding of the one than the other. Many people had said it was because the pastures were so superior in those counties. Undoubtedly that was an essential point, and where there was good pastures horses could be brought up cheaper than where they were inferior. Mr. Badham had dwelt a good deal upon pedigree, and they must all concur that there was much in that; but it was not long since he heard one of the best judges of horse-flesh he knew say that breeding from pedigree was useless unless they had the right shape and conformation and the requisite propelling power. He was far from thinking they ought to ignore pedigree; but many pedigree horses were ill-shaped animals and ill-adapted for the purpose for which they were intended. Mr. Badham had given them some excellent hints with regard to the management of colts; for undoubtedly after they had been at great expense in breeding an animal it was ill-judged policy to stint him in the way of keep or management. Nothing wanted to be kept so well as mares and foals, and the latter should be well kept from the time it was foaled until it really came into use. Why was it that thoroughbred animals were developed so

early? It was simply because of the forcing system pursued with them. Farmers forced both bullocks and sheep: they now brought out hoggets of 5, 6, and 7 stone, while formerly it used to be two or three years before they reached that weight, and the same principle was applicable to horse breeding. The better they were kept and the more they were forced the earlier they would come to maturity.

Mr. BADHAM, in acknowledging a vote of thanks, wished to make one remark as to customers. If they would only breed such animals as he wanted them to breed, they would have no difficulty in finding customers for them. A horse he was now

riding, which he bred by one of Major Barlow's horses, he could have had 50 customers for in London. Horses were exhibited at shows, and took prizes, and gentlemen saw them there and were anxious to buy them. There might be a difficulty in selling inferior horses, and the sooner such were sold the better, but they would always find plenty of customers for horses of the class he wished to see bred. With regard to sloping shoulders, he was aware that many people were of opinion that a straight shoulder was the proper thing for a horse to pull by, but he believed that many were now convinced that that was a mistake, and were coming round to his opinion.

THE BEST METHOD OF MANAGING THE HAY CROP.

At the quarterly meeting of the members of the Morayshire Farmer Club Mr. YOOL (Conlarbank), the chairman, said: The question for discussion is "Hay: What is the opinion of members as to the best method of managing the hay crop in this country?"

Mr. ROSE could not prescribe anything better than the usual mode of cutting it, letting it lie a day or two, putting it up in small coles, then into larger ones, and allowing it to remain in stack for the winter. It would scarcely do in this country to adopt the English plan of turning it over and over for two or three days. He fancied the plan the farmers adopted in this country was the general rule of this part of the country.

Mr. HARRIS was in the same position with Mr. Rose in regard to the growing of hay, for he had scarcely grown 100 acres during his lifetime. He thought they should cut it pretty green, beginning with it when the bloom was on it, certainly before it had left it. He would leave it in the swathe for two or three days, then turn it gently over with the handle of a fork, and get it into cole as speedily as possible. They were apt to forget that the hay grown in this country differed from natural grasses and seeds of England, because the latter consisted of clover without any grasses, grew large and rank, with stalks like pea straw, that when dried much, lost its nutritious juices and grew hard. It had, therefore, to be sorted in quite a different manner from the hay in this country, which was a mixture of clover and grasses. Some years ago he had an English gentleman with him, a very successful farmer, from the midland counties. That gentleman laughed at the manner in which the hay was being managed, and it was left to him to try his own way with it. He knocked it about in the English fashion, and appeared to leave about one-half of it on the field. It was put into the stack, and, though it heated, he insisted it was all right, until the cattle came to get it, when they would not eat it. He thought the plan presently pursued in this country, though very much run down, was the proper way of making hay.

Mr. WALKER (Leuchars) said he had perhaps more experience in the way of making hay than any gentleman present. The way they made hay in the county of Fife, so far back as forty or fifty years ago, was to cut it and let it lie for two or three days, the time depending upon the strength of the hay. When hay was left in the swathe as cut, it would stand a great deal of rain, but if they turned it over and over, it was easily spoiled. After lying for two or three days in the swathe, he would turn it over with the handle of a fork, then put it into cole, and it would stand two or three good showers; then put three or four of the small coles into one, and allow it to stand till it could be put into stack. He might mention, with regard to his experience of the English mode of making hay, that they turned it up at once immediately after it was cut, and put it into little handcocks at night. After turning it up, however, it began to rain; but, being fair the next afternoon, they turned it out of the small cocks and began to put it into larger ones. It rained again, and they wrought away in that manner with it till they got it put into large coles, and by the time that operation was completed the hay was almost on fire. They had to turn it out again, and the crop was lost nearly altogether. They could not in this country depend upon weather for making the hay, as in England.

Mr. PATERSON (Mulben) said he generally made a little hay. If it was hay for use, he cut it when the bloom was upon the clover. If the weather was very good, perhaps a

day or two was sufficient time for it to lie, and if there was much sunshine at the time it was cut, he coled it at night. He did not make the coles large, but increased them in size as he thought expedient. With regard to hay for seed, he let it ripen pretty well before cutting, and if the weather was good he left it out a day or two and then shook it over a paling bar. He never thrashed hay. If the weather did not look well, he put it into stook; and if the weather improved, he shook it over a bar out of the stook; if the weather was not favourable, he carried it home and stored it till satisfactory weather came for shaking it out.

The CHAIRMAN said, before summing up, he would express his own opinion. In the first place, in their country, as almost no natural grass was cut for hay, the system pursued must be considerably different from that pursued in England. The whole of the grasses cut for hay in this country consisted of mixed clovers and grasses grown under a regular system of rotation. There was one point that had not been alluded to by any of the speakers, the modes of cutting the crop, whether it was best done by scythe or machine. The machine, he was aware, was in great favour, and was generally admitted to do its work in as good style as the scythe. His own experience corroborated that. By the help of the mowing machine he could cut a great deal more than with the scythe, and they had the crop left lying thin upon the ground behind the machine, so that in good weather they could carry it off very much sooner than they could if left lying in swathes by the scythe. That was no inconsiderable advantage. In cutting by the scythe, the crop being left in swathes took longer to dry. During wet weather, cutting by the scythe was the best course, because in swathes the hay was not so much liable to be damaged, lying in a large body the rain was easier thrown off it. If the weather was dry, they would cut better with the reaper. The machine considerably reduced the expense of the operations, while it was clear that where the surface of the ground was moderately even and free from stones, the mower could do the work as well as the scythe, and could be set to cut quite as close as was desirable, and made more level work than the majority of scythemen. The difference of expense in mowing a heavy crop of grass by machine and scythe was considerable, amounting, according to his calculation, to from 2s. 6d. to 3s. an acre in favour of the machine. A comparative statement of the cost might be put thus. The manual labour for cutting with the scythe a heavy full crop of grass might be put down at 4s., or say 4s. 6d., an acre. Against that, cutting by the machine, he would put down the manual labour at 2½d. an acre, allowing that the machine would cut ten acres a day, which it would do in a fair crop; the horse labour at 6d. an acre, which would give 5s. a day for horses; the percentage upon the mowing machine he estimated at 9d., making a total of 1s. 6½d. an acre, and giving a difference in favour of the machine at 2s. 11d. per acre. At least 2s., and as he thought 3s., could be saved by the use of the mower in place of the scythe. They had also to add the lessened cost of the after operations, for that they did not require to turn the hay made the case still stronger in favour of the machine. If the crop consisted principally of Italian rye-grass it should be cut on the appearance of the flowers, as this grass is such a fast grower, that if cut at this stage a second cutting can be obtained nearly, if not quite, equal to the first, and on good land a third, and perhaps even a fourth cutting. With regard to ordinary rye-grass, it might be allowed to produce the flower,

and clover was best cut when the greatest number of heads were in full bloom; if left longer the leaves begin to fall off, the stems got more woody, the weight of crop was diminished, and the quality deteriorated. Fields of mixed grasses and clovers, if for ordinary hay, should be mown when the greatest number of the plants are in full flower. When the crop was cut by the mower it required very little handling during the drying operation, the principal thing necessary being to spread out somewhat more thinly that part of it which was drawn together by the dividing shoe of the machine, in order to clear a space for the horses' feet; then the less turning they gave it the better, until it was put into small coles. When cut by the scythe it should be turned as quickly as possible, without knocking it about on the second or third day, in order to let the drying process get through the swathe. It should then be put into small cocks, and carried as soon after as there was a chance of it keeping. All this should be done with as little rough shaking as possible, so as to retain the leaves of the clover unbroken. He thought the use of the tedders would be of no use to them, but rather disadvantageous, and for this reason that their clovers would not bear to be knocked about with the tedder as the natural grasses of England would. If they knocked the clover about they

knocked off all the fine leaves, which were very nutritious to the cattle. The practice of letting hay stand long in the field in small cocks he had frequently observed in this and other parts of Scotland was very wasteful. When allowed to stand long on the fields in these small cocks it would be found that the parts of the cocks next the ground were very much deteriorated, in fact, were worth little or nothing, except for manure. As soon as it was fit to be carried to the ricks it should be carried; in fact, the whole process of cutting, drying, and carrying the hay crop, should be done as fast as possible with safety. If just sufficient time is allowed to let it dry thoroughly, so as not to heat in the stack; the more quickly it was carried the less would be the loss incurred through wasting and fermentation. These were his experiences, and from what had been said it seemed to him that the finding of the meeting would be that a party making hay could make, on the whole, very little improvement upon the prevalent system. As Mr. Harris said, Scotch farmers had been often taunted for the inefficient way in which they made hay, as compared with the English farmers. But really there was no comparison between the two. By machines they might cheapen the cost of making hay, but, on the whole, their mode of managing the hay crop could not be very much improved upon.

CAPITAL IN AGRICULTURE.

At a recent meeting of the Staffordshire Chamber of Agriculture, the Earl of Harrowby presiding,

Mr. CARRINGTON SMITH introduced a discussion "On the causes now in operation which discourage the application of capital to agriculture." He attributed the discouragement alluded to to three principal causes. The first was the unjust incidence of taxation on real property. Next to that he considered that a great deterrent was the infancy of the science of agriculture. By that he meant not that agriculture was in its infancy, but that the application of true scientific principles to farming pursuits was very imperfectly understood. The third cause was the deficiency of a good land bill, and the total absence of power to compel compensation, either to the landlord for dilapidation caused to his land, or to the out-going tenant for unexhausted improvements. On this point he must hold that as the tenant ought to be paid for the latter, it was but a correlative that the landlord should be paid when the tenant had suffered his farm to deteriorate. If agriculture was to make that progress which it ought to make, and which he felt it would make in its race with commerce, there must be a more general knowledge of the productive capability of the soil; there must be just laws for landlord and tenant; and all must press forward, shoulder to shoulder, in friendly emulation. These were the only means of securing success.

Mr. ROBOTHAM expressed disappointment that Mr. Smith had not brought forward more causes than he had done as a solution of the difficulty, and remarked that in his opinion there were other reasons why, in a country so densely populated as this, and where such a great production of food was required, men of capital and skill did not embark in agriculture. He referred to that clause in leases which gives to the landlord an exclusive right to the game; and concluded by moving, "That one chief cause which prevents the employment of capital in agriculture is the preservation of game by the landlords."

Mr. STUBBS, who seconded the resolution, said he would be the last man to prevent his landlord coming over his farm and having reasonable sport, but not to such an extent as now existed.

Mr. BRAWN objected entirely to many of Mr. Carrington Smith's views, and did not altogether accord with Mr. Robotham's. Capitalists, he said, looked for both security and interest. Agriculture gave a smaller return for the capital employed than any other industry, and it could not be said that it afforded great security. It therefore became them to consider how a better return could be secured. The last vestige of protection on imported agricultural produce had been removed, and the farmer was put on an unequal footing with foreign producers. He submitted the following proposition: "That the application of capital to agriculture is discouraged by the absence of provisions which, whilst protecting the interests of the landlords, would give to the tenant security for money invested in improvements on the farm. That the de-

struction of crops by the ravages of ground game in many instances causes considerable loss to the tenant-farmer; and that the malt-tax and existing laws of levying local rates almost exclusively on land and buildings are a great discouragement to the application of capital to agriculture."

The Earl of LICHFIELD said, in his opinion, the main cause in operation which discouraged the application of capital to agriculture was, in the first place, the want of capital on the part of the tenant-farmers. The fact was that in the country where the farms were large the tenants were invariably men of capital. There were considerable tracts of land in that county which were not cultivated because of the want of sufficient capital, and other parts were badly cultivated through the tenant-farmers not having capital. He entirely agreed with Mr. Smith when he talked of the necessity for greater security for tenants' outlay; but he thought the application of capital upon a large scale to the land must be a work of time. He did not think landlords as a rule had been sufficiently business-like in their agreements with tenants; but had been content to let things go on, trusting to the good understanding which usually existed between them. With regard to the Earl of Warwick's published letter explaining his lordship's views on the Game Laws, he thought his noble friend was wrong in wishing to see discussion on agricultural matters stilled at meetings of that description. He (Lord Lichfield) could not see what harm there could be in discussing the question of the Game Laws. To avoid such meetings would be to avoid the discussion of subjects the proper understanding of which would be likely to produce a good feeling between tenant-farmers and landlords, as it would show to the tenants that the landlords were willing to discuss matters that affected them both in a rational spirit. As to the advancement of agriculture, nothing operated so strongly in retarding it as a want on the part of farmers of a scientific knowledge which could only be obtained by degrees. His lordship advocated the necessity for a law which would give ample compensation for permanent improvement by the tenant, and referred to the different customs existing in the counties of Lincoln and Stafford, expressing an opinion that there should be one uniform system. In some places landlords gave their tenants power to kill rabbits upon their farms; but that power was of little use when next to their farm there was a cover into which the tenant could not go. The tenant had no power to defend himself against the mischief done by game. He thought that landlords ought not only to give their tenants power to kill rabbits during a certain time of the year, but they should also assist the tenant to kill them. With regard to the malt-tax, every argument was against it except one, and that was as to how the amount now raised would be raised if the tax were abolished.

Mr. BRAWN's resolution was carried.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

MONTHLY COUNCIL: *Wednesday, June 1.*—Present, the Duke of Devonshire, K.G., in the Chair; Earl Cathcart, the Earl of Powis, Viscount Bridport, Lord Chesham, Lord Kesteven, Lord Tredegar, Lord Vernon, Lord Walsingham, Sir Watkyn W. Wynn, Bart., M.P., Mr. Cantrell, Colonel Challoner, Mr. Clayden, Mr. Davies, Mr. Dent, M.P., Mr. Druce, Mr. Jonas, Colonel Kingscote, M.P., Mr. Ridley, M.P., Mr. Shuttleworth, Mr. Thompson, Mr. Webb, Mr. Wells, M.P., Lieut-Colonel Wilson, and Dr. Voelcker.

The following members were elected:

Baker, William, Combe Farm, Woodstock, Oxford.
 Beaumont, Joseph, Ducklington, Witney, Oxford.
 Butler, Edward, Ewell Hall, Kelvedon, Essex.
 Caffin, Peter, Hazelwick, Crawley, Sussex.
 Cleminson, Robert, Endon, Stoke-on-Trent.
 Colman, J. J., Carrow House, Norwich.
 Combe, Thomas, Oxford.
 Davis, Stephen, Woolashill, Pershore.
 Dawson, George, Thorncliffe, Sheffield.
 Freer, Jesse, Rothley, Loughborough.
 Gorst, William, Garston, Liverpool.
 Hall, Richard, Great Barford, Deddington.
 Hansell, Rev. Henry, Magdalen College, Oxford.
 Hawkes, William, Thlenford, Banbury.
 Hitecock, Rev. John, Clitterne, All Saints, Heytesbury.
 Hopkins, Rev. T. H. T., Magdalen College, Oxford.
 Hornby, Captain Montague, Hanley House, Shrewsbury.
 Hudson, John, Subberscroft, Lea Cross, Salop.
 Inge, Rev. George, Thorpe Constantine, Tamworth.
 Jones, Edward, Park Farm, Caersws.
 Jones, George, Osney Wharf, Oxford.
 Jones, Stephen, Lea Cross, Salop.
 Kirbell, Edward, Latimer, Chesham.
 Lake, John, Edgeworthy, Morehard, Tiverton.
 Maedona, Rev. J. Cuning, Hillre House, West Kirby, Birkenhead.
 Mauwaring, Charles S., Galltaenan, Rhyl.
 Mansell, Edward, 27, Great George Street, London, S.W.
 Marsh, Richard, Little Olley House, Hitchin.
 Masters, Joseph, Bengeworth, Evesham.
 Mount, William George, Wasing Place, Reading.
 Nalder, James Hall, Hasely Iron Works, Tetworth.
 Paxton, Edmund, Willaston House, Biester.
 Pritchard, William T., Angel Down Farm, Wantage.
 Roberts, George, Overbury, Tewkesbury.
 Robinson, George John, Maunby, Thirsk.
 Rush, Thomas, Babraham, Cambridge.
 Savage, Gilbert Cole, Pony Knoll, Shifnal.
 Sawyer, Henry G., Richmond Park, Richmond, S.W.
 Smith, William, Sandon House, Clifton Down, Bristol.
 Townsend, William, Westcote, Chipping Norton.
 Troutbeck, George, Barton-under-Needwood.
 Vernon, Benjamin, Aychley, Prees, Salop.
 Waller, Hugh Sidney, Farmington, Northleach.
 Warrington, William, Bretby, Burton-on-Trent.
 Wearing, J. W. Oxford.
 Whitfield, Thomas, Oswestry.
 Williams, E. A., Gilli, Mold, Flintshire.
 Williams, John Fisher, 10, Queen's Square, Bloomsbury, London, W.C.

The motion for the adjournment of the Council was withdrawn.

FINANCES.—Mr. Davies presented the report, from which it appeared that the secretary's receipts during the past month had been examined by the committee, and by Messrs. Quilter, Ball, and Co., the Society's accountants, and were found correct. The balance in the hands of the bankers on May 31 was £3,659 3s. 7d. The com-

mittee reported that a new valuation of the household furniture, fixtures, and books in the library had been made, and they recommended that the amount of this valuation, £1,451 7s. 6d., be substituted for the previous estimate of £2,000. The attention of the committee having been called to the suggestion made by Mr. Freebody at the last general meeting, viz., "That a committee, to consist of three governors, three life members, three annual subscribers, and one honorary member—not heretofore in any way employed by this Society—be appointed to inquire, and confer with its present honorary and official staff, in order to report at the next general meeting what measures this Society can best adopt in order that some of its accrued funded capital should become of greater practical service towards the general advancement of English agriculture than of being invested in the New Three per Cents.;" they therefore recommended that a communication be addressed to Mr. Freebody, referring him to clause 9 of the charter, in which it is enacted "that the president and council shall have the sole management of the income and funds" of the Society. This report having been adopted, the committee gave notice, in accordance with bye-law No. 76, that at the next December council meeting they will propose a bye-law embodying a suggestion, contained in a letter from Mr. G. Drewry, that members of twenty years' standing and upwards should be permitted to compound for future annual subscriptions by a single payment of £5.

JOURNAL.—Mr. Thompson (chairman) reported that the committee recommended the preparation and publication in the Journal of a map of the prize-farm district round Oxford, showing the surface-geology, at a cost not exceeding £40. In accordance with the notice given at the last monthly Council, the committee moved for a grant of £100 towards defraying the cost of an autumnal visit to representative farms, in order to obtain a report for the Journal on the following departments of Scotch agriculture:—(1) Arable farming in the Lothians; (2) Arable farming in the western counties; (3) A large dairy farm; (4) Hill sheep-farming (blackfaced); (5) West Highland cattle-farming; and (6) Aberdeenshire cattle-farming, including descriptions of any special arrangements for supplying the London market. The committee also recommended that a competent writer be engaged to report on the trial of implements at Oxford, and that he shall embody in his report the awards and opinions of the judges, which shall be given before leaving Oxford. This report was adopted.

CHEMICAL.—Mr. Wells, M.P., reported that the committee recommended the publication of the following quarterly report, containing analyses and information furnished by the consulting chemist:

There is at the present time need of very great caution in the purchase of Peruvian guano. Samples have been forwarded to Professor Voelcker from all parts of England; for instance, from Devonshire, Staffordshire, Nottinghamshire, and Surrey, in each of which the guano, although in some cases coming direct from the importers, and being genuine Peruvian guano, was damaged by sea-water, contained a considerable proportion of sand and rock, and was inferior in value to the best samples by 50s. to 60s. per ton. The great number of these guanos that have been forwarded for analysis prove the truth of the warning given earlier in the year, that the qualities of guano now arriving are so variable and uncertain that great caution is necessary in making purchases

of this manure. The following are examples of such inferior guanos :

Moisture	16.10
*Organic matter and ammoniacal salts	43.98
Phosphate of lime	20.73
Alkaline Salts	10.01
Sand	9.18
						100.00

*Containing nitrogen 10.65
Equal to ammonia 12.21

This guano was sold as "best Peruvian guano," at £14 2s. 6d. per ton. It is, however, not best Peruvian guano, for it is damaged by sea-water, contains too much sand (rock), and yields only 12 per cent. of ammonia, and is worth about £2 less per ton than Peruvian of average quality.

Moisture	17.79
*Organic matter and ammoniacal salts	46.24
Phosphates	20.21
Alkaline salts	10.75
Sand	5.01
						100.00

*Containing nitrogen 11.49
Equal to ammonia 13.95

This guano was bought at the full market price of £14 5s. cash. It is genuine, but damaged by water, and worth about 25s. to 30s. less. per ton than good Peruvian guano.

Moisture	16.04
*Organic matter and salts of ammonia	41.38
Phosphate of lime	20.81
Alkaline salts	9.32
Insoluble siliceous matter	12.45
						100.00

*Containing nitrogen 9.65
Equal to ammonia 11.71

The bulk of this guano was delivered in a very damp state, and with a quantity of stone. The quality was guaranteed first-class Peruvian guano, and the price charged £14 per ton. It is genuine Peruvian guano damaged by water, and, apart from the larger stones, contains 12½ of fine siliceous matter (rock), and yields only 11¼ per cent. of ammonia, instead of 1½ to 15 per cent., which Peruvian guano of good quality at present contains, on an average.

The committee next directed attention to the following analysis, showing the composition of a sample of British guano, sent to Dr. Voelcker by Mr. H. Robbins, Northfield Farm, Witney :

Moisture	26.80
*Organic matter	11.09
Phosphate of lime65
Oxide of iron and alumina	2.94
Carbonate and sulphate of lime	47.26
Alkaline salts and magnesia	1.72
Insoluble siliceous matter	9.54
						100.00

*Containing nitrogen53
Equal to ammonia64

This so-called guano is sold as Pound's British Guano, at High Street, Bromley, Bow, E., at £3 10s. per ton, and is described by the maker as "an extraordinary scientific combination of night-soil, sulphate of lime, and bones, possessing immense body, which gives it great durability and feeding power, whilst no known manure can compare with it in quantity of fixed ammonia." The preceding analysis, however, shows that the sample sent to Mr. Robbins contains merely a fraction of one per cent. of ammonia and phosphate of lime, and is all but worthless as an artificial manure. Its strong smell is chiefly due to animal or bone-oil.

As an instance of the caution that is requisite on the part

of agents for the sale of manures, the committee wish to call attention to the following case, in which the son of a farmer was about to become agent for a manure known as the British Economical Manure. Before undertaking this agency he was requested by a friend who had formerly purchased the manure to have an analysis made of the article, and accordingly Mr. Stephen H. Allen, of Eastover, Andover, forwarded a sample to Dr. Voelcker, which was analysed, with the following result :

Composition of a sample of British Economical Manure, sent by Mr. Stephen H. Allen, Eastover, near Andover, sold at £12 per ton by B. Coveney, 17, Devonshire Square, Bishopsgate Street, E.C. :

Moisture	9.86
Crystallised sulphate of iron (green vitriol)	28.81
Sulphate of lime	2.05
Chloride of sodium (common salt)	13.39
Bisulphate of soda	30.69
Insoluble siliceous matter (sand)	15.20
						100.00

Nitrogen06
Equal to ammonia07

The proprietor of the British Economical Manure states in his prospectus that 1¼ to 1½ cwt. per acre has been found in result equal to 3 cwt. of the best Peruvian guano, and cautions farmers not to apply more than 1¼ to 1½ cwt. to the acre. This caution is very appropriate, for a compound like the Economical Manure, which contains no intrinsically valuable fertilising matter, and which is a mixture of cheap saline matter with green vitriol—a constituent inimical to vegetation—is certain to do injury if it be used in quantities in which Peruvian guano and other concentrated artificial manures are usually employed.

In corroboration of the above, the following analysis of another sample of the same manure, which was sent by Mr. G. W. Hicks, Hillgrove, Wells, Somerset, may be quoted :

Moisture	11.84
Crystallised sulphate of iron	20.92
Sulphate of lime	2.81
Chloride of sodium	13.77
Sulphate of soda	37.30
Sand	13.36
						100.00

Nitrogen traces.

Both samples are worthless as manure.

Many samples of superphosphate, which contain either no bone whatever or but very little, are sold this season professing to be made from bone. The following case is an illustration of this fact :

Composition of a sample of superphosphate advertised as made from bone, sent by Mr. S. Browne, Brockton, near Shifnal, Salop, bought from Mr. George Dawler, Plume Works, Aston, Birmingham, at £7 per ton :

Moisture	11.76
Water of combination and *Organic matter...	25.33
Biphosphate of lime (monobasic phosphate of lime)...	1.69
Equal to bone phosphate (tribasic phosphate of lime), rendered soluble by acid, 2.56						

Insoluble phosphates (coprolite powder)	17.91
Sulphate of lime	28.27
Alkaline salts and magnesia (common salt)	5.18
Insoluble siliceous matter	9.86
						100.00

*Containing nitrogen56
Equal to ammonia68

Practically this bone-superphosphate contained no bone, but was a badly-made coprolite superphosphate, containing only 2½ per cent. of soluble phosphate. It would be dear at £3 3s. a ton.

Cake is often sold as genuine linseed-cake, which is

either made from inferior and undressed seed, or is mixed with other articles. The following is a good example of one of these cases. Mr. Dudfield, of Catsley, forwarded a sample of cake branded  Bewdley, genuine, price £10 & Smith, bought from Mr. Firmston, Stourbridge, 15s. per ton, and manufactured by Walker of Hull. The analysis is as follows:

Moisture	12.30
Oil	9.69
*Albuminous compounds (flesh-forming matters)	32.50
Mucilage, sugar, starch, and digestible fibre	26.16
Woody fibre	13.03
Mineral matter (ash)	7.32
					<hr/>
					100.00
					<hr/>
*Containing nitrogen	5.20

This cake was found to be made of dirty linseed, and to be mixed with earth-nut cake. A correspondence on the subject with Mr. Dudfield ensued, and the committee think it right to that gentleman and the manufacturers to publish the last letter received from him:

"Catsley, Bewdley, April 15, 1870.

"Dr. Voelker.—Dear Sir: I have to thank you for yours of the 13th inst., as also for other communications, but I have not to thank you for any information tending to lead me as to the relative value of the cake you analysed for me; and I beg to say that it is not my wish that any publicity should be given in this matter, or if it is, it must be on your own, or the Council of the Royal Agricultural Society's account—the parties I bought the cake of having amicably settled the matter with me, and the makers, Messrs. Walker and Smith, having accounted for the error, and shown every courtesy in the matter. I am, dear sir, yours truly,

"BENJ. DUDFIELD."

Another sample was forwarded by Mr. Hudson, of Castle-acre, bought of Messrs. Marsten, of King's Lynn, as genuine; linseed-cake, at £10 15s., of which the analysis is as follows:

Moisture	13.71
Oil	10.33
*Albuminous compounds (flesh-forming matters)	30.94
Mucilage, sugar, starch, and digestible fibre	22.43
Woody fibre	15.51
Mineral matter (ash)	7.00
					<hr/>
					100.00
					<hr/>
*Containing nitrogen	4.95

This cake was found to be mixed with earth-nut cake, and although it was by no means a bad feeding cake, it should not have been sold as genuine linseed-cake.

Other cases of adulteration have occurred, in some of which the Professor has been able to prevent loss to the purchasers; but the committee regret to find that many farmers are unwilling to give up the names of the dealers, resting satisfied with the settlement made in their individual cases.

It was also reported that the committee had had under their consideration some observations made at the general meeting, with reference to the possibility of experiments being carried out to a greater extent than is the case at present, and that they had requested Dr. Voelker to prepare for the next meeting of the committee a statement of what he has done in this direction during the last few years, with the view of considering with him whether any change in the present system can be advantageously adopted. This report was adopted.

GENERAL OXFORD.—Lord Kesteven reported that the committee recommended that the secretary be empowered to make arrangements for advertising the Oxford Meeting at a cost not exceeding £400, and that the secretary be instructed to communicate with the Home Office, requesting the assistance of the usual number of the A division of the London police. This report was adopted.

COUNTRY MEETING DISTRICTS.—Mr. Thompson (chairman) reported that the committee had agreed to an order of rotation to be recommended to the Council, and that

they suggested that a copy of this scheme should be sent to each member of the Council, to insure its being duly considered by the next meeting, when the committee will move its adoption. This report was adopted.

In the absence of Mr. Booth, it was moved by Mr. Shuttleworth, that the railway expenses of the Committee of Inspection at Shrewsbury, Stafford, and Wolverhampton be paid by the Society; and it was explained that this motion was brought forward in consequence of the refusal of the railway companies to grant free passes, as on former occasions. Mr. Cantrell having seconded the motion, Lord Kesteven and Mr. D. R. Davies, who were members of the committee, expressed their unwillingness to be reimbursed as an exceptional case. It was, therefore, suggested by Mr. Dent, M.P., that the resolution should be amended as follows: "That the railway expenses of the Committee of Inspection for the present and future years be paid by the Society." This suggestion having been adopted by the mover and seconder, the resolution was carried unanimously.

The Earl of Powis, in moving "that in future lists of stock prizes a class be established for mules," urged the desirability of improving the character and increasing the value of these useful animals. He quoted facts showing that a large number of them are employed on small holdings, especially in Ireland, and particularly mentioned the school at Oldcastle, to which is attached a farm of 13 acres, worked entirely by a jennet. He also mentioned the greater longevity of the mule as compared with the horse, and the probability that owners might treat their mules better if the value of the animals were more generally appreciated, as reasons why the Society should establish a class for them in future prize lists. That mules were really valuable for draught purposes and as beasts of burden was proved, he maintained, by their extensive use in Spain and other countries, and particularly by the use made of them by our own Government in the Abyssinian expedition. Mr. Dent, M.P., while agreeing with what had been stated by Lord Powis, urged that the reasons which proved that the Society ought to give prizes for mules were at least as strong in favour of their giving prizes for asses. Lord Powis, having concurred in this view, moved "That in future lists of stock prizes classes be established for asses and mules." This resolution was then seconded by Mr. Dent, M.P., and carried unanimously.

The Secretary laid before the Council the following letter, which he had received from the chief of the Veterinary Department of the Privy Council at Dublin in the course of correspondence with reference to the conveyance of cattle, sheep, and pigs, to and fro between Ireland and the Society's show-yard at Oxford:

"Veterinary Department of the Privy Council Office, Dublin Castle, May 20, 1870.

"Sir,—In reply to your communication of the 17th inst., addressed to the secretary of this department, I have the honour to inform you that there is no legal obstacle to animals going from Ireland to the Oxford Show, and returning therefrom, if the cattle or sheep, as the case may be, are accompanied on their return with a declaration and a certificate of health. There is, however, an obstacle with which the Government has, unfortunately, no power to interfere. It is caused by the steam-packet companies, principally the Dublin one, refusing to bring agricultural live stock in their vessels from Great Britain to Ireland. For any stock going to, or returning from, the Oxford Show of the Royal Agricultural Society, the greatest facilities in the power of the Government will be afforded; and on application to this department by the owners or exhibitors of stock at your approaching show, wishing the same to come on return to Ireland, and be landed at the port of Dublin, instruction will be immediately given to their owners, or agents, and to the steam-packet companies, that the Government have no objection to such animals being

lauded at Dublin, provided that they are accompanied with a certificate of health.

"Assuring you that I have received directions from the Government to afford the utmost facilities for the movement of cattle into Ireland, compatible with safety and the provisions of the law,

"I have the honour to be, sir,

"Your obedient servant.

"HUGH FERGUSON,

"I.L.M.V.S.

"To H. M. Jenkins, Esq., Secretary, &c."

The Secretary also stated that he had applied for, and obtained from the authorities at Dublin Castle, copies of the forms of declarations and certificate of health for the use of Irish exhibitors at the Oxford show, and that he had ascertained, by direct communication with the com-

panies, that although the City of Dublin Steam-Packet Company refused to convey cattle to Ireland under any circumstances, the Chester and Holyhead Company, in connection with the London and North-Western Railway Company, were prepared to convey them if accompanied by the necessary documents, mentioned in the foregoing communication from the veterinary department, properly filled up and signed by the authority appointed by the Government.

Mr. J. D. Dent, M.P., gave notice that at the next monthly council he would move—"That it is undesirable to persevere with the agricultural examinations hitherto carried out by the Society, but that in lieu thereof the Society should give medals or other premiums for agricultural knowledge in such public county schools as may apply for them, and be approved of by the Council."

THE ROYAL CORNWALL AGRICULTURAL SOCIETY.

MEETING AT LAUNCESTON.

The sixty Devons shown were the principal attraction; and, being so near to the home of the breed, it was nothing but natural to expect a good entry, particularly when the list of breeders who exhibited was seen. The first heifer under three years was Pretty Maid, a beautiful animal, though not quite perfection behind. She was, however, no doubt, an excellent specimen of the breed; and the judges had considerable difficulty in deciding whether this or the Shorthorn shown by Messrs. Hosken in Class 12 was the best in the show. It ended in the matter being referred to an umpire, who gave the prize to Messrs. Hosken. In the class for heifers under two years Mr. Burton, of Broadclyst, was victorious with an animal of his own breeding, one year and seven months old. At the recent fire the animals which this exhibitor was preparing for the various shows were much frightened, and have since suffered so much that he has been obliged to kill five of them. Mr. W. Smith, of Higher Hoofern, Exeter, had entered in some of the classes; but his animals did not arrive until after the judges had commenced their work, and they could not, therefore, compete. After the Devons came the Shorthorns, which, if they were not numerous, yet those shown were particularly good. The best Shorthorn bull was the first prize-taker in the ninth class: he had altogether a much finer and handsomer appearance than the others. Messrs. Hosken's first prize heifer in Class 12 was also very good; and, indeed, this was the one that had the contest with Mr. Farthing's Devon heifer as the best in the show. Messrs. Hosken sent nine Shorthorns, every one of which took a prize, as did others also bred in the Loggan herd. Their Penzance prize bull, second Earl of Oxford, was entered, but he died in the week previous to the show. The Herefords were very far from a good lot; and the two prize-takers in Class 13 were perhaps about the best.

Some dissatisfaction was expressed as to the judging of the sheep; but there are some exhibitors who always will object. The Leicester yearling rams were a good lot, particularly the prize-takers. The yearling ewes were of pretty good quality, but rather small. The yearling long-wooled rams were but a middling lot, and those to whom the prizes were awarded were hardly as thick through as they should have been. In the long-wooled old ram class many thought that the positions of the first and second-prize animals should have been reversed. Viscount Falmouth took the first and second prizes in all the Shropshire Down sheep; and though few were shown, yet they were a splendid lot. The Dartmoors were also a very good lot of useful sheep, and attracted a considerable amount of attention.

The show of horses was very poor, and there was great dissatisfaction at these not being on view on the first day. Some of the prizes in this section were withheld, and others have not yet been published.

PRIZE LIST.

JUDGES.—Devons and Herefords: J. S. Quartly, Molland House, Southmolton; J. Smith, Bradford Peverell, Dorchester. Shorthorns and Pigs: S. Widdicombe, Ugborough; J. K. Fowler, Aylesbury. Sheep: J. Moon, Plymouth; J. Gould, Broadclyst; G. Coaker, Plympton; B. Lee, Milton Abbott. Horses: V. Calmady, Tedcot; G. Bullmore, Newlyn East. Implements: S. Brown, Landrake; E. Elliott, Landulph; Wills, Southpetherwin.

DEVONS.

Bulls above three years old.—First prize, Viscount Falmouth, Tregothnan (Sunflower); second, W. Farthing, Stowey Court, Bridgewater (Master Arthur); third, T. Julian, Creed (Duke of Cornwall).

Bulls above two, and not exceeding three years.—First prize, Viscount Falmouth (Narcissus); second, J. Jackman, Hexworthy (Perfection); third, W. Farthing (Sir George). Highly commended: A. Parsons, Highweek, Black Torrington.

Bulls not exceeding two years.—First prize, J. Jackman; second, Viscount Falmouth; third, J. Jackman. Highly commended: H. Davey, Penhole House, Northhill.

Cows above three years old.—First prize, Rev. S. N. Kingdon, Bridgrule (Pickys); second, J. Nicholls, Altarnun; third, R. Jackman, Lifton.

Heifers not exceeding three years old.—First prize, W. Farthing (Pretty Maid); second, J. Menhenick, Wadebridge (Venus); third, J. Jackman (Belle). Commended: J. Jackman (Beatrice).

Heifers not exceeding two years old.—First prize, R. Barton, Broadclyst; second, Viscount Falmouth; third, Rev. S. N. Kingdon (Princess Ida).

SHORTHORNS.

Bulls above three years old.—First prize, R. Tremain, Treturffe, Ladoek (Towneley Grand Duke); second, H. Bradshaw, Lifton Park; third, Mr. Horswell, Headland Villa, Plymouth (General Berrington).

Bulls above two, and not exceeding three years.—First prize, J. T. Gerrans; second, Mr. Whitford, St. Erme (Telemachus).

Bulls not exceeding two years.—First prize, Messrs. Hosken and Son, Loggan, Hayle; second, T. Cardell and J. K. Martyn, Colan; third, D. Venning, Whalesborough.

Shorthorn cows above three years old.—First, second, and third prizes, Messrs. Hosken and Son.

Heifers not exceeding three years old.—First, second, and third prizes, Messrs. Hosken and Son.

Heifers not exceeding two years old.—First prize, Messrs. Hosken and Son; second, H. Bradshaw, Lifton Park; third, Messrs. Hosken and Son. Highly commended, H. Bradshaw.

HEREFORDS.

Bulls above three years old.—First prize, G. and W. E.

Lobb, Lawhitton (Werrington); second, G. and W. E. Lobb (Chief 2nd).

Bulls above two and not exceeding three years old.—First prize, W. A. Grose, Penpont, Wadebridge (Zenith).

Bulls not exceeding two years old.—First prize, J. Paull, Ruamlanhorne (Gamester); second, G. and W. E. Lobb.

Hereford cows above three years old.—W. R. Grose, Penpont, Wadebridge, second, J. Bartlett, Lifton.

Hereford heifers not exceeding three years old on 1st June, 1870.—First prize, J. Bartlett; second, J. Paull.

A special prize of £10, given by the Right Hon. Viscount Falmouth, for the best animal in the cattle classes. The judges of Devons took Walter Farthing's Pretty Maid fifth, and the Shorthorn judges Hosken and Son's heifer, which won the first prize in class 12. The Council of the Society appointed T. Oliver as umpire, and he eventually gave the prize to Hosken's heifer.

SHEEP.

Leicester Yearling Rams.—First, second, and third prizes, J. Tremain, Polsue.

Leicester Old Rams.—First and second prizes, James Tremain; third, George Turner, Branford Speke.

Leicester Yearling Ewes.—First and second prizes, J. Tremain; third, B. Parsons, Launceston.

Yearling Long-wooled Rams.—First and second prizes, W. E. Drakes, Warbstow. Highly commended: R. Corner, Torweston, Williton, Somerset.

Long-wooled Old Rams.—First prize, W. E. Drakes; second, R. Corner. Highly commended: G. Martyn, Camclford.

Long-wooled Ewes.—First prize, W. E. Drake; second, R. Clark, St. Beaudaux.

Yearling Shropshire Down Rams.—First and second prizes, Viscount Falmouth.

Shropshire Down Old Rams.—First and second prizes, Viscount Falmouth.

Shropshire Down Yearling Ewes.—First and second prizes, Viscount Falmouth; third, H. Bradshaw, Lifton Park.

Dartmoor Yearling Rams.—First prize, R. May, Grendon; second, Drew, Artiscombe.

Dartmoor Old Rams.—First prize, W. Geake, Penhelc; second, R. May, Grendon.

Dartmoor Yearling Ewes.—First prize, R. Palmer, Venn; second, Drew.

PIGS.

Boars, large breed.—Duckering and Sons, Northorpe, Lincolnshire.

Sows, large breed.—First prize, Duckering and Sons; second, J. S. Davey, Redruth.

Boars exceeding 12 months old, small breed.—First prize, R. Jackman, Lifton; second, Duckering and Sons.

Boars not exceeding 12 months old, small breed.—First prize, J. Palmer, Lewannick; second, Duckering and Sons.

Sows, small breed.—First prize, Duckering and Sons; second, R. Bickle, Lifton.

Pen of two breeding sows not exceeding 12 months old.—First prize, J. S. Davey; second, Duckering and Sons.

IMPLEMENTS.

Prizes were awarded—for single plough, to Hornsby and Sons, Grantham. Turnwrest plough that will efficiently turn the furrow against the hill, J. Davey, Crofthole, Devonport. Cultivator, grubber, and scarifier, J. Davey. Set of harrows, J. Davey. Set of seed harrows, J. and F. Howard, Bedford. Set of chain harrows, J. and F. Howard. Clod crusher or pulveriser, Beverley Iron Works, Reading. Corn drill for small occupation in hilly districts, W. Brenton (Hawkes and Spencer machine), Polthabac, St. Germans. Turnip and mangold drill for ridge or flat, depositing manure with seed, W. Brenton. General manure distributor, W. Brenton. Horse-hoe for green crops on ridge and flat, adapted to work horizontally along the side of a hill, J. Davey. Winnowing machine convertible to a blower, W. Brenton. Grass-mowing machine, Samuelson and Co., Bamberbury, and W. A. Wood, London, divide; highly commended, W. Brenton. One-horse cart for general purposes, G. Milford, Thorverton. Chaff-cutter, Lewis and Hooley, Shrewsbury (A protest entered by Messrs. Piesley and Sims, who alleged that their patent had been infringed). Grating or pulping machine, Hornsby and Sons. Corn and pulse bruiser and best oilcake crusher, Amies, Barford, and Co., Peterborough. Best and most improved collection of implements, W. Brenton; second, J. Buckingham, Launceston; third, J. Davey. Sheep-feeding hurdle rack, J. Ellaout, North Petherwin. Field-gate, — Prout, Lewannick, Launceston.

THE HADLEIGH FARMERS' CLUB AND AGRICULTURAL ASSOCIATION.

MEETING AT HADLEIGH.

At the annual Spring meeting the number of ploughs was this year unusually large, there being as many as 56, against 44 last year. In the champion class, consisting of the winners of former years, there were ten, including James Barker, the celebrated ploughman, who has sustained the renown of the ploughs of Messrs. Ransomes, Sims, and Head, all over the country. To-day Barker had to succumb to local men, but the victory for Messrs. Ransomes' ploughs was even greater than if he had won, for the winners of both first and second prizes used implements made by that firm. The judges of stock were Mr. W. Biddell, Lavenham Hall, Mr. Pettitt, Friston, and Mr. B. M. Lungley.

PRIZE LIST.

HORSES FOR AGRICULTURAL PURPOSES.

Best stallion, £2, G. Green, Norton.

Best brood mare, £2, J. Matthew, Aldham; second, £1, James Gentry, Washbrook.

Best gelding, £1, W. Rand, executor to Mr. Stubbin, Raydon; second, John Martin, Semer Hall.

Best ghaist mare, £1, P. Stearn, Elmsett Hall.

Best three years old filly, £1, C. Frost, Wherstead.

Best colt under 27 months old, £1 10s., N. Catchpole, Whitton.

Best gelding ditto, £1, S. Johnson, Lawford.

Best filly ditto, £1 10s., R. and J. Rand, Hadleigh; second, 10s., Joseph Matthew.

Best colt or gelding under 15 months old, £1 10s., P. Stearn.

Best filly ditto, £1 10s., R. Partridge, executor to E. Partridge, Layham.

Best foal, £1, Mr. Norfolk, Burstall; second, 10s., J. Gentry.

Best team of four Suffolk cart horses (mares or geldings indifferently), £3, S. B. White, Bildeston.

RIDING AND NAG HORSES.

Best stallion, 2 years old and upward (if not less than three competitors), £2, no entry.

Best heavy-weight carrying mare or gelding, not less than 15 hands high, £2, S. B. White, Bildeston; second, £1, J. Scott, Pond Hall, Hadleigh.

Best light-weight ditto, not less than 14 hands high, £1, M. Archer, Semer; highly commended, T. W. Stow, Kersey.

Best cob not extending 14½ hands high, £1, J. F. Robinson, Hadleigh; second, 10s. Josiah Matthew, Aldham.

Best pony not exceeding 13 hands high, £1, W. Kersey, Raydon; second, 10s., A. B. Woods, Hadleigh.

Best pony not exceeding 12 hands high, £1, J. Strutt; second, 10s., J. F. Robinson.

CATTLE.

Best bull of any breed, £1, N. Catchpole,

Best polled cow, £1, J. Cook, Hadleigh.

Best horned cow, £1, N. Catchpole.

Best fat beast of any age, £1 10s., Messrs. Rand; second, £1, Messrs. Rand.

Best fat steer or heifer under 3 years old, £1 5s., W. Kersey; second, 15s., R. Fidgett, Layham.

SHEEP.

Best tup of the Southdown breed, of any age, £1, Messrs. Rand.

Best shearing tup of any other short-wool breed, £1, R. Woodgate.

Best shearing tup of long-wool breed, £1, H. D. Postaus, Shelley.

Best tup of long-wool breed, of any age, £1, R. Partridge.

Best pen of three Southdown ewe hoggets, £1, R. Woodgate.

Best pen of three wether hoggets of any short-wool breed, £1, Messrs. Rand.

Best pen of three ewe hoggets of any short-wool breed, £1, Messrs. Rand.

Best pen of three long-wool wether hoggets, £1, W. Kersey.

Best pen of three long-wool ewe hoggets, £1, W. Kersey.

Best pen of ten ewes of any breed, with their lambs, £1 10s., J. Scott; second, £1, executors of I. Strutt.

Best fleece of hogget short-wool (not being a tup), 15s., W. Kersey.

Best fleece of hogget long wool ditto, 15s., Messrs. Rand.

PIGS.

Best boar, £1, C. Frost; second, 10s., J. Vinco.

Best breeding sow, £1, W. Nunn; second, 10s., J. F. Robinson.

The dinner took place at four o'clock in the Town Hall, Sir Charles Rowley in the chair.

SALE OF THE LATE MR. W. H. S. ADCOCK'S HERD OF SHORTHORNS.

AT FARNDISH, ON TUESDAY, MAY 24, 1870, BY MR. JOHN THORNTON.

There were probably few men more popular in the county of Northampton or more respected at the ring-side than the late Mr. Adcock, whose death occurred in February last. His sound judgment, coupled with a quiet unassuming but cheerful disposition, endeared him to a very large circle of acquaintance, and, as was well known, for years past he had set his heart on having a fine herd of cattle. A number of those first selected were sold off at Mr. Longland's sale in 1868; with the remainder, some of which had been purchased at the Havering Park, Preston Hall, and Milcote sales, he started what might as yet be called merely the germ of a first-class herd. Affliction fell heavily upon him in the beginning of 1869, and although he was seen at the Royal and Highland Society's meetings in a Bath-chair, it was remarked that his prophecy of having but a few years to live had well-nigh been fulfilled. We were accordingly fully prepared to see at the little Irchester Station a very strong muster of the well-known Shorthorn fraternity on the sale-day. Mr. Sartoris, whose estate is but a mile or two from Farnish, had taken great interest in the stock, and entertained a large party the night previously.

Mr. Gandem, the acting executor, fully kept up his old friend's hearty and bountiful hospitality. A magnificent champagne lunch was brought from the George at Northampton, at which Mr. Sartoris, who presided, passed a very happy eulogium on his late friend and neighbour Mr. Adcock, and proposed that his memory should be drunk in silence. The company then adjourned to the ring, which was well packed. In the sale waggon were Lord Feversham, Mr. Foster, Mr. Cox, Mr. Ranson, Mr. Blackwell, Mr. Woodward, Mr. Gandem, and Mr. Baxter, well remembered at the Towneley ring, when bristling over with bottles, he occupied the box-seat, and was often whipper-in. Opposite were the brothers Graham, Mr. Sheldon, Mr. Clayden, Mr. C. Howard, and some locals, whilst Mr. Tippler, Mr. Walker, and others from Essex, took the adjoining waggon. The Northamptonshire men mustered round the ring to the right and left of the auctioneer. On the right were Captain Oliver, Mr. Sartoris, Mr. Beasley, Capt. Eden, Mr. Gwyn Wallis, Mr. Lynn, Mr. Beard, Mr. Wortley, and others were congregated, whilst, to the left were Mr. Dormer's and Mr. Strickland's agent Messrs. Winnall, Canning, Hamer, Purkis, and a large party from Warwickshire. The county men gathered thick at the gates, determined to see the entrance and departure of every lot. The stock had been viewed all the morning in the fields and yards, but there was a general feeling that they had not had much doing and were shown in a state upon which they would, with a little good keep, greatly improve. Lady Knightley 2nd, with her sweet head, her graceful form and fine hair and colour, was the general favourite, and a knot were always around her; and notwithstanding her seven months dead calf she looked healthy but thin. Catalani was admitted to be but very so-so for a pure Charmer, and her doubtful condition as a breeder for the last eighteen months made her a speculative lot, though there were a good many bids for her; her heifer Claribel a roan, was very small for her age. Heartsease, a large fine cow, wanted elegance; and her heifer, Hepatica, sweet and

nice-looking, went apparently cheap to Messrs. Graham. Charmer 2nd was taken out of the field and calved during the luncheon a red bull-calf. It was rather a novelty to see the biddings going on and no lot in the ring. The size and quality of Adeline was greatly admired, and, full of calf, seemed a cheap purchase for Mr. Blackwell. Fanny 15th, as tame as a dog, followed those who patted her, about. She had a deep, but narrow frame, sweet docile head, and fine hair and handling; 50 gs. seemed no great price for so good a cow, and we were pleased to see Mr. Owen Wallis get her. The young animals were nice, and gave great promise of what the herd might have been had the owner lived: they sold well. Janette, a fine red J. calf, made 55 gs., from Mr. Beasley, with whom the family is associated. When he bought the company cheered, and when Mr. Sartoris gave the highest price for the Lady Knightley 2nd, the cheers were "continued." He had already a very fine herd of Knightley blood, and it seemed to give great satisfaction that he had taken the best "Bates upon Knightley" lot to join the Rushden herd. Miss Barrington, a fine heifer of good quality, went for 90 gs. to Mr. Foster, and Mr. Sartoris bought her dam cheap enough for 27 gs.

Twelfth Duke of Oxford was low in condition, but still very useful and remarkably quiet with his kindly head and long quarters though somewhat deficient in middle and girth; he was a noble looking old bull, and Mr. Baxter and Mr. Dormer's agent, Mr. Gardener, had a good fight up to 145 gs. Second Duke of Waterloo, rather plain and a little wicked went at butcher's value, but he got some good calves, indeed, better than Oxford's; and Baron Geneva, the herdsman's pet, for his great feeding properties and quiet disposition, went cheap enough to Aberdeenshire, though several of the countymen bid well; but not quick enough. The sale finished soon after four to the satisfaction of every one concerned; the average of £49 3s. for the entire herd, and £50 6s. for the cows being considered, as it was, a remarkably good sale.

COWS AND HEIFERS.

Miss Banks, red and white, calved May 28, 1856, by Duke of Bolton (12738), out of Bonquet by Garrick (11507).—F. Sartoris, Rushden Hall, 27 gs.

Adeline, roan, calved September 16, 1859, by Sir Colin Campbell (16961), out of Albreda by Earl of Dublin (10178).—R. Blackwell, Tansley, 61 gs.

Jantja 5th, roan, calved November 21, 1860, by Yeoman (17257), out of Jantja by Lycurgus (7180).—T. Pashler, Addington, 28 gs.

Patience, roan, calved April 9, 1861, by Waterloo Duke (21077), out of Pearl by Paucake (15043).—W. Strickland, Cokethorpe Park, Witney, 34 gs.

Fairy Princess, roan, calved October 30, 1863, by Hayman (16245), out Fairy by St. Patrick (12038).—J. H. Blundell, Woodside, Luton, 41 gs.

Heartsease, red and white, calved November 4, 1863, by Chanter (19423), out of Floret by Douglas (12714).—C. C. Dormer, Courteenhall, 80 gs.

Pearly, red, calved February 16, 1864, by Grand Duke 5th (19875), out of Pearl by Hopewell (10332).—J. W. Larking, Ashdown House, Sussex, 45 gs.

- Faucy 15th, roan, calved June 6, 1864, by Fugleman (14580), out of Fanny 7th by Satan (16910).—O. Wallis, Overstone Grange, 50 gs.
- Charmer 2nd, roan, calved January 16, 1865, by Grand Duke 4th (19874), out of Charmer by Mainstay (16490).—C. C. Dormer, Courteenhall, 100 gs.
- Catalani, red and white, calved April 4, 1865, by Touchstone (29986), out of Cornelian by Mameluke (13289).—T. Purkis, West Wrattling, Cambridgeshire, 55 gs.
- Lady Knightley, roan, calved February 13, 1866, by Sixth Duke of Airdrie (19602), out of Maidenhair by Mocassin (18406).—J. W. Larking, 63 gs.
- Bonny Oxford, roan, calved March 24, 1866, by Twelfth Duke of Oxford (19633), out of Bonny Lass by Jemmie Lind (18105).—T. G. Curtler, Worcester, 41 gs.
- Jocosa, red and white, calved April 11, 1866, by Twelfth Duke of Oxford (19633), out of Jantja 5th by Yeoman (17257).—J. Gross, Wollaston, 51 gs.
- Fairy Oxford, red roan, calved June 28, 1866, by Twelfth Duke of Oxford (19633), out of Fairy Princess by Hayman (16245).—W. Strickland, Cokethorpe, 33 gs.
- Duchess of Bedford, roan, calved July 24, 1866, by Twelfth Duke of Oxford (19633), out of Pearly by Grand Duke 5th (19875).—B. Baxter, Elslack Hall, Yorkshire, 34 gs.
- Lady Knightley 2nd, roan, calved February 10, 1867, by Grand Duke 4th (19874), out of Maidenhair by Mocassin (18406).—F. Sartoris, Rushden Hall, 140 gs.
- Lady Essex 2nd, roan, calved December 13, 1867, by Costa (21487), out of Lady Essex, by Grand Duke of Essex (17995).—S. Burchuall, Burton-on-Trent, 28 gs.
- Miss Barrington, red and a little white, calved February 9, 1868, by Twelfth Duke of Oxford (19633), out of Miss Banks, by Duke of Bolton (12735).—J. P. Foster, Killow, 90 gs.
- Julianna, roan, calved March 3, 1868, by Twelfth Duke of Oxford (19633), out of Jantja by Yeoman (17257).—Capt. Eden (for the Duke of Buccleuch), Boughton House, Kettering, 43 gs.
- Claribel, roan, calved May 7, 1868, by Twelfth Duke of Oxford (19633), out of Catalani by Touchstone (20986).—H. J. Sheldon, Brailes, Warwick, 100 gs.
- Fairy Oxford 2nd, roan, calved June 15, 1868, got by Twelfth Duke of Oxford (19633), out of Fairy Princess by Hayman (16245).—Capt. Eden, 47 gs.
- Hepatica, roan, calved June 30, 1868, by Potentate (22537), out of Heartsease by Chanter (19423).—G. Graham, Yardley, Birmingham, 50 gs.
- Albreda 2nd, roan, calved August 18, 1867, by Twelfth Duke of Oxford (19633), out of Albreda by Earl of Dullin (10178).—H. J. Sheldon, Brailes, 72 gs.
- Lady Knightley 3rd, roan, calved October 5, 1868, by Twelfth Duke of Oxford (19633), out of Lady Knightley by 6th Duke of Airdrie (19602).—Capt. Eden, 30 gs.
- Primula, red and white, calved November 25, 1868, by Twelfth Duke of Oxford (19633), out of Patience by Waterloo Duke (21077).—B. Baxter, 30 gs.
- Countess Spencer, roan, calved March 16, 1869, by Grand Duke 4th (19874), out of Fairy Oxford by Twelfth Duke of Oxford (19633).—Capt. Eden, 37 gs.
- Faithful, white, calved May 24, 1869, by Twelfth Duke of Oxford (19633), out of Fairy Princess by Hayman (16245).—W. Cox, Brailsford, Derbyshire, 18 gs.
- Penelope, roan, calved May 28, 1869, by Twelfth Duke of Oxford (19633), out of Pearly by Grand Duke 5th (19875).—H. Robinson, Leyburn, 17 gs.
- Janetta, red, calved July 27, 1869, by Second Duke of Waterloo (23800), out of Jocosa by Twelfth Duke of Oxford (19633).—J. N. Beasley, Pitsford Hall, 55 gs.
- Lady Knightley 4th, white, calved August 21, 1869, by Twelfth Duke of Oxford (19633), out of Lady Knightley by 6th Duke of Airdrie (19602).—A. Winnall, Hlawthorn, Ledbury, 46 gs.
- Bonny Waterloo, roan, calved October 18, 1869, by Second Duke of Waterloo (23800), out of Bonny Oxford by Twelfth Duke of Oxford (19633).—F. Wythes, Ravensden House, Bedford, 40 gs.
- Pansy, red and white, calved October 25, 1869, by Twelfth Duke of Oxford (19633), out of Patience by Waterloo Duke (21077).—B. Baxter, 28 gs.
- Fruitful, roan, calved March 5, 1870, by Twelfth Duke of Oxford (19633), out of Faucy 15th by Fugleman (14580).—B. Tomlinson, Lincolnshire, 27 gs.
- Farndish Lass, red, calved March 26, 1870, by Second Duke of Waterloo (23800), out of Fairy Oxford by Twelfth Duke of Oxford (19633).—R. Wood, Clapton, 17 gs.
- Favorita, roan, calved April 19, 1870, by Twelfth Duke of Oxford (19633), out of Fairy Princess by Hayman (16245).—W. H. Woodhouse, Hertfordshire, 30 gs.
- White Legs, red and white, calved December 3, 1865, by Twelfth Duke of Oxford (19633), out of White's Old Cow. Captain Wetton, Northampton, 28 gs.
- Poddington Lass, red, calved January 14, 1867, by Marquis of Airdrie (26834), out of White's Old Cow.—D. M. Brown, Clipston, 34 gs.
- Tiny, red and white, calved in January, 1868, by Twelfth Duke of Oxford (19633), out of White's Old Cow.—Captain Wetton, 21 gs.
- A bull calf, red and white, calved March 28, 1870, by Baron Geneva (25568), out of Tiny.—Captain Wetton, 7 gs.
- A milking cow, giving three gallons of milk daily.—Hon. C. W. Fitzwilliam, 26 gs.

BULLS.

- Twelfth Duke of Oxford (19633), roan, calved September 26, 1862; by Grand Duke of Wetherby (17997), out of Oxford 15th by Fourth Duke of York (10167).—C. C. Dormer, 145 gs.
- Second Duke of Waterloo (23800), roan, calved December 28, 1865; by Lord Lally (22161), out of Waterloo 28th by Grand Duke 3rd (16182).—W. Tippler, Roxwell, Essex, 36 gs.
- Baron Geneva (15568), roan, calved January 4, 1866; by Duke of Geneva (19614), out of Adeline by Sir Colin Campbell (16961).—A. S. Blacklaw, Aberdeen, 70 gs.
- Oxford Barrington, roan, calved January 26, 1869; by Twelfth Duke of Oxford (19633), out of Miss Banks by Duke of Bolton (12735).—T. Johnson, Warwickshire, 41 gs.
- Duke of Northill, white, calved March 19, 1869; by Baron Geneva (25568), out of Jantja 5th by Yeoman (17257).—W. Jervis, Woodford, 30 gs.
- Fawsley Oxford 2nd, red and white, calved March 19, 1869; by Twelfth Duke of Oxford (19633), out of Anemone by Buckingham (17471).—Captain Wetton, 50 gs.
- Baron Russell, roan, calved September 1, 1869; by Grand Duke 4th (19874), out of Duchess of Bedford by Twelfth Duke of Oxford (19633).—Mr. Gadsby, Lowick, 32 gs.
- Earl of Oxford, roan, calved in October, 1869, by Twelfth Duke of Oxford (19633), out of Roan Princess by Grand Duke 3rd (16182).—Mr. Henry, Norfolk, 30 gs.
- Earl of Waterloo, roan, calved February 5, 1870, by Second Duke of Waterloo (23800), out of Heartsease by Chanter (19423).—W. George, Gayton, 20 gs.
- Duke of Thornville, white, calved March 10, 1869, by Twelfth Duke of Oxford (19633), out of Fanny 16th by Fugleman (14580).—W. H. Walker, Brentwood, Essex, 26 gs.
- Baron Wollaston, roan, calved March 6, 1870, by Second Duke of Waterloo (23800), out of Jantja 5th by Yeoman (17257).—J. Woodward, Worcestershire, 25 gs.
- Baron Farndish, red and white, calved March 15, 1870, by Twelfth Duke of Oxford (19633), out of Miss Banks by Duke of Bolton (12738).—Lord St. John, 17 gs.

THE LATE MR. W. G. NIXEY'S DEVON HERD, AT UPTON COURT, SLOUGH.—BY MR. JOHN THORNTON.—The lots consisted of four bulls, 29 cows and heifers, and 29 fat oxen, steers, and heifers. The highest price obtained was for a cow Young Hebe, with a calf six months old, which together realised 117 guineas, the cow fetching 36 guineas and the calf making 81. Young Hebe, which was bred by Lord Portman, and afterwards purchased by Mr. J. A. Smith, of Bradford Peverell, passed into the hands of the late Mr. W. G. Nixey at the sale of Mr. Smith's stock at Dorchester in February, 1869. Several other animals bred by Mr. Smith were also disposed of, including a steer, which brought 47 guineas; another, a two-year-old, realised 28 guineas; whilst a number of yearling steers brought from eleven guineas to 30 guineas a-piece. Young Dewdrop, bred by Mr. W. Smith, of Exeter, realised 40 guineas. A calf, bred by Mr. Nixey, was knocked down at 30 guineas, and a bull, Prince of Wales, bred by Mr. John Quartly, was sold for 30 guineas. The total proceeds amounted to £1,330.

PHILADELPHIA BUTTER: HOW IT IS MADE.

"Philadelphia print" is known in the central cities of the United States as butter unsurpassed for sweetness, solidity, and golden colour. It always commands a fancy price, and is ever sought for with an avidity that makes its sale a pleasure rather than a labour. Excellent butter is found elsewhere, as in New England, New York, and northern Ohio; but inferior qualities are the rule in the dairy sections proper, which these exceptions only prove; while in a large portion of the West and South there is very little superior butter, a considerable quantity that is passably good, and a large amount not fit to eat, of less value for cooking than good lard, and unworthy the repute of the American farmer. Greater advances have of late been made in cheesemaking than in the art of butter-making. The factory system has secured uniformity with positive progress in processes and knowledge of principles. Butter dairies are individual and isolated, and excellence in their product is the result of peculiar care in the manager, and special adaptation to his business. It is of the utmost importance that the very best modes of manufacture should be understood; that the dairyman and the farmer's wife who cares for the smaller dairy of the ordinary farm should compare their processes (which they may now deem best because they know no other better) with those of model establishments, and learn to stamp a higher excellence upon the yield of their dairies. The difficulty of obtaining really good butter in the city markets appears to be increasing, probably from a growing fastidiousness of butter eaters, as well as from the increasing disproportion in numbers of consumers and producers. This fact gives urgent and immediate importance to efforts for improvement. The best Philadelphia butter comes mainly from Chester, Lancaster, and Delaware counties. A committee of New York gentlemen lately visited several of the dairies of Chester county, Pennsylvania, as representatives of an incipient organization, the "American Jersey Cattle Club," designed to facilitate the work of publishing such a record of importations and pure breeding as should secure the integrity of this famous dairy breed. The following extracts from their report, written by George E. Warring, jun., begins with a description of the dairy of Samuel J. Sharpless, of Street Road station, in Chester county, whose cows are all thorough-bred Jerseys: The milking-house is a light wooden structure, with so many open doors and windows that it is hardly more than a shed. In the winter it is closed up, and used as a stable for young stock. In size it is about 22 feet by 36, with a row of stanchions on each side, and with mangers in which a little bran is put at milking time. Each cow has her own place, with her name, age, and pedigree on her own manger, and she always goes to it as though she could read. Their names have been put up in the order in which they come from the pasture, the "master" cow entering first, and the least plucky last. The milking is done by women, the same one always milking the same cows, and it is done rapidly and quietly, no unnecessary talking and no skylarking being allowed. We measured "Niobe's" yield, and found it to be 11 quarts (she gave 9 the next morning, making it 20 quarts for the two milkings)—not bad for a butter-making Jersey. The others gave less (the smallest not more than 8 quarts at two milkings); but the whole herd of 18 cows could not have given less than 200 quarts a-day, and this of milk that yields over 20 per cent. of cream. Near by the milking-house is the "spring-house," about 24 feet long by 18 feet wide, built of stone, with its foundations set deeply in the hill side, and its floor about 4 feet below the level of the ground at the down-hill side. The site is that of a plentiful spring, which is allowed to spread over the whole of the enclosed area to the depth of about three inches above the floor of the oak laid on sand or gravel. At this height there is an overflow by which the water passes to a tank in an open shed at the down-hill end of the house. On the floor of the spring-house there are raised platforms or walks to be used in moving about the room, but probably three-quarters of the space is occupied by the steady-flowing spring water. The walls are about ten feet high, and at the top, on each side, are long, low

windows, closed only with a wire cloth, which give circulation of air at the upper part of the room. The milk is strained into deep pans of small diameter, that are kept well painted on the outside, and are provided with bails, by which they are handled. The depth of the milk in the pans is about three inches, and they are set directly upon the oak floor, the water, which maintains a temperature of about 55 degs. Fahrenheit, surrounding them to about the height of the milk. The cream is taken off after twenty-four hours, and is kept in deep vessels having a capacity of about twelve gallons. These vessels are not covered; and as the room is scarcely warmer than the water, the cream is kept at about 58 degs. or 59 degs. until it is put into the churn.—*Churning*: The churn is a large barrel (balging only enough to make the hoops drive well), with a journal or bearing in the centre of each head, so that it may be revolved by horse-power. Thus barrel has stationary short arms attached to the inside of the staves, so arranged as to cause the greatest disturbance of the milk as it passes through them in the turning of the churn. At one side is a large opening secured by a cover that is screwed firmly into its place—this is the cover or lid of the churn. Near it is a hole, less than an inch in diameter, for testing the state of the churning and for drawing off butter-milk: this is closed with a wooden plug. The churning lasted about an hour, at the end of which it was necessary to add a little cold milk to cause the butter to gather. Thus being secured, and the butter-milk drawn off, cold water was twice added, a few turns being given each time to the churn, and when the last water was drawn off it came nearly free of milkiness. A crank was then put on to an arm of the churn, the horse-power thrown out of gear, and a gentle rocking motion caused the butter to be collected on the lower side, and directly over the small hole, through which the remaining water escaped. It was left in this condition about two hours. After breakfast we returned to see the working of the butter.—*The Butter Worker*: In one corner of the spring-house stands the butter-worker, a revolving table about three feet in diameter. The centre of this, for a diameter of twelve inches, is an iron wheel with a row of cogs on the upper side of its rim. From this rim to the raised outer edge the table (made of wood) slopes downward, so that the butter-milk as worked out is passed into a shallow groove, and is carried away through a pipe which discharges into a pail standing below. Over the sloping part of the table there works a corrugated wooden roller, revolving on a shaft that is supported over the centre of the table, and has a small cog-wheel that works in the cogged rim of the centre wheel, and causes the table to revolve under the roller, as this is turned by a crank at its outer end. Of course the roller is larger at one end than the other, so as to conform to the slope of the table, and its corrugations are very deep, not less than two inches at the larger end. Supported on each end of the roller, and on both sides, are bevelled blocks which, as the table revolves, force the butter from each end towards the centre of the slope. About 20 lbs. of butter is now put on the table, and the roller is turned, each corrugation carrying through a long narrow roll, which is immediately followed by another and another, until the whole table is covered. The roller does not quite touch the table, and there is no actual crushing of the particles. The bevelled blocks slightly bend these rolls and crowd them towards the centre of the sloping part, so that when they reach the roller they are broken in fresh places, and by a few revolutions are thoroughly worked in every part.—*Final Processes*: Then follows a process that was new to all of us—the "wiping" of the butter. The dairyman turning one roller backward with the left hand, so that the butter came through at the right hand side, presses upon every part of it a cloth which has been wrung dry in the cold spring water, and which he frequently washes and wrings out. This is continued until not a particle of water is to be seen in the butter as it comes from the roller, to which it now begins to adhere. If there is any secret in the making of Philadelphia butter this is it; and it has much to do with the uniform waxiness of texture,

whether hard or soft. After this, the butter is salted (an ounce of salt to 3 lbs. of butter), still by the aid of this machine, and any lurking atom of moisture is in this way prevented from becoming a cause of rancidity. When the salt is thoroughly worked through the whole mass the butter is removed to a large table, where it is weighed out and put up in pound prints. The working, wiping, and salting of over 100 lbs. of butter occupied about an hour; and before 10 a.m. the entire churning, beautifully printed, as fragrant as the newest hay, and as yellow as pure gold, such butter as only Jersey cream will make, was deposited in large tin trays and set in water to harden. The next morning it was wrapped in

damp cloths, each pound by itself, put in a tin case, each layer having its own wooden shelf, with two compartments of pounded ice to keep it cool, and, surrounded by a well coopered and securely locked cedar tub, was sent to the Continental Hotel, where we found it on our return as delicious as when it left the farm. It is very difficult to describe any process in which so much depends on the judgment of the operator; and the writer hardly hopes for more than that his example will stimulate others who are interested in the subject to examine for themselves the daily operations of this interesting and beautiful region for butter-making.—*Boston Cultivator.*

THE CENTRAL CHAMBER OF AGRICULTURE.

A Council Meeting of the Central Chamber of Agriculture was held on Tuesday, May 31, at the Salisbury Hotel, Colonel Tomline, M.P., presiding over about twenty-five members.

A communication was read from the Cambridgeshire Chamber relating to occupation roads, the object in view being to enable occupiers of land lying on either side of an occupation road to make arrangements among themselves for securing the repair of the road in such a manner as to bind their successors.

Mr. HODSOLL moved: "That the subject is of sufficient importance to be worthy of consideration by the Government in connection with any general road bill that they may hereafter introduce."

Mr. C. S. READ, M.P., in seconding the motion, observed that such an alteration in the law was greatly needed in a considerable portion of the fen district of Cambridgeshire bordering on Norfolk.

The motion was then agreed to.

The following resolution of the Warwickshire Chamber, which had been forwarded for submission to the Council, was read: "That this Chamber regrets to find in the Government Turnpike Acts Continuance Bill now before Parliament that trusts, with toll income amounting to nearly £200,000 (£11,183 of which is in the county of Warwick), are placed in the abolishing schedules of the Bill. The Chamber had hoped from Mr. Knatchbull-Hugessen's speech at the Central Chamber on the 5th of February that the Government were preparing to deal with the whole subject of roads at the first convenient opportunity, and therefore trusted that the annual Continuance Act would not be made the vehicle for shifting the burden of the repairs of the turnpike roads from the users thereof to the adjacent payers of rates levied upon real property alone until a revision of the incidence of local taxation had been inquired into and readjusted. It is also resolved that the Society send a copy of the above resolution to Sir Massey Lopes, Chairman of the Local Taxation Committee of the Central Chamber, and to the M.P.'s of the counties, cities, and boroughs, requesting them to give their strenuous opposition to the Bill, unless the abolishing schedules are abandoned."

Mr. CALDECOTT (Warwickshire Chamber), in moving that this communication be received, said he felt certain that everyone who heard the speech delivered by Mr. Knatchbull-Hugessen in that room a few weeks ago, went away fully satisfied that the abolishing schedules would not be brought forward in Parliament until a general measure was proposed; yet not only were those schedules retained in the Bill, but there was another section—the 10th—which militated very much against the interest of the ratepayers; that section enacting that wherever any turnpike had been abolished within the last seven years, or should be abolished in the carrying out of the Bill, if there were a highway board, the roads should be repaired out of the common fund of that board. If that Bill passed, where there was no highway board, the injustice which had been so much complained of would be perpetuated, and the parishes would each have to repair their portion of the road on which the turnpike had been abolished. It was, in short, the old story of real property alone being taxed for the maintenance of highways (Hear, hear).

Professor BUND read a resolution passed by the Worcestershire Chamber on the previous Saturday in harmony with

that of the Warwickshire Chamber. It was felt in Worcestershire, he said, that the Government were acting unjustly in proposing to abolish trusts before they had brought in a comprehensive road measure.

Mr. BEACH, M.P., said if he regarded the Bill as a permanent measure establishing a system for all future time he should oppose it; but he believed it was only intended to be temporary. The clause which provided that where a turnpike had ceased to exist, the burden of maintenance, instead of falling upon the respective parishes through which it passed, should be thrown on the highway fund, struck him as being very fair indeed. Parishes, through which a turnpike road passed, were in many cases no more in need of the road being kept in good repair than other parishes. No doubt it was a great grievance that so many turnpikes should be abolished, and they must press upon the Government the necessity of introducing as early as possible a comprehensive measure, so that all roads and all the various interests connected with them might be placed on a fair and proper footing. The local taxation question was extremely important in reference to that subject, and he agreed with the Warwickshire Chamber that it was most unfair to throw the burden of repairing roads solely upon the owners of real property.

Mr. WHITAKER (Worcestershire Chamber) did not agree with the last speaker with regard to the character of the Government bill. It seemed to him a deceitful measure from beginning to end (Hear, hear). Professing to be a "continuance" bill, it was in fact a discontinuance bill; and, moreover, it tended to set one road district against another (Hear, hear). He contended that if the Government wished to act equitably they would propose to continue all existing trusts until a good comprehensive measure had been laid before Parliament (Hear, hear).

The motion was then adopted.

Mr. A. FELL, M.P., read the report from the Local Taxation Committee: "The Local Taxation Committee, in presenting their report, beg to state that at the request of the Central Chamber of Agriculture they have taken into consideration a communication from the East Kent Chamber on the subject of the property-tax, which was read at the last meeting of the Council on the 3rd inst. The question is one of large and wide importance, and refers to imperial rather than local taxation; and as the time and attention of the Local Taxation Committee are at present fully occupied with their more immediate duties, they would leave it for discussion on some occasion at a general meeting of the Council of the Central Chamber of Agriculture. The committee also beg to report that they have made arrangements for holding a public meeting at Taunton during the exhibition week of the Bath and West of England Agricultural Society. The committee also remind the Central and local chambers that a meeting on the subject of local taxation will be held at Oxford during the exhibition week of the Royal Society in July next. The committee would also call the attention of the members of the Central and provincial chambers to the Turnpike Acts Continuance Bill, 1870, which has already passed the second reading in the House of Commons, and which, if it becomes law, will place another serious additional charge of £195,773 annually on the local rates.

Mr. WHITAKER, in moving that the report be received and adopted, urged the necessity of the various local chambers of

agriculture liberally supporting the Local Taxation Committee peculiarly. It was, he observed, absolutely essential to bring before the public generally the gross injustice which was done to the landed interest by heaping upon it burden after burden. What was now proposed by the Government with regard to turnpike trusts was another nail in their coffin (laughter). They were driven from pillar to post, and where they were not "abolished" they were oppressed. They should earnestly solicit all their friends in the House of Commons to be in their places whenever it was proposed to impose any additional burden on land, and to show that they were united and determined on that point. All agriculturists wanted was that all kinds of property should contribute alike.

Mr. GENGE ANDREWS in seconding the motion said the total cost of repairing the roads of this country was about £1,000,000 per annum, in addition to which there was an aggregate debt of £3,600,000, including interest, to be provided for. Mr. HUGGESS stated distinctly that the Government had no intention of throwing the burden upon the Consolidated Fund, and if that were the case it would have to be provided for by means of the poor-rate assessment. The Bill before Parliament included the abolition of about 12 per cent. of the existing turnpike trusts, and it seemed to him as if one object of the Government were to reduce the trusts within narrow limits and thus diminish the difficulties of future legislation (Hear, hear). The agricultural members in the House of Commons were much too Conservative (laughter); they acted too much on the gentle principle. How did members on the Liberal side of the House act with regard to the Cattle Bill of the late Government? Night after night a few of them resisted a measure which would have prevented the introduction of cattle plague in future, and the Bill was ultimately thrown out through the persistence of a small number of members backed by Mr. Gladstone (Hear, hear). He should like to see rather more vigorous action on the part of their own friends in the House of Commons. If the views of the Central Chamber of Agriculture were thoroughly urged by those gentlemen in Parliament their speeches would be reported in the daily newspapers which circulated among all classes, and would produce a much greater effect than speeches delivered in that room which were only reported in the *Chamber of Agriculture Journal*.

Mr. C. S. READ, M.P., said he had noticed that the proceedings of that Chamber were, until a very few months ago, much better reported in the *Mark Lane Express* and in *Bell's Weekly Messenger* than in the *Chamber of Agriculture Journal* (Hear, hear). With regard to the course which Mr. Andrews thought the agricultural members should pursue in the House of Commons he could assure him that, little weight as they might have now, they would have much less if they were to adopt the sort of factious opposition which he recommended (Hear, hear). That course might sometimes have been exceedingly successful when followed by a few clever talking members; but, generally speaking, agricultural members had not the gift of the gab (laughter); and he did not think they would succeed in such a course. He could assure Mr. Andrews that the agricultural members in the House of Commons did try to do their duty, although perhaps they were not exactly as successful as they could wish, and had certainly not acted in the manner which had been shadowed out by that gentleman (Hear, hear).

Mr. F. KNIGHT, M.P., observed that if agricultural members were supported by a larger number of agriculturists on special occasions they would perhaps have greater weight in the House of Commons. If, for example, when an agricultural deputation went to Downing-street, it were 500 strong, that might cause the voice of such members to be better listened to.

Mr. HENEAGE, M.P., considered it a great mistake to treat a question like that of turnpike roads as if they were merely farmers' questions. It was now proposed to inflict an additional burden on rate-payers for education as well as for highways, and all classes were of course interested in such matters. He quite agreed with Mr. Read that a factious course would not do in the House of Commons (Hear, hear); but at the same time he concurred with Mr. Andrews as to the importance of increased publicity with regard to the views of agriculturists. The Lincolnshire Chamber, of which he was a member, regarded local taxation as the most important question of the day, and had recorded its opinion to the effect that

the Central Chamber should devote special attention to that subject.

Mr. BEACH, M.P., said as regarded the course which agricultural members should pursue in the House of Commons, the case cited by Mr. Andrews showed how a determined opposition on the part of a few members might prevail against a weak Government; but it should be recollected that the present Government was not a weak one (Hear, hear). When the cattle plague question was before Parliament the members and supporters of the present Government were in opposition, and were dealing with a weak administration; and the agricultural members would have lost their influence by pursuing since that time such a course as was pursued by others then. He believed that an appeal to the good sense and right feeling of the country would lead to satisfactory results (Hear, hear).

Mr. WEBB (Worcestershire Chamber) observed that four noblemen in his county had subscribed to the funds of the Local Taxation Committee.

The motion was then put and carried.

A communication was read from the Council of the International Decimal Association proposing a joint committee in relation to uniformity of weights and measures.

Capt. CRAIGIE gave a brief account of the recent discussion of the subject at a meeting of the Society of Arts.

After a short discussion, the following were, on the motion of Mr. T. Willson, seconded by Mr. Bennett, requested to act as members of the proposed joint committee: Col. Tomline, M.P., Mr. C. S. Read, M.P., Mr. A. Pell, M.P., Mr. R. Jasper More, Mr. R. Varden, and Mr. Clarke.

The Council next proceeded to consider the question of the game laws and the proposed legislation thereon, resolutions relating to the subject having been prepared by the business committee.

Mr. STORER (Nottinghamshire Chamber) moved the following: "This Council, while declaring that an excessive preservation of ground game is incompatible with good farming, disapproves of any legislation on the subject that would interfere with freedom of contract between owners and occupiers." He said that farmers in his county lamented very much the extent of this evil, principally resulting from the false ideas with respect to game which had prevailed of late years among men who called themselves sportsmen, and under the influence of which the battue system had been carried to such a great extent. In many cases extreme hardships were, as they all knew, inflicted upon tenants by the excessive preservation of game; but of late years an improved feeling had existed among many landlords on that subject, and in some cases, particularly on large estates, where game was formerly preserved by the owner of the estate it was now given to the tenants. In his Chamber there had been great difficulty in organising any movement on that question lest it should foster antagonism between landlord and tenant—antagonism which, in establishing the Chamber, they were anxious to do away with. While they deprecated and regretted the excessive preservation of ground game, they thought the matter should be left in a great degree to the good feeling which was increasing on that subject. They had no wish to do away with the doctrine of political economy, which allowed every man to a certain extent to do as he liked with his own; they did not wish to restrict by legislation any landlord in using his land as he thought best. When a landlord was addicted to excessive preservation of game, it was pretty well known that such was the fact, and those who took a farm under such circumstances must be aware that they were making a very bad bargain. They (the Nottinghamshire Chamber) would be sorry to interfere with freedom of contract between owners and occupiers. That freedom seemed to them very important; and if legislation went on as it had done, they would soon have Parliament legislating for the rotation of crops. He had seen in the Isle of Wight a farm entirely devoted to the breeding of rabbits, but it was wired round (Hear, hear). That question could not be treated in reference to the national wants, for nearly all the nation's wants were now abundantly supplied from abroad. Even if attempts were made to interfere with freedom of contract by law they would prove futile, for the competition for land was so great that every tenant would waive his right in favour of his landlord. The great object of the Central Chamber should, he thought, be to bring the influence of the

whole body of the landed interest of the country into one focus to bear upon Parliament. It did not do anything which would tend to alienate landlords from occupiers. They were joint partners in the same concern, and though the landlord might be a sleeping partner he formed the most material part of the stock-in-trade.

Mr. G. SMYTHIES, in seconding the resolution, said he thought it was a very sad thing if the tenant farmers of this country could not take care of themselves. He did not believe they had the least inclination to be legislated for or protected by arbitrary power; and if they could not take care of themselves, it was quite time they learned to do so.

Mr. DANIEL LONG said he thought that it was game that was protected by Act of Parliament (Hear, hear). In his opinion the game laws ought to be expunged altogether. Game was very detrimental to farming; and if it was to be preserved at all, it should be kept quite apart from farms and enclosed in covers. By eating up the crops, as it had done all over the kingdom, it was very prejudicial to agriculture, and he thought that evil ought to be remedied. He would move, as an amendment to the resolution: "That in the opinion of this Central Chamber, the special laws which surround the preservation of game are prejudicial to the interests of agriculture and the public generally, inasmuch as they diminish home production and the supply of food for the people, greatly increase crime, and frequently cause animosity between landlord and tenant. They therefore solicit the early attention of the Legislature, with a view to their abolition, and the substitution of a sufficient and effectual law of trespass."

Mr. JOSEPH SMITH (Essex), in seconding the amendment, said he considered the present system of game-preserving very objectionable. For 30 years he knew what it was to occupy a game farm, and a continual diversity of sentiment existed on that subject between him and his landlord. The game on that farm was afterwards given up to him, and everything then went on as harmoniously and comfortably as possible.

Mr. SMYTHIES: Without legislation (Hear, hear).

Mr. J. SMITH: Without legislation; but there was such competition in this country for land that many tenants had no opportunity of making a bargain (Hear, hear). A tenant-farmer could not do greater injustice to his son than by placing him on a game-preserving estate; but the temptation was often so strong that it was almost impossible to resist it, the young man wanting, perhaps, to marry and to settle in a farm preparatory to that (laughter). He believed that the proposal of the Chancellor of the Exchequer with regard to game-licence certificates struck at the root of the system of game-preserving, and was surprised that it was not viewed in that light by the last meeting of the Chamber. He thought the Government intended it to be a boon to the tenant-farmers who suffered so much from the over-preservation of game.

Professor BUND considered it very inexpedient for the legislature to interfere with the right of contract; except in the case in which an occupier having taken a farm for a long period, say a 21 years' lease, on the understanding that there was to be only a moderate amount of game, the landlord died within two or three years, and the quantity of game was afterwards enormously increased. The Bill brought in by the Lord Advocate and Mr. Bruce contained a provision which met that case, and he thought such an interference as that with freedom of contract was perfectly justifiable.

Mr. C. S. READ, M.P., said he thought the Chancellor of the Exchequer was a better judge of the reasons which led him to propose the new gun-tax than the seconder of the amendment; and the right hon. gentleman had stated that his object was to check poaching (Hear, hear). As regarded the amendment, it was nothing more nor less than the Bill which Mr. Peter Taylor, the member for Leicester, had introduced in Parliament, that was to say, a proposal for the abolition of the Game Laws. It was certainly intimated at the end that a stringent trespass law would be necessary, but the drift of the amendment was abolition (Hear, hear). The last speaker said something in praise of the Government Bill. That was the first time that he (Mr. Read) had heard it praised. It was simply a Bill to enable a tenant to go to law with his landlord. He believed that the tenant had that great privilege now (laughter); and he did not doubt that if a farmer having a lease went into a court of law and there proved that during the lease an excessive increase of game had taken place, he would obtain substantial damages from his landlord. Mr.

Loch's Bill, which was so much in favour in Scotland, was not viewed in the same light here, because it proposed to interfere with existing contracts. His hon. friend, Mr. M'Lagan, member for Linlithgowshire, whom he was happy to see present, proposed last year the best bill that had been introduced in Parliament, that was, a Bill for taking hares and rabbits out of the game list; and, though he had not introduced it this year yet, he believed he would do so next year if the question had not been previously settled. Mr. Hardcastle's Bill simply enacted that game should be property and poaching thieving—a change which would make the game laws much more stringent and oppressive than they are now (Hear, hear). He must tell the mover of the original resolution that as the law stood it was impossible for any tenant to know how much game there would be on his farm (Hear, hear). The last speaker alluded to what might occur during a lease. Why, it was quite possible for a new gamekeeper, even without the landlord's knowledge, if he were an absentee, to increase the quantity of game so much within a few months as to ruin some farmers. A man might perhaps be allowed to do as he liked with his own so long as he kept his land in his own hands, but when third parties came in it was desirable for the Legislature to interfere and impose certain restrictions. How often had Parliament interfered with the rights of owners of land? For example, there was an agreement that every tenant should pay all new taxes imposed during the term of the lease; yet when the property-tax was imposed Parliament said that notwithstanding any agreement to the contrary the landlord should pay under Schedule A. In the case of the Cattle Plague rate it was enacted that the landlord should pay half. There were, in fact, many instances in which the Legislature had interfered between landlord and tenant; and, though he extremely regretted the necessity for Legislative interference with regard to the Game-laws, he felt that tenants were driven to ask for something of that kind, because—he did not wish to use strong language, but he could not help doing so—because of the rashness of a few owners of land who would persist in the over-preservation of ground game (cheers).

Mr. JABEZ TURNER hoped it would go forth to the world that that Chamber regarded over-preservation of game as a great evil, and as incompatible with good farming. He had known cases in which, when a farm had to be taken, the quantity of game was very moderate; and as soon as the farmer's capital was invested, it rapidly increased. As to gamekeepers, he regarded them as the natural enemies of tenants (laughter).

Mr. M'LAGAN, M.P., said he was glad to hear such sound opinions expressed with regard to the over-preservation of game in England. He approved both of the original resolution and of the amendment. He approved of the resolution, because it condemned interference with freedom of contract, feeling confident that the party who would suffer most from such interference was the weaker party, the tenant (Hear, hear). As regarded the amendment, he believed that, if the game laws as they now existed were abolished, and there were a stringent law of trespass, the general result would be that there would be a moderate amount of game, and the tenant would aid the landlord in preserving it. He had always felt that a landlord who wished for good sport should allow his tenant to shoot as well as himself (Hear, hear). No gamekeepers would then be required; and the best gamekeepers a landlord could have were the tenants on his different farms. He intended to borrow from the Lord Advocate's Bill on that subject some clauses which would render his own Bill more complete. The 7th clause of the former enacted that all "injunctions" as they were termed in this country, or "interdicts," as they were called in Scotland, should be abolished, so that, if a tenant entered upon a farm with an agreement that the landlord should have the game, and the landlord afterwards preserved game to an extraordinary extent, the tenant would be able to shoot down the game if he thought proper. At present, the landlord could prevent that by taking out an injunction; whereas, if the Lord Advocate's proposal were carried, he would be unable to adopt that mode of proceeding. The landlord would then be obliged to proceed against the tenant for breach of contract; and that would throw the whole onus of prosecution and of proof on the landlord, and leave the tenant's hands free. Legislative interference with freedom of contract between landlord and tenant would, he thought, be at once useless in practice and

dangerous in tendency, because it would be a precedent for proceeding further in the same direction. Before the Legislature interfered with freedom of contract, it must abolish the game laws. The object of his Bill was to take hares and rabbits out of the game list; and he thought that, when that had been done, landlord and tenant might be left to contract as they pleased. He thought the alterations he had mentioned would place the tenants of this country in an advantageous position, and settle the question of the game laws for some time to come.

Mr. HENEAGE, M.P., said the Lincolnshire Chamber was opposed to legislation at present for two reasons—first, because it would disturb the whole of the existing arrangement in this country between landlord and tenant, and, secondly, because that was a very inopportune moment for doing what would be like throwing the apple of discord among the Chambers, union being now expressly desirable. Let them first try to get rid of the irregularities of local taxation, and then deal with other questions. Many persons seemed to forget that rabbits were the food of a great many people. He did not think the damage which they did was equal to the amount of food which they contributed (Oh, oh). Of course where game was kept for battues the case was different (Hear, hear). There the tenant lost, and the landlord gained. In some cases tenants themselves were the greatest preservers of game. One tenant in his district had the shooting under a long lease, and he had known as many as 400 hares to be killed on his farm in one day.

The amendment was then put and negatived, the numbers being 4 for it and 19 against it.

Mr. C. S. READ, M.P., said he believed he should be in order in now moving another amendment. Last year the Council passed a resolution declaring that it regarded the preservation of ground game as an unmitigated evil; it was now asked to declare that was "incompatible with good farming," and he thought it would appear as if they were going backward rather than forward if they did not use stronger language than that. The amendment which he had to propose rested not on his own authority, but on that of a large and influential meeting of the Norfolk Chamber, held on the previous Saturday. It was as follows: "This Council repeats its protest against the over-preservation of ground game, and considers that in all future agreements the owner and occupier of the soil should have a joint right to kill hares and rabbits" (Hear, hear). He was quite aware that the law as it now stood gave the whole of the game to the tenant (No, no). He said, yes; and he might add, that in 99 cases out of every 100 the tenant as a matter of course relinquished the whole of his right. The law as it stood was totally ineffectual to prevent a flagrant amount of injustice. He did not know whether or not any one would second his amendment, but he felt that he did his duty in proposing that the Council should declare that owners and occupiers ought to have a joint right to kill hares and rabbits. One word upon rabbits regarded as food. If rabbits were kept in warrens, or in places where a farmer could grow nothing but rape, they might be found very profitable animals to keep; but if rabbits or hares, or any other wild animals, scampered over arable land and ate and spoiled what they pleased, he did not hesitate to say that every pound of such food was the most extravagant kind of food that could possibly be produced (Hear, hear).

Mr. WREN HOSKYNs, M.P., in seconding the resolution, said that, knowing the difficulty which there was in dealing with that question, and how seldom it was approached with a determination to get to the bottom of it, he could not help thinking that what Mr. Read now proposed would answer the purpose better than any of the legislative measures which had hitherto been brought forward on that subject (Hear, hear). They all knew that the game-laws were a vestige of the old forest-laws of England, which were perhaps the most disastrous of the tyrannical laws inflicted by the conquerors upon the conquered in this island. Those laws were unpopular from the first; and they were only borne with so long because they were partially kept in abeyance. Mr. Read was strictly correct in saying that the tenant of a farm was the owner of the game. A person who took a farm, took with it all that went upon it, including both winged and ground game. That was his own property, and therefore, if he gave it up, he put himself out of court, as it were, for complaining—he now spoke merely in a legal point of view—of any damage which afterwards

arose from an evil to which he himself had consented. The question was, How was that to be remedied? It might be argued that the tenant was the author of his wrong by giving up his wright; but the answer to that was, that the land of England was such a limited commodity that the applicants for it were almost innumerable, and that hence it had become a sort of monopoly. There were in England three distinct causes which tended to render land a monopoly. First, there was the law which enabled a man to determine the ownership of the land even after the extinction of the generation in which a will or settlement was made.

Mr. STORER rose to order, contending that the speaker had no right to introduce the tenure of land into the discussion.

Mr. HOSKYNs maintained that he was not out of order in alluding to a fundamental law which bore on the question of game preservation. The three causes which he wished briefly to mention were—the law of entail, the law of intestacy, and the expenses of transfer, all of which tended, he maintained, to make land a greater monopoly than it otherwise would be. A freer distribution, by which he did not mean an extensive subdivision, of land would, he believed, tend to diminish the over-preservation of game. He believed that farmers would ere long see that question satisfactorily settled, and he seconded the amendment, because he believed it tended to that result.

Mr. COLTON said he hoped that Mr. Read, as the tenant-farmers' friend, would not press his amendment. In his belief it tended to divide landlord and tenant, and he should be sorry to see any animosity between the two classes.

Sir G. JENKINSON thought that the adoption of Mr. Read's amendment would be going backward. At present, as Mr. Read himself said, the law gave the tenant all the game, whereas what he had proposed would only give him half. When so many Bills had been introduced in Parliament, it was clear that the day had arrived when the question must be faced and legislation take place. He concurred in the first resolution as far as it went, but thought it did not go far enough. In his opinion the only way to abolish the game-laws was to abolish the word "game." If hares and rabbits were excluded from the operation of the law, and all winged game were treated as poultry, and the stealers of it as thieves, the question would be settled.

Col. BRISE, M.P., did not agree with Read in his condemnation of the Government Bill. In his opinion it was the best of the Game Bills now before the House of Commons, and would remedy the evil of over-preservation.

Mr. ORMSBY GORE, M.P., hoped the amendment would be withdrawn, as any difference in that Chamber would produce a bad effect in the country generally. They ought to be perfectly united on that point (Hear, hear). He deprecated as strongly as any one could the over-preservation of game. With his own tenants he had no difficulty whatever; matters were so arranged that they never differed on that question. If anybody disliked rabbits much, he (Mr. O. Gore) disliked them more (laughter); he considered them the curse of agriculturists, both landlords and tenants. He also disliked battue-shooting, but was fond of good sport. He would submit for the consideration of the Chamber whether the levying of a duty on the sale of game would tend to do good.

Captain CRAIGIE observed that last year the Council deprecated the preservation of ground game, and he thought Mr. Read's present proposal was a natural sequence to that. As to the original resolution, it was a dilution of an opinion expressed previously.

Mr. C. S. READ, M.P., then replied. He thought that half a loaf was better than no bread. He knew that in theory the law now gave the tenant the whole of the game; but he was unable to appropriate any portion of it to his own use, and therefore he (Mr. Read) said that under any future game bill, or any future agreements, the owners and occupiers of the soil should have a joint right of killing hares and rabbits. Having thus put on record his own opinion and that of the Norfolk Chamber, being perfectly satisfied with the discussion which had taken place, and wishing above all things to promote unanimity in that Chamber, he should, with the permission of the seceder, feel great pleasure in withdrawing the amendment (cheers).

The amendment was then withdrawn; after which the original resolution was adopted.

Mr. HODSOLL then moved the following: "This Council

considers that, in justice to ratepayers, all rights of sporting should be assessed to the poor rate."

Captain CRAIGIE moved, as an amendment, to insert after the word "that," "pending a revision of the whole system of local taxation;" and at the end of the resolution, "pending a revision of the local rates;" observing that those amendments would make the resolution more consistent than it then was with what had been done by the Council previously.

Mr. C. S. READ, M.P., thought it was impossible to assess rights of sporting. If they said "all land should be rated at its full value, irrespective of any rights of sporting on the part of the owner," that would make woods contribute to the poor rate a great deal more than they did at present.

After a short conversation the resolution was passed unanimously in the following amended form: "This Council considers that, in justice to ratepayers, all land should be rated at its full value, irrespective of any reservation of the rights of sporting on the part of the owner."

Mr. A. PELL, M.P., moved the following: "That this Council is of opinion that hares and rabbits should be excluded from the operation of the game laws; but considers that such exclusion would render imperatively necessary some change in the law of trespass." He said that resolution was directly at variance with the Government bill, which seemed to him a most incomplete measure for dealing with what was admitted to be a fit matter for legislation. The 8th clause of the Bill introduced into the consideration of the question another party whom he was sorry to see there, namely, the lawyer (Hear, hear); and he believed that nothing could be more likely to interrupt good feelings between landlords and tenants, or to prevent a satisfactory solution of a question involving such conflicting interests. For many years he had considered it desirable that rabbits should be excluded from the game list (A voice, "They are not in it"). They were included under the name of "conies" in most of the Acts of Parliament, and constituted the code of the game laws. He had long been of opinion that, whoever it might offend, the words should be struck out; and he thought the advocates for retaining rabbits were bound to show that the whole nature of the animal had changed (laughter). Wherever a man chose to enclose rabbits in hutches, or in a ten-acre field, let him have the protection which he required for that purpose; but, unfortunately, in many parts of the country rabbits wandered about, not at their own sweet will, for there was nothing sweet about them (laughter), but at their pleasure, committing serious depredations upon land which was highly cultivated, and therefore he said they should not be in the game list. When they came to the question of hares there was greater difficulty; but he believed that public opinion had changed very greatly with regard to that animal, and he thought the Chambers of Agriculture, consisting of both landlords and tenants, should consider how far it was desirable to retain protection for the animal, which was often quite as injurious to agriculture as the rabbit, and in some cases even more injurious (Hear, hear). He, for one, was prepared to contend that that animal should also be struck out of the game list. It had been objected that by such a course they would make friends of the poachers. He had no desire to make friends of any man who broke the laws of his country (Hear, hear); but it was a very disagreeable fact for consideration, with regard to poachers, that at present there were hundreds of them who had made themselves friends of the farmers. Great a crime as poaching was, especially night poaching, it could not be denied that marauders who engaged in it had been instrumental in diminishing an evil, which but for them would have been far more mischievous. So long as protection was given to rabbits and hares by law, it would be the duty of the police to repress crime in relation to them as well as anything else; but the striking them out of the game list would do away with the crime which their retention created. Something had been said about rabbits as food. He had something to do with the town to which, as was stated the other day in the House of Commons, a large portion of the rabbits that were killed went to be eaten—he meant Leicester; but he could assure the Council that the presence of a live rabbit on a farm gave no satisfaction in the Midland Counties. He could not assent to the doctrine, that they ought to take into consideration the value of rabbits as food, unless they came out of enclosed places and off land which was

specially adapted for their production, in which case it was a mere question of account—whether they paid for keeping, or whether the cultivator lost by them. Everyone of these creatures that had its liberty, feeding at its own will, checked the production of mutton and beef (Hear, hear). The rabbit devoted his attention to turnips, the hare devoted his to wnrzels; they both completely prevented the cultivation of such crops as cabbages and tares; and to suppose that under such circumstances the production of rabbits which were sold at a shilling a-piece was an economical way of producing food, seemed to him altogether erroneous. The Government Bill provided that the question of damages arising from that source should be intrusted to men of skill, who were to inspect the farm and report the result. He believed it would be impossible to estimate the damage, especially as the very existence of rabbits prevented the growth of some of the most valuable crops (Hear, hear). With regard to the second part of the resolution, declaring that the Council "considers that such exclusion would render imperatively necessary some change in the law of trespass," he hoped it would not be supposed that this was a case of taking away with one hand and restoring with the other. The intention was, that some change should be made in the law of trespass which would enable owners and occupiers to keep off men who would otherwise be popping their guns wherever game was preserved. He trusted the Chamber would affirm the principle involved in the resolution that, for the end in view, the wisest course was to deal with the animals and not with the owners and occupiers (Hear, hear). It had been assumed, that if the relations of landlord and tenant were placed on a satisfactory footing with regard to game, the whole question would be settled. He did not think so. Speaking as an outsider, as one who took a moderate view of this question, he must say that he should not be satisfied unless the Legislature left tenants at perfect liberty to shoot these animals or get rid of them in any other way they could.

Mr. JASPER MORE had much pleasure in seconding the motion, because it was the conclusion unanimously agreed to by the Shropshire Chamber that hares and rabbits ought to be struck out of the game-laws; secondly, he thought it important that a definite decision should be arrived at; and further, it was his own opinion, after long considering the question, that this was the solution required. As it was desirable that opinions should be registered at their meetings he would state what took place on the subject in shropshire. The farmers of that county asked him to introduce the subject, and he did so in as important a statement as he could make. The largest landowner in Shropshire was the Duke of Cleveland, and he gave the shooting to his tenants. At the meeting hardly any one but the farmers who had the shooting would speak, the rest being afraid, and those who had the shooting acted as spokesmen for those on other estates. A magistrate of great experience told the farmers of Shropshire that if they were plagued with the game it was their fault, and served them right for not making better agreements. This line he had seen adopted at other meetings. In Shropshire they once had an estate that "struck"; all the tenants declined to take farms till the rabbits were killed. They threw up their farms, the rabbits were killed, and the tenants came back again. But the farmers must be of a very independent class to do this, and the small farmers would not dare to do it. Therefore, on behalf of the class whose education unfitted them for any occupation except farming, and who were obliged to take farms however over-run with rabbits or hares, he felt convinced relief must be given by striking hares and rabbits out of the protection of the game-laws.

Mr. BENNETT (Leicestershire) said: He foresaw many difficulties which might arise from a stringent law of trespass in the case of fox-hunting. If they destroyed all the pleasure of landlords and "their little game" (laughter), they could not expect to see landlords amongst them (laughter). If they wanted to have money circulated they must not drive landlords away.

Mr. HENEAGE, M.P., thought the law of trespass was a very dangerous thing to deal with. In his opinion when rabbits and hares were declared to be no longer game, they would become the property of the tenant; and as vagrants were taken up when found lurking near woods, why should they not be taken up when found lurking near fields? If there were a stringent trespass law, hunting would be a "gone con" altogether (laughter). He should like to move as an amend-

ment that rabbits should be made by law the property of the occupier.

The CHAIRMAN: They are so now.

Mr. A. PELL, M.P.: Not till they are reduced into possession.

Mr. HENEAGE, M.P., said he wanted to have the matter treated as larceny.

Mr. CALDECOTT said the change which he would propose was that there should be a summary remedy for trespass, and no necessity for proving pecuniary damage.

Mr. HENEAGE, M.P., moved, as an amendment, to insert after the words "That this Council is of opinion that hares and rabbits should be excluded from the operation of the game laws," "but that they should be deemed to be the property of the occupier of the land on which they are reduced to possession."

Mr. SMYTHIES seconded this amendment.

Mr. D. LONG supported the amendment, adding that he should have preferred the abolition of the game laws altogether, combined with the establishment of a stringent law of trespass.

Mr. WHITAKER hoped the amendment would be withdrawn.

Mr. C. S. READ, M.P., cordially concurred in the opinion that independently of the game laws, agriculturists needed a more stringent law of trespass. A few months ago, for example, some fellows in Norfolk dug out a litter of foxes, and because the fox was a wild animal there was no redress. He did not believe anything could compensate a farmer for the damage done by game. To show how little the Government understood that question, he might mention that it was provided in their bill that there should be only one arbitration in a year, so that if there were a crop of winter vetches and a crop of swede turnips in the same year, there could only be compensation for one of those crops (Hear, hear). He hoped it would not be supposed because he had spoken so strongly about the depredations of hares and rabbits that he was against the preservation of winged game (Hear, hear). Nothing, he thought, could be more disastrous than to annihilate sport in the case of that kind of game (Hear, hear). If he might point to a model landlord, he would allude to an owner of 20,000 acres of land in Suffolk. On that estate there were killed last year by the owner and his friends no less than 12,300 head of partridges and pheasants. And how many hares and rabbits were there? Three hundred and thirty-seven! Need he say that the tenants on that estate were the happiest, even in the county of Suffolk; or need he remark that that landlord was not very far from him? (cheers). [Mr. Read was understood to allude to the chairman, Col. Tomline.]

Mr. Heneage's amendment was then put and negatived.

Mr. WEBB moved to substitute for the resolution the following amendment: "That this Council is of opinion that if the several Bills now before the House of Commons on the subject of the game laws, the one introduced by the Lord Advocate and Mr. Secretary Bruce is the best calculated to meet the requirements of the case, and that clauses should be added to compel the payment of damage caused by over-preservation to the crops of adjacent owners, and hares and rabbits excluded from the operation of the game laws."

Mr. WHITAKER seconded this amendment, which on a show of hands was lost, only four hands being held up in favour of it.

Mr. STORER moved the omission of the words "hares and" from the original resolution, thus limiting the exclusion to rabbits.

Mr. COLTON seconded the amendment, which was also rejected, the numbers being 7 for and 9 against.

Mr. CALDECOTT proposed as an amendment that the second clause of the resolution should be as follows: "But considers that such an exclusion—that of hares and rabbits—"would render imperatively necessary a change in the law of trespass, by giving a summary remedy without the necessity of proving pecuniary damage."

The amendment having been seconded, the resolution was carried in this amended form, the numbers being 12 for the amendment and 11 against it.

The adjourned discussion on the provisions of the Elementary Education Bill having been resumed, it was resolved, on the motion of Professor BUND, "That the limit of distance which is to determine the exemption of a child from liability to attend school should be two miles instead of one as provided by clause 66."

On the motion of Mr. HENEAGE, M.P., it was further resolved "That it is the opinion of this Council that the age up to which children should be required to attend school be reduced from 12 to 10 years."

The proceedings then terminated with a vote of thanks to the Chairman.

THE TURNPIKES ACTS CONTINUANCE BILL.

DEPUTATION TO THE HOME SECRETARY.

A deputation from the Worcestershire Chamber of Agriculture had an interview with Mr. Bruce at the Home Office, Whitehall, on the Tuesday afternoon, on the subject of the abolishing schedules of the Turnpikes Acts Continuance Bill. The deputation included Earl Beauchamp, Colonel Tomline, M.P., Sir J. Pakington, M.P., the Hon. G. H. Lyttleton, M.P., Mr. C. S. Read, M.P., Mr. A. Pell, M.P., Mr. F. W. Knight, M.P., Mr. Laslett, M.P. for Worcester, and Mr. P. Amphlett, M.P.

Mr. AMPHLETT, M.P., one of the Worcestershire county members, opened the subject. He said the Worcestershire Chamber felt alarmed at the prospect of having the turnpikes removed and all the expense of maintaining the roads thrown upon the different parishes and districts. £195,000 a year was, it appeared, the total burden which was to be thrown upon the rates, and of that amount the share of Worcestershire would be £17,500; and having regard to the present position of the question of local taxation, and to the fact that a larger measure relating to roads had been promised, they wished to obtain the consent of the Government to the postponement of the abolition of the Worcestershire trusts, at all events for a year, when new legislation on the subject might have taken effect. The Worcestershire tollgates now produced a revenue of about £7,000 a year; and more than half the parishes were not included in any highway district.

In reply to a question from Mr. BRUCE,

Mr. AMPHLETT said there were eight trusts, and the debts were now all paid.

Mr. WHITAKER said that as regarded the City of Worcester the Highway Board had offered to remove the turnpikes beyond the city boundaries provided the Town Council would undertake to keep the roads in repair. There were five miles of road, the repairs of which were enormously expensive. Worcester being a large manufacturing town, it would be very hard for agriculturists who lived at a considerable distance to have to bear such a burden; and there was reason to apprehend that if the bill were passed as it stood the roads in that neighbourhood would become greatly deteriorated. In order to get rid of the debt the Board had limited the repairs to a thin coating of material, and every penny that could be obtained was now required to put them in a good condition. The question of the continuance of turnpike trusts had been recently discussed in the Worcester Town Council, and in a division the numbers were 11 for and only 14 against it.

Mr. LASLETT, M.P. for Worcester, said he had been requested to state that it would be a great hardship to the majority of the inhabitants of that city if the turnpike trusts were abolished before the whole system of maintaining the roads had been altered. For a considerable distance the roads would be chiefly for carriages, and ratepayers in a humble position would be burdened for the repairs.

The Rev. Mr. PEARSON, chairman of the Worcester Highway Board, said he hoped that nothing further would be done with regard to turnpike trusts before there was general legislation relating to roads. The effect of discontinuing turnpike trusts would be that many parishes in his county would be saddled with an additional burden of sixpence in the pound; while some parishes would in consequence of the expensive character of the roads have to pay altogether as much as 2s. in the pound, other parishes, the inhabitants of which also used them, paying nothing at all. Nothing could be more unfair or unjust than such a system.

Mr. BRUCE: But that is a kind of injustice which exists in other places where there are no turnpike trusts. There are roads leading to railway stations which are used much more by the inhabitants of neighbouring parishes than by those of the parishes which have to maintain them.

Mr. PEARSON said that the inequality which the deputation protested against was a new inequality which was threatened by Government legislation, and the result of which

might be that the roads in question would gradually fall into complete disrepair. He thought that before the process of demolition went on they ought to have some idea what the system of reconstruction was to be. What the Worcestershire Chamber then objected to was the immediate abolition of the trusts.

Mr. GUEST was remarking on the injustice of the proposed abolition, when

Mr. BRUCE, interrupting him, said: All this injustice of which you complain is the natural result of the whole system. You went to Parliament for the power to raise money; the Act was only to last for a certain number of years; you raised the money; you made your roads, you paid off the debt; when the time for the operation of the Act expires you return to the old common law system, and you consider that an injustice. For twenty years or more we have been abolishing turnpike trusts; you don't stand alone. No doubt there is inconvenience in the inequality which has been mentioned, but turnpikes were authorised for the general advantage, and not for the advantage of particular localities.

The Rev. Mr. PEARSON: If any hardship exists it should be remedied.

Mr. BRUCE: There is no hardship. You got your Act, made your road, and paid for it.

Mr. WHITAKER thought that if Mr. Bruce considered the matter he would see that there was hardship. Because Irish agriculturists had murdered landlords and land-agents they obtained justice, and he did not see why the Government should oppress another class of agriculturists.

Mr. BRUCE: It was part of your bargain that you were to be murdered in this matter at a certain time (laughter). The time is come when you are to cease to live, and it is justice and law that you should cease to live.

Mr. WHITAKER said he could not admit the justice of that reasoning. He knew as an agriculturist that persons of his class had great difficulty in paying their local rates already; and he contended that property to the amount of £100,000,000 ought not to go free.

Mr. BRUCE: We cannot go into that; it is too general a question (Hear, hear).

Mr. WHITAKER continued: Agriculturists felt the difficulty with regard to roads most grievously, and they thought they were ill-treated when with a general Government measure looming in the distance the abolition of turnpike trusts was hurried forward. Why should there be such haste in the matter? Here was a turnpike trust which had existed for a century, and to abolish it in order to gratify the determined disposition of certain Members of Parliament, and thereby impose on the ratepayers an additional burden of 4d. or 5d. in the pound was, he submitted, in the present state of agriculture and with the prospect of a new general Bill, a gross injustice.

Sir J. PAKINGTON, M.P., must say that he had not been converted by the argument of the Home Secretary with regard to the expiration of the trusts. When a man seemed likely to die the usual course was to send for the doctor; and, in like manner, the deputation regarded the right hon. gentleman as the doctor in the present case, and looked to him to avert the apparently impending fate. He did not agree with him that the immediate abolition of the trusts was an unavoidable result of the existing system; and, although they must no doubt make up their minds to encounter some great change of system, yet they asked the Secretary of State to endeavour to mitigate and diminish the evils attending that change (Hear, hear).

Mr. BRUCE: I am afraid there is no middle course between letting trusts go on in their present state and putting an end to them. If there were any middle course I should be happy to adopt it.

After some further remarks from Sir J. Pakington,

Mr. BRUCE said he admitted that there was great force in some of the arguments which had been used, and he felt that there was special ground for consideration in the case of roads which when the trusts expired would receive a large amount of traffic from other roads. All he could say was that he would take the arguments which had been addressed to him into consideration, and give the subject his best attention. He could not state at that moment what course the Government would pursue.

The deputation then withdrew, the interview having occupied about an hour.

A SKELETON SKETCH OF FREE TRADE.

[The subjoined remarkable letter, which it will be seen the writer signs as "Chairman of the Central Chamber of Agriculture," has just been put into circulation. Is it to be understood from this that the Chambers are committed to such a manifesto?]

And hunger's scowl was prophecy.—E. ELLIOTT.

GENTLEMEN,—We shall have a free mint. No Government will again be able to refuse silver and gold coins to men whose business in life is to earn them.

One cause of pauperism will be removed. Others remain in excessive taxation and unequal rates. I venture to ask you to consider what our position is now, and what it might be?

One per cent. is a light tax.

The Probate and Legacy Duties average $4\frac{1}{2}$ per cent.

The Malt-tax is 100 per cent.

Railway passengers contribute 5 per cent. to the Exchequer.

The duty on Tobacco in England and Ireland is—

Prohibition to grow it.

Local Rates are 15 per cent. on one-third of the income of the nation.

One per cent., therefore, is a light tax.

Six per cent. is taken from the silver coinage, which, though it be the wage of all industry, is limited in amount.

The duty on an Inland Bill of Exchange for £10,000 is £5. The duty on £10,000 in shillings, which are the livelihood of poor men, is 600 sovereigns; and neither the sovereigns nor the shillings are permitted by the Chancellor of the Exchequer to be coined, though bills may be multiplied at the pleasure of rich men.

The duty on a Foreign Bill of Exchange for £10,000 is £1 13s. 4d.

The Bank of England deducts $1\frac{1}{2}$ d. from every ounce of gold bullion which it receives in exchange for bank notes. If the metal remain uncoined it does nothing for this charge. £2,000 per million is only part of its profits if the gold be coined, though the expense be borne by the taxpayer.

The Bank has charged 10 per cent. for the loan of bank notes, with the consent and advice of Government, to break the law when in difficulties.

Mr. Lowe has justly proposed to take 1 per cent. from the sovereign to pay Mint expenses. In India there is a duty of 1 per cent. on gold; of 2 per cent. on silver, the poor man's metal. In Australia the duty on gold coin is 1 per cent.

One per cent., therefore, from the circulation is a common and light tax.

The assessed taxes stop employment and deny to Englishmen freedom of trade, which for many years seems to have been reserved for foreigners. These duties are now paid in advance, and a poor man has no practical appeal from the Surveyor, but is at his mercy.

Therefore the assessed taxes are a grievance.

The Income-tax is a sad source of immorality. Fifty-seven millions in Schedule D escape the tax unfairly; and this immorality, become systematic, is ruining our commercial credit at home and abroad.

Therefore the Income-tax is a grievance.

The Malt-tax is a charge of 100 per cent. on the arable land of England and Ireland. It is borne chiefly by poor men, and injures the character of statesmen, who declaim in favour of free-trade, while they refuse it to their countrymen.

Therefore the Malt-tax is a grievance.

A tax of 1 per cent. shown to be comparatively light, on funds which pay no poor or other rates, would supply the means of redressing these three grievances.

The London Clearing House statistics explains this:

£3,720,623,000 in cheques and bills were paid there last year.

One per cent. on three billions seven hundred and twenty millions six hundred and twenty-three thousand pounds, which now pay scarcely a tax and no rates, would give £37,206,230, collected weekly, by stamps, without the expense and annoyance of Excisemen, Income-tax Commissioners, or Surveyors of Taxes.

No poor man would feel this tax, and the wealthy might escape by using coins, which would become abundant instead of continuing scarce, as they are now.

One per cent. on unlimited paper money is a favour if contrasted with 6 per cent. on silver coin, which is limited, depreciated, and when exported not to be replaced.

If other nations had Free Mints and Free-trade they could be customers to each other, with power to purchase, of which

now all are destitute. In the Banks of France and England £73,000,000 are hoarded. Were these coins circulated, the French Treaty would be a success; now both nations complain of it.

I give a skeleton sketch of Free-trade, and ask you to examine it, bearing in mind that under our present system, 1 man in 18 is a pauper, that other nations are as poor as we are, and that over-production and depression of trade mean that neither at home nor abroad can we sell what we produce to people who are willing to buy, but are not permitted by their Ministers of Finance to have coins with which they can gratify their desires.

I have the honour to be, your obedient servant,

GEORGE TOMLINE,

Chairman of the Central Chamber of Agriculture.
Orwell Park, Ipswich, May, 1870.

A BREEDING FLOCK ON HEAVY LAND.

At the meeting of the Ixworth Farmers' Club, the Vice-President, Mr. P. Huddleston, in the chair,

Mr. J. Fison, of Barningham, said: The purport of this paper is to assert and show, from a practice of more than a quarter of a century, that farmers may be independent of bullocks. I must premise my particulars by erasing your indulgence and gentle judgment, inasmuch as I have too recently engaged in agricultural pursuits to perhaps critically or correctly convey my ideas. The object of our meeting is, however, well understood; one gentleman is elected to bring forward a subject for discussion. This follows, throwing light and shade, assents and dissents, on the matter treated. I freely confess my knowledge of stock is so limited that I look forward to your friendly critiques with considerable interest. I will thank you to remember I am only pursuing a system of farming as commenced by my late father, and continued by him for many years; his rough and useful appliances I found ready to hand, and, as I before stated, my ignorance of farming detail prevented my attempting anything beyond what was well understood on the farm. Whether our system be or be not too elaborate and expensive, I must leave for your collective wisdom to determine. In order that you may arrive at something like a correct estimate, I beg to tell you that last year my labour at 11s. per week per man cost £1 18s. 6d. per acre for harvest, thatching, picking stones, thrashing, chaff-cutting, draining, and a carpenter—everything, in fact, excepting steward's salary, lamb money, and shearing; with these addenda it cost £2 3s. 6d. I shall feel obliged by any opinion respecting this heavy item. My occupation consists of two small farms, very inconveniently lying right and left. These collectively represent 280 acres of good land, requiring draining, 25 of which are pasture, not super-excellent, as our friend Mr. Goldsmith stated, but rendered prolific by the maintenance of an unusual quantity of sheep. We keep 420 half-bred Leicester ewes, purchasing, as a rule, the largest two-shear we can pick. With these and our horses we make our manure. For the long period mentioned heavy crops have been raised entirely without the agency of bullocks. We use Oakey's tups, which we think have a dash of Cotswold in them. Please note this, and subsequently give me your opinion, as I have been recommended to revert to a prurer breed—to use the improved Hampshire as raised near Salisbury. Our fall of lambs averages heavy; last year and this are exceptional. Last year the absence of the usual stimulant—rape—at the time the males were turned to the ewes, was against us, and that the rape is a most useful food at that particular time we had a singularly plain proof. As we had a small quantity which lasted a fortnight of the time the tups were with the flock, the corresponding time for lambing cheered us with a good fall. The other portion, though we gave them best linseed-cake, was miserably slow, and the fall small. If similarly again so situated, I would use barley cautiously, or beans. In 1866 we sold 614 lambs, realizing £788; in 1867, 617, making £743 3s. 6d.; and in 1868 596 sold for £602, and in 1869 544 for £519 17s. 6d.; for four years an average yearly sale of £668 3s. 3d. I am able to account for our small crop this year. Our quantity now rearing is about 27 score. For last autumn and the spring-feeding we provided 26 acres of rape, 8 of which

were after early dun peas, now in wheat; 4 acres of cabbages, now in barley, about half-an-acre being left for lambing; 20 acres of turnips, six of which, after a bad layer, now in wheat, 5 acres were swedes, the latter partly drawn and partly fed on land were grown; 18 acres of beet, 10 of which were autumn tilled, 8 after rye—the 10 acres are in wheat, the 8 in barley. The flock was folded in autumn on turnips, stubbles, &c., supplemented by barley-straw chaff, layers slightly run over. For spring feed—30 acres of layer, 8 rye, now planted with beet; 13 acres of Italian rye-grass, to be broken up as early as we can and sown with rape, followed by wheat; 11 acres tares and oats. We began using beet in January, pulping about 16 bushels daily, mixing them with chaff. You will understand the term chaff implies cut barley-straw; the quantity daily increases, till some days we have 300 bushels consumed, and as soon as we think it necessary we commence adding corn or cake ground, beginning at four stones daily, increasing to 18 stones. On March the 26th our week's corn, &c., was—4 coombs of barley, costing £2 10s.; 4 coombs of peas, £3 8s.; $1\frac{3}{4}$ linseed-cake, 18s. 4d.; $1\frac{3}{4}$ cotton-cake, 10s. 6d.; grinding, 8s.; toll, 2s. 6d.—making £7 18s. 10d., or a daily cost of £1 2s. 8d. Here, again, for the ewes I have been advised to replace linseed-cake by cotton, husked palm-nut meal, and corn. The flock is yarded when the weather becomes wintry, and there trough fed with the chaff mixture morning and night, or when necessary having a run of a few hours, according to weather, on some pasture where is thrown out one or two Scotch carts of roots. Our usual time for turning in the males is the 9th of October, but this year we advanced the time a week, as you may be sure we are anxious to clear our land as early as possible. Our farm is generally cleared by the middle of June, and as early as prudent our ewes go out to keep; last year we kept them at home, but, judging by the experience of my late father and our observations, it is in our case no gain. It is considered by us that the change of locality benefits the flock and increases the fall of lambs. Of course it sweetens the farm. The lambs are dropped in the yard, which at this time really presents a most busy and interesting little world. Two long sheds are enclosed, with pens on each side, to which the ewes and lambs are conveyed immediately on the birth of the latter, and from which in a few hours they are drafted off according to condition of mother and lamb into sundry small lots. They are still penned and daily drawn off, making three lots—single, doubles, and weak mothers and lambs. The doubles, of course have the best pick and the larger allowance of artificial food. Implements are unhoused, barn, straw-houses—in fact, every available space is devoted for a few weeks to the respective lots. The management of the lambs afterwards is a repetition of other farmers' plans—layers folded, lambs running forward to an advanced fold, in which troughs with cake and peas are placed. I omitted mentioning our sheep-yard has fresh straw almost every day. I buy the best cake, fearing cotton-cake, where so much dry food is used; but at Barningham Hall it is used without bad results. I am trying it this year, as you find. We find in wet seasons the following mixtures invaluable when diarrhoea follows too-luxuriant or wet food: Powdered catechu, $\frac{1}{2}$ oz.; powdered ginger, $\frac{1}{4}$ oz.; prepared

chalk, 1 oz.; peppermint water, $\frac{1}{2}$ pint; lamb dose, two table-spoonfuls night and morning. One very serious evil resulting from an over-stocking is the foot-rot, which we minimise as much as possible by separation; all remedies I have tried are useful for a time, but nothing is so rapid in its effect or permanent as the following, which I give in the hope it may be useful: Ounce of quicksilver dissolved in an ounce of nitric acid, and to this subsequently add $\frac{1}{2}$ pint of vinegar. Like other flockmasters, we have both seared and drawn successfully; we practise the latter now—but with the assistance of the knife, we have lessened very much the exhaustion, and indeed pain of the poor victims, to say nothing of the disgusting features of the old mode of drawing. You will observe that the bulk of our winter-feed is cut barley-straw; we cart the barley at the barn-door, where the drum is so placed as to eject the straw into the straw-house, which will contain two days' thrashing, the cutter converting it into chaff in about the same time—by steam, of course. We consumed in the winter 1868-69, 69 $\frac{1}{2}$ acres of barley-straw so converted, and more this winter. What remained was fermented with cut wheat-straw, tares, and a sprinkling of salt; this we find admirable food for our horses, and lessens interruption in harvest. Our wheat-straw is converted into manure, as you see by the agency of the flock. Ours I am aware is a system which cannot be carried out on every farm; and our returns simply consist of wheat, barley, and lambs. To make this as large as possible, we steal all we can, cropping in a very irregular way, and getting as large an acreage as possible. Our present corn-growing is 84 acres barley, 60 wheat, and 10 early peas, these to be followed by turnips or cole, and further followed by either wheat or barley. Our last year's crop was 86 acres of barley, 64 wheat, and 8 early peas, followed by early rape (now in wheat), and 3 of peas and beans. Our crop in 1868, you will observe, shows the irregularity of acreage when we come to it. This striving after effect of course adds much to horse-wear labour, as also the careful treatment of the flocks; but the balance-sheet shows the figures on the right side. Yet the expenses are so heavy, I confess I am always vexed at the close of our farming-year (Michaelmas Day), that the per side does not show a heavier result; further than this, it teaches me indisputably that farming, though a most enjoyable occupation both for mind and body, is very far from an El Dorado. It may interest you to hear a rough statement, which I found amongst my father's papers, of the supposed cost and profit of 20 score ewes from July 1, 1861, to June 30, 1862.

The following is the statement:

	£.	s.	d.
To Feed purchased	96	6	0
" 280 sacks of chaff at 3d.	3	10	0
" 20 weeks ditto, 140 per week.....	35	0	0
" Malt colrus	11	4	0
" Cake.....	76	12	0
" Offal.....	20	5	0
" Cleaning beet	7	0	0
" Carting ditto	5	10	0
" Horse mencing.....	4	0	0
" Shepherd's wages	38	16	0
" 612 lambs at 6d.....	15	6	0
" 17 acres of turnips.....	17	0	0
" 25 ditto beet	140	0	0
" 28 ditto Italian grass	14	0	0
" 13 ditto rye.....	6	10	0
" 3 coombs beans	3	6	0
" Keep of 5 sheep	5	0	0
" 20 acres of layer	20	10	0
" Extra labour—sheep	21	10	0
" Replacing crones.....	100	0	0
	641	5	0
Profit	250	5	0
	891	10	0
By 608 lambs	637	10	0
" 4 tup ditto	10	0	0
" Wool	122	0	0
" 72 acres folding	72	0	0
" 500 loads of manure	50	0	0
	891	10	0

This seems an approximation only, as there is no credit entry for sale of crones and skins. Further, as this is a case 'Sheep versus Bullocks,' and to more fully carry it out that farming may be successfully practised without the latter, I give you the corn valuations for 1868 and 1869, with their results:

MICHAELMAS VALUATION, 1868.

Acres.	s.	£	s.	d.
70 $\frac{1}{2}$ wheat, 10 coombs per acre, at 25.....		881	5	0
69 $\frac{1}{2}$ barley, 11 " " 20.....		764	10	0
10 peas, 7 " " 20.....		70	0	0
13 peas and beans.....		104	0	0
		1,819	15	0
Plus valuation.....		334	1	9

RESULT.

Wheat sold.....	949	19	10
Barley.....	1037	16	10
Peas consumed.....	85	0	0
Beans and peas.....	91	0	0
	2,153	16	8

MICHAELMAS VALUATION, 1869.

Acres.	s.	£	s.	d.
64 wheat, 11 coombs per acre, at 22.....		774	8	0
86 barley, 11 " " 18.....		851	8	0
8 peas, 11 " " 17.....		74	16	0
3 peas and beans, 9 " " 20.....		27	0	0
		1,727	12	0
Plus valuation.....		1	18	6

RESULT.

Wheat sold.....	806	11	9
Barley sold, £649 2s.; 48 $\frac{3}{4}$ coombs used for seed, at 17s., £41 8s. 9d.; 21 coombs winter, at 15s.; £15 15s.; 178 dross, at 13s., £115 14s.	821	19	9
Peas consumed.....	76	19	0
Peas and beans ditto.....	24	0	0
	1,729	10	6

My barley was very inferior, and manures, value £70, were worse than thrown away; though I grew 1,041 coombs, the result, as you see, was considerably below the 69 $\frac{1}{2}$ acres of the former year. Gentlemen, I must apologise for my discursive paper, and at the same time thank you for your polite attention. I appeal to you for the verdict—That these facts, running over so many years, indisputably prove that farming can be carried on with good results without bullocks.

The CHAIRMAN asked how many months the sheep were kept in the yard?

Mr. FISON said they were put in as soon as the weather became wintry, and kept there until the lambing, and then they were drafted off as he had explained.

The CHAIRMAN said he should like to hear why light land farmers did not carry out Mr. Fison's system, as he did not see why it should not be equally successful. He was surprised at the large number of sheep Mr. Fison kept upon 260 acres of land.

Mr. HATTEN said it was more expensive keeping sheep in the yard than on the land, and he should like to know the total cost of keep for Mr. Fison's in the winter months. He kept his on the land, and it cost 7s. a-week to feed them, but Mr. Fison's cost him a good deal more.

Mr. FISON said his cost £1 2s. 8d.

Mr. HATTEN said it cost more, taking into consideration the carting of the roots to the yards.

The CHAIRMAN said there was a great deal of extra labour in keeping sheep in the yard, and he wanted to know if Mr. Fison included that in his average per acre.

Mr. FISON said every farthing for labour was included in his calculation, and it was a great deal too much. He wanted to learn whether by expending money in that extra labour he was on the right track.

Mr. MANFIELD thought sheep on heavy land paid better than bullocks, and Mr. Fison not only got a good return for his sheep, but also a good return of corn. He should like to know how much land was given up to sheep.

Mr. FISON said about 25 acres.

Mr. MANFIELD said he was of opinion that keeping sheep

on light land on Mr. Fison's system would not do, as drawing the roots off impoverished it. Mr. Fison did not farm on the four-course system, and that was a point to be considered. The feeding off roots on heavy land often did more harm than good.

Mr. FISON, in answer to Mr. Hatten, said his flock was now in as good a state as ever it was.

Mr. S. W. HUNT said in Barningham there was land that would not be found in many parishes, and besides Mr. Fison kept profitable sheep, and his was altogether an exceptional case, and should not be put forth as an average one. People would be led to suppose that farming was a very paying occupation, but it was not so. Mr. Fison's land was far superior to many people's, although there was great credit to him for what he had done. His system would not pay on an average farm.

Mr. FISON said he had some land on his farm as heavy as any in the county.

Mr. HARRISON: Not much.

Mr. FISON said there were about 24 acres, and it did not produce 5 coombs an acre.

Mr. HARRISON said even that was not to be compared with some of the heavy land in the county.

The CHAIRMAN said Mr. Fison's might be good land, but Mr. Hunt said it was very well managed, and that might apply to many other farms. He saw no reason why they should stand still at a four-course system if it was not the best, but that was a very large question.

Mr. HUNT said many farmers, if their landlords would allow them, would be glad to farm on another system. There were many who could not, like Mr. Fison, farm as they liked. But they must remember the four-course shift of the present day was different from that of fifty years ago.

The CHAIRMAN said if the tenant's interest was adverse to the landlord's, there was an end to the question.

Mr. HUNT said farms were let to the highest bidder, without any inquiry being made as to whether the tenant had any capital to carry them on, and he thought that ought not to be. If a tenant had capital, then he ought not to be tied down to the four-course system.

Mr. TAYLOR asked if the four-course system deteriorated the land? If not he could not see any objection to keeping to it.

Mr. HARRISON said they were all indebted to Mr. Fison for bringing the subject before them. He had not had much experience in feeding sheep from yards; but what he had had gone against him. If sheep were kept on the land, there was the manure already spread, and on mixed soil and light land it would be ruinous if the sheep were not folded on the land. Mr. Fison's item for labour was very heavy. By the request of Mr. Fison, he had looked into his (Mr. Harrison's) labour account, and he found that from 1833 to 1844 his wages were for three years 9s. a week, and for four years 10s., making an average of £1 9s. 10d. per acre. From 1863 to 1869 they varied from 9s. to 11s., and averaged 16s. 4½d. per acre; and this was far below Mr. Fison's average, for his labour was very heavy compared with labour throughout the country. As to the four-course system of farming, he did not think they could beat it, and on land of the description of Mr. Fison's it might be made to grow something in the fallow shift.

Mr. HARRISON contended that his corn and lamb returns were satisfactory, and his experience after three years was that feeding on the land was injurious instead of beneficial. As to wages, Mr. Harrison's averaged £1 10s. per acre; and his, which included a farm steward and the extra carting, only averaged £1 18s. 9d. The four-course system was the most simple; but, at the same time, great results might be obtained by farming as he did, although it entailed a large amount of labour. His farm had been farmed well for fifty years, and that made a great difference.

Mr. HARRISON said his wages were beyond the regular average, and he was known to be an extravagant farmer. With regard to what had been said about tenant-right, he was not of opinion that it was landlord-wrong. A change in the present tenant-right was necessary; and although he was not so much in favour of leases, he should like to see a two years' notice, subject to all improvements, being made by the incoming tenant.

Mr. T. GOLDSMITH said he could farm his land as he liked, but he would not farm out of the four-course system. He tried it once at the Dairy Farm, and it entirely beat him.

The CHAIRMAN said if a person who had not much capital did not farm on the four-course system he would be out of pocket.

A vote of thanks to Mr. Fison and the Chairman closed the proceedings.

THE SCOTCH FARMERS ON THE GAME BILLS.

At a special meeting of the Logie and Lecroft Farmers' Club, held at Bridge of Allan, to consider the Game Bills at present before Parliament, Mr. Wm. Henderson, Craigarnhall, in the chair,

The CHAIRMAN said: The resolution which has been put into my hands to move is, "That the Bill brought into Parliament by the Lord Advocate and Secretary Bruce, intitled a Bill to amend and assimilate in certain respects the laws of England and of Scotland relating to game be opposed and rejected." We have heard much of late of the curiosities of the Game-laws, but how such men as Lord Advocate Young and Secretary Bruce, both representatives of Scotch constituencies, should ever think of passing such a Bill is past my comprehension. It is called a Bill to amend the laws relating to game. Its amendments, if any, are altogether in favour of the landlord, a game-preserver, and against the tenant. It sets out with a flourish, that "the sole right of taking or killing game shall belong to the tenant." Very good, indeed, and quite as much as could be expected; but here comes the gull, "unless expressly reserved by the landlord." This right to reserve by the landlord is at the root of all the mischief, and so long as this power of reservation is allowed to the landlord, the rest of the Bill goes for nothing. The late Lord Advocate (Mr. Moncrieff), when in Parliament, told the House that game was the property of no one. There is really something curious about these Game-laws, which no ordinary mortal can possibly understand. Why give the power of reserving the game to the landlord, or rather the power to prevent the killing of game, when it actually does not belong to him? By this Bill, the power being still retained to the

landlord to reserve the game, the tenant will have to feed animals having no rightful owner, and yet the landlord has the power to prevent him killing them for the purpose of protecting his property. Can anything be more absurd than this? And as game is known to travel far in search of food, the better and sweeter the tenant's clover, the more hares and rabbits will he have to eat it; and the thicker he sows his corn, the more winged game he will have to pick it up. This reserving power of the landlord seems to me sufficient cause why the Club should oppose the Bill, and do all in its power to prevent such a contemptible piece of would-be legislation from passing into law; and I do therefore move accordingly.

Mr. ANDERSON (Westlees) said: I beg to second the motion. Surely the learned Lord Advocate was not aware of the state of feeling in the country in regard to the Game-laws when he brought in his Bill to amend them, otherwise I consider his Bill to be rather an insult to agriculturists than a remedy for their grievances, and therefore should be strenuously opposed, for few farmers would venture to enter the Court of Session against their proprietors.

Mr. PEAT (Manor) said: The motion that has just been passed shows what we wish to avoid; the one I have to propose is what we ought to do, which is as follows: "That Mr. Loch's Bill be approved of, and a petition in favour of it to the House of Commons forthwith sent to Mr. Campbell, M.P. for the Burgh of Stirling." Of the four game Bills at present before Parliament against the Game-laws, Mr. Loch's appears to be the most equitable one for all parties; it protects the interest of both landlord and tenant, and prevents the one party from unduly taking advantage of the other. It does

not interfere with winged game, which affords most sport to the sportsman, and it divests the landlord's right in favour of the tenant to kill the hares and rabbits, which commit the chief injury on the crops, and incur so much distrust and bad feeling between landlord and tenant. The clause making it illegal for the landlord to claim the right to the hares and rabbits on the land let to the tenant can, I think, on the score of interference with the liberty of bargain-making, be easily got over, because it is just a clause for preventing the powerful taking unfair advantage of the weak. Many parallel enactments are at present in operation and work well. It should also be kept in mind that our importations of grain are very considerable and yearly increasing, and it seems right that the law should step in and prevent owners of the soil from making an abuse of its capabilities, or turning the land into little account when the country stands in need of its amplest crops. Another part of the bill puts an end to contracts already made, protecting the hares and rabbits, but affords full compensation to the landlord by the tenant, so the landlord meets with no pecuniary loss by the change. There is another very good clause allowing compensation for damage caused by an undue number reared by owners or tenants of adjoining lands, and like the smoke arising from chemical works, creating a nuisance all round. The clause is applicable to this district; it also provides that all prosecutions under the Game-laws should be before the Sheriff-Substitute of the county, and not cognisable by Justices of the Peace, thereby doing away with the double part acted by the justices of being a party in and judge of the

same case. The Bill contains some other useful clauses, and altogether I think we should petition in its favour.

Mr. JAMES M'LAREN (Spittal) said: The resolution which has just been proposed by my respected friend, Mr. Peat, to support Mr. Loch's Bill now before the House of Commons for modifying and improving the Game-laws in this country does, as I believe, give general satisfaction to the great body of practical farmers. It does come short in some points, but upon the whole I am persuaded that were Mr. Loch's Bill, in its present form, passed into law, it would have the effect of settling in a great measure that long vexed question between landlord and tenant which has for many years been the cause of so much unpleasant and unprofitable litigation between these parties on that account, and also as a general public good I have much pleasure in seconding Mr. Peat's motion.

Mr. WINGATE (Corntown): In this year's Budget, the Chancellor of the Exchequer has announced that it is intended to repeal the game licences, and to impose a tax upon guns instead of them. As there is no exemption on behalf of guns used by farmers for the protection of their corn and green crops from injury by rooks, ravens, wild pigeons, and other destructive birds not under the protection of law, I beg to move that a representation be sent to the Chancellor of the Exchequer, urging upon him the propriety and justice of exempting guns from said tax which are so employed for the protection of the said crops—the main necessities of life.

Mr. JAMES FINLAYSON (Pendreich) seconded the motion, which was unanimously agreed to.

PAROCHIAL ASSESSMENTS.

The following paper was read by Mr. EDWARD RYDE at a meeting of the Institution of Surveyors, Mr. R. C. Driver in the chair:

This paper contains a description of the various kinds of property in respect of which poor rates are levied, and the manner of valuing that property for the assessment. Property to be expressly liable to the poor rate under the statute of Elizabeth must be "locally within the parish;" "visible within the parish;" and, "productive of a private profit within the parish." Briefly it may be described as—1. Lands (in occupation) in the parish. 2. Houses (in occupation) in the parish. 3. Tithes inappropriate and appropriations of tithes arising within the parish. 4. Coal mines (in occupation) in the parish. 5. Saleable underwoods in the parish. All the lands in occupation in a parish, except woodlands, are rateable; but the word "lands" in the statute does not appear to carry the usual legal meaning of that word, because it cannot include houses, as they are separately referred to therein. The words "lands and houses," together, have been held to include all descriptions of landed property used for any purpose above the surface of the ground, excepting that of growing wood and timber. These products of the land have always been held to be exempt, because "saleable underwoods" are specially made liable. In the same manner, as regards things below the surface of the soil, the courts of law have always held that all mines, other than coal mines, were intended to be exempted from poor-rate, because "coal mines" are specially by name made liable (*Rex v. Sedgley*, 2 B. and A. 73). This speciality has raised a difficulty. It has been necessary for the courts to determine where land, which is rateable, ended, and a mine, which is not rateable, began. In the case of *Rex v. St. Austell* (reported in 5 B. and A. 693), it was held that a part of the produce of a mine (not a coal mine) reserved to the owner was subject to the rate—not as a mine, but as a reservation of the soil or land itself—and the owner was held to be rateable as occupying the land. In the case of *Rex v. Sedgley*, Lord Tenterden thus described the difficulty he felt in attempting to reconcile the judicial dicta on this subject: "The whole mine, not being a coal mine, is exempt. If the owner works the mine and takes the whole produce, he is not rateable for it, either as a mine or land. If he lets it to an occupier, reserving a rent, the occupier is not rateable for it either as mine or land, nor is the owner liable, no one being rateable for a mere rent. But if the owner lets it, reserving a part of the produce, that part is held to be land,

although the whole mine, or the whole of its produce is not land, and the owner is rateable for this part of the mine as occupier of land, though he would not be rateable for it if he occupied and worked the whole and took directly the whole produce." In the case of *Rex v. Earl Pomfret* (5 M. and S. 139), it was held that one of a lead mine, reserved by the owner, which had to be smelted before it was rendered, was not a portion of the soil, and not subject to the rate. And in the case of *Rex v. Tremayne* (4 B. and A. 162), it was held that where the reservation to the owner was the value in money of a portion of a mine, other than a coal mine, the owner is not rateable for that. In the case of the *Telargoch Mining Company v. St. Asaph Union*, it was held that the appellants were rateable to the poor rate in respect of the occupation of a stream, which they had diverted from its natural course for the purpose of working the machinery connected with a lead mine which was not rateable. The water-course was about a mile and a half in length, being partly open, partly tunnelled, and for about 350 yards in pipes. The company were owners of part of the land occupied by the water course, and part of it they rented. The land was held to be enhanced in value by its capability of conveying water and not exempt from rateability by reason of its connection with a lead mine. Operations involving the consumption of the body of the soil itself, but which do not amount to mining, render the land operated on subject to the rate. For example, stone quarries, lime works, slate works, salt works, potteries, brickfields, pits of fullers' earth, sand, marl, and gravel have all been held to be rateable, but with this distinct qualification—that if the minerals cannot be got without involving a mining operation, then they are not rateable. To enumerate all the purposes for which lands can be so occupied as to be rateable would, in these days, almost amount to an impossibility. There are lands used for agricultural purposes, accommodation lands, building lands, railways, private roads and ways, canals, reservoirs, docks, gas works, water works, markets, yards, wharves, bleaching grounds, fisheries, &c. As regards navigation and fishing, a mere right over the water, without an interest in the land, is not rateable. The right of shooting over land occasionally complicates questions concerning the rateability of the respective occupiers of the land and the shooting. It was clearly laid down in the case of the *Queen v. Battle Union* (L. R., vol. 2, p. 8) that, where an owner retains in his own occupation woodland, but lets the right of shooting over it with a neighbouring mansion, he is

rateable for the land and the shooting, on the ground that the right to take game is an incident to the occupation of the land, and that he derives a benefit, not from taking the game himself, but from a pecuniary recompense made to him for allowing some one else to take it. His occupation of the woodland is productive to him of a value enhanced by the rent which he receives for the shooting. The case of *Reg. v. Thurlston* was of a different character. The landowner had let a farm to one man, and had granted the right of shooting over the farm to another. It was held that the occupier of the farm is to be rated only for the bare occupation of the land (28 L. J., M. C., 106). The right of shooting alone without the occupation of land, or without connection with some rateable subject, is not rateable. This was decided in the case of the Overseers of Hilton and Wakefield, and the Overseers of the Township of Bowes (L. R., vol. 1, p. 359). It was there laid down that, in order to make a person rateable to the poor rate, he must be the occupier of some subject matter which is itself rateable; but the rateable value of the subject matter may be enhanced by something which is incident to the occupation, though not in itself rateable, such as the right of shooting. The case was a very peculiar one. The wastes of a manor had been converted into a stinted pasture under an inclosure award; but the rights to minerals and of shooting were left in the lords. Thus the right of shooting has been severed from the ownership, as well as the occupancy of the soil. Springs of water are rateable in the sense that they enhance the value of the lauds in which they arise. In the case of *R. v. Miller* (3 Cowp. 69), Lord Mansfield said: "The value of the four acres of land arises partly from the building and partly from the spring that produces the mineral water." In the case of *Rex v. New River Company*, the land in the parish of Anwell was of the value of £5 only; but it had a spring in it, which enabled the company by means of pipes to bring water to London, and which increased the value of the land. The land with this spring in it was therefore rated at £300, although the water alone would not have been rateable at all, and the land alone would only have been rated at £5. The rateability of "lands" may be very fairly summed up by the "rule of thumb" of our ancestors, viz., that everything in the parish which can be seen is rateable except woods, other than saleable underwoods, provided always that there is a beneficial use and occupation made of them, and that they do not belong to the Crown. "Houses" being expressly mentioned in the Act, in the same way that coal mines and saleable underwoods are mentioned, it might have been supposed, as in the case of other mines and other woods, that houses only are rateable and other buildings exempt. But, if ever such a construction has been contended for, it has not been held to be law. All houses, whether the dwellings of man, cattle, or animals, are subject to the rate. So are barns and granaries for the housing of corn or produce, warehouses, lighthouses, machine houses, and the like. So also are kilns, furnaces, factories, mills, bridges, and erections of every kind, with the following exception, viz., property occupied for the purposes of the Crown. Neither the Crown, nor the King, nor the Queen, being named in the Act of Elizabeth, is bound by the Act; and it has been held to follow that lands or houses occupied by the Crown, or for the purposes of the Crown, are not liable to be rated. This principle exempts from rates not only royal palaces, but also the offices of the Secretaries of State, the Horse Guards, the Post Office, and many similar buildings. Police Courts, County Courts, and even County buildings occupied as lodgings at the Assizes for the Judges, have been held to be exempt on the ground that, in effect, the Crown is in occupation by public servants, carrying out the purposes of the Government of the country. The Queen is the fountain of justice to all subjects of the realm, and buildings which are necessarily occupied for the purpose of administering justice and cognate objects, are within the exception, as buildings really occupied for the discharge of duties arising out of the prerogatives of the Crown. The Queen *v. St. Martin's, Leicester* (L. R., vol. 2, p. 493). The Queen *v. Castle View, Leicester* (L. R., vol. 2, p. 497). But, nevertheless, in the case of the Justices of Lancashire and the Overseers of the Township of Clichtham (Law Reports, Q. B. Cases, vol. 3, p. 14), it was held that buildings used as courts, lodgings for Her Majesty's Judges and other officers, lock-ups, and all other accommodation necessary for carrying on the civil and

criminal business of the Assizes; but, out of which a profit is made by letting portions of such building to the Corporation of a town, notwithstanding the Corporation use the building for public purposes, are liable to be rated in respect of, and to the extent of the profit received, whatever the occupation may be. Churches, chapels, and other places exclusively appropriated to public religious worship are also exempt. But the exemption does not apply to any part of such churches, chapels, or premises which are not so exclusively appropriated, and from which parts not so exclusively appropriated some person receives rent, or derives profit or advantage (3 & 4 W. IV., ch. 30). Tenements and hereditaments including lands, which are the property of and in the occupation of a Municipal Corporation in which the limits of the parish are co-extensive with the limits of the city or borough, and in which city or borough the poor are relieved by one entire poor rate, are exempted from poor rates, because it was considered that the imposition of the rate on the borough property would be of no advantage to the borough, as the same parties would be both receivers and payers of the rate (4 & 5 Vict., ch. 48). But, although this view was correct as regarded the particular parish or borough; yet, if such parish now forms one of a union of parishes assessable to the common funds of the union, according to the rateable value of the property comprised therein, under the Union Chargeability Act, 25 & 29 Vict., ch. 79, there are reasonable grounds of complaint on behalf of the other parishes in the union, as the exemption of the Corporation property in the one parish disturbs the equality of the basis upon which the contributions of the several parishes are founded. Notwithstanding this, it has been held in the case of the Queen *v. Mayor of Oldham* (L. R., Q. B. Cases, vol. 3, p. 474) that such property is still exempt, so that it is probable that the question will be litigated again, and this particular exemption will soon be abolished. Societies established exclusively for purposes of science, literature, or the fine arts are specially exempted by statute from county, borough, parochial, and other local rates; provided, nevertheless, that each of such societies shall be supported, wholly or in part, by annual voluntary contributions, and shall not, and by its laws may not, make any dividend, gift, division, or bonus in money unto or between any of its members; and provided also that it obtain a certificate from the barrister appointed to certify the rules of friendly societies (6 & 7 Vict., ch. 36). But it has been held that the statute exempts the society and not its property; so that, if the society is rated, its members must appeal (*Q. v. Justices of Birmingham*, 18 L. J., R. M. C., 83). The Linnæan Society, incorporated for the cultivation of the science of natural history and for the promotion of every kind of improvement in arts and sciences, has been held to be exempt (Linnæan Society of London *v. St. Anne's, Westminster*, 23 L. J., R. M. C., 148). So also has an institution for the collection and maintenance of a library of books for the use of the members and of persons who subscribed for the occasion only. But, an institution established partly for the amusement of its members, such as a concert hall, built and supported by subscription; or a library, a part of which is applied to the reading of newspapers, is not exempt (*Q. v. Brandt*, 20 L. J., R. M. C., 119; *Q. v. Gaskell*, 21 L. J., R. M. C., 29; *Russell Institution v. St. Giles-in-the-Fields*, 23 L. J., R. M. C., 65). A mechanics' institution, some of whose rooms are occasionally let out for concerts, lectures, and public meetings, is not exempt (*Purvis v. Trail*, 18 L. J., R. M. C., 57); nor is a subscription library, if a part of its premises are let off to another scientific society (*Earl of Clarendon v. St. James's, Westminster*, 20 L. J., R. M. C., 213). National schools, hospitals, dispensaries, and other similar properties held for public purposes only, where the trustees derive no personal pecuniary profit for themselves, have, until very recently, been considered to be exempt from rates; but the case of the Mersey Docks and Harbour Board *v. Jones* and another (30 L. J., M. C., 239), carried by appeal from a judgment of the Exchequer Chamber to the House of Lords, has established the contrary rule. Six of the judges assisted the Peers when the argument was heard, of whom, five expressed opinions that the exemption could not be supported. The remaining judge considered that the exemption had been established by a long current of authorities, and could not now be rejected. Since this decision was given, "The Sunday and Ragged Schools (Exemption from Rating) Act, 1869," has been passed, by which every

authority, having power to impose or levy any rate, may exempt from the payment of any rate for any purpose whatever any building or part of a building used exclusively as a Sunday school or ragged school. Much litigation has arisen, in connexion with the assessment of buildings, concerning the rateability of fixtures, trade plant, and machinery. It was decided in the case *Reg. v. Southampton Dock Company* (20 L. J., M. C., 162) that buildings to which machinery is attached for the purposes of trade, are assessable to the extent of their existing value, as combined with the machinery, whether such machinery be real or personal property. In the case of the *Queen v. North Staffordshire Railway Company* (30 L. J., M. C., 65) it was decided that "things so attached to the freehold as to become part of it;" and "things which, though capable of being removed, are yet so far attached as that it is intended they shall remain permanently connected with the railway or the premises used with it, and remain permanent appendages to it, as essential to its working," are rateable. In the case of the *Queen v. The Phoenix Gas Light and Coke Company* (L. R., vol. 1, p. 241) it was decided that the retorts, purifiers, gas holders, steam engines, and boilers are parts of the works which are absolutely necessary to the manufacture of gas, which is the purpose of the company's undertaking; that it was intended, when those things were erected, that they should remain permanently connected with the premises, and that they should remain permanent appendages to it, as essential to its working; and, if not forming part of the freehold, they are still so far connected with it as to be intended to be permanently attached to it, and, therefore, they ought to be taken into account, in determining the rateable value of the land and premises. Without the retorts, purifiers, steam engines, and gas holders the premises would be worthless for the purpose for which they were erected: the building would not be a gas manufactory at all. All these things are fixed, and so far annexed as to be intended to be permanent, and, being really necessary for the use of the premises as gas works, they therefore form part of the rateable subject. So in the case of a railway, although the sleepers are in no way fastened to the ground, but are laid on and packed up in ballast, and the rails are laid on and bolted to the sleepers only, nevertheless, it has been held that they form as many parts of the rateable hereditament, as does a house, the foundations of which only rest upon a bed of concrete (*Great Western Railway v. Melksham, J. P.*, vol. 34, p. 102). Utensils in trade and furniture are not rateable. The meters of a gas company were held, in the *Phoenix Gas* case already referred to, to be mere ordinary chattels, kept for the purpose of measuring the gas, and in no sense part of the gas works. In the *North Staffordshire Railway* case, things moveable, such as office and station furniture, were held to be chattels, and not rateable. In many cases, such things as a mirror fixed to a wall have been held to be furniture, and not rateable; but, a billiard table fixed to a floor has been held to enhance the value of the house to which it was attached, and in that way to become rateable. Power looms in a silk mill, portable and continually moved from place to place, but steadily by their feet being screwed to the floorings, are not rateable (*Reg. v. Overseers of Halsestead, J. P.*, 1867, p. 373). It was held that, although such fixtures are no doubt fixed to the freehold, they are, nevertheless, not so fixed as to make them part of the freehold, so that on a demise they would pass with the premises. "*Tithes inappropriated*," are those which have been severed from a benefice, and are now payable to some lay person or corporation. "*Propriations*," or "*appropriations of tithes*," are tithes severed from a benefice, and annexed to a spiritual corporation. These are the only description of tithes expressly referred to in the statute of Elizabeth; but, all tithes arising within the parish are rateable, and, every rent-charge payable instead of such tithes, is subject to all rates and taxes, in like manner, as the tithes commuted for such rent-charge have heretofore been subject (6 & 7 Wm., ch. 71, s. 69). *Coal mines*, in occupation in the parish, are rateable for what they produce; that is to say, at such a sum as they would let for. But, as has been already explained under the head of land, all other mines have been held to be exempt, because coal mines are especially made liable. *Saleable underwoods*: The statute of Elizabeth especially refers to saleable underwoods, and specially makes them rateable. In the early cases, saleable underwoods were defined as being "wood which grows

expeditiously, sends up many shoots from one stool, the root remaining perfect, from which the shoots are cut, and producing new shoots, and so yielding a succession of profits." But, in a recent case, *Lord Fitzhardinge v. Pritchett* (Law Rep., Q. B. Cases, vol. 2, p. 141), Mr. Justice Mellor has very clearly defined what woods are saleable underwoods within the meaning of the statute of Elizabeth. He says, "the question does not depend upon whether the woods consist of what are timber trees, either by general or local custom; the nature and quality of the wood is not the test; but, wherever the woods are treated so as to raise successive crops from the same roots and stools, and, whether the crops ripen, and are cut at intervals of ten, fifteen, or even thirty years, is immaterial; or, whether the woods consist of oak, ash, or elm, which are universally timber trees; or, of beech, which may be timber by custom; or, willow, the stools of which can be and are so treated as to produce a succession of saleable crops: in such cases, the woods are saleable underwoods." *Mode of valuing property liable to be rated*: There are two estimates required by the statute 6 & 7 W. IV., c. 96, which regulates parochial assessments, viz., "gross estimated rental" and "rateable value." The former is the rent at which the property might reasonably be expected to let from year to year, the tenant paying all usual tenant's rates and taxes and tithe commutation rent-charge (if any), the landlord bearing the cost of repairs and insurance and other expenses (if any) necessary to maintain the premises in a state to command such rent. The rateable value is so much of the gross estimated rental as remains after deducting therefrom the probable average annual cost of the repairs, insurance and other expenses necessary to maintain them in a state to command such rent, as aforesaid. The actual words of the statute are very simple when understood; but, it is probable that no words in any statute were ever more misunderstood, or ever caused more confusion and gave more trouble than they did. They are as follows: "No rate for the relief of the poor in England and Wales shall be allowed by any justices, or be of any force which shall not be made upon an estimate of the net annual value of the several hereditaments rated thereunto, that is to say, of the rent at which the same might reasonably be expected so let from year to year, free of all tenants' rates and taxes and tithe commutation rent-charge (if any) and deducting therefrom the probable average annual cost of the repairs, insurance and other expenses (if any) necessary to maintain them in a state to command such rent." Soon after the passing of this statute, viz., on the 3rd of March, 1837, the Poor Law Commissioners issued a circular defining gross rent as the rent which would be paid to a landlord who himself undertakes to pay all the usual tenant's rates and taxes with which the hereditaments or premises reuted by the tenant are chargeable, together with tithe commutation rent-charge, the expense of upholding the buildings in tenable repair, insurance against loss by fire, and any other expenses, if any shall exist, necessary to maintain such hereditaments in a state to command such gross rent. Net rent they defined as the amount which is received by or which remains clear in the hands of a landlord after all such taxes, charges, and expenses, as are above enumerated, shall have been provided for. Acting upon these definitions, many surveyors included in their estimates of gross estimated rental the whole of the rates and taxes usually paid by the tenant. For example, in the case of a house worth £100 per annum to a yearly tenant, the rates and taxes upon which amounted to £20 per annum, and the average cost of insuring, repairing, and maintaining the property £20 per annum, they called the gross estimated rental £120, the rateable value £50. So far as regards the mere payment of poor rates no injustice was done to the ratepayer; but, in the case of other uses made of the gross estimated rental it became apparent that the intentions of the Legislature had been misunderstood; moreover, valuations so made seemed to estimate the value of property in a parish unfairly and unnecessarily high. It very early became the practice to disregard the instructions of the Poor Law Commissioners and to omit all consideration of rates and taxes in making valuations, and, in 1859, the Poor Law Commissioners were advised by the then law officers of the Crown (Sir Fitzroy Kelly and Sir Hugh Cairns) that the term "gross estimated rent" meant the rent at which the property might be expected to let, the tenant taking the burden of rates and taxes and tithe upon himself. In other words, they were of opinion that the word

“free” in the statute must be considered as referring to rent and not to hereditaments. An attempt was made in the Union Assessment Committee Act, 1862, to remove the doubts which had existed; but, without much success so far as ordinary ability can comprehend it. Nevertheless, the opinion of the law officers in 1859 is now universally acted upon and generally understood. It must always be borne in mind that the rateable value is not the actual rent at which a property may be let; but that rent at which, after taking all things into consideration, it might reasonably be expected to let. Moreover, it must be remembered that the circumstances to be taken into consideration in estimating the value must always have reference to the period at which the valuation is made. A house which on the completion of a railway, or some other public improvement will be worth £100 a year, may, at the present time, be worth only £50 a year. While it is worth £50 it must be assessed at that sum only; but, as soon as the improvement takes place, the assessment must follow the increased value. Again, the rent reserved in a lease may not be evidence of rateable value. A property may possess a gradually increasing value, extending over many years. A lessee, in agreeing to pay a fixed constant rent, would average those circumstances. The rate must be made on an estimate of the annual value from time to time; low, when that value is small, and higher as it increases. Again, property may, from unforeseen circumstances, increase or decrease in value during the term of a lease. If it should increase, it would be unfair to the other ratepayers, who might not be similar lessees, if the assessment upon it were not increased; and, if it should decrease in value, it would be unfair to the lessee not to decrease the assessment. The term from year to year must not be misunderstood, as it sometimes is. It does not mean a letting for a year only, nor a letting on a yearly tenancy; but it means that changeable circumstances must be taken into account from year to year as they arise.

Valuation of Agricultural and Accommodation Lands: In addressing the Institution of Surveyors, it is quite unnecessary to attempt to explain the mode of valuing agricultural or accommodation land. Nevertheless, it is well to again point out that the rateable value is not the rent actually paid either on a yearly tenancy or under a lease; but that it is the rent which, all things considered, a tenant might be reasonably expected to pay for the year next following the making of the valuation. The late Lord Denman, whose judgments were always as clear as it is possible for judgments to be, in delivering judgment in the case of a brickfield appeal, says: “It may well be that, although at the end of the year the lessee has made so many bricks that he can afford to pay £150 in royalty to his landlord, yet he could not prudently, at the beginning of the year, contract, at all events, to pay more than £100, and, if so, the latter rather than the former will be the sum at which the land may reasonably be expected to let from year to year.”

In the case of accommodation lands, a piece of meadow land may be situated in the middle of another estate and in front of the drawing-room windows of the occupier's house. It is reasonable to suppose that, in such a case, the occupier of the house would give more rent for the meadow land than its value for agricultural purposes would justify, and, therefore, it possesses a corresponding rateable value; but, if such land becomes by purchase a portion of the other estate, it then possesses no greater rateable value than the adjoining lands of which, in fact, it has become part. Small pieces of land adjoining a town will often let at rents quite disproportioned to their agricultural value, and their rateable value is such a rent as they may, in that way, be reasonably expected to fetch, notwithstanding that exactly similar adjoining lands which form part of an adjacent farm can only be reasonably expected to let at their agricultural value. The difference between the gross estimated rental and the rateable value of land is very small, and in practice it has hitherto, for the most part, been disregarded; but The Valuation (Metropolis) Act, 1869, fixes the allowance in metropolitan districts at five per cent., and, therefore, it is presumed that such an allowance will very generally be made in all places in the future. It may be mentioned that, in the case of lands subject to tithes the amount of the rent-charge should be deducted from the estimates of both gross and rateable value, the tithe rent-charge being itself rateable as a separate hereditament.

Valuation of houses: The gross estimated rental of a house is that rent which a tenant might

reasonably be expected to give for the right to occupy it for one year, assuming that the landlord bore the expense of insuring, repairing, and upholding it. The net rateable value is the rent which a tenant might be reasonably expected to pay, who took upon himself the expense of insuring, repairing, and upholding it. The rent is the rent to be expected for the year following the making of the rate; but, the allowance for repairs is to be the probable average annual cost. To give but one instance: general painting, which occurs only once in seven years, is not to be allowed in the year in which it actually is done to the exclusion of all other years; but, a fair average annual charge on account of it is to be taken. In addition to the allowance in respect of indispensable repairs, an allowance is to be made in respect of contingent or future renewals. In the case of the Queen v. Wells (Law Reports, Q. B. Cases, vol. xi., p. 518), the most recent decision upon this point, Lord Chief Justice Cockburn stated that there seems no distinction in principle between the sum annually laid by to make good, when it shall become necessary, an inevitable loss by the destructive agency of time, and a fund laid by for an indemnity against a loss by fire or storm, or other peril, insured against.

Valuation of farm homesteads: In estimating the rateable value of farm homesteads, several matters have to be taken into consideration. For example: the buildings may be very much in excess of the actual requirements of the lands of a farm; but it is obvious that a tenant can only be reasonably expected to pay such a rent as the buildings which he actually requires would command. Even that rent may have to be diminished instead of increased, from the fact that the repairs and insurance of the larger buildings are more costly to the tenant than the repairs and insurance of buildings of the proper size would be. It may, however, happen that the occupier of such a farm may also occupy, as a separate rateable hereditament, land, either wholly without buildings, or otherwise deficient in that respect, in which case the rateable value to him of the buildings previously alluded to will be increased.

Valuation of trade premises, mills, factories, &c.: In estimating the value of trade premises, such as a factory fitted up with machines, a foundry with furnaces and forges, or a brewery with fixed steam engines and vats, the value of the machinery as enhancing the annual value of the freehold, of which it forms part, is to be taken into consideration. An important decision in respect of the rating of mills was given in the case of Staley and another v. Castleton (33 L. J., M. C., p. 175). The mill was fitted to its full capacity with the machinery useful and necessary for a cotton mill; a steam engine was fixed for the purpose of turning the machinery, and steam pipes from the boilers were carried through all the rooms in the mill for the purpose of warming them. Some of the machinery was fixed to the floors in order to its steadier working, while, in other instances, it was merely placed upon the floors of the mill. According to the custom of the trade, the machinery was in the nature of tenants' machinery, or fixtures. Before the American war, the property had been of considerable annual value as a cotton mill; but, in consequence of the state of trade during the war, the mill was closed. Nevertheless, the machinery was kept in it, and a man was employed to attend to the fires for the purpose of keeping up a proper degree of warmth, and to keep the machinery in a state of repair. The Court held that the mill was thus used as a storehouse for the valuable machinery that it contained, and was to be valued for assessment to the extent of the rent which it would command as such storehouse. Following this decision came another important case, Harter v. Salford (34 L. J., M. C., p. 206). The appellant for many years carried on the business of a silk manufacturer; but, in 1863, he gave up business with the intention of never resuming it. The mill and premises were advertised for sale. The decision was that, although not in use as a mill, the buildings were to be valued as storehouses for machinery. Hotels, refreshment rooms, Epsom and other race stands, canteens and similar trade premises which, by reason of their special situations, command rents in proportion to the extent of the trade which can be carried on in them and nowhere else, must be valued in connection with their trade receipts, *i. e.*, from the gross receipts must be deducted the working expenses necessary to earn the receipts, allowances for trade profit to the tenant, for interest on the capital which he must necessarily employ, and for risks and casualties. The balance is the rent which he may reasonably be expected to be willing to pay to his land-

land as rent. In valuing all descriptions of house property, the question constantly arises—is cost ever the measure of the rateable value of property? In giving his decision in the Mile-end Old-town case, Lord Denman says, “the outlay of capital might furnish no criterion of the rent a property should yield, since such capital may have been injudiciously expended, and what was costly may have become worthless by subsequent changes.” It should be observed that Lord Denman did not there say that cost was never the measure of value, and, obviously, it sometimes is. Assume, for example, that the guardians of a Union are in want of a workhouse, and that some landowner within the Union is possessed of a building exactly suited for such purpose, but that he requires a rent of £1,000 a year for it. The guardians find, upon inquiry, that they can build a new workhouse and provide the land at a cost of £10,000, and that they can obtain the money at the rate of 5 per cent. per annum, which will equal a rental of £500 per annum. They elect to take the latter course and build the workhouse, the rateable value of which is £500 per annum, because that sum is the highest rental which it would be reasonable to expect them to give. Assume, however, on the other hand, that the landowner was unable to get a tenant for his building, for any purpose, at a higher rent than £250 instead of £1,000 a year, and that he therefore would be willing to let it to the guardians at £250. In this case, the rateable value would be £250 per annum only, because it would not be reasonable to suppose that the guardians would pay for any other similar building a higher rent than that at which they had been able to take this from the landowner. In estimating the rateable value of bridges, as in the case of railways, it does not follow that any direct receipts arise in the parish which is the subject of the valuation. The case of the *Queen v. the Hammersmith Bridge Company* is one in point. It was there held that, although the whole of the receipts were in the parish of Hammersmith, yet the bridge itself was the direct source of the rateable value, and that such net rateable value when duly ascertained was to be apportioned between the parishes according to the length of the bridge in each.

Valuation of Tithe Rent Charges: The rateable value of a tithe rent-charge is the rent which a hypothetical tenant might be reasonably expected to give for it annually, such tenant having to pay the usual tenants' rates and taxes upon such tithe rent-charge and to derive some remuneration for his time and attention in collecting it (*Queen v. Capel*). In the case of a clergyman, whom by reason of the number of parishioners and the value of the incumbency the bishop of his diocese could compel to keep a curate, the reasonable salary of such a curate was, in the case of the *Queen v. Goodchild*, directed to be allowed; so also in the case of the *Queen v. Lamb*, where the duties of the incumbent were greater than one man could perform, the curate's salary was directed to be deducted; but, this allowance for a curate has, by the recent case, the *Queen v. Sherford*, been overridden, so that it must now be taken that such a deduction cannot be allowed.

Valuation of Coal Mines, &c.: Coal mines, brick fields, clay pits, slate quarries, &c., which involve the removal of portions of the soil, must be valued according to the rent and royalty which it is reasonable to expect the occupier would pay the landlord for that species of occupation. In the case of the *Queen v. Westbrook* it was held that a royalty so paid must be considered as a portion of the rent.

Valuation of Saleable Underwoods: Saleable underwoods must be valued at the rental at which they might reasonably be expected to let, according to the quality of the wood and the situation of the land. The valuation of railways, gas, and waterworks involve considerations so special that the subject is reserved for a separate paper.

Mr. T. S. WOOLLEY had great pleasure in moving a cordial vote of thanks to Mr. Ryde for his clear and able paper, which was so exhaustive that, if the discussion was to be confined to the topics therein dealt with, namely, the incidence of rating under the existing statutes, and the general principles on which the different kinds of property at present rateable should be assessed under those statutes, there was nothing further to be said. He agreed most thoroughly with the author's views, and would take this opportunity of mentioning with regard to the apparent divergence of opinion between himself and Mr. Ryde, on a former occasion, relative to the position which tithe rent-charge bore to rates, that they were now agreed in this, that the rent-charges are rateable to the same extent as

the tithes they represent were before the commutation took place, and in no other sense.

Mr. T. HUSKINSON, in seconding the vote of thanks, said the subject of rating was one of extreme and growing importance, and especially so in rural districts. There was hardly a subject within the province of the surveyor which required such a combination of legal knowledge and acquaintance with the value of property as rating, and so much tact and common sense in applying that knowledge.

Several members having expressed a wish that the discussion should be adjourned, to afford them an opportunity for the necessary consideration of the paper,

Mr. E. J. SMYTH suggested that it might be desirable, in the event of the discussion being adjourned, to extend their views in some measure beyond the subject of the paper, strictly speaking, and to express their opinions as to the expediency of changes either in the mode of assessment or in its distribution. All must be well aware, as agents, that there had been charged upon the occupiers, under the guise of assessment to the poor, a great number of items, which, in the opinion of many persons, should rather come under the head of imperial taxation. A considerable portion of the difference between the 3s. 6d. or 4s. in the pound which was paid now and the 2s. 6d. which was paid formerly was occasioned by charges which were hardly of the same character as those which used to be imposed. He thought, therefore, that the discussion should embrace, not only the history of the past in these matters, but should also elicit, if possible, the course which it was expedient to take with regard to the future.

The CHAIRMAN, in putting the motion for adjournment of the discussion on the paper of the evening, said that it had very recently come to his knowledge that a commission was either nominated or about to be nominated for the purpose of determining at what proportion, if any, the freeholders of property, let at ground rents, should be assessed in respect of the rates and taxes now imposed, or about to be imposed, on their lessees. It was a serious and important matter for ground landlords. He did not know whether it was desirable to discuss this matter, but it might be desirable to inquire into this subject before the next meeting, and then take it into consideration, and be prepared to discuss it in conjunction with Mr. Ryde's exceedingly able and exhaustive paper.

Mr. RYDE suggested that the course proposed was a little unusual. If the question of the incidence of local taxation were to be referred to, it would open up an interminable field for discussion. For instance, it might be suggested that not only should a proprietor be rated for his ground rents, but that stockholders should be rated in respect of their stock in the Funds; and that would involve the question whether the rating should be in the parish in which the Bank of England was situated, and of which it occupied the entire area, or whether the rate should be made in some other parish. He suggested that they should first finish the discussion of his paper, and then, if they pleased, enter upon the other topics referred to.

An adjournment took place accordingly. At the second meeting, Mr. John Clutton, the President, in the chair, the discussion was opened by

Mr. E. J. SMYTH, who said the only point which seemed to him to require a little further explanation was with regard to the precise interpretation of the wording in the first Act. Mr. Ryde seemed to consider that the interpretation of the first section, which obtained from the year 1837 until the decision of Sir Fitzroy Kelly, was accidental, on which decision, after an interval of twenty-two years—viz., in 1859—the present accepted interpretation was substituted. But he (Mr. Smyth) believed that the true history was that it was intended by the Poor Law Board that, under that Act, the first column in the assessment book should contain the annual value of any hereditament, after deducting only the occupier's return on his capital, and not the rates, nor the tithes, nor any outgoings. Under the existing system, the first column contains an annual value arrived at after deducting the rates and taxes paid by the occupier. It was undoubtedly the intention of the first Act that the first column should contain all that it contains at this time, with the addition of those taxes. It was supposed at that time that the owners would always take upon themselves the payment of tithes, and it was thought desirable that they should take upon themselves the payment of all other taxes; but the owners did not see it in that point

of view, and not only abstained from paying the other taxes, but almost invariably threw upon the occupiers the payment of the tithe rent-charges also. It was found, therefore, that this object of the Act was not obtained, and, after an endeavour extending over twenty years, the attempt was given up, and there came then the different interpretation given by Sir Fitzroy Kelly and Sir Hugh Cairns, which has subsequently been adopted. He ventured to suggest at the last meeting that it might be expedient to consider in this discussion the desirability of changes, either in the mode of the assessment or in its distribution. As he then said, it appeared to him that a considerable number of charges were now made, particularly in respect of agricultural property, and paid under the head of "poor rates," which ought to come under the head of imperial taxation. At the same time, he did not at all concur in the view that all rates ought to be charged on income-tax, and thought any such change (which, as they knew, was advocated by influential representatives of the agricultural interest) not only inexpedient but hopeless. As agricultural estates had always hitherto assisted in maintaining the poor and the highways, and had been purchased and sold under the expectation of doing so, it would be difficult to make out a case for any change by taking off those charges; but he thought that the other charges which had been imposed, and were now charged under the head of "the poor," should rather be paid out of the Consolidated Fund.

Mr. E. P. SQUAREY would illustrate the subject by stating the facts of his own case. He held his farm on a sixteen years' lease, and when he took it, his parish was a close one, Lord Radnor and himself being the only ratepayers. The actual rent of the farm was £1,300 a-year, and the rates only £75 a-year. No doubt he had occasionally employed incompetent men at higher wages than they could fairly earn, simply to keep them off the poor-rate, and the actual outgoing might therefore be put a little higher. The Union Chargeability Act came into operation, and his expenditure was increased from £75 to £180, on the average. He felt this to be a hardship, and he appealed to the Assessment Committee to reduce his rateable value, which he should say had been assessed at his rent, *minus* 10 per cent. He asked that it should be reduced by the excess amount of rates he was then paying over what he paid when he took the farm, and then a further reduction of 10 per cent. on that amount. After a good deal of discussion, the Board consented to reduce his rateable value to the lower terms; and on those he continued to pay. He mentioned this as an illustration of the folly of admitting rent, without considering what rent meant, as the basis of annual value. He agreed with Mr. Smith that some injustice was done to the occupiers of farms, by compelling them to pay, under the head of "poor-rate," charges which were of a purely philanthropic or sanitary character, and which were not contemplated when the tenancy commenced. He referred more especially to police rates and lunatic-asylum rates, in which the whole public was as much interested as the owner and occupier of the land. He thought, therefore, that in the interest of all parties, the whole question of the basis of rating demanded reconsideration.

Mr. J. H. LLOYD said he was engaged as referee in a case of the rating of a colliery producing a large annual return, and he had various schemes propounded to him as to the principle on which this description of property should be rated. Looking at the importance of that interest, more especially in the midland, northern and western counties of England, and in South Wales, it was a question of great magnitude, and by no means free from difficulty; and, with great respect to Mr. Ryde, he considered the question had been treated by him in a somewhat perfunctory manner; for all he said (p. 269) on that subject was—"Coal-mines, brick-fields, clay-pits, slate quarries, &c., which involve the removal of portions of the soil, must be valued according to the rent and royalty which it is reasonable to expect the occupier would pay the landlord for that species of occupation." He confessed that he was rather startled by this passage, because the rent and royalty paid to the landlord (if by that expression was meant the sum payable to the proprietor of the land and the underlying mineral) could not be a reliable basis of the rateable value. Royalty was a proportion of the produce raised, reserved to the mine-owner; rent was that which was paid for the area of ground occupied in the working of the

mine; but that the rent or royalty, either separately or together, could be the rateable value of the coal mine, seemed to him an untenable proposition; because it might be that the owner of the mine leased it, having incurred the first expenditure for winning the coal, or it might be that the lessee himself incurred that expenditure; and the royalty of course varied materially according to these varying circumstances. He understood the principle of rating to be, that whatever was the value of the undertaking, in its then present condition, was to be the first item of the valuation. Say, for instance, he had so many acres of coal under a surface area, as ascertained by borings. If a lessee undertook to develop this he would pay a royalty of so much. The lessee had then to sink his shaft, put up machinery, and incur other expenses; and when thus developed it became totally different property. The stereotyped principle of rating was what a man would be willing to give as rent, undertaking all the costs and risk, and reserving to himself a fair interest on the working capital required and a reasonable profit on the working obtained. That was the saleable value, and he apprehended that was as applicable to coal mines as to other property. His friend Mr. Ryde, had studied this subject a good deal, and he had hoped to have some light from this Paper; but the only gleam of information he had derived was in the paragraph which he had quoted. He deemed it a subject which deserved great consideration, and he held in his hand a very interesting pamphlet (lately presented to the library), by Mr. Hedley, of Sunderland, who had great experience in valuing collieries. Mr. Hedley gave, in the first place, the estimated gross value of coal produced at the pit's mouth, then he gave the working expenses and the expenses of the tenant for management. These were charges against the gross proceeds. Then came tenant's capital and plant. Mr. Hedley took a percentage upon that, reducing it to an annual interest. Then he took 25 per cent. for tenant's profits, which he (Mr. Lloyd) thought too high, and there was then to be added maintenance and renewal of the tenant's plant, and so at last they got at the net rateable value. His object in rising was to get from Mr. Ryde, if possible, something a little less meagre than the information he had given them in his Paper on the subject of the rating of coal mines.

Mr. W. EVE desired to refer Mr. Ryde to the passage in his paper (p. 264), in which he said, "The difference between the gross estimated rental and the rateable value of land is very small, and, in practice, it has hitherto, for the most part been disregarded; but The Valuation (Metropolis) Act, 1869, fixes the allowance in metropolitan districts at 5 per cent., and therefore it is presumed that such an allowance will very generally be made in all places in future. Now Mr. Ryde had expressed no opinion as to the wisdom of that course, and he hoped to hear that he did not approve of it. The value of land might easily vary from 5s. to £5 per acre, and if 5 per cent. were taken off in each case, it was evident that in one case they took off twenty times more than in the other for exactly the same repairs executed. The same observation applied with more force to houses, and he had ventured to lay these views before Mr. Goschen, when the bill was before the House. He had taken the trouble to investigate the rating of one house in Cornhill, and found that, taking off 20 per cent., as was done in that instance, the rental value being £500, the rating was £400. Now, in his judgment, the land in that case was worth £400, and the structure only £100, and for the repair and insurance of that structure, worth £100, they took off a sum equal to the annual value of it. The same thing applied to land, and he thought it was most unfair that any arbitrary per-centage of that sort should be laid down by the Metropolitan Act. If a schedule of deductions was to be adopted it must, as to house property, apply to the structural value only, and not include the value of the ground, and, as to land, it must be an acreage deduction, and not a per-centage on the value.

Mr. C. STEPHENSON said there was no question that the system of rating was not understood by the public authorities. The practice of parishes (even under the same surveyors and assessors) was inconsistent, and he thought that considerable time would elapse before rating could be made uniform or satisfactory. He found that in most districts the rating of a house was governed by what happened to be the rental of the adjoining house, with additions or deductions arising from any difference in structure. In the case of houses in new streets

the Assessment Committees and assessors were all at sea, and their only basis of rating seemed to be what people had been foolish enough to give as ground rents added to interest on outlay. This they call a gross estimated rent, and from it they deduct an arbitrary per-centage of from 5 to 20 per cent., and call that the rateable value. Such a system could not find favour, nor last for the time contemplated by the new Act, viz., five years. With regard to Mr. Squarey's own case, that ought to be put before the Committee of the House of Commons on Local Taxation, now sitting. [Mr. Squarey said he did submit it to them.] It seemed to be the view of that Committee that some of the present and future taxation of the country should be removed from the occupiers and put on the shoulders of the freeholders of the land. Mr. Squarey's case, he thought, proved that the owners of the land, as freeholders, did now bear the brunt of the taxation; though in the case of leases, where arrangements were made between the freeholder and the occupier, the occupier for the time being bore the burdens. Any attempt to put a further burden on the freeholders was most unjust and unfair.

Mr. J. FISHER said that, with respect to the rating of mines, his practice had been to ascertain the productive power of the land while being exhausted as a coal mine as a basis for the assessment, in the same way as for brick-earth or gravel; but when it is exhausted, the land reverts to an inferior value. It may be, in some cases, so well preserved that the land is of nearly the same value as it was before it was opened; but while the land has that extra production in it, the occupier is liable to be assessed on a proportion of the profit that accrues during the time of the occupation. That was a principle which he believed to be uncontroverted. As the profits accrue the liability to assessment occurs; they run together, and when one ceases the other does so. He thought it a fallacy to say that there was any right to an allowance on account of the exhaustion of the soil; it was only a temporary assessment, and the land had to be assessed at as much as it was producing at the time. In his practice, the want of a competent tribunal for the settlement of these questions had much struck him. Assessment Committees differed very much in the views they took of the questions brought before them, and there was very little certainty as to the decisions they came to. He also found that the ultimate tribunal of the Quarter Session was almost as unsatisfactory—considering the power it has, it was almost worse. The courts of Quarter Session differed so much in the views they took, that he thought it extremely desirable that there should be one common tribunal to which mixed questions of law and fact, such as often occurred in matters of rating, should be taken. He would illustrate what he said by mentioning a case within his own experience. He had an appeal before the Sessions, and, in making a claim for deduction in respect of some every-day expense, in the nature of repairs done by the landlord, one of the magistrates said to him, "Do you mean to contend that the landlord's repairs are a deduction from your rent?"—evidently believing the proposition to be a great fallacy, which he could not be expected seriously to entertain. The decision in the case was based upon the view which this magistrate took. He (Mr. Fisher) was quite sure that if the appeal had been heard in an adjoining county, the decision would have been exactly the reverse. A case was refused, so that there was no opportunity of having what was laid down reviewed. Another fact bearing upon the necessity for such a common tribunal was the unwillingness of Assessment Committees to undertake the full amount of the duties they were appointed to perform. He was a member of the Assessment Committee of the Union in which he resided, and they said, "We are not a body of valuers, we must take for granted what we are told," and they shirked their duty in that way. It must be remembered that an Assessment Committee was nothing more than an aggregation of parish officers, who perform for a Union what overseers perform for a parish; but sometimes, from want of local information, indolence, or other causes, the duties were performed in a very unsatisfactory manner, and he hoped that before long officers would be appointed to see that these matters were properly investigated before a competent tribunal.

Mr. C. CADLE wished to mention that, under the statute of Elizabeth, personal property (in the shape of stock-in-trade, which at that time was almost the only personal property known) as well as real property was rateable; and there was now, he believed, an Act of Parliament passed every year

exempting such property from rating. He had experienced some difficulty in dealing with accommodation land and game farms; because, with regard to the former, the Act recites the rating is to be at what the land "would reasonably let for." If a man chose to give an excessive rent for accommodation-land, it was not fair that the Assessment Committee should assess him upon that rent—a tenant at an excessive rent would probably take everything off the land he could, and so impoverish it—but the rating was to be based on a rent which would admit of the land being kept in a state to command such rent. The same remarks applied to a game farm. If a man gave 10s. an acre less rent, because the land was burdened with game, the valuer ought to rate the farm at what it was reasonably worth, and the Assessment Committee had no right to make an allowance in respect of game, but ought to put it at what it is worth to let. Some few years ago the question of not including tithe in the gross estimated rental caused a great stir, and the recent decision of the law officers of the Crown seemed to be a wrong one, because, in valuing land, they must value it at its worth in full, including the tithe, and if any tithe is payable, deduct it. In a field valuation of a parish, if the tithe were not taken into account, injustice must be done to someone; therefore, to make a proper valuation three columns were required, instead of two, in the valuation book—the rateable value column, the gross estimated value column, and a third one for the gross estimated rental. What can gross mean, unless it includes everything? Another difficulty was the question of larch plantations. A good deal of larch was grown in Shropshire, and exemption from rating was claimed for it. It seemed, however, to be an injustice to other ratepayers if a field were taken out of rateable occupation thereby. For a few years it might produce little or no income; but, after a time, a large profit accrued to the owner, by the thinning out of the young trees; and, according to recent decisions, such plantations did not come properly under the designation of "saleable underwoods," which were liable to be rated. Perhaps Mr. Ryde would favour the meeting with his experience, with regard to the practice of water-power. He would also call attention to the practice of Assessment Committees in making deductions. The rule was to deduct 10 or 15 per cent. from farms and buildings together; but, if a man happened to have land in one parish and farm buildings in another, he only got 2½ per cent. deducted for the land, and 10 per cent. for the house and buildings. That was an injustice, for his neighbour would get a deduction of 10 per cent. on both land and buildings when situate in the same parish. What was wanted, was that Boards of Guardians and Assessment Committees should each appoint a surveyor to act on their behalf in these matters; and, until they did so, they would neither satisfy themselves nor the country at large.

Mr. P. D. TUCKERT said he had just had an opportunity of looking for a few minutes into Mr. Hedley's pamphlet on the "Rating of Coal Mines," and it seemed to him that Mr. Ryde's statement on that subject, although it might not be very full, agreed substantially in principle with the views expressed more in detail by Mr. Lloyd. He had no doubt that Mr. Ryde, in his reply, would tell them he had not meant to be understood that a coal mine was to be rated upon the actual rent and royalty paid, but upon the rent and royalty which might reasonably be expected to be paid; and those calculations of Mr. Hedley's which Mr. Lloyd pointed to might, he thought, be shortly summed up in two words—as the rent or royalty—(whichever form it took) which could be reasonably realized by the coal mine, deducting a fair allowance for repairs needful to maintain such rent and royalty. There was the rent paid for the mine, and interest on the money expended in sinking the shaft, and on the plant, &c., whether provided by landlord or tenant, which must be taken in the light of rent, and from the total so arrived at a deduction was made on account of repairs, thus coming simply to the established principle of rating for all descriptions of property. With regard to larch plantations he might mention that, some years ago, he was engaged (in conjunction with another member of this institution) in the valuation of the parish of Farnham, where larch was grown to a considerable extent, and cut young for hop-poles. It was then considered that, as they did not grow from old stools, these plantations could not be regarded as underwood, and they were not assessed. Care was taken at the time to get the best information as to the then

state of the law upon the point, and he did not remember that any decision had since been given altering it; though he knew it was one which had often been a subject of discussion amongst those interested.

Mr. REX asked Mr. Ryde to explain, in his reply, the apparent inconsistency of two paragraphs in his paper, which were as follows: On page 263 he said, "The term from year to year must not be misunderstood, as it sometimes is. It does not mean a letting for a year only, nor a letting on a yearly tenancy; but it means that changeable circumstances must be taken into account from year to year as they arise." Then, on page 265, "The gross estimated rental of a house is that rent which a tenant might reasonably be expected to give for the right to occupy it for one year."

Mr. J. W. PENFOLD, the Secretary, with reference to the schedule of deductions in The Valuation (Metropolis) Act, pointed out that they are put as the *maximum* deductions to be allowed in the several classes of property. There was no reason, therefore, why, in such a case as Mr. Eve mentioned, the proper per-centage should not be taken from the £100 a-year, the value of the structure, and the £400 a-year ground rent be left without any deduction whatever. No doubt the practical objection to a schedule of deductions was, that the Assessment Committee applied it by a rule of thumb, and deducted the given per-centage all round. A competent surveyor would deal with each case on its own circumstances, and if such advice were always obtained there would be no need of the schedule at all. So far as he was able to see, one column for net value ought to serve all purposes. The gross value column seemed to be only for the inhabited house duty, property tax, &c., which it would be much more equitable to assess on the net value. He presumed the Legislature was aiming at such a centralization of assessment and appeal as had been suggested. The Valuation (Metropolis) Act provided that the assessments for all rates and taxes should be from one valuation list, and all appeals be brought to one tribunal. This would get rid of the annoyance and injustice which at present existed of many rates and taxes being assessed on different valuations, with a separate tribunal of appeal to each.

Mr. EVE said that he was aware the scale in the schedule alluded to was that of the maximum per-centage, still he had found, in several examples he had worked out, that the margin of deduction for buildings and land produced, in combination, a different result to the margin given for buildings and land separately, and must therefore be incorrect in principle. If there were to be a per-centage at all, it should be calculated on the structural value of buildings, and not include the value of the ground on which they stand.

Mr. E. RYDE, in reply, said that he had expected that the discussion would have assumed more strongly two phases. He had anticipated a discussion on his paper, and on that more important subject, which was now occupying the attention of a Parliamentary Committee. No speakers, with the exception of Mr. Smith and Mr. Squarey had touched upon the latter question—the incidence of rating. He gathered from his remarks that Mr. Smith considered the incidence of local assessment about right where it was. That, as parties have bought land subject to all these charges, there would be considerable injustice if the charges were removed from the land and imposed in other ways; and there was a great deal to be said in favour of that view. Take, for example, two houses—one at the east and the other at the west end of London. The house at the west end, where the rates were low, would command a larger price than that at the east end, where the burden of rates was greater; therefore, when men talked of equalizing rates, it only meant robbing Peter to pay Paul. The real question which presented itself was—Should the owners of landed property be called upon to bear almost exclusively the burden of local taxation? It seemed to be in the minds of the Committee now sitting, that part of the burden should be put upon the landlord for the relief of the tenant. But the landlord bore it all now. It was quite clear, if a farm were worth £100 a-year, and the taxation were £20, it is worth £120 as against the tenant. If the taxation were only £10, he would be bound by competition to give £110 a-year rent; so that rent and rates constitute the value of the farm; and if the landlord did not bear the local taxation he would get the gross value in rent. It might fairly be argued that portions, at all events, of the local taxes should no longer fall upon the real property of the district. For instance, when

the burden of repairing the highways was first put upon real property, the owners and occupiers of land made the most use of the highways. But now it often happened that a man who was worth £200,000, without possessing an acre of land, made as much use of the roads as the owners of real property, without being called upon to contribute towards their maintenance. This would not be the case if the repair of the highways were made an imperial tax. The remainder of Mr. Smith's speech had reference to the intention of the Legislature with regard to the mode of filling up the gross column of the assessment. Whatever that intention might have been, the practice had obtained, long before the date of the opinion of Sir Fitzroy Kelly and Sir Hugh Cairns, of dealing with the gross column as we do now, by omitting the addition to it of the rates and taxes. With respect to the remarks of Mr. Squarey, who had informed them that he formerly paid £75 a-year for rates in respect of a farm which he held at a rental of £1,300, he must express his surprise at the smallness of the amount; for it was little more than a shilling in the pound. He thought that what Mr. Squarey had said would go far to substantiate his view that the landlord actually pays the rates. Mr. Squarey's words were: "When my rates were £75, my farm was worth £1,300 a-year. Make my rates £180, and my farm is not worth so much by the difference between £75 and £180." In effect, he would not have given so much for the farm if he knew the rates would have amounted to £180. That agreed precisely with what he (Mr. Ryde) had said, that the rent and the rates together made up the real value. But a tenant in taking his farm was bound to calculate on having to pay the *proper and usual* tenant's rates and taxes; and, therefore, if his farm were rated exceptionally low, he must not complain of excessive rent if, after that rent had been fixed, the rating was raised to a par with the rest of the Union.

Mr. SQUAREY reminded his friend that he stated his parish was a close parish, and that no other person was rated in the parish. The Union Chargeability Act was that which raised the rates on his farm.

Mr. RYDE now came to the speech of Mr. Lloyd, who had objected that he had not gone sufficiently into the question of the rating of coal mines. His general answer was, that in consequence of the length of his paper, he had been induced to treat that branch of the subject as concisely as he could; but, shortly as he had treated it, he believed that he had included the whole of the liabilities connected with that class of ratings; and though he had not read Mr. Hedley's pamphlet, to which Mr. Lloyd had referred, yet looking through it cursorily, he saw nothing in it at variance with what he had said in his paper. Mr. Lloyd represented him as saying that the rent and royalty actually paid to the landlord constituted the rateable value of the mine. That was a misapprehension. However badly he might have expressed himself, there would be found in his paper this paragraph as a safety-valve: "It must always be borne in mind that the rateable value is not the actual rent at which a property may be let, but that rent at which, after taking all things into consideration, it might reasonably be expected to let." What he meant was that the reasonable rent and royalty at the time the valuation was made was the rateable value. If money had to be expended upon the mine to make it productive, that must be taken into consideration; and they could not rate the coal mine till there was a beneficial occupation in it. It does not matter by whom the expenditure is made, whether by the landlord or the tenant—that becomes a transaction between landlord and tenant—if the latter has to make the outlay, he will not pay so much rent; but the rateable value remains the same. He had quoted a judgment by Lord Denman to the effect that the rateable value was the royalty which it might be reasonable, at the beginning of a year, to expect that a tenant would be able to pay; and not the royalty, which, at the end of the year, experience had proved he could pay. But, notwithstanding that judgment, he (Mr. Ryde) apprehended that there was nothing to prevent the experience of a past year being taken as a guide to the assessment for another year. He quite agreed with Mr. Eve that deductions based on a schedule of per-centage were entirely wrong in principle. Take the case of an old wooden house for which a man gives £50 a year; it would constantly need repairs; the 10 or 20 per cent. deduction would be totally insufficient, and it might even be that the expenses of repairs

amounted to as much as the whole rent. Take the case, on the contrary, of a new brick building, in respect of which the same deduction is made for repairs; it becomes much more than sufficient for the purpose. He did not agree with Mr. Penfold that any surveyor or rating committee would in practice make less than the maximum allowance for repairs, set forth by the Act of Parliament. He quite coincided in the opinion that some of the tribunals to whom appeals were made knew little about rating, and that there was very great variation in their practice. A new tribunal had just been created within the metropolitan area; how that would act they had yet to learn. Practically, a great deal would depend on the chairman; but they must not expect that he would always decide as they individually wished him to do. The mode of rating coal mines in South Wales had been explained by Mr. Fisher, who laid down the principle as an incontrovertible one that coal mines should be rated according to their production of profit. He (Mr. Ryde) considered that to be an erroneous principle. The question was what might the tenant be reasonably expected to give for the mine; and though the tenant paid a fixed rent, and the rest in the shape of a royalty, they had still to ascertain what he might reasonably be expected to pay, and put that as the rateable value. If it were in a state that no tenant would pay rent for it, there could be no rateable value; but the reasonable rent which a tenant would pay was that which was to be assessed. When the coal was all gone it ceased to be rated as a coal mine, and thus applied also to a brick field or a stone quarry. It had been said by Mr. Cadle that a man paying an unreasonable rent ought not to be rated upon that rent, and he quite agreed with him. He might give three times the value of the land, but that was not the rateable value. Nevertheless, they must not assume that a man rented accommodation land at the same price as land which formed part of a farm. The word "reasonable" must be kept in mind throughout the whole question. With regard to water-power, it was the additional rent which a property would let for with that advantage, above that for which it would let without it, which was to be rated.

Mr. LLOYD: Supposing that the power has not been used, but exists, and is potential. Assume that you have a property on a stream of water in a manufacturing district, which might come into use for water-power. Does that, in your opinion, enhance the value of the property?

Mr. RYDE: It does not become rateable until it is brought into use. With reference to larch plantations, where they were planted for hop poles, it was not the practice to rate them, as they are not considered to come under the designation of "saleable underwoods."

Mr. CADLE remarked that the thinnings of the trees, necessary for the growth of those which remained, were disposed of, and yielded profit to the owner.

Mr. LLOYD: Supposing you got, not an annual but an accommodation profit, does not that enhance the value of the property?

Mr. RYDE said that timber was not rateable. In the case of cutting poles he believed there had been no decision. They were not "saleable underwoods." He had now only to say a word as to what fell from Mr. Rex, with respect to what he considered an inconsistency between two paragraphs of his paper. In no part of the paper was it stated that the rateable value was the rent which a tenant might be expected to pay for one year's occupation only. "No man would rent a railway and stock it for one year's occupation." That was not what was meant, but that they were to take the property at the rent it might reasonably be expected to produce in the year; assuming that the rate was going to be adjusted from year to year according to circumstances. By a parity of reasoning no man would take a large mansion and furnish it for one year. Assume there was to be a gradually increasing value, with or without a lease, that a house was worth £100 the first year, £200 the next, and £600 the next, they had to take into account in each year the special circumstances of that year. He concurred with Mr. Penfold that the house duty and other taxes would be better taken on the net value than on the gross. If a man had £100 a-year from land, with no outgoings, he was assessed £100 a-year to the property tax; if he had £100 a-year from cottages he was still rated at £100, though he had to spend £20 or £30 for repairs. With regard to game farms, he considered that he had treated the subject very fully in his paper.

The PRESIDENT said that he understood the Act of Elizabeth, in exempting timber from rating, applied only to oak, ash, and elm timber. And, with regard to other plantations, he had always paid rates upon plantations when profit was derived from them. It might be wrong, but that was his experience. With reference to Assessment Committees, many years ago, being in Ireland on a drainage commission, he spent a considerable time with the head of the Valuation Department, and he became so impressed with the importance of having a central control over that class of assessment, he was satisfied that without a controlling body of the kind the assessment in this country would never be equal. He had, on one occasion, the task of looking through the whole assessments of the county of Norfolk, for militia-rate purposes, and he found that the assessment varied between half the annual value and an excess of the annual value. He found, however, that the farms were almost universally under-rated, while the houses in the towns were over-rated. He was convinced, as he had already said, until they got a central body, and the assessments were made by competent surveyors, it would be in vain to look for equitable assessment in this country. These Assessment Committees were almost entirely controlled by rent. In one case, he found a farm was let to a tenant, subject to the tenant paying all charges, including repairs and materials for the same; in another, the landlord found all materials and labour; and these instances were treating in the rating as being equal. The heavy burdens upon land have made it the more important that property should be equitably rated. He did not say he thought the land should bear the whole burden; it was now so large and important a question that other property should bear a portion of those burdens which were made for general purposes, and not as pertinent to the land only. He did not think there could be a doubt on the mind of anybody that the landlord bore the whole charge. For what was rent? It was the residue, after all charges were paid. Therefore, in fact, the landlord did pay all charges. It was true that, as lessee, the tenant might hold part of the fee; and that was the only conflict about the rating of coal mines. It seemed to him that the man who took the original lease, with covenants that he shall lay out a considerable sum of money, should not be rated at the amount he paid, but at the price at which it would let in the position in which the property was then found. With regard to the Metropolitan Assessment Act, it struck him that the scale of maximum deductions fixed by that Act was put in to limit the power of the Assessment Committees who made the valuations, so that they might not take off a larger amount than ought fairly to be deducted. If there had been a central control, no such limitation would have been placed in that Act of Parliament. He had been asked to give evidence before the Committee now sitting, because he was supposed to have a leaning in favour of a part of the burdens being placed upon the landlords. Having lived for three or four years in Scotland, he found that in the country districts the landlords paid a proportion of the rates, and were represented upon the Boards of Guardians and on other local bodies; and it did seem to him that the working of the system in Scotland was good. He did not think it mattered materially who, in the first place, paid the rates. Boards of Guardians, there could be no doubt, were for the most part composed of occupiers, and their meetings might be attended by magistrates *ex officio*, but, because they had no position there, they very rarely attended, unless they had some specific duty to perform. He thought there was some difficulty in the suggestion that the landlord should pay part of the rates in towns; and he confessed he was not prepared to go the length in that respect at which the Committee appeared to be aiming. With regard to farms damaged by game, he confessed it seemed to him an anomaly that a farm burdened with game, of which the owner received the benefit in one way or another, should be rated lower than one on which the game was not made a matter of consideration. There was a beneficial occupation in the game; and the two farms ought to be similarly rated, although the one might not command so high a rent per acre as the other.

The meeting then adjourned.

THE ROYAL AGRICULTURAL BENEVOLENT INSTITUTION.

The annual dinner of this institution took place on Wednesday, June 8, at Willis' Rooms, St. James', and was attended by about 100 gentlemen, over whom Lord Lytton presided.

After the health of "The Queen, our Gracious Patron," had been drunk with loyal enthusiasm,

The CHAIRMAN, in proposing "Their Royal Highnesses the Prince and Princess of Wales, and the other members of the Royal Family," said that in addition to his other accomplishments his Royal Highness had a manly taste for old English sports, which formed another claim to the cordial recognition of his merits; and if in the pursuits of farming he should be able to show at the end of the year as good a balance-sheet as their friend Mr. Mechi had done, he hoped he would communicate his secret for the benefit of those praiseworthy, but ill-starred agriculturists, of whom he was one, called gentlemen farmers (laughter). As to the amiable Princess, it was needless to say that she had charmed all eyes and won all hearts (cheers).

The CHAIRMAN then proposed "The Army, Navy, Militia, and Volunteers," and in doing so dwelt on the fact that many of the most celebrated members of both the army and navy sprung from the agricultural districts.

Colonel LOYD LINDSAY in responding for the army also testified to the immense importance of agricultural element in the army, and by way of illustration alluded to the fact that in the Crimean war men who had been connected with agriculture were always selected for the digging of trenches and other work requiring special bodily vigour.

The CHAIRMAN, in proposing "Prosperity to the Royal Agricultural Benevolent Institution," spoke as follows: Among the attributes for which England is distinguished I know not if there be one which is more remarkable—and certainly there is not one which presents the character of our countrymen in a more amiable light—than that readiness to combine for purposes of charity and benevolence which springs from active sympathy with human suffering. The main distinction between the civilization of Christianity and the civilization of the old heathen world is, that all Christian communities recognize to an extent unknown to the most enlightened commonwealths of antiquity the simple doctrine "Help one another." The ancients had among their goddesses three graces to whom they gave in their language the endearing name of "The Charities." Goddesses very charming and attractive were they; elegant companions in feasting, in merriment, and in gallantry. But those charities did not take their stand by the sick bed and the desolate hearthstone. They had no fellowship with old age and decrepitude; no broken-hearted widows knelt at their altars; no fatherless orphans cried to them for bread. Instead of those three heathen charities we have adopted one simple image of Christian charity; we place her not amidst the hearths of joy, but in the abodes of sorrow; and the only festivals to which we invite her are such as we hold to-day, in order the better to fit her to-morrow for her sacred mission as the benefactress of poverty and the consoler of distress (cheers). Now, gentlemen, when I look around me I see many with whom I am familiar—many with whom I hope on some other occasions to become more familiar—who are engaged in the active pursuits of life; and I think most of us may say that we are that (Hear, hear). It is commonly said that those who are engaged in such pursuits, and in keen competition for gain and power, are apt to forget others in their desire to advance themselves. And yet there are no communities in which that competition for gain or power is so active as it is amongst us of the Anglo-Saxon race; and in no communities are there so many institutions that attest the sympathy of the prosperous for the unfortunate, or in which the desire to aid and serve those who have to struggle against the ills of life more systematically pervades our public legislation or more enters into our private habits of thought. So that, perhaps, the truth is in reality that the more active and busy our lives are, the more our sympathies for large varieties of mankind are aroused and diffused; and our exertions for gain and power bring us naturally so much into familiar contact with the poor

and the feeble, that we become more sensible and compassionate simply because objects of compassion are brought more frequently before our eyes (cheers). The Samaritans were much more engaged in the active pursuits of life than the priests and the Levites; but when the wounded traveller lay half dead in the public thoroughfare, the priests and Levites passed by on the other side, and it was the Samaritan who bound up his wounds and took care of him (cheers). Amongst all our charitable institutions, speaking honestly and fairly, I know not one which is more entitled to general support than those in aid of which we are met this evening—a support which should not be confined to that class the suffering members of which it is the object of this charity to relieve. For the wealth of our nation has its groundwork in the culture of the soil (Hear, hear). It is in proportion as land becomes productive that capital arises for the purposes of trade, commerce, and manufactures. So that all classes may well say, "Speed the plough," because it is the plough which puts in motion the ships of the merchant and the mills of the manufacturer (cheers). And yet, gentlemen, while every other class and vocation long since established its special guild or benevolent institution for its unfortunate members, it is only within the last ten years that there has been added to the charities of this country this institution for the benefit of those cultivators of the soil who, while adding to the wealth of the nation, have themselves been overtaken by poverty. There are many who think that the life of the farmer is the most enviable of all, and in many respects it is. Still the life of the farmer is exposed to vicissitudes over which he has no control. This has been the case at all times; but I think I could show that in the times in which we live there is a more special call for the resources of this institution. In all times the English farmer is exposed to the risk of bad seasons in a climate proverbially fickle and uncertain; in all times his flocks and herds are exposed to disease, and his crops to blight and mildew, storm and tempest; in all times he is subject by the conditions of other countries as well as his own to great fluctuations in prices, and to the consequent difficulty of calculating profits and guarding against losses; in all times, too, he must be subject to that anxiety and fear of the morrow which preys upon the heart and undermines the health. And if he belong not to one of the higher order of farmers, such as I see to-day, but is one of the working class of farmers, his frame must be always exposed to the inclemencies of the weather, and, stout though that frame may be, he is thus more liable than weaker men who carry on their work under shelter within doors to be suddenly stricken down by disease. And yet, perhaps, there is no vocation in which the eye of the master is more imperatively demanded than in that of the laborious agriculturist (Hear, hear). While, then, at all times the life of the farmer is exposed to unforeseen reverses, this institution, in aid of which we are now met, is the only one existing in which in case of misfortune he can find comfort and relief, a provision for his old age, a pension for his wife, and a school for his orphans. The times in which we now live are marked by circumstances which may perhaps render the resources of this institution still more called for and important. We cannot conceal from ourselves that for several years past a transition state of agriculture has been in operation, and that it must continue in increased activity and force. There is a growing persuasion that a much larger amount of capital than was formerly needed is now required for the due cultivation of the soil. Small farms are being somewhat rapidly melted into large ones, and that old class of farmers whom we may fairly call working-farmers, who had little other capital than their own bodily labour and the scanty savings of their own careful thrift—that class is either rapidly disappearing, or, where it exists to any great extent, is engaged in a life and death struggle against the competition of neighbouring tenants, with all the costly advantages of machinery and science at their command, perhaps with some resources at their banks, which enable them to resist the pressure of adverse seasons and fluctuating

markets. That change began long before the repeal of the Corn-laws (Hear, hear), but that repeal gave to the change an irresistible impulse. The change is inevitable, and if it is for the good of the community, I cannot say that it is not desirable. Whatever brings to any description of business a higher degree of education and a larger amount of capital is not a change which any sound reasoner can deprecate or lament. But in the course of that change there must be a correspondent amount of innocent sufferers, and this institution comes opportunely to their aid (cheers). But even when the change shall be completed, even when large farms have become universal, and when the opulent tradesman and the scientific agriculturist shall more and more become eager competitors, at high rents, for the hire of acres in which to invest their capital and hazard their improvements, still we cannot hope that all will succeed. On the contrary, the hope of large profits necessitates the risk of great losses; and thus, perhaps, the uses of this institution may become more demanded when the change is complete than they are now that the change is in course of operation (Hear, hear). Why, I learn from the last report, which I have looked over rather carefully, that among the recipients of your bounty are the former occupiers of large farms at high speculative rents, farms of five or six hundred acres (Mr. Mechi: "A thousand"). The occupier of one farm paid, I find, not less than £3,500 a year rent. We must not forget that in the course of this transition, in which the old class of farmers is disappearing, with it must also disappear the old affectionate spirit of clanship between landlord and tenant. Formerly there was a kindly, affectionate relationship between the squire and the farmer. The former was naturally—he could not help being so—indulgent towards the man whom he had known in his childhood, whose ancestors had lived there almost as long as his own ancestors; and I don't see how he could be persuaded to set adrift in his old age a tenant who, whether from straitened circumstances, from infirmity, or from obsolete notions of agriculture, was not doing full justice to the land. But when the hire of acres is to become that mere matter of business which political economists tell us, and perhaps rightly, it ought to be; when the sole consideration between landlord and tenant is to be that of rent and contract, you cannot expect that the landlord will have the same affectionate indulgence that he has had heretofore for a failing tenant; and then the uses of this institution may become more urgently required. Now, in presenting the subject thus earnestly before you, I have not attempted to disguise the fact that it is dry and tedious; but I have dwelt thus minute upon it, in order that I might bring the uses of this institution now and hereafter more visibly, not before the public, but before those distant counties which at present subscribe to your funds in a proportion so slight compared to the wealth of the districts and to the agricultural interest there that I am induced to suppose that in those districts the uses of your society must be unknown (Hear). With a few brilliant exceptions, which I shall presently notice, I have observed that, while the society has been liberally supported in the home-counties, where its benefits are, I suppose, best known, as a general rule the amount of support diminishes in proportion to the distance of a district from the metropolis. Well, ought that to be the case? This society offers its bounty impartially to the three kingdoms; yet Ireland, with regard to which we hear a little more about the distress of small tenants than we hear in the case of either of the other parts of the United Kingdom sends us only one subscriber, and he is a physician at Dublin (laughter)—long life to him as well as to his patients (cheers)—while Scotland, which justly prides itself upon its agriculture, and which sets in many respects so notable an example of prudence and of foresight, sends, I think, only five subscribers, one of whom is a duke, and another a bishop. Long life to the duke's order, and long life to the bishop's church! We may be reminded of the old sarcasm, that farthings were first coined in order to enable the Scotch to subscribe to our public charities (great laughter). Yes; but, then, I find that the Welsh seem to think the farthings just as useful to them as they are to the Scotch, or more so, for North Wales and South Wales together only send us eight donors and subscribers (Hear). The county of Cornwall exceeds them all in care for the farmers. With the single exception of Earl St. Germans, not one single farthing has that great county contributed to our funds. Derbyshire

sends us, I think, nine subscribers; Cumberland and Westmoreland combined send us four; and the wealthy district of Lancashire, which would never have had its manufactures or its wealth but for the agriculturists, in spite of the munificent example of the late Earl of Derby, and of the interest evinced in the Society so sincerely and so warmly by the present Earl, who was my predecessor in this chair, that county only sends us fifteen subscribers, nine of whom (honour to the town and discredit to the country!) as appears from their place of residence, are not squires, or farmers, or persons belonging to rural districts, but persons residing in the towns of Liverpool and Manchester (Cries of "Shame"). Well, then, gentlemen, surely our object ought to be to diffuse as far as we possibly can a knowledge of the uses of this institution among those wealthy but benighted districts (laughter). How much can be done by the efforts of a single individual we may learn from the brilliant example of the founder of this institution (cheers). I have no doubt that it is owing much, and mainly, to his exertions that we are so greatly supported by the home counties in general, and by the county of Middlesex in particular. Perhaps the generosity with which certain southern districts contrast the parsimony of the northern counties is also to be ascribed partly to the superior exertions of individuals, and especially of the honorary local secretaries; I mean the districts or counties of Hampshire and Leicestershire (Hear, hear). Being myself the son and the brother of a Norfolk squire, perhaps I may be allowed to say with pride that the county of Norfolk sends us 85 donors and 250 annual subscribers (cheers). Well now, I would suggest one very cheap and simple mode of extending a knowledge of the society in those districts which do not at present contribute to our exchequer, and confirming our hold upon those which do: it is, that we should endeavour that at the various agricultural dinners, which take place every year "Prosperity to the Royal Agricultural Benevolent Institution" should form one of the toasts, and be entrusted to some person of local weight and influence. If he be a farmer of local weight and influence, it will be better than if he were a squire (Hear, hear); but at all events let him possess those qualifications. I should like to see such a toast proposed by my friend Mr. Brandram at the next agricultural dinner in Hertfordshire. No one could propose that toast better; and though Hertfordshire—thanks much to him—has done its work worthily, and we subscribe largely, still if the example be once set of bringing the institution fairly and clearly before the farmers of the county, it might be followed at other county festivals and the practice become general. Further, I think that the editors of the great county newspapers should really make a fair mention of the society; and if, besides this, we could secure in the more distant, and at present niggardly districts, honorary local secretaries who would actively exert themselves to get farmers to take an interest in the work, then, I think, year by year we should be enabled to extend the benefits of this institution. There is one object to which I wish to allude that is only partially carried out, and which, to my mind, is of the highest importance to the community—I mean a provision for the orphan children of poverty-stricken farmers. To soothe and cheer the last days of the old in their passage to the grave is a noble and a lovely charity. But for the community at large it is perhaps of still more importance that the rising generation, which is to influence the days to come, should be saved from the adverse influences of ignorance and destitution, and trained to become useful members of the body politic. I have here to appeal to the ladies who have honoured our festival with their presence. This is an object to which they can contribute, and I cannot believe that the cry of the orphan will fall in vain on the heart of woman. Now, ladies and gentlemen, why have I thus argued? To increase your funds (cheers). And, while I have complained of the comparatively small proportion of subscribers, let it not for a moment be supposed that I am dissatisfied with the progress you have already made. On the contrary, when I consider within how short a time the society has been founded, and how large is the country it has to permeate, I see ample reason for congratulation. Within the past year you have distributed amongst the pensioners nearly £3,500, and, besides your annual subscriptions, you have within 10 years accumulated £22,000, which is now invested in the funds; and while your resources have thus increased, your expenditure has been almost annually diminished; so that the society presents every ground

for encouragement, combining, as it does, a most rare and admirable economy of management, with a benevolence which comprehends in its range affliction and old age, pensions for widows, and schools for orphans. Knowing, then, that I appeal to your reason as well as to your hearts, I give you "Prosperity to the Royal Agricultural Benevolent Institution" (loud cheers).

The toast having been drunk with three times three, and much enthusiasm,

Lord SONDES proposed "The Chairman" (Hear, hear). In doing so he spoke in terms of admiration of the speech just delivered, and expressed a hope that it would be circulated throughout the length and breadth of the kingdom, and induce Lancashire and other counties which had been referred to as manifesting no interest in the society to become liberal subscribers to its funds. He had always considered the number of pensions too small, and he hoped to see such an increase in the subscriptions as would justify a great extension.

The CHAIRMAN in responding, expressed the deep interest which he had felt in agriculture ever since he became connected by property and residence with the county of Hertford.

The CHAIRMAN then proposed, "Our Visitors;" which was suitably acknowledged by the Honduras Minister.

Mr. MECHI proposed, "The Agricultural Societies of England, Ireland, and Scotland," coupled with the name of Mr. Long, of Cambridgeshire; in doing which, he congratulated the company that the society was not called a "charity," but a "benevolent" institution, so that there was no possibility of degradation connected with the reception of its pensions; and, also, on the absence of almshouses from the system adopted. As regarded the future, knowing the enormous wealth of agriculture, the capital of the landowners amounting to 1,500 millions, and that of the tenant-farmers to between 300 and 400 millions, he could not doubt that the council would obtain all the aid that was required to carry out the objects of the society. The speech of the chairman would be circulated through all parts of the kingdom, and would, he was confident, bring a fitting response.

Mr. LONG having briefly returned thanks,

Mr. JAMES ROUND, M.P., proposed "The Executive Council.

Mr. CHARLES S. CANTRELL, in responding, assured the company that the council bestowed its best attention on the affairs of the society, and congratulated it that after the approaching election the society would be giving about £4,000 a-year in pensions—a result of ten years' work, which appeared to him very satisfactory, and which he believed had no parallel in the history of benevolent institutions. He emphatically repeated his denial of last year that there was any ground for imputing to the council extravagance in the management of the society, and gave figures in support of that denial.

The CHAIRMAN proposed, in eulogistic terms, the health of "The Secretary," for which, after a fitting response, Mr. C. B. Shaw briefly returned thanks, expressing his satisfaction at finding that his brief tenure of office was, at all events, not considered to have been detrimental to the interests of the society. He then proceeded to propose "The Honorary Local Secretaries."

Mr. JOHN B. BRANDRAM in acknowledging the toast deprecated any undue parsimony with regard to the pensions. He was for a liberal expenditure of the money subscribed, believing that the more freely the society spent its money the more easily it would obtain increased subscriptions. As regarded the amounts of the pensions, he thought there should be £50 for married couples, £30 for single male pensioners, and £25 for single females.

The Rev. G. C. BERKELEY expressed a hope that the clergy in the rural districts would interest themselves in the society, and spoke of the success of his own efforts in that respect in a secluded part of Essex.

Mr. THOMAS SCOTT then proposed the concluding toast of "The Ladies;" and Mr. ROUND, M.P., having briefly returned thanks on their behalf, the proceedings terminated.

THE USE OF A FARMER'S CLUB.

At the dinner of the Dorchester Farmers' Club, Mr. J. G. HOMER, the Chairman, said he had accepted the office of president for another year. Last year he sent in his resignation, and he then fully made up his mind to resign the presidency. This was principally on account of the small attendance at the meetings. He was pleased to say, however, that during the whole of the past session every lecture had been well attended, which was an encouragement to those in office. All of them knew that the object of the club was to consider the best means of increasing the produce of the country—of improving agriculture; it was, therefore, but reasonable, to expect a good attendance at the lectures. He was quite sure that the object of the club had been accomplished. He was satisfied that through the operations of different clubs in the land agriculture had been improved, and that it now surpassed what it was some ten years ago. There had, of course, been certain drawbacks to improvements. They would remember the circumstance of a friend, an old and respected friend, a former member of the Winfrith Club—Mr. Saunders—sending in his resignation. They would remember that a good deal was said about the improvements effected having been taken advantage of by the landlords. Some of them would bear in mind what was said on this subject. Now he (the president) did not think that was the case with all the landlords. He did not think that every landlord would take advantage of the tenant with regard to the improvement of the land. He should be sorry to think so, because the improvement of the land was the staple business of the country, and when that was brought about by better farming the greater was the produce, and those who brought it about were general benefactors. Matters, perhaps, were not at all times equal to their wish; but this would always be the case more or less. The prices realised for produce would not at times meet their outlay. They must look to themselves and go forward as much as possible. That should be their principle. These clubs must by no means cease their work. They had already tended to the improvement of agriculture, and they would still continue to do so. He admitted that there were many instances of improvement being taken advantage of. For instance, when a man's farm had been very much improved from capital, and indeed extra capital laid out upon it, one of the first things he was liable to be falling in contact with the assessment committee, who would probably say, "Here is a farm assessed at so and so; we must put on 15 per cent. because of the improvements which have been effected." Now that was one thing which was not a great inducement to a person to improve his farm. Then, again, local taxation had had some effect upon agriculture. Local taxation was, in his opinion, eventually a landlord's question and not a tenant's. It was a tenant's question, he granted, during the time of his lease—during his occupancy—when he had additional rates and taxes put on; but eventually it must be a landlord's question. Those in possession of leases must, he knew, bear the first brunt; that was one of the drawbacks to which he had referred. It could not be overlooked that additional local rates were looming in the distance. One of the first additions would be a rate for education. He said by all means let the children be educated; but then it appeared that Government were easing themselves and casting the burden upon the local rates. Still, however, they were not to look to the Legislature. The Legislature, he believed, had never benefited agriculturists in the least. But he would not trench upon politics. The great thing they had to do in connection with these societies was to look to themselves, to farm their land better, to assist one another. For his own part he had derived considerable benefit from these societies, and they should continue to have his support. He concluded by expressing a hope for the success of the club during the next session.—[We gave some report of the other speeches in a recent number.]

FARM PHOTOGRAPHS.

CENTRAL YORKSHIRE.

This name will not be found in the maps; neither will Bradshaw nor Murray throw any light upon the subject. For parliamentary purposes Yorkshire is divided into three Ridings—North, East, and West; and the latter is again subdivided into three divisions, each represented by two members. It has also its Wapentakes, or Hundreds, its Petty Sessional divisions for local government, and its Unions and parishes for poor-law business; yet no one of these is coincident with the agricultural district which we allude to. It is a district large and important, and contains within its limits decidedly representative specimens of "the best of everything" that English agriculture possesses—good land, well farmed and well stocked—horses, cattle, sheep, and pigs being equally cultivated.

This district is really what we have named it—Central Yorkshire; being situate as nearly as possible in the very middle of the great county. It is of irregular figure, and may be generally described as a parallelogram, bounded on the east by the North Eastern Railway, from Milford Junction *via* York to Easingwold; and on the west by the North Eastern Railway from Leeds to Ripon. This district has in it the important towns of Leeds, York, Ripon, Borobridge, Knaresboro', Harrogate, Wetherby and Tadcaster, and a population greater than that of any other agricultural district of the same size in England. Its agricultural capabilities are as varied as its situation will permit. It does not produce hops; but every other description of live and dead produce are staples. Every kind of cereal and green crop is produced in the highest excellence on the new red sandstone range between York and Borobridge. The limestone belt running from Knaresboro' to Nottingham is a highly-farmed turnip and barley district.

The extensive district over the coal measures is productive of wheats and clovers unsurpassed. While the portion of the Great Vale of York, of the valleys of the Nidd and Wharfe, which run across the district, offer a large area of alluvial soil, adapted to any and every sort of crop; and in the neighbourhood of the several towns, on the banks of the Ouse, and alongside the Nidd, and the sparkling Wharfe are pasture lands upon which a beaumont of beeves and oxen are annually fattened for the public market; and broad meadows where the grass-mower "has ample room and verge enough," and where it has already relieved muscle of many a heavy strain in cutting the thick grass.

In this land of fleece and corn, of hoof and horn, there are famous sports and pastimes. Cricket holds sway on many a village green, and the champion of the ball, Freeman, learnt the alphabet of his art under the walls of the now rural village of Alborough, once a borough sending two members to Parliament; the quondam Isurium of the Romans, and, before Romulus was born and Rome founded, *Iseur*, the capital of the ancient Britains. Green forests and woods there are here too, and park demesnes, where the fox is sacred, except when the horsemen gallop down the broad glades to hear

The music of the hounds
Uncouple in the western valley.

But we must pull up at present. We are on holy ground. At this moment the sporting agricultural spirit of the district is struck dumb with sorrow at the Grecian tragedy, where one of the truest hearted of Yorkshiremen fell

victim to miserable political intrigue. He was indeed "the noblest Roman of them all!" and those who know how clannish Yorkshiremen are, will understand the spirit of indignation that just now reigns in every house and cottage in this locality. Here is the broad territory over which his noble relative holds sway—Studley, where the monks of old lived, and fished, and quaffed, with as few cares and as many of the good things of this life as was good for them—Studley, where the "first white bull," a very early ticket in the herd-book, held his levee, and where the lordly Shorthorn has ever since been a standard "institution." Here too, is Newby Hall, where the bereaved mother was when

She read
Who in his shroud lay sleeping.

Here where, a year and a-half ago, she saw one of her sons narrowly escape death, and another of her brave boys face it time after time to save others from the sudden death that came in the twinkling of an eye upon master, huntsman, and two of the first flight of the Ainsty. The loss at the ferry of Newby of Sir Charles Slingsby, Mr. Lloyd, Mr. Robinson, Orvis the whipper-in, and the two boatmen, father and son, in February, 1869, opened a wound which has not yet healed, and which this new affliction has caused to bleed afresh. Gallant, chivalrous, patient, pious, mild and soft-mannered, yet affectionate and brave, the name of Frederic Vyner—"poor Fred!"—will long be held up to honour under every roof-tree in this broad county, and will be associated in memory with "Sir Charles," whose name is yet "a household word" with farmers and sportsmen.

Well do we remember the last of the Slingsbys and his pluck as a boy, when he hunted his own harriers, first on foot and then on his pony; and often have we, when he was Master of the Hounds, and master of the art too, witnessed his perseverance and patience, and admired still more that calmness of temper which neither design nor accident could overcome. To have felt his welcome, and to have occasionally given him the gate, is a jewel of a reminiscence to be carefully stored. We, too, have met Lloyd and Robinson in the field, and have seen the latter go as he could go. With Mr. Lloyd we have marched over, *through* and *in* Knavesmire when the heavens opened and the rains fell upon the devoted heads of her Majesty's gallant Volunteers; and we have sat at his elbow at the mess, where his smiles and bon-hommie endeared him to every junior, and gained him the respect of all.

Few years have elapsed since Sir Charles consulted us on some little agricultural difficulty; and the manner in which he mastered his subject, and cast back and quartered the ground, and hunted every inch of it till he came to a conclusion, we well remember.

But he had no vanity. He "did not profess to be a great gun at farming." Neither did he profess to be such in hunting; but he was one. "The first amateur huntsman and master of his field in England." A very great authority says this; but we back it, and utter it as our own, and will take the responsibility.

When men of this calibre ride over the land, fox-hunting and farming must go hand in hand. Class distinctions and political opinions weigh little after forty minutes' *fast* across country; and the gap which has been

made in cover-side society, where the farmer and his landlord winnow their sporting and farming chaff, and give and take freely, has been widened by the cold-blooded murder of so young and popular member of the hunt as Frederiek Vyner. But the last year was a sinister one, and public sympathy was excited by other disasters in the sporting world. Amongst these we may mention the death of poor Poulter the whip, who saw his master and huntsman sink beneath the waters, and who, escaping the danger of the "flood" in February, perished in the "field" over a grip in November; and the awfully sudden and fatal accident in May to a well-known and highly-esteemed agriculturist in the district—poor Tom Hannam. One of a race of sporting farmers—he loved Sir Tatton's thoroughbreds and Leicesters—he had won the prize, £50, for the best-managed farm, and many times carried off local prizes as a sheep-breeder. As an amateur steeple-chase rider, he formerly won frequently, and was for twenty years across country, one of the best of the "Bramham-moor Blackcoats." Fearless in the saddle, he met his death out of it; being killed instantaneously while acting as judge at a horse-race near Wetherby. We mention these "moving incidents," because in our recent wanderings we found them in everybody's mouth:

Tale!—Lord love you,
I have no other tale to tell.

was virtually our answer, now that the deaths of Vyner and his companions have brought back to memory and to mention, the other local disasters. And one or other of these gloomy pictures in all cases have we listened to, before we could get any attention to our objects, or elicit a single fact or feature useful to our agricultural photograph. It is then with bated breath and subdued tone that even yet horse, hound, or hunter is mentioned at any farmer's ordinary between York and Ripon.

But "after darkness cometh the light." Young blood moveth quickly, and farming and foxhunting will again become the popular toasts.

In this fine district, then, with an eye for pleasure as well as business—scenery and fishing, as well as farming and photographing—we have pitched our tents for the present. Whence we come, and where we go, we say not; but "here we are!" And that is all that any one will care to know; except that, whenever we have been told of anything to see or learn "in our line" there we *have gone*; and whenever we shall find that there is something worth seeing that we have not seen, *there we shall go!*

Before attempting to bring our art to bear on the agricultural specialities of particular persons and places that may be worthy of "fixing," we shall, on this occasion, simply attempt to picture the general agricultural position of the district at the present moment. The first feature we must notice in our written photogram is the weather. Well for us, under the canvas, and in our wanderings, and well for the country it is, that it is now genial and lovely. May began inauspiciously with cold winds and night frosts. About the middle of the month there was a rainfall, and since then we have had uninterrupted sunshine. Poets in all ages have sung the praises of May, the "merric month," when, as Reginald Heber says,

Flocks on the mountains,
And birds upon their spray,
Tree, turf, and fountains
All hold holiday;
And love, the life of living things,
Love waves his torch and claps his wings,
And loud and wide thy praises sing,
Thou merry month of May.

We are at the end of it, and it is not the least of its

attractions that it brings us to the portal of June, the queen of months in England. In this month the day reaches its full length, flowers attain their perfection of bloom; earth gleams and glows with beauty; birds are in full song; earth, air, and water teem with life, and all Nature is gay and joyous. On the farm this change is now seen. The trees are in full foliage, the quickthorn has burst into leaf, and the hedges are green walls fringed with the sweet may bloom. The fruit blossom is on every tree, and the orchards in the landscape look like a mass of rich lace thrown here and there upon the carpet of the earth. The wheat plant has changed in colour from the sickly yellow to the dark green, and its broad leaf waves heavily as the sap circulates rapidly in the pores, and the materials which will eventually form the stem and the ear accumulate. The spring corn has also grown out of its delicate first blade, and now totally hides the brown clods of the soil. The very bare pastures of the spring have become a mass of fine dark green herbage, and are gilded with a profusion of the buttercup and cow-slip, the former being a true indication of the wealth of the soil and the richness of the pasture. And the meadows, which looked starved and mean in early May, though backward, are now fresh and vigorous. This is all the effect of a fortnight of fine genial weather, after rains. Before the rain came cold winds from the N.E. ruled; the nights were very cold, and on the 4th of May vegetation was cut off by the frost. The long tedious winter and the cold spring had kept back the early bite of grass, and winter food was exhausted before vegetation had made a move; so that the old grass was eaten up to the quick, and three weeks ago the pastures were truly like Falstaff's contingent, as they marched through Coventry,

Exceeding poor and bare.

The wheat plant, at that time, looked in many places rugged from the ravages of insect enemies, and from the loss of root during winter. The hoe, however, has been busily employed, and the improvement in the appearance of the crop during the last ten days has been very great. We say "the appearance," because in those places where the crop is patchy, from loss of root, the vigorous growth now going on and the broad leaf that has been developed, cover up the vacancies caused by the loss of plant, and conceal the real thinness of the crop. The improvement that the present fine weather has produced in the wheat crop is therefore nothing more than is always to be expected, either early or later, in June; and is nothing to build a theory of future productiveness upon. And in the cases to which we have referred, where the root of the plant has perished, it really only covers up deficiencies and gives the crop a better external aspect.

The failures in the wheat crop we find to be quite as extensive and numerous in this county as in all others where we have lately travelled. Reports concur in stating that the same is the case generally throughout the kingdom. Certainly here, on the light lands after clover and seeds, where wheat is taken generally, upon open fallows and upon bean and pea stubbles, crops with sufficient plant are quite the exception. As a rule they are patchy. In many instances large portions are very thin, and in some cases the roots have all gone. In these cases the crop continued to go away during April, instead of gathering root as might have been expected. So that not nearly as many farmers ploughed up the tailing patches, and resowed them with barley as might have done so. Where the wheat has sufficient plant, it is however looking capital. The weather has done all for it that could be done, as it glories in a fine dry period of some duration after rain in May, and always in June assumes the rich dark green foliage that seems to indicate full health and vigour—hence the old rhyme:

Go, look at your crops in May
 And you are sure to come weeping away;
 But visit them again in June
 And you'll sing a different tune.

The barleys and oats are looking unmistakeably well here. They are full of plant, and well forward. If June sun gets to the soil it makes bad work of the yield of the barley crop, hence the advantage of early sowing. Considering that in this district the farmer grows turnips on nearly all his fallow break, except where potatoes are grown, and that some of these turnips must necessarily be consumed on the soil in spring, the quantity of late sown barley is very small. Knowing how soon moisture escapes, every effort appears to be made here to get the seed barley in quickly, and every energy of man, horse, and machine is concentrated for that object, when the turnips are off, and the barley has to be put in.

Spring beans and peas are only looking moderate, but winter beans are a miserable lot. If they have not, to use a farming phrase, "stood the winter" in one sense, they have certainly done so in another; for they have certainly *stood still*, and made no improvement during winter or spring. The fallows have been thoroughly done; the whole are now clean; and such as are not sown are quite fit for the turnip. Swedes are now nearly all sown. In many cases half the acreage grown were put in a month ago. Those sown then are now well up, and fighting bravely with the fly. If rain should come quickly it would give them great help. The swedes sown recently are in great need of rain. In some instances the seed will not vegetate owing to the deficiency of moisture in the soil; in others it has vegetated, but can scarcely form root, and, certainly, if dry weather should continue for many days longer the young plant will succumb before the combined influence of the drought and the fly.

In both these cases the advent of rain is a necessity to the crop. The white turnips, which are now being sown, will rest quiet in the soil till rain does come; and upon the date when that shall occur will be the bulk of the crop depend. A late crop in this district is seldom an average one, never a good one. The advantages of early sowing turnips are an accepted doctrine by the best men here, who farm highly and use cake, and hand tillages as well, freely. Autumn scarifying and cleaning, steam-smashing, and the use of cultivators instead of ploughs at spring are the agencies which accomplish the work—horse-power in abundance in autumn is required to do this, but the relief is found at spring, when the whole physical power of the farm can be applied to getting in the crop, instead of sweating and broiling in the sun to get out the quicks and to turn the soil over and over till it is leaked into either large, moderate, or minute bricks as the ease may be, incapable of affording soluble nutriment to the young rootlet and the vegetating seed until rain comes in abundance; for an ordinary summer shower has no effect upon land in that condition.

The mildew was formerly a bugbear to early sowing; it is no longer so here. If the early-sown swedes are highly manured they will get grown into a good crop before they are touched by the mildew, and will swell again in the autumn, after being mildewed, and get to be much heavier than the late-sown ones that are not touched with mildew. Of course, to sow swedes early on poor soil, or on any soil, without manuring freely, both with farmyard and bought fertilizers, is folly. It is equally folly to use fertilizers freely, and to lose the advantages of early sowing, especially on a large farm, where one field may be sown rather later, and kept for the very latest consumption. Along with the implements named above the water-drill is now adopted in many localities here. At

the present moment it is doing good service, and will ere long be in general use. The mangold is a good plant, and enjoys the present sunshine. It "digs deep" for its food, and flourishes best in summer weather. The early potatoes, though checked by the severe frost in the first week of May, have recovered, and the general crop is now well up, and looks promising. This district is in repute for its bright-haired Leicester wool, and this year the clip has been good. An improved system of washing has become more general. The crop of lambs is a full one, and the sheep stock healthy. Now that the pastures are stocked great anxiety is felt for the health of cattle. This district suffered greatly in the plague year. The foot-and-mouth disease was almost universal last year; and the pleuro-pneumonia "hit hard" in particular localities. The farmers are beginning, however, to be aware that they must assist the authorities in carrying out the law and in putting out the parties who infringe, by moving diseased animals about, if they wish to prevent their feeding pastures and dairies being again made profligate by the visitation of disease amongst their live stock. Pleuro-pneumonia has for many years decimated the cattle on the grazing lands here. If the now Order in Council which regulates the transit of cattle by sea as well as land, and the Orders already in force relative to moving home-bred stock, should be effective in excluding this disease from our farms, the farmer will look back on previous losses without regret; the future immunity from such attacks being compensation in full for the past. That this will occur we have great faith. The sea-passage from Ireland has always seemed to be the *fons et origo* of the disease. The horrors of that passage in some cases have been depicted. The crush and excitement on going on board—the crowding and heat—the sea-suffering—the night-sweat and putrid atmosphere—the early-morning chill—the cold bath at landing when swum ashore—and the damp ground for a lair—have been sufficient to sow the seeds of disease freely amongst a drove of cattle; and these have ripened and born fruit in the death of hundreds of valuable animals in our pastures. On this ground alone can we explain the arbitrary and eccentric course it ran throughout the country last year.

"Nunc huc, nunc illuc, et utroque sine ordine currit."

This is its peculiarity. When existing in a district it harasses the farmer by being always with him or about him, and by being intermittent so far that if he be free of it to-day, to-morrow it may make its appearance. Now it sweeps away a drove of lean stock, and next it takes the one prime bullock intended for Smithfield. Now Smith's Irish heifers fall victims, while Jones's Scotch bullocks in the next field escape; and Robinson's Short-horn Peceresses are struck down, while the half-bred milch cows on the same farm escape scathless.

In one year, out of one noble pasture eighteen years ago, we lost forty-eight head of cattle—lean, half-fat, and fat. Our neighbour, separated by an iron hurdle only, escaped without loss. Next year, however, he was to a serious extent victimized. The regulations which are now the law of the land, to our mind may, if thoroughly carried out, for the future preserve our herds from these visitations. At least they will seriously lessen the risks of infection; but if they exclude pleuro-pneumonia they will be the greatest "blessing and boon" that have been conferred upon the agricultural interest by the wisdom of our legislators.

THE STAFF OF LIFE.—The Cornish bread is decidedly the best that I have ever seen, and that which I tasted at Lundy Island would make the fortune of any baker, if it could

be produced in the London market, instead of the bubbly, scentless, tasteless stuff which we are unfortunately condemned to eat. The loaves are usually large, and will fill a room with the fresh smell of corn; the grain is excessively close, but only of leather weight. I have used the phrase, "condemned to eat," and verily it means a great deal; I may also add "condemned to drink." It is no use having a penny, if you are compelled to put up with a halfpenny's worth; it is a dead loss of half your fortune—fifty per cent. deducted at once, and that in the most annoying way; for I would much rather pay fifty per cent. over, and obtain the article I want, than lose fifty per cent. the other way, the actual moneyed loss being the same in either case. Free trade is all very well, but free trade was never intended to spell "licence." It is plain that the capitalist with only a penny has no choice in the matter—he must pay his penny and get a halfpenny-worth; his is the cause which requires especial attention. The seller says, "If you can pay for my goods, you shall have them;" and he thinks that he is really stating the case honestly on its bearings. He says: "Do you want bread? I have loaves at one penny, twopence, threepence, of one and the same size and order of bread, but more attention is paid to the preparation of one sort than another, because we find it pays the trade." To discuss the subject on its merits, it is necessary to commence at the beginning; the radical idea must be exhumed for liberal discussion. What is the radical idea? Free trade? No; but trade is. Why is any one allowed to trade? Oh, to make a fortune rapidly, or slowly, as the case may be, but certainly to make one as rapidly as possible. Such may be considered one radical idea about another radical idea; but is it the correct one? Certainly not. Again, I will ask, Why is a man allowed to trade? Why are the baker, the grocer, the butcher allowed to open their shops? Because the grocer must eat bread, the baker must eat groceries, and both baker and grocer must eat animal food. Life must go on; for once the creature is born, creation becomes responsible, and places its responsibility in the guardianship of certain of its parts. The stallion protects the troop of wild nares; the bull, the herd of wild cows; trees, hillocks, and rivers protect the grass and the cattle grazing on it. Take away the stallion, take away the bull, the trees, hillocks, and rivers, and the world would wither, parch, and die. A want is supplied to keep the stallion and his troop, the bull and his herd, the trees, hillocks, and rivers from preying on each other. Such a want is man, together with the other orders of creation. Man is born, and lives on the rest; generates acuteness, and makes bread. Savages become civilized, huts become houses, grass yields to cabbage; knowledge increases, collects the spice, and the grocer is made. Why is the baker made? Why is the grocer made? Because the rest of the world require the bread and the spice. Ages follow ages, houses become towns, towns become cities, shops are opened, licences procured. Why are licences procured—to raise money for the taxes? Partially so, but to throw a responsibility upon the seller. What responsibility? That of selling a sound article, and the soundest article for the money. I have now arrived at an important point in the argument. I wish particularly to show that the seller is allowed to sell simply because others want; a certain responsibility is thrown on him, namely, to provide a want. The carrying out his responsibility allows him to support himself, wife, and family; and as the making a certain amount of superfluous wealth cannot be guarded against, it is allowed. This is the second count that I wish particularly to point out; the trader is allowed to make money, but his doing so is not a recognized necessity, or a first cause of his being a trader at all. He is allowed to make money as every one else is allowed to make money, but the State does not depend upon him individually for its wealth. It depends upon trade for its wealth, but not on the trader; to make myself better understood, I will say any particular class of trader. I am arguing the cause of the poor, and will stick to the baker. I have shown that he is allowed to open his shop because people want bread, and not because it is necessary to the State that he, the baker, should make a fortune. And now I will pass on to the particular point of the discussion. "Because people want bread" means a very great deal—a great deal more than the mere supplying the want. The poor man with his penny wants a pennyworth, wants fifty per cent. more than he gets, wants close-grained corn-smelling bread, instead of bubbly, scentless, tasteless stuff. If the baker cannot supply it, take away his licence, and give it to one that

will; to keep the one that will up to the mark, protect the poor man by appointing a public prosecutor, whose duty it shall be to examine the bread and prosecute the seller of bubbly, scentless, tasteless stuff. "The least said, the soonest mended," is a very old saying. I could take the grocer and the butcher, in fact half the world in turn, and I daresay I could find something fresh to say about each of them; but I do not see that the argument would gather force; if I did see it, I should not hesitate for a moment. I have pitched upon bakers simply because the poor have to live chiefly on bread; and I recognize that bread, such as the Cornish bread made by the Cornish women, is a real staff of life; but the bakers are not a bit worse than any one else.—*Mr. Middleton's Cruise of "The Kate."*

THE SMITHFIELD CLUB.

At a meeting of the Council, held on Monday, May 23, present Lord Walsingham, in the chair, Lord Tredegar, Messrs. Canning, Beasley, Newton, Webb, Leeds, J. S. Turner, Joseph Druce, and Brandreth Gibbs,

The minutes of the last Council meeting were read and confirmed.

In reference to the pigs disqualified at the last show, the reply of Mr. Chamberlayne to the letter written to him by order of the Council, inquiring whether he still retained his steward and bailiff in his service, was read, and the following decision was come to, viz.,

"The Council considering that both Mr. Chamberlayne's steward and bailiff (Mr. Gilbert and Mr. Rowbottom) are highly culpable in respect of the false entry of the age of the pigs shown in class 59 at the last Show, resolve that no entry be received in future, signed by either of those individuals, and that Mr. Chamberlayne be allowed to exhibit in future on the sole condition that he shall himself certify the particulars required by the Club."

A letter from the Earl of Powis, the President of the Club, was read, offering to place at the disposal of the Council a sum of money for prizes, to be given for the best instrument for the slaughter of animals by the severance of the spinal vertebrae.

It was resolved: That the thanks of the Council be given to the President for this offer, and that his Lordship be requested to draw up, with the assistance of Professor Simonds, the conditions for offering the prizes; the same to be submitted to the November Council.

The Hon. Secretary having stated the result of the conference of the Show-yard Committee with the Directors of the Agricultural Hall Company, respecting the proposed additions to the Hall, it was determined that the Club should not at present incur any expenditure in reference thereto, but that the Directors should be requested not to permanently appropriate the site in question without first giving the Club the offer of it.

The consideration of the subject of the Club's annual dinner was postponed to the November Council.

Mr. Francis Savile Foljambe, M.P., of Osberton Hall, Worksop, was duly elected a member of the Club.

The Hon. Secretary notified the death of Mr. Thomas Switchell, a member of the Council, and for many years one of the most successful exhibitors at the Club Shows, and that the vacancy in the Council caused by his lamented decease will be filled up at the November Council meeting.

The thanks of the meeting were voted to Lord Walsingham, for his conduct in the chair.

THE CENTRAL CHAMBER OF AGRICULTURE ON THE GAME QUESTION.—The resolutions adopted by the Chamber coincide rather with the views of landlords as to the direction the Legislature should follow than those of tenant-farmers. While commending much of what was said at the meeting as to the evils of game-preservation and the harsh game code, we cannot overlook the fact that the resolutions adopted by the meeting are "most lame and impotent," and cannot be regarded as the opinions of the more enlightened of the tenant-farmers of England.—*The North British Agriculturist.*

THE RECLAMATION OF WASTE LANDS.

At a meeting of the Hampshire Chamber of Agriculture, at Romsey, Mr. W. W. B. Beach, M.P., in the chair,

Mr. BLUNDELL said: Whether we view the subject of reclaiming waste or unproductive lands as a public or private question, it is alike important. Whether it is viewed as a matter affecting the interest of the crown, of the large landed proprietors, of the occupying tenants, the town tradesmen, or the labouring classes, it must be admitted that it is one of the greatest economical and social questions of the present time, for I think I shall be able to show you that royal forests and crown lands, now in many cases of little value, may be made to yield an enormous revenue; that the large landed estates may be made infinitely more productive in rent to the proprietor, offering an extended area for the occupying farmer, increasing the business of the trading and commercial classes, and yielding more employment to the working men; so that pauperism may decrease, that emigration from necessity may diminish, and that the country at large may be more capable of maintaining its own population without foreign aid. I do not propose to speak upon the practical operations of culture, believing that the policy of reclaiming waste land is the subject intended to be discussed at this meeting, and will therefore dismiss the subject of culture by observing that the leading points are paring and burning, trenching or steam cultivating, draining and chalking, or marling, and it is only in a few cases where all these are really required, and that the cost of these operations cannot be stated accurately, because it is found to vary according to locality, the price of labour, and other circumstances. I think it will be best to consider our subject under two separate headings, viz., crown lands, forest and commonable lands, and, secondly, land as private property, lying in a waste and comparatively unprofitable state. Let us take, first, the crown lands and forests in the hands of the Government, and these are to be found in various counties, and are very extensive. It is, however, generally considered that Hampshire contains, in proportion to its size, more than any other county, and, after carefully going into the matter, the only estimate I can make is that we have at least 130,000 acres (which includes the New Forest, the Forest of Bere, Alice Holt and Woolmer Forests, and Parkhurst Forest, in the Isle of Wight—some of the land in connection with all of these has been enclosed from time to time). My figures, therefore, are only approximate, but I introduce them to show the extent and importance of the subject, and will now proceed to state what, in my humble opinion, would be the best plan of proceeding in the endeavour to utilize and reclaim those wild and barren tracts, which are alike disgraceful to the Government and the boasted civilisation of the age in which we live. The local enclosures sanctioned by the commissioners, by which many heaths and commons have during the last 25 years been brought into cultivation, may be a good guide in enclosing the New Forest, as far as acquired rights are concerned. I find that the commission appointed under the Act of Parliament passed in 1854, for defining the rights of parties in the New Forest, have allowed rights to about 1,400 properties, owned by about 1,100 proprietors. Having, therefore, ascertained the number of claims which have been allowed, and before entering upon the question of appropriation of the forest, it seems desirable that, after careful survey, good roads and main dykes for drainage should be laid out, after which all the rights, whether of pasturage, pannage, turbarry, &c., should be compensated, and not by money payments, but by allotments of land. In this way many poor border residents would be retained, and this would be desirable, inasmuch that it would localise a labouring population, whose interest in the locality would be very beneficial. In fact, it is only reasonable to suppose that the reclaiming such vast tracts for productive purposes would involve the necessity of accommodation for an increasing population. The next step I should propose to take would be the apportionment of land for recreation purposes, and that it should be done in a liberal spirit—say 1,000 acres for such towns as Southampton, Lynton, Christchurch, and Ringwood, and 500 acres for smaller places, such as Lyndhurst, Brockenhurst, &c., reserving all the timber as it

stands, in order to retain and preserve its picturesque appearance. We may then commence to set out for sale or letting on long lease such portions of the land in suitable lots as lie contiguous to the various landed properties bordering on the forest, in such proportions as would be likely to attract the attention and facilitate purchases by the neighbouring landowners. In this way some thousands of acres may be disposed of at good prices, any timber thereon to be sold standing. The next proceeding may probably be most successful by offering all the best building sites, especially those most suitable for gentlemen to erect country residences, and there are very many, some of them being of a romantic and highly picturesque description. The quantity of land offered in connection to depend upon the circumstances by which these selected spots may be surrounded, but in all cases to reserve the timber and sell with the land. It seems to me that these sales would eventually tend to form the nuclei or centres of landed estates, and with this object in view, perhaps, it would be well to offer land for sale for agricultural purposes in considerable quantities periodically, say at intervals of five years, by which mode of disposal the land would realise a good price, and thus secure an increasing and permanent revenue to the Crown. There is, however, another view taken by some parties as to the rights defined by the Commission in 1858—viz., that they extend over the whole of the unenclosed parts of the forest, and that they are entitled to allotments in accordance with the extent of their rights, on the same principle as ordinary commons have been allotted to copyholders and others by the Enclosure Commissioners, and they view the Crown as only possessing manorial rights. This matter, however, if not explained by any existing Act, would sooner or later be decided by Act of Parliament, and it appears to me of but little moment, if the forest is enclosed, whether it is done by an allotment or otherwise, so far as the general public are interested. So much has been said and written lately in reference to the value of land in the forest for agricultural purposes that I cannot refrain from offering my opinion, and, having been a close observer during the last twenty years of the reclamation of the waste or common lands in the southern division of this county, I beg most distinctly to state that the South Hants division has the advantage of a climate which is first-rate; and in reference to the New Forest, although the soil varies a great deal, yet there is none but would answer well for reclaiming; quite three-fourths are fit for arable or pasture land, and all the remainder is well adapted for fir and other plantations as woodland. Before quitting the subject of utilising our Crown lands, it should be understood that, although I consider the present growth of old timber in the forest as nearly all useless for navy purposes, it would be well for the Crown to retain possession of some of the most flourishing and extensive plantations of young oak trees. To my mind a number of causes seem to have transpired within the past 25 or 30 years to render necessary the reclamation of the waste lands of the kingdom. Look at the extent of land absorbed by railways, and the area of the stations, &c., connected with them. Again, the extension of towns. The land not many years ago occupied by the market gardeners is now built over, and the gardens banished into the country; also the area of land absorbed by factories and public works in endless variety is very great, and in the interest of the country at large the Government is bound in a national point of view to restore to agriculture and the productive resources of the country as much of the waste as possible, in order to compensate for that which has been taken by Act of Parliament and otherwise for the purpose above-named, and also to meet the wants of an increasing population. And foremost in the demand for restoration we very naturally find the occupying agricultural tenantry of the country, and I propose, with your permission, to name some other causes which have more particularly operated to render an increase of land for agricultural purposes highly desirable. The area of the kingdom is limited, and every deduction from the cultivatable extent is a loss to the nation in its producing and self-sustaining power. The tenant farmers are the great producing medium of the country, and

any cause which operates adversely to their interest is in fact a strong reason why greater extent of land if attainable should be secured for them. Referring to some of the adverse causes in operation, I cannot help saying that the tenure of land operates very much against them. Anything short of a lease for a term or an agreement with two years' notice, with compensation for unexhausted manures and improvements, is against good cultivation, and diminishes production. Again, the subject of game, which engaged your attention at the last meeting of this Chamber, is a monstrous evil, but I shall not enlarge upon it now, and will merely observe that I estimate only one farm in five in this kingdom is let without the game being reserved, and that only represents one-eighth of the land. The law of entail is also a great evil. Immense tracts of excellent land are let subject to six months' notice to quit in consequence of the proprietors having only a life interest in the estate, and I need not tell you how this prevents the outlay of capital, and, in fact, together with the reservation of game, positively deters large numbers of men with ample capital from investing it in agricultural pursuits. The foregoing causes are sufficient to justify a demand for more land to be brought into cultivation, there being at this time an immense amount of capital ready to be embarked in agriculture if it could be secured by a reasonable tenure. In entering upon an inquiry as to the extent of waste lands in the kingdom, it is of the first importance that we should obtain some reliable evidence, and I think you will agree with me that the map now exhibited, showing the extent of waste in each county, and for which we are indebted to the kindness of Captain Maxse, who has introduced it to the Chamber for the purpose of illustration, supplies such evidence. Who is there amongst us that could have supposed that such a large portion of the kingdom actually lies waste, or comparatively unproductive? and I cannot imagine anything more striking and convincing, and better calculated to leave a lasting impression on our minds, than this map. And what do we learn from it? First, that the total acreage of the kingdom, in round numbers, is 77 millions; that the cultivated area, as shown by the Board of Trade returns, is 46 millions under crop, and 23 millions of permanent pasture and grass land; leaving 31½ millions uncultivated. [These figures of course do not agree.] In speaking of this 31½ millions, we must include the woodlands; and, after all the inquiry I have made, and all the evidence I can obtain, I estimate that about 15 millions of acres are capable of being made productive; and the remaining 16½ millions unaccounted for consist of rivers, towns, railways, mountain ranges, heaths, moorlands, and woodlands, some of which are partially productive. Large tracts of it, however, may be made much more so under cultivation, or in pasture and plantations. I find it difficult, in introducing this subject, to avoid some repetition of a paper read by me before the Botley and South Hants Farmers' Club, on "Woods and Wastes," and have also laid under contribution the excellent paper read by Captain Maxse, at the same Club, on the "Waste Lands of England." I therefore propose, in order to bring the subject more under special notice, to speak of our county, from the best information I can obtain, without examination of the Ordnance map, and which would, to have insured accuracy, taken much more time than I have to spare.

I find that the area of the county of Hants contains	Acres.	1,070,216
Arable and pasture land, as per returns by Board of Trade.....		685,540
		384,676
Deduct land estimated to be capable of reclamation	Acres.	130,000
Deduct area of rivers, roads, railways, towns, factories, villages, &c.		54,676
		184,676
Leaving in timber, woodlands, &c.....		200,000
Let us now refer to the 130,000 acres as above stated to be available for inclosure.	Acres.	
Crown lands, uncultivated.....		68,000
Heaths and commons		44,000
Mudlands and estuaries.....		3,000
Chalk Downs.....		6,000
Private property in heath and rough woodlands...		9,000
		130,000

In analysing this 130,000 acres, it will be remembered the part called crown lands I have before referred to being 68,000 acres, the heaths and commons being 44,000 acres, I must compare with much which has been enclosed, such as Curdridge Common, Titchfield Common, Waltham Chase, and others, and may be made productive, if allotted under the Enclosure Act in the same way. There is, therefore, a large field open in this direction for private enterprise, if the parties holding rights would join in application for powers to enclose. The next item which occurs is 3,000 acres, estimated as capable of being profitably reclaimed from the rivers and estuaries by embankment, and converted into pasture land. This should be done by the Government, and considered as public works, and may be effected by the employment of penal labour, in the same manner as Portland Breakwater and other public works; and I think it will be admitted that it would be a better policy than discharging convicted felons under a ticket of leave. If we look at the coasts of some counties more land may be reclaimed in this way than can be obtained in Hampshire; and as an example both as to value and extent, we have only to take the fen-lands already reclaimed in Lincolnshire, Cambridge, and other counties. Instead, however, of the Government encouraging works of this kind, I fear that they have hitherto been opposed to them; for I hear that the Admiralty are very jealous of any enclosures which would reduce the extent of backwater in our tidal estuaries—in fact, the Enclosure Commissioners have already claimed in some instances their rights over land which had heretofore been considered private property. The chalk downs, estimated at 6,000 acres, may to some extent be reclaimed from comparative barrenness to arable land of fair quality—that is to say, much which is now only worth a few shillings per acre rental, and producing only a scanty herbage, may by cultivation be made worth from 12s. to 15s. per acre, producing good crops of roots and corn, and maintaining a larger number of sheep also. There is, however, much that is too poor to cultivate, and of but little use even as a sheepwalk. It then becomes a question whether such land, often of a north aspect, very steep and hilly, with scarcely any soil above the chalk, can be made more profitable to the proprietors, and I propose to test this matter by stating that my plan of planting larch-firs in these cases be carried out with the greatest advantage, for I have no hesitation in saying that every acre of the poorest chalk hills which intersect the county, and stretch across between Winchester and Basingstoke, may be turned to good account; and there are numerous instances of flourishing plantations on the chalk hills, although they have been planted with little care and expense. I will, with your permission, state the plan of planting which I recommend: First is a method of planting larch firs for a quick and profitable return. The land should be trenched or steam-cultivated not less than eighteen inches in depth; the use of fresh, strong manure should be avoided, although good vegetable mould may be applied with advantage on very poor and stony soils. The plants should not be too large—say about from 24in. to 30in. high, and if they have been grown and previously transplanted on poor soil so much the better, if they are healthy, clean grown, and well-rooted. The first two years after planting the land should be kept clean by hand-hoeing. Particular attention should be paid during their growth by the removal of diseased or decayed plants, and as soon as the poles are marketable (which they will be by taking the best at the end of eleven years) commence by thinning and selling, looking only for a quick return. I believe a great mistake is made by many who allow the plantation to go on unnoticed until the plants are neither fit for one purpose nor the other—not large enough for sawing into rails, pales, &c., yet having passed the size called poles. It often happens also that the plants are set at too great a distance from each other; the consequence is they do not grow so fast, neither do they make such handsome poles. When planted close they protect each other, the winds take less hold of them, and they gather more moisture from the atmosphere in the summer months. They cover the land quicker, keeping in check both grass and weeds. Again, instead of growing boughs, the growth centres in the poles, which come earlier for use in consequence. In following the above plan the plants should be set at 36 inches by 30 inches apart. I will now furnish a statement of the cost of planting, and also of the mode of taking and the value of the crop per acre:

EXPENSES.		£	s.	d.
Trenching 18 inches deep, at 1s. 9d. per rod		14	0	0
5,250 plants, at 25s. per thousand		6	11	3
Planting by spade		2	10	9
Hoing		1	0	0
		<hr/>		
		£24	2	0
Interest on the outlay of £24 2s., at 4 per cent. for sixteen years		15	9	4
Failures allowed, at 10 per cent.		7	15	0
		<hr/>		
Total expenses of plantation		£47	6	4
Commence cutting, taking the best at the 11th year, cut 600 poles at 3d each.....		7	10	0
12th year ditto ditto		7	10	0
13th year ditto ditto		7	10	0
14th year ditto ditto		7	10	0
16th year, cut the remaining 2,850 poles, at 4d. each		47	10	0
		<hr/>		
Value		£77	10	0
Cost		47	6	4
		<hr/>		
Profit		£30	3	8
Annual profit, 38s. per acre.				

As however the plan of quick returns, as just stated, by the growth of only larch firs require a great deal of constant attention, some parties may object to it for that reason or others. I will therefore allude to a plan whereby a less number of plants may be set, and take the crops at the end of twenty-five years, and in this case, if required, rows of the common acacia, or sweet-chesnut, &c., may be planted, with the view of remaining for the growth of underwood after the crop of poles has been sold off. Planting is advised in the following way: Larch fir plants at intervals of three feet and six feet alternately, and at three feet apart in the lines, the six feet space being planted with underwood plants at three feet apart. Then, at some intermediate time, each line of poles at three feet apart, may be cut and sold, as also half the poles in the remaining line, thus leaving the lines of firs standing for the main crop at six feet apart each way, and the underwood plants will be found standing also at the same distance. According to this plan there would be left at the end of twenty-five years about six poles to the rod, which at 1s. each, would give £45 per acre, being a large return, in addition to the valuable plant of underwood left on the land. If we can remove timber from those soils capable of producing corn and grass in abundance, and grow timber upon those soils on the hills which are not capable of being cultivated for corn and grass at a profit, it must be a benefit conferred on proprietors and on the country, and at the same time the climate would be greatly improved by growing timber on the hills, for it is well known that we should derive advantage by the shelter afforded, and the rainfall be increased thereby upon these exposed and arid soils. The remaining portion of land, estimated at 9,000 acres, as private property, in heaths and woodlands, I must refer to as capable of vast improvement. Some of it is a very useful soil, and, being the tree, capable of being converted into arable land, worth in rental from 25s. to 30s. per acre, and where situated within a reasonable distance of chalk would pay well for reclamation from its present rough and barren state. The remaining portion being poor soil, for the most part composed of sand and gravel in varying proportions, often growing a little timber, may be broken up and planted with firs, as before stated, such soils being especially adapted to their growth. It is, however, a very common occurrence for landlords to entertain the idea that the planting of timber will not turn to advantage during their lifetime; but when, as my statement shows, that valuable crops of firs may be sold off the land at a period varying from 16 to 20 years, it is encouraging to think that most proprietors on attaining possession may reasonably hope to live and reap the profits of planting, and leave a valuable underwood for succession. No. 3 (given in my paper which was read at the Botley Club) is a level piece of woodland, in a southern county, and is situated a long distance from chalk or marl. It contains about 16 acres, is surrounded on three sides by arable land, the value of which to rent is 20s. per acre. The woodland is of the same description of soil, which

is strong and gravelly, but does not require draining. There is a good plant of timber, principally oak, about 160 trees per acre, a large proportion having been left from stemmers. It is only those which have proceeded direct from the acorn that make any perceptible growth. The underwood is very rough and bushy, not worth more than 40s. per acre at 10 years' growth. These trees do not mete in measurement at more than 4 feet of timber, and do not increase annually more than $1\frac{1}{2}$ per cent. on their value. The following calculation will show the propriety and profit of taking the crop of timber and converting the land into arable:

		£	s.	d.
Expenses—Grubbing, per acre		£10	0	0
Chalking		4	0	0
		<hr/>		
Outlay		£14	0	0
Interest on, at 4 per cent.			0	10
Value of 160 trees, 4ft. metings, 640ft. at 8d.		21	6	8
Annual increased value on the same, at $1\frac{1}{2}$ per cent.			0	6
Value of underwood		2	0	0
		<hr/>		
		£23	6	8
Annual value of the underwood			0	4
		<hr/>		
Total annual value of the woodland in present state			1	1
Value of land to rent per acre after grubbing, being tithe free			1	4
Gain by interest on value of timber and underwood sold off, £23 6s. 8d. at 4 per cent.			0	18
		<hr/>		
Value after grubbing			2	2
Ditto before ditto, deduct			1	1
		<hr/>		
Actual advantage of converting into arable		£1	1	6

In looking back to our total area of the county we find 200,000 acres of land unaccounted for. This, therefore, must be taken as woodlands of various qualities, and all in the hands of private individuals and proprietors. Much of this woodland is comparatively waste, because it can be made so much more profitable. Therefore I propose to show that a great portion of it may be reclaimed or receive an additional value through a better system of management, and will illustrate it by taking certain pieces of woodland as stated by me in a former paper upon the subject. Again, No. 6 is a poor soil, being a mixture of sand and gravel, with a blue pebble in it. This wood is also in a southern county, extends over about thirty-four acres, and is bounded on two sides by good roads. There is no underwood, but ferns grow strong. Some fifty years ago it appears to have been slanted in an irregular and careless way with the Scotch firs, some of which having been cut at intervals, there are now only a few trees left, probably about forty to the acre. They are now quite fit to cut, and it is easy to see how little gain has been or can be derived from timber left in the manner described, and it should be borne in mind that, although this land is too poor for corn growing, yet it is such as would be profitable under a course of cropping for timber. There are instances where some of the very best land adapted for arable is still in coppice, and to show the impropriety of keeping it so, as far as rent or value to the owner is concerned, I beg to read my statement adapted for the conversion of good land. No. 5 is a good piece of woodland, of about 24 acres, in a southern county; the land is level, consisting of a fine hazel loam, surrounded entirely by arable fields of the like soil, and worth to rent 35s. per acre. There are about eighty trees to the acre, of 8ft. metings, and all oak. The underwood is worth £4 per acre at ten years' growth. These trees have been nearly all let up together, and they should stand or fall together. I, however, estimate that they annually increase in value about 3 per cent. only. This land under cultivation would be worth 40s. per acre rent, being tithe free. In this case, also, we must not lose sight of the immense benefit to adjoining lands by the removal of this wood. Let us now calculate the advantage of bringing this land into cultivation:

	£	s.	d.
Expenses—Grubbing per acre	£10	0	0
Chalking	4	0	0
Outlay	£14	0	0
Interest on, at 4 per cent.		0	10
Value of 80 trees, 8 ft. metings, 640 ft. at 1s. 3d.	40	0	0
Annual increased value on the same at 3 per cent	1	4	0
Value of underwood	4	0	0
	£14	0	0
Annual value of the underwood	0	8	0
Total annual value of the woodland in its present state	£2	2	6
Value of land to rent per acre after grubbing, being tithe free	2	0	0
Gain by interest on value of timber and underwood sold off, £14, at 4 per cent.	1	15	2
Value after grubbing	3	15	2
Ditto before ditto, deduct	2	2	6
Actual advantage by converting into arable	£1	12	8

This statement is earnestly recommended to the attention of proprietors possessing the best woods our county can produce. I fear that in reading this paper I have tried your patience, as I know many gentlemen present are prepared to speak on the subject. In conclusion, I can only say that I have endeavoured not only to show that great advantage to the country at large would arise from the reclamation of waste lands, but I have endeavoured by illustration to show how parties possessing landed property may apply it to their own case upon the different soils and under varying circumstances. Mr. Blundell, during the reading of the above paper, by way of parenthesis, expressed a hope that some member of Parliament present would move for a return of the number of farms let with and without the game reserved upon them, their extent, &c., and asked why, in a country like this, possessing such facilities for a Parliamentary return, we should be left in the dark upon such an important matter!

The Right Hon. COWPER-TEMPLE said that the long array of facts which had been brought forward, coming from a person of so much experience as Mr. Blundell, must have great weight upon any body investigating the subject; but it had struck him that Mr. Blundell had not reached the natural conclusion, which was—to raise the question how they were to compel owners and occupiers of land, which they thought not worth cultivating, to expend their capital and labour in cultivating it. Mr. Blundell appeared to divide his subject between lauds which were in the possession of private landowners and those which were waste or crown lands. Now there was a great vagueness in the use of the term "waste lands." According to the law there were no lands without owners, with certain small exceptions known as "No man's land." Every other acre was considered to be owned by someone. There was also great vagueness in the use of the word "waste," which included land that might be most profitably brought into cultivation, and also lands which would ruin anybody foolish enough to expend money in attempting to do it. The first thing they should attempt to do, on the premises laid down by Mr. Blundell, would be to endeavour to induce private proprietors to cultivate land belonging to them in severalty; but anyone could see (even during a railway journey) near Woking and Farnborough large tracts of sandy soil not brought under cultivation, belonging to men many of whom were not deficient in capital, and willing to look to their own interests, yet not cultivated. In Dorsetshire, too, they would find miles and miles uncultivated. He understood, however, from Mr. Blundell's statement that all the proprietors were dead to their own interests in not allowing them to be cultivated. It was, however, a question of expedience, and he believed that all the different kinds of soils had been sufficiently cultivated to enable the Chamber to consider them. They must examine all the circumstances surrounding each case before they could arrive at a conclusion. He was strongly of opinion

that, where land could be profitably cultivated, the landlord could do no wiser thing, nor anything more patriotic than drain, improve, and cultivate it. The Palmerston estates, which he had inherited, were a remarkable instance of what might be done in improving land. Lord Palmerston was a great advocate for the improvement of land, and he drained his estates, grubbed up the coppices, threw small fields into large ones, &c., and the outlay was so productive as amply to justify the wisdom with which the money had been expended. But he (Mr. Cowper-Temple) did not think that so highly a sagacious man as Lord Palmerston was would have spent money on some tracts of land in the direction of Wellow, which were only capable of producing firs, and which, if after having £20 an acre spent on them before producing corn (which would be considered a very fortunate arrangement) the result would be hardly such as to make a good place on a balance-sheet. He believed that the owners of lands had already scrutinised the matter thoroughly, and, though they might not be so good an authority upon land in general as Mr. Blundell, they must be considered to know something of the land upon which they were living, and from which they were likely to get a good result if they dealt with it in the wisest manner. The waste lands of the country were always in the joint ownership of the lord of the manor and the freeholders or commoners. These men were generally alive to their own interests, and the law of enclosure worked with great facility and little expense, under which eight millions of acres had been reclaimed in England, without including large tracts in Wales. He was not aware that any additional facilities were required for the ordinary enclosure of waste lands, in dealing with which the course naturally taken was to select those likely to be most profitable first, and what remained was consequently those lands less profitable, and therefore less tempting to the owner. They must also take into consideration the fact that every year the progress of agricultural science enabled them to get more profit out of the entire soil than formerly, and this was evident to all. Let them turn to the New Forest. Mr. Blundell spoke of "crown lands." He thought this was a misnomer, and that they were not at all crown lands. The crown had no right to plant a tree in any part of the forest except in that part which the Deer Removal Act of 1851 gave it. So the crown had no more right in the New Forest than a land-lord had in an ordinary waste or common; its position was similar to that of a lord of the manor. The New Forest, therefore, belonged to the joint proprietorship of the crown and commoners. They had at present a property in it, so that what we should do is, not to exercise any public force or Act of Parliament, but to persuade those who represented the crown and those who represented the commoners that their respective interests could be better preserved by enclosure and by legally dividing the property. And he did not think that the interests of these commoners should be overlooked, or treated with any disregard. They inherited rights which existed before the Forest was made by William the Conqueror, and they were able to present a very happy and fortunate contrast to those agricultural labourers who were not in possession of similar advantages. He quite agreed with Mr. Blundell and others who argued that it was desirable, wherever there was any land on which capital could be profitably employed, it should be applied at once, but they ought not to lose sight altogether of the other side of the question—that was, although enclosure might increase the number of agricultural labourers employed in a particular place, yet it might deteriorate the condition of that labourer. All persons who had examined the records of enclosures would see that the loss of the power to turn out a cow, a horse, or pigs upon a common must be a great disadvantage to the cottager who lived in the neighbourhood, and he (Mr. Cowper-Temple) esteemed very highly the advantage to a labouring man of keeping a cow. The financial advantages were clear, and what an advantage it was also to the labourer to have the power of getting milk for his children to drink! One of the great misfortunes of the agricultural population was that they could not get sufficient milk for their children, for it was nearly all sent to London, and the agricultural labourers had no means of getting it in sufficient quantity. The commoner felt also a sense of independence when he was the owner of a cow; but when an enclosure took place there was, of course, provision in the Enclosure Act for giving some compensation

to those who had rights of grazing upon commons, but that compensation often went to the owner, not inhabitant, and therefore the inhabitant often lost his right without getting any compensation. In other cases compensation in land was given to the cottager, but then arose a great temptation to turn it into money. He met with some one who was willing to give a large amount for it, and the result was that his successor in the cottage was without any of these common rights, and was reduced to the condition of a mere dependant on his daily labour. He (Mr. Cowper-Temple) would be therefore sorry to see compensation given absolutely in land in the event of the enclosure of the New Forest, because he believed the same thing would occur there again. It might not be desirable, too, that any further facilities should be given to the aggregation of land, which was the inevitable result of these enclosures, speaking broadly. He thought a more advantageous arrangement would be, whenever the time came for dividing the New Forest between the Crown and those who had rights in it, that that portion which would come to the commoners—and that would be about two-thirds of the whole Forest—should remain as land in common, to be disposed of according to their pleasure, and, if they saw any advantage in it, they should be able to use a considerable portion as regulated pasture, by which means abuses would be kept away, and there would be a proper amount of pasture left for the cattle. There were many disadvantages in confining a man's cow to a paddock, and a great advantage to be derived when cattle could stray over more extended boundaries. Mr. Blundell had estimated the good soil in the New Forest at a somewhat larger amount than he (Mr. Cowper-Temple) had been accustomed to hear it computed, which was about 30,000 acres. Owing to the exercise of rights on about the other half of the Forest, little soil was left on the hard chalk, so that the efforts made to stimulate the remaining surface would soon exhaust the soil, and people would find they were cultivating something exceedingly like a highway or gravel road. As long as the rights of commoners were fairly met and maintained, he thought they might be safely left to take care of their own interests, and the interests of the crown might be fairly left to those who represented the crown. There was, however, a third party somewhat interested in these questions of open lands and of the New Forest in particular. Mr. Blundell had acknowledged the great claim which the inhabitants of a town in the neighbourhood of a forest had for a place to be set apart for the purposes of recreation. He hoped the land selected would be a portion containing some of those natural beauties for which the New Forest was remarkable. Where certain soils existed which were not likely to be profitably cultivated, there it often happened that the people of the country might have a natural park with all the beauty and lovely scenery which inspired the poet, and which appeared more especially to belong to primeval surfaces. He did not see why they should push this eagerness for cultivation in regard to lands belonging to the crown to a greater extent than they would with respect to those belonging to private individuals. He did not suppose Mr. Blundell would go so far as to insist on every one turning his pleasure grounds or shrubberies, from growing roses or laurels, into fields for the cultivation of turnips or mangel wurtzel. He would acknowledge in every residence that some utility might be sacrificed to beauty and enjoyment, and so he thought with regard to our larger tracts—that it was a great advantage to England that some amount of utility had given way to those beautiful sylvan scenes which gave many a weary, toiling man a most happy day's pleasure in summer-time. And it was more especially the poorer-classes who were interested in this question, and to whom this boon was available provided they were in the neighbourhood of towns, from which the people could reach them. He thought it was evident, however, that the time was coming when the New Forest must share the same destiny that had overtaken some other forests. But he did not desire that it should follow the same course as Epping Forest, because there they saw a large tract of country, which formed the delight and enjoyment of the inhabitants of London, converted into private parks and private residences, and he was not sure that, if the Crown looked to making the most money out of that portion of the Forest which came to them, it would not find it better to sell it to a number of rich people, who would make parks and gardens, than to allow it to be sold for agri-

cultural purposes; and if they were to part with the most beautiful portions of the New Forest, he should not think they had done anything very successful in promoting the happiness and welfare of the people.

Capt. MAXSE explained the map on the wall, the coloured portions of which showed not only the area under all kinds of crops, fallows, and grass, but also the estimated space occupied by towns, cities, villages, river courses, canals, rail and road traffic, &c. It was only a map of England and Wales, and a far more startling representation might have been made if Ireland and Scotland had been included. He did not think that the Hon. Mr. Cowper-Temple allowed sufficiently for the crisis which had arrived. There was a great cry for emigration now heard in England, and it was declared that the country was over-populated; but he believed this to be a great fallacy. Capt. Maxse argued that England suffered from congestion in the towns, and depletion in the provinces, and the really important point in regard to population was its distribution. It was said that in England and Wales, with a population of 21 millions, there were 347 persons to the square mile, whilst in the east of London there were 130,000 persons to the square mile. While we have 11 millions in towns, there were but 10 millions in the country. Belgium, with a poorer soil than our own, was much better off, although she had 430 persons to the square mile; for out of her population of five millions, one million and a-half lived in towns, and three million and a-half in rural parishes. Mr. Cowper-Temple appeared to speak as if the land system of England were unalterable, but that was precisely what they wanted to alter. In France, perceiving the evils arising from the accumulation of land, a law had been established by which, at the parents' death, the land became distributed amongst the children, but, in England we stimulate the accumulation of land by the power which we give of entail. By means of this system the land became tied up, and there were a great number of rich and a great number of impoverished tenants, whose object was to get as much out of the land as possible. But the real reason of the existence of so much waste land was that cultivation was not the primary object of ownership. It would not pay, according to the ideas of many people who had other investments, to bring waste land into cultivation. If a man could invest money at seven per cent. he would do so, preferring to get that high rate of interest, and at the same time keeping his capital more ready to hand. He had himself about forty acres of what was called at this time last year "waste land." If he had mentioned this, in discussing this question of waste land, he should have been met with some objection that it would not pay; but during the winter he had brought it into cultivation, at an outlay of £15 per acre in grubbing, draining, and chalking. He was now about to conclude an agreement by which he would let that land at 35s. an acre, and if that would not pay him he did not know what would. Captain Maxse then referred to the enclosure of Titchfield Common in 1862, when it was let out in allotments to large and small owners. Nine hundred acres were allotted to the former, in parcels exceeding eight acres, and of these only 225 had been up till recently broken up and tilled, leaving 675 acres uncultivated; whilst of the 190 acres allotted to small owners, in parcels under three acres, 182 had up to the same date been broken up and tilled, leaving only eight acres uncultivated. This showed in a strong light the advantage of allotting land in small parcels to small owners. Having referred to the great extent of waste lands in Ireland and Scotland, Captain Maxse denounced the accumulative land system in the kingdom, and said he did not think labourers would be induced to emigrate when they saw so much land lying uncultivated in their own country. He expressed his belief that the farmers at home could very well compete with foreign farmers. In addition to corn there would also be an immense amount of other food imported from foreign countries, most of which was the produce of the dairies of small farmers, and he believed that we should be producing this were it not that all the small farmers had been banished from the country. He believed that we had arrived at a dead lock with respect to our land system. Land always stood in a different category as private property to other articles, for the simple reason that it was the productive power which supplied us with food. We might take all the gold and silver in the world, and plunge it to the bottom of the ocean, but the loss would not be so great as the loss

of a single acre of land. He was glad that the subject had been brought forward in so able a manner as it was, and he hoped that the landlords generally of the country would be induced to perceive the necessity of devoting their enterprise, energy, and capital to make the soil produce as much food as it was capable of bearing.

The CHAIRMAN said it appeared to him that the subject was divided into two parts—namely, that property in which the crown had an interest, and that in which private individuals with the crown had an interest, such as the New Forest, which was not entirely possessed by the crown, but which did possess valuable rights, and the only objection which appeared to him with respect to carrying out a system of reclamation of the Forest was how far it would pay, and how far the difficulty, with respect to the rights of the crown on the one hand, and of the commoners on the other, could be satisfactorily arranged. He was afraid from what he had heard on the subject, though from not living in the neighbourhood he did not possess accurate information, that some litigation might ensue from the adoption of such a proposition, as each party would strive to obtain as much as possible. A great deal might be effected in the proposed direction if it could be clearly proved that much of the New Forest land could be advantageously cultivated. He agreed that if this were carried out to a great extent that land ought to be assigned for the purposes of recreation. That should not be lost sight of in any enclosures where there was a sufficient population to demand it. In some cases, however, great care was requisite in defending the land when assigned. There was an enclosure in a parish with which he had something to do where a certain quantity of land had been assigned for the recreation of the poor of the parish. Considerable encroachments were made on it, and there arose a great difficulty in protecting the rights of the poor, because great expense was entailed on the overseers when they took steps to defend them. With respect to the private owners, no doubt a great deal of the land in their hands was woodland and down, and it had been pointed out that they should be induced to reclaim them by any means by which this could be fairly brought about. No doubt the chief inducement would be a pecuniary one. Show them that it would be advantageous, and they would not be slow to take action. With regard to down land he had had some experience, and he thought it was rather an open question. A great deal of such land had been enclosed of late years in Hampshire. Much had been reclaimed, partly good for cultivation of barley, but other ground had been broken up which had proved so bad that it had not paid for cultivation, and when laid down to down again it was scarcely worth anything at all. Maiden down was valuable land, but when laid down again it was worth very little. As to the plan proposed for planting by Mr. Blundell, his scheme might be carried out in some parts with great advantage; and he believed that the planting of larch timber would in the long run be very advisable. There was a great demand at present for larch timber; and if anybody would go to the necessary outlay in the first instance, and would be satisfied to wait for a return, in the end he would get a very fair profit. Woodland had some claims upon it which Mr. Blundell did not allow. At present timber was not assessed, but woodland was for the purpose of rating, and that item should enter into the calculation. They were told that the tenure of land had a great deal to do in the first place with deterring landowners from granting leases; but the law of entail had nothing in it to prevent the granting of leases. The owner for life could grant a lease to any moderate extent—say 21 years, which term was generally considered sufficient for any ordinary purpose, and he thought the landlord should grant full freedom to his tenant in the cultivation of his land. That was of absolute importance. He should be restricted as little as possible, and let him cultivate the land to the best advantage he possibly could. They were told by Captain Maxse that landlords had decreased. He was not going into that question; but the decrease had been a necessity of the age. The real cause had been that of late years, to make agriculture productive, a very large outlay had become necessary, and buildings had been erected for which in former days there was little demand. The capital of a large landowner would now sometimes be highly taxed in a particular year, and he would have to find money to enable him to build in that particular year. Unless, therefore, a man had a considerable amount of

capital besides the land he owned, it would be impossible for him to erect the buildings with the same facility that a man could do who had a number of farms, and who, as it was commonly called, rang the changes. Whether a peasant proprietorship would be advantageous or not, it was only right people should have the opportunity of entering upon it, but he thought they were better off when in the position of little tenants than of little landlords. A peasant proprietor was rather in the position of a labouring man, and he would scarcely occupy the position of a small landowner to any advantage. The result would be that he would soon have to contract some little debt on his small property, and the land would, perhaps, before long fall to the possession of another, who would find that capital which should have been invested in the land.

Mr. WARNER, after having seen many waste lands brought into cultivation, spoke strongly in favour of such a proceeding. He referred, as an instance, to Waltham Chase, which was formerly a worthless piece of wet land, but now produced some of the finest corn and roots in Hampshire. He had brought into cultivation some land of his own, part of which was a bog, which did not return a shilling an acre, and had now let it for 40s. an acre. Their object was to show not only that this cultivation of wastes was profitable to the owners, but was also beneficial to the general population of the country. It was said that "the love of money was the root of all evil," and certainly the love of land was a great evil, and a heavy responsibility rested upon those who held large entailed estates to make the best use of the property possessed by them. Mr. Warner condemned the law of entail, and contended that it would be to the advantage of the country that the large tract of land in the New Forest should no longer remain out of cultivation. All the difficulties could be surmounted by an Act of Parliament. He advocated a system both of large and small farms, and corroborated Mr. Cowper-Temple's remarks with respect to the great improvement which had been made on the Palmerston estates. He hoped the owners of estates would look round and see what could be done with respect to the changes which they advocated, and not send that labour out of the country which constituted one of the chief sources of its wealth, believing that the more land there was brought under cultivation, the better it would be, not only to the producer, but to the consumer also.

Mr. TRASK quite agreed that there was a considerable amount of land not growing corn at the present time which might be improved so as to become capable of growing it; but at the same time there was a vast amount of land now growing corn which paid nothing at all. How, then, could he understand Mr. Blundell and Captain Maxse, who asserted that the cultivation of the description of land which they advocated could be made to pay? There were several thousand acres of enclosed land in the northern division of Hampshire to be let, and he invited Captain Maxse to go and try his hand at farming in that locality, and see if he could make it pay.

Captain MAXSE said that, perhaps, the system required altering with respect to the holding of land and the restrictions upon it.

Mr. TRASK believed no practical farmer in the kingdom placed any reliance upon the returns from which the map had been compiled (Agricultural Returns for 1868). Mr. Blundell asserted that nearly the whole of the New Forest was capable of growing corn crops. He did not believe this statement, and he should like Mr. Blundell to inform them how woods were to be grubbed by steam.

Mr. BLUNDELL said he should have read the account, but it would have taken too long.

Mr. TRASK, continuing, observed that he doubted the assertions of Captain Maxse with respect to the effect of supplying corn to this country from foreign markets, and said that the holding of a small piece of arable land would ruin a man. He had much better be a carter. As to petitioning Parliament to make occupiers or owners break up their waste land, he considered the proposition absurd, and it was not giving them credit for common sense as to what was best to be done with their own property. It would be much better to wait, and let public opinion influence them.

Captain MAXSE defended his statements, and a string of questions and answers passed between him and Mr. Trask with regard to the land system in the northern portion of this county.

Mr. SPOONER expressed a hope that the result of so much ventilation which this question had received would not end entirely in wind. He disapproved of the extreme statements made by different parties with respect to the New Forest, and argued that the question before them was whether or not the New Forest could be profitably made of greater use to the public than it was now in its present state. He maintained that it could.

Mr. BLUNDELL, in reply, alleged that the cottagers were most tenacious with respect to their allotments.

Mr. SPOONER then proposed a resolution to the effect that, in the opinion of this meeting, it would be conducive to the public good that the New Forest should, after the rights and privileges of the commoners and others are fairly satisfied, be

brought gradually into the market for sale, reserving such portions as may be required for public recreation.

This resolution was seconded by Mr. Warner.

Captain MAXSE hereupon moved an amendment to the effect that that portion of the New Forest be enclosed and set out in large and small farms, on long leases, which fell to the ground for want of a second, and the resolution was carried.

Mr. BLUNDELL proposed another resolution, setting forth that it was further the opinion of the Chamber that there was also ample room for the more extended cultivation of waste lands on private estates.

Captain MAXSE seconded this proposition which was carried, though a majority of the meeting did not vote.

THE HORSE SHOW AT THE AGRICULTURAL HALL, ISLINGTON.

Time and the hour steal on throughout the darkest night, and the seventh annual show of horses at the Agricultural Hall commenced on Saturday even before the doors were open to the public. It is customary to open before the play begins; but this time the public were kept waiting a quarter of an hour at the entrance-gate on Islington Green to find on their reaching the ring some of the first batch of hunters drafted. At first a blue mist prevailed throughout the Hall, so that you viewed everything as through smoked glass, and you were in doubt whether there was a total eclipse of the sun going on, a display of fireworks had taken place, or that Mr. Pepper had been engaged to give an unreal phantom-like appearance to the whole thing. In the mist we descried Lords Portsmouth and Coventry, or their ghosts, who proceeded with the judging of the first and second classes of hunters before they were joined by Mr. Chaplin, who, like the idle boy, came late to school. The Hall was as might be expected, rather sultry, but sweet and clean, though packed with horses throughout, there being very few empty stalls. The numbers to the horses in the catalogue ran 391 to 364 last year, but there is nothing like that number of horses in the Hall, as many play several parts, and are continually coming before you till you are sick of them—first as hunters, then park hacks, ladies' horses, chargers, cover hacks, in harness, or extraordinary animals, while the exhibitors number 247 this year to 223 last. The first class taken in hand by the judges was the weight-carrying hunters, mustering about thirty-nine strong. The judges had them in lots of nine and ten at a time, from which the best would be selected and the lot drafted, and so on through the class. Then the selected from the several lots would come in, consequently the horses were never all out at the same time and compared one with another, the only way we think of getting at all the best, for one lot may be all good, with two superior horses like Expectation and Iris in, which, of course would be the chosen, while the next division may be a very middling lot, and the pick not so good as those previously drafted. In fact, let a man have a memory as long as the Atlantic Cable, and an eye as quick, the odds are against his doing himself justice or the exhibitors without he can have all the class out before him at the same time. Then how much more satisfactory would it be, we think, to the judges, exhibitors, and the public, if the judges were only presented with the numbers, height, and pedigrees of the horses, as customary at all other shows, instead of, as here, the public catalogue—with the name, address, and titles of the owner in full, a glowing description of his horse, and a fabulous price attached to the end of it. These things do tell with some people, and the latter even if attached to the tail of a Cochin China or a smock-frock. In conse-

quence of the water-jump being in the centre of the ring, the chief part of the judging takes place at one end or the other, so that a great many see little of what is going on. But we are diverging from the thirty-nine articles in horse-flesh, who, with Iris and Expectation, are far in advance of last year's lot, headed as they were by the soft, carty-looking St. Clare, and the flashy Harkaway. The latter is much improved, and again tried for honours, together with such prize horses as Tyrconnel, Brian Boru, and Monarch. Then there was that tough old Chicken of Captain Heath's, a hunter of a couple of hundred years ago in form and breed, and who in his seventeenth year may be had at five hundred guineas. Iris, the prize horse at Wetherby, and of the year 1868, and whose wall eye and form now attract, as much attention on the walls of the Royal Academy as they do at Islington, came straight away from Fife by rail in a box, and landed at the Hall the over-night—out of the frying-pan into the fire this; for anyone who has tried the rail and the Hall knows that one is hot and the other hotter; so we were not surprised to see so high-couraged a horse fretted away and shrunk. But the Hall is too confined for Iris to show himself to advantage, in fact he is not a circus horse, and was fairly beaten on the tan or sawdust by the grand, square, symmetrical chesnut of Sir Watkin's, a model of a weight-carrying hunter, and a show-horse from head to heel. If his joints are a little gummy what of it? as hunters are not made to look at, and most of them, especially if they are good for anything, bear a memento of some good run. Then that noble sensible-looking head and perfect tail, how varmintly are they set on and what a jaunty way he carries them as he steps away so firm and free, as if the whole place belonged to him, and he was on good terms with everyone: or should he catch the eye of some crabbing dealer or coper who has not fingered something out of him, he has that honest independent composure that tells the fellow his abuse is useless. But we hope to see Iris and Expectation meet again in the open, either at Oxford or the Great Yorkshire Meeting, where they will have room on the turf to fight it out, as at Islington the prize has generally gone to the best form or "standstill" horse. The third prize, Ironmaster, is a neat horse and does not look sixteen hands and an inch, which is the greatest compliment we can pay him. The first eight in this class, with the exception of Iris and Expectation, we did not see out through the play commencing before the doors were open, so say no more about them. Of the others not already mentioned Mr. Ellerby's Tubal Cain was short and compact; Mr. Barker's Sampson, a whip's horse who did not get his hind legs under him; Major Stapylton's Storm King by Whoo Hoop, dam by Vulcan, of good form, but we thought fifteen stone a

top weight for him; Mr. Welit's Loiterer is a thick middled animal with action more adapted for a weight-carrying hack or machiner, while his Southwold was of fair form, with the exception of a slight slackness in the loin, on a short leg. Then Mr. Charles Symonds, of Oxford, has a compact, powerful, and good goer in Bombardier; while Mr. Jewinson's The Knight is of capital form, and Mr. R. Powlett's The Roper, a light horse, of character and breed, but a bit of a peacock to look at. Brian Boru, with a lot of flesh on, went very well, but looked rather cobby, but then he is so even a tempered horse, and of such a constitution that he fattens where others would starve, while he travels like a commercial traveller. The prize mare in the hunting class without condition as to weight, is as handsome and as neat as can be, she is wiry and muscular, hardy-looking, free from lumber, and although a hunter would hold her own in Rotten Row, as a hack, and with Expectation as the hero of the hunting classes she is decidedly the Heroine. The second is a shorter horse, very handsome, and a good goer, but he is not right in his neck, and rather cramped and thick in his forehead. Their owner is noted for good-looking ones with breed, and showed Goldfinder, a very handsome and blood-like chesnut hunter and a prize-taker a year or two back. The third, Loiterer, we described in the previous class. Out of some thirty odd were Kildare, a prize horse in the weight-carriers last year; Young Artillery, a prize four-year-old at Manchester, last year, and the following, who had form, breed, and hunting characteristics: Mr. W. Crawshaw's Wensleydale, Mr. F. Barker's The Sweep, Mr. G. Waugh's Sir Harry Martin, Mr. G. Bland's Rival, Mr. Paterson's Terrona, Mr. Head's Planet, Mr. W. Ellerby's Ashdale and Marston, Major Stapylton's The Streamer, Mr. Arlington's Limerick, Mr. Sterling's The Norman, and Mr. Wheeler's Master of Arts, a bay, and not the mealy chesnut and prize-taking impostor of that name. Coxcomb, in a very poor class of hunters, not exceeding fifteen hands two inches, was declared the winner, a light charger-like animal, or ladies' horse, and well up in doing the pretty business round a circus, or in the Row, for which he is just adapted. Bird-on-the-Wing, who has fined and improved in form since last year, and well known to show goers as a fencer, as for his stylish action, and with his hind legs always so beautifully under him, was much more to our mind, though only placed second. Mr. T. Skinner's Forester is of very good form, and exceedingly bloodlike. Mr. Badham's Eclipse had too much beef on to show to advantage. Major Quentin's Burnt Sienna, is a strong-shouldered cobby hack with a dash of the Arabian. Mr. Brown's Tiny Tim, a wild-looking chesnut, with some shape, and Mr. Harrison's Tillah has length and good ends. The four-year-olds were a capital class, and a great improvement on last year, which was about one of the very worst we can recollect. They came in in batches, and the blue ribbon was handed over to Mulcaster for a very good-looking hunting-like horse of Mr. J. Booth's; but as another batch came in directly after, he had much against his inclination to return it, and it was finally awarded to Comrade, steered by Webster, another well-known performer in the ring. Comrade was bred by Mr. Pease, M.P., and looked something between a charger and one of his celebrated trotting hacks on a higher leg. Borderer, with more hunting characteristics, came in for second honours, and changed hands we heard for 200 gs. Mr. T. Thompson's Byron, Mr. E. Paddison's chesnut gelding, Mr. F. Stafford's Tommy, Mr. Badham's Baronet, Mr. Berridge's The General, Mr. H. D. Boulton's Brown, Major Stapylton's Fitzwilliam, were those that took our eye, while Mr. Grout's Ace of Clubs by Captain Barlow's horse of that name got a commendation. The Ace

of Clubs was by Stockwell, and departed this life a year or two back at Mr. Gerard's establishment. Rapid Bay Adelaide. The thoroughbred stallions comprising, Camperdown, by the Flying Dutchman out of Harry Scurry by Pantaloon, is, like many of the Dutchmen, a light middled leggy animal. Touchwood by Touchstone, out of Bonny Bee by Galanthus, with many of the Touchstone characteristics, was of a better stamp. Deerswood by Orlando, out of Arrow by Slane, was not much to look at. Nutbourne by the Nabob, out of Princess by the Merry Monarch, was a long way the nicest horse of the lot. Anglo Saxon by Ethelbert, out of Griselda by Touchstone, a thick-set short-legged useful country horse. Aleibiades by Cossaek, out of Aunt Philia by Epirus, the well-known steeplechaser, failed to strike us with any reverence for his form as a stallion. He was shown in hunting trim, as he has not yet been used as a stud horse, and struck us as a leggy light-loined mean-quartered narrow animal. Bertie by Newminster, out of Queen Mary by Gladiator, had not much to recommend him besides his pedigree; while Rowsham by King Tom, out of Mentmore Lass, did not move with any freedom; and Diophantus by Orlando, out of Equation by Emilius, though a nice little horse, looked rather lumpy. Amsterdam and Sincerity were entered, but not in the flesh. In the riding horses with fine action, the first horse Sobraon is a good-looking powerful charger, while Angela, with some of the charger characteristics, though rather light in her back ribs, is much freer in her action than the grey Sobraon. Countess is a powerful, useful hack, and originally had the third prize, but owing to some defect in her it was given to Twilight, on the Monday, a gentlemanly hack of Mr. Spencer Lency's. Daisy, in cover hacks and roadsters, is a very handsome, powerful, cobby mare; a nicely dappled grey, with grand action, but more adapted for harness; while the second, Old Tom, is an old-fashioned farmers' cob, with about a ton of flesh on him, and, we think, had no right to a place before Bird on the Wing, who was shown as a cover hack. When Bird on the Wing was handed the third prize, some one gave a horrible shriek that made one's blood almost run cold, for we really thought some poor fellow was in a fit, but it turned out, we are told, to be some one interested in Bird on the Wing. A very agreeable place a horse show would become if everyone that was disappointed kicked up such an unpardonable row. In park hacks and ladies' horses Coxcomb was awarded by the new set of judges a prize. Master Stiggins is a cobby charger-like animal, smothered with flesh, while Beauty is not good-looking enough for the name. Mr. Gurnell's Elegance is a really nice ladies' horse, and Mr. Raine's Grasshopper a fine goer. In the half-bred stallions Fireaway is a powerful dark chesnut, with good action, while Quicksilver is a Norfolk trotter, of good form and action. The well-known American trotter Shepherd F. Knapp, was scarcely noticed by the judges, although this was a class for horses calculated to get trotters,—at Beverley last year, in much better company, he was awarded with a first prize. Mr. Gront's well-known horse Sportsman was present. The stallions of any breed, with an exception or two, were a wretched lot, but the winner, Sir George, was a really handsome, well-made cob. Perfection, a stallion pony, bred by Major Barlow, was one of the handsomest things we saw out. Selim is a powerful Arabian, and was shown well by Mr. Seffert, the well-known steeplechase rider and steerer of Moonraker many years back. The other classes were judged this morning, Monday, and among the harness horses, hacks, cobs, and ponies were several very stylish animals, but a great many of a very common stamp. Expectation, Heroine, Coxcomb, and Comrade came in to compete for the Gold Medal. The contest

lay between Expectation and Heroine, as Coxcomb and Comrade had not the slightest chance; of one there is nothing, while the other is coarse. During the following week it was stated by one that Expectation had enlarged joints, by another, he had a spavium, while a third said he had sprung a back tendon, and a fourth that he brushed; but no one discovered that the horse had two tails, which he really has, for to his foretop he has a dock about the length and size of a man's finger. As to brushing, he has carried Sir Watkin four seasons—a mere infant, who, with the hunting tackle, only pulls down a trifle under twenty stone. We can fancy Sir Watkin making many a horse brush altogether in a quarter of the time.

PRIZE-LIST.

HUNTERS.

JUDGES.—Lord Portsmouth, Lord Coventry, Mr. Henry Chaplin, and for thorough-bred stallions.

Weight carriers up to 15 stone.—First prize of £80 and Gold Medal, to Sir Watkin W. Wyun, Wynstay, Ruabon (Expectation); second, £40, to Captain J. Anstruther Thomson, Charleton, Fife (Iris); third, £20, to Mr. H. Sanders, Brampton, Northampton (Ironmaster); commended, Mr. Booth, Killerby (Brian Boru).

Without condition as to weight.—First prize of £50 and second of £25 to Mr. Henry Spencer Lucy, Charlote, Warwick, for Heroine and Golden Hue; third, £15 to Mr. S. J. Welitt (Loiterer); commended, Mr. Barker (Sampson), Mr. Ellerby (Ashdale), Mr. J. Wheeler (Master of Arts).

Without condition as to weight and not exceeding 15 hands 2 inches high.—First prize of £40, to Major Quentin, Woodleigh, Cheltenham (Coxcomb); second, £20, Mr. F. Barker, Ingatstone, Essex (Bird on the Wing); commended, Mr. Brown's Tiny Tim and Mr. Wright's Pilot.

Four years old.—First prize of £50, Mr. T. Sutton, Middleton One Row, Darlington (Comrade); second, £25, Mr. J. Booth, Killerby, Yorkshire (Borderer); commended, Mr. E. Paddison ch. g., and Mr. J. Grout's Ace of Clubs.

RIDING HORSES.

JUDGES.—Colonel Maude, Mr. J. J. Baillie, and Captain Whitmore.

Fine action and breed, exceeding 15 hands 2 inches high.—First prize of £20, Captain G. Cooke, London (Solraon); second, £10, Lord Rosslyn, Dunmow, Essex (Angela); third, £5, to Mr. H. Spencer Loney (Twilight).

COVER HACKS AND ROADSTERS.

Weight carriers not exceeding 15 hands 2 inches.—First prize of £15 to Mr. H. Frisby, St. James Place (Daisy); second, £10, to Mr. J. Savory, Norwich (Old Tom); third, £5, to Mr. F. Barker (Bird on the Wing).

PARK HACKS AND LADIES' HORSES.

Not exceeding 15 hands 2 inches high.—First prize, £20, Major Quentin (Coxcomb); second, £10, Mr. R. Beart, Raynham, Norfolk (Master Stiggins); third, £5, Mr. T. Cook, Winchcombe (Beauty).

STALLIONS.

Thoroughbred.—Prize, £50 and medal, Mr. B. J. Angell, Lubbenham, Leicester (Alcibiades).

Halfbred, not less than 15 hands high, for getting trotters.—First prize, £30 and medal, Mr. B. Mitchells, Downham Market, Norfolk (Fireway); second, £15, Mr. W. Flanders, Mildenhall (Quicksilver).

Of any breed.—Prize of £15 and medal, Mr. H. Roundell, Otley (Sir George).

Not exceeding 13 hands 3 inches, for getting ponies.—Prize, £10 and Agricultural Hall Medal, Mr. J. A. Ransome, Ipswich.

Prize of £10 for any animal of extraordinary merit, not qualified to compete in any of the sixteen classes, Mr. H. W. Peek, Wimbledon (Selim).

HARNESS HORSES.

Not exceeding 14 hands 2 inches, in single harness.—First prize, £15, Mr. H. Frisby (Dunstan); second, £10, Mr. Grout (The Colone); third, £5, Mr. Gaunt (Rocket).

Not exceeding 15 hands 2 inches.—First prize, £15, to Mr. H. Frisby, St. James's Place (Daisy); second, £10, to Mr. H.

Farquhar, Lowndes Square (Blackstrap). Commended: Mr. P. G. Sechiawi, Craven Hill, (King George).

PARK HACKS AND LADIES' HORSES.

Not exceeding 15 hands 1 inch.—First prize, £20, to Mr. H. Frisby (Dainty); second, £10, to Major Quentin (Burnt Sienna); third, £5, Mr. G. Garnell (Quickstep).

PARK COBS.

High Steppers: not exceeding 14 hands 2 inches.—First prize, £20, to Mr. F. Cooper, Piccadilly (Primrose); second, £10, to the Duke of Wellington (Skewbald); third, £5, to Mr. C. Gates (Princess).

PONIES.

Not exceeding 13 hands 3 inches, in single harness.—First prize, £15, Mr. W. King, Leighton (Tommy); second, £8, Mr. F. Haines, Oxford Road (Mulum in Parvo); third, £5, Lord Cardross (Dun).

THE ISLINGTON MOUNTEBANKS. — The general arrangements were much the same as usual; but we must notice the introduction of a water-jump just in the centre of the arena, which necessitated the judges working either at one end or other of the tan, thus being at an unfair distance from one-half of the occupants of the reserved seats. Now for the jumping itself. "Have you seen the leaping at Islington?" inquired a friend. "No." "Then by all means do so; you will never forget it!" Accordingly we went, and first saw the ponies jump, which was all very well, as it was good fun for the boys who rode them, though we are sorry to say one poor little fellow got a severe rick in the back from his pony "bucking" the gorse, which was as high as himself. Two of them had a shy at the water-jump, and got over very well, going at it like lions, which, by the way, goes to prove, if dwarfs are sharper than giants, as is generally held to be the case in the human race, the reverse holds good with horses; for the big ones for the most part did not see it, and either declined, or jumped most unwillingly. They thus showed themselves to be much wiser than their owners and riders. When the horses came in, the scene of uproar and confusion was beyond all description, some riding one way at a fence, some another, at one and the same time, hacks, hunters, and cobs of low degree being mixed up in one confused mass. The secretary mounted a hack, and "tittupped" about in the *mêlée*, gesticulating and imploring them to keep order, but all to no purpose. He was wise in his generation; for it was exceedingly warm for what Dickey Boggledike termed "the fut people"—and the poor fellows who repaired damages and kept the tan raked were in a position that receiving cavalry in square would be a fool to. One of them was so near jumped upon that the horse's head knocked off his hat, and he only saved himself by scuttling away in the most ludicrous fashion. Then the riding was a sight to witness. Few men, except the very *élite* of our amateurs, escape making themselves ridiculous when they get up in public, either for racing or steeple-chasing; but here, where the *oi polloi* attempted to "witch the world with noble horsemanship," the effect beggared description. Could they but see themselves as others see them, many a man would decline playing the clown on horseback. One gentleman managed to get thrown over into the arms of the crowd, who kindly and considerately threw him up into his saddle again, amidst roars of laughter. Another came down, and laid gasping like a flat fish, whilst his horse deliberately trotted along his back, luckily without injury. Then there was great splashing into the water-jump by those who condescended to try it, which was a small minority, however. One or two got pretty well over; but with them negotiating Mr. Sidney's puddle would be held by hunting-men to be but a poor passport to safety over a country; in fact, a couple of little ponies, as we said above, did it as well as anything. No wonder such crowds are attracted; for it is the most ridiculous and laughable exhibition in London, and surpasses all that Leech ever conceived of fools on horseback. One or two will be killed some day; but as no one with any sense would trust himself in such a situation, perhaps the mourning won't be very great when it happens.—*The Sporting Gazette*.

THE FATAL ACCIDENT AT THE HORSE SHOW.— On June 10th Dr. Lankester held an inquest at the Angel, Islington, on the body of Mr. Francis Barker, aged 55, horse dealer, of Westlands, Ingatstone, who fell with his horse,

while riding round the ring at the Agricultural Hall, on Monday afternoon, and died on Wednesday night. Mr. Barker's son said that his father was riding Forester, the property of Mr. Skinner, to show it for sale. The witness did not know whether the horse was vicious or not. Mr. Thomas Mashiter, of Priest's Estate, Romford, said he saw Mr. Barker in the ring on the Monday. The horse kicked out two or three times violently, but he got him to settle down. He walked him

round to where the exit door was. The horse wanted to get out of the ring, but deceased would not let him. The horse then reared, fell over backwards and lay on deceased, completely covering him. If deceased had not been so good a rider he would have fallen off when the horse reared, and would not have been hurt; but as the horse reared he bent with the horse, and kept on his back, so that he was carried over with him. A verdict of accidental death was returned.

HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND.

The general meeting was held in the Society's Hall, George IV. Bridge, Edinburgh; his Grace the Duke of Buccleuch in the chair.

One hundred and forty-three new members were elected.

Mr. WALKER (Bowland) said he had been requested by Mr. Anthony Murray, who was unable to be present, to submit to the meeting a proposed alteration in bye-law No. 2. The alteration had been submitted to two meetings of directors, in terms of the charter, and now it was reported to the general meeting of the Society for confirmation if they thought fit. The present bye-law to which he referred was to the following effect: "That tenant-farmers, secretaries, and treasurers of local agricultural associations, factors, and proprietors, farming the whole of their own lands, whose assessment in the valuation roll does not exceed £500, shall pay at admission, and afterwards annually, in advance, the sum of ten shillings, with the option and power of redeeming the same by payment of five guineas, as the purchase of a life subscription, and which life subscription may be so purchased, under deduction of any annual payments that the member may have previously made, with this limitation, that at no time shall a member have the power of redeeming the annual payments for a less sum than £3." The bye-law as proposed to be altered was as follows: "That all tenant-farmers, who are not also proprietors of land to an extent exceeding £500 per annum, and all secretaries and treasurers of local agricultural associations, resident agricultural factors, and others, whose incomes do not exceed £500 per annum, shall pay at admission, and afterwards annually, in advance, the sum of ten shillings, with the option and power of redeeming the same by payment of five guineas, as the purchase of a life subscription, and which life subscription may be so purchased, under deduction of any annual payments that the member may have previously made, with this limitation, that at no time shall a member have the power of redeeming the annual payments for a less sum than £3." The object was to define and explain more accurately than the present bye-law did the persons who were entitled to its benefit, and in some respect to extend the operation of the bye-law.

Sir JAMES GARDINER BAIRD said the alteration would admit on the reduced rate gentlemen who were in no wise connected with the land. He would ask if it was advisable to bring in everybody as members of an agricultural society who had no interest in agriculture or in land at all. He doubted whether such a step would tend to the advantage of the Society. For his part he would not care if these persons did not come in at all.

Mr. WALKER said he did not think that Sir James Baird had quite accurately stated the nature of the case, because one of the objects—the main object—of the proposed change of the bye-law was to admit at a reduced rate of payment several classes of people to whom they, as agriculturists, had a very intimate relation, directly and indirectly. These were the agricultural implement makers, to whom the shows of the Society were very greatly indebted, breeders of poultry, tradesmen, and various other parties who were either directly or indirectly interested in agriculture and agricultural operations, and whose assistance this society required. At present these persons, because they had not a certain amount of land, were not eligible, and it was thought it would be desirable if the bye-law was extended so as to embrace this class.

Professor RANKINE asked if it would not be possible to define who those others were that would be brought under the operation of the bye-law. There was an objection to admit all persons indiscriminately whose income fell below a certain amount at the reduced rate. This was a thing that had never

been done with any society for the cultivation or promotion of art or science, and he did not think sufficient reason had been shown for their adopting it. In special cases, no doubt, there were special reasons for doing something of the kind, but these cases, in his opinion, should be specified.

Mr. WARDLAW RAMSAY said, after hearing the explanation of Mr. Walker, he felt that the proposal was a wise one. He, however, would like if a limitation was made as to the persons to be eligible under the proposed bye-law.

Mr. DUNDAS (Ariston) said that the directors were not altogether unanimous as to the recommendation that they should make, and it was clear that the meeting were scarcely prepared to accept the alteration without further consideration. He moved that the subject be remitted back to the directors for re-consideration.

Professor RANKINE seconded the amendment.

Mr. ORD (Muirhouselaw) seconded the approval of the proposed alteration, believing that it would have the effect of strengthening the Society.

A show of hands was then taken, when the amendment was carried, and the matter was accordingly remitted.

Mr. KINLOCH (Gilmerton) gave in a report of the arrangements for the Dumfries show, to be held at Dumfries on the 26th, 27th, 28th, and 29th of July. The following table shows the entries which have been made for the forthcoming show, with the entries at the show in 1860, for comparison:

	1ST ENTRIES.	
	Dumfries, 1870.	Dumfries, 1860.
Cattle...	360	298
Horses ...	170	166
Sheep... ..	715	558
Swine... ..	72	54
Poultry ...	375	216
Dairy produce	123	195
Implements ...	1,650	911
	3,465	2,398

The SECRETARY read the following report from Dr. Anderson: "The business of the chemical department during the past half-year has been carried on in a satisfactory manner. The number of analyses, though not quite so large as during the corresponding period of last year, has been quite up to the average, and has embraced the usual variety of work. Although the state of my health has not enabled me to engage in actual analytical work, every analysis has passed through my hands, and I have been able to express my opinion as to the quality of the manure it represented. As regards the manures examined, the point which most especially merits the attention of the farmer is the general inferiority of the Peruvian guano imported during the present season. I have already, on various occasions, pointed out that during the last few years Peruvian guano has by no means reached the standard which it formerly had, but that the ammonia, which once generally exceeded 17 per cent., has latterly rarely reached 16 per cent., and has often been not more than 15 or 15.5, which at present prices is equal to a diminution in value of about £1 per ton. During the present season much Peruvian guano has been imported containing from 5 to as much as 10 per cent. of sand, and only 12 or 13 per cent. of ammonia. Such samples are certainly not adulterated, but are in the condition in which they are taken from the deposit, and show that the excavators have come upon a portion which is of a lower quality than that with which we were formerly supplied. However this may be, it is obvious that the farmer should at

the present time exercise unusual caution in the purchase of Peruvian guano, even when it comes from sources which, under ordinary circumstances, would be considered above suspicion. The deliberate adulteration of Peruvian guano is not frequent at the present moment, but several cases have occurred in which from 10 to 20 per cent. of gypsum have been used for that purpose. A good deal of inferior dissolved bones have been in the market, made either from bones which have been boiled for the extraction of gelatine, or by adding a considerable quantity of bone-ash. The use of this article enables the manufacturer to obtain a more pulverulent and drier product than can be produced without it, while it is still guaranteed as made entirely from bone without admixture of mineral phosphates, although the diminution in the ammonia materially affects the value. Small quantities of coprolites and other cheap materials are also frequently used, and it is now comparatively rare to find dissolved bones made solely from raw bones and acid as those sold twelve or fifteen years since usually were. Of course there is abundance of excellent dissolved bones in the market, provided the farmer uses proper precautions in purchasing; and it will generally be found that the best bargains are obtained by taking the higher-priced articles. The feeding stuffs analysed have been of the usual kind, and have shown the usual proportion of good, bad, and indifferant samples. Two or three samples of adulterated rapecakes have occurred, which is unusual, the low price of that substance making it difficult to find a substitute for it. In the cases examined the material was a heterogeneous mixture, containing a little linseed, rape, Indian rape, mustard, and a quantity of vegetable débris of various kinds, so disintegrated that it could not be identified; and the best account I can give of it is that it might be the sweepings of a warehouse floor. It is not likely that adulteration of this kind can be carried on to a very large extent; but that it is possible is worthy of notice. The field experiments extending over a rotation are still in progress; and the plots this year are in grass for hay. Next year will complete the rotation, when it is hoped the results may prove important and instructive. In conclusion, I must express my most sincere thanks to the Society for the indulgence accorded to me during the past winter, by which my health has been materially improved, though not as rapidly as I hoped and expected. My medical advisers think that I am not yet in a condition to resume active work; but I trust that at no distant period I may be able for it. Meanwhile, I have done all in my power to protect the interests of the Society, and I venture to say that they have not suffered from my enforced absence.

Mr. HARVEY, Whittinghame, drew the attention of the Society to the desirableness of having an officer resident in Edinburgh to whom the members could apply for any chemical analyses of manures, or for any other information which they might require in connection with the cultivation of their lands. He suggested that the directors should take that matter into their serious consideration at the earliest opportunity.

Dr. BALFOUR reported that the two prizes of £6 and £4 annually given by the Society to the students in the agricultural class in the Edinburgh University who pass the best and second-best examination were this year awarded to John M'Dowall, Stewarty of Kirkcudbright, and Robert M'Cracken, Wigtownshire.

The Chairman of the Committee on the Forestry Department stated that on a report by the Woods and Forests Committee, the directors had resolved to institute examinations in the Department of Forestry, and to grant first and second class certificates bearing the arms of the Society, and signed by the president, the examiners, and the secretary of the Society. It is proposed that the next examination should be held about November.

Dr. BALFOUR suggested that in regard to forest appointments in India a memorial should be sent by the Society to the Duke of Argyll, Secretary of State for Scotland, in the following terms:

"The Highland and Agricultural Society of Scotland was established in 1784, and incorporated by Royal Charters granted in 1787, 1834, and 1856—the latter charter being to prescribe a curriculum for agricultural education and to grant diplomas. Your memorialists as representing the nobility, landed proprietors, and all who are interested in the management of landed property in Scotland, and in the

education and training of young men in every branch of practical knowledge connected therewith, have seen with satisfaction that the Secretary of State for India has thrown open to competition the appointment of forest officers in India, and laid down a general course of education to be followed by the young men who are selected. Your memorialists, however, observe that it is made obligatory that the selected candidates should, after the preliminary examination, proceed to the German or French forest schools for two years and a half to obtain special and technical education, on which they are to be further examined before proceeding to India; and they understand that this has been deemed expedient in consequence of the absence of any recognised system of education in forestry in Britain. There can be no doubt that an inspection of some of the great Continental forests may be advantageous to the candidates; but with great respect your memorialists submit that for the following reasons such a visit of inspection is unnecessary: 1st. The subjects allied to practical forestry specified to be studied abroad, viz., land surveying, levelling, road-making, elements of agriculture, botany, zoology, practical mathematics, &c., can be better studied at home. They are efficiently taught in our schools and colleges, and examinations are held therein, and certificates of competence granted either by them or by this society. 2nd. The plan of sending the young men to study forestry abroad is most inconvenient to parents, removing them entirely from their parental control at a critical age; and such a system of forestry education would be liable to interruption in the event of a Continental war. 3rd. The valuable experience of those in Britain who have formerly lived in India, both as to Indian forestry and botany, and in the management of the natives, will be lost to the students, as will also the experience of the Forest Officers themselves who return here when their term of service expires. 4th. However proficient the students may be, either in German or French, it is improbable that they will be able to acquire the technicalities of their education with so much facility as they would do in their native tongue. 5th. By pursuing their studies in this country the candidates would have the opportunity of being instructed by persons skilled in the general land laws of India, which, it is submitted, would be more to the public advantage than that a large portion of time should be devoted to the study of the Continental Forest Laws. 6th. The knowledge, experience, and other requisites for education in forestry already exist in this country. The two millions of acres of woodland (of which 125,000 belong to the State) are amply sufficient for all educational purposes, and there are special advantages enjoyed in Britain which are not to be had on the Continent. 7th. That your memorialists have for more than sixty years directed their attention specially to advancement of practical forestry generally, and have given great encouragement by means of prizes for essays and reports on the management and general treatment of woods and plantations. They have contributed largely as a body and by their members, to the introduction of many valuable forest trees suitable to the climate and wants of the country. 8th. Your memorialists have also recently instituted a system of examination in forestry, and grant certificates to candidates of merit as exhibited in the accompanying syllabus. 9th. That while your memorialists consider the organisation of a system of forestry education in Great Britain as a matter of the greatest importance for the education of forest officers for India, they deem it also a question of vast importance to this country, as well as her various colonies. Your memorialists would therefore propose that the candidates for all Government Forest Appointments be allowed to acquire their special technical education without any restriction. And your memorialists will ever pray.

(Signed)

"Edinburgh, 1st June, 1870." "TWEEDDALE, President.

The CHAIRMAN thought it was of great importance that candidates for India Forest appointments should acquire a knowledge of Hindostanee and Arabic, in order that they might be properly understood by the people amongst whom they were located. It was also necessary that they should learn a great deal more in regard to the nature of the people with whom they had to do, and the implements generally used in that part of the world. The Royal Horticultural Society in London had prepared a memorial very much to the same effect as that proposed by the Highland Society of Scotland,

and it was intended if possible that both motions should be taken up at the same time. The precise time, however, would not be fixed before he (the Duke of Buccleuch) was able to go back to London, and to meet the Council on that subject.

The memorial was then agreed to.

Mr. GILLOX (Wallhouse), read the report of the veterinary department, which gave a detailed account of the results of the examination for the Society's veterinary diploma. He also reported that the directors had recently under their consideration a letter addressed to Professor Dick's Trustees by Professor Williams, suggesting that there should in future be two examinations for the Society's veterinary diploma every year instead of one—namely, the usual examination in April and another about Christmas—as two examinations in the year were of great advantage to many of the students who might be rejected. The proposal was unanimously agreed to by the Board, and would be carried out during the present year if a sufficient number of students (say six) presented themselves.

Mr. GILLOX then brought under their notice the Charlier system of horse-shoeing, and stated that the result of his visit so Paris for the purpose of making inquiries into the subject was that he had become quite converted to this method of horse-shoeing. People, he found, who had tried this system in France, had never given it up.

Sir WALDEGRAVE LESLIE asked if there was any possibility of seeing horses shod on this principle at the Dumfries show? It was important that their country blacksmiths should see for themselves that it was not necessary to cut away the frog. The fact now was, that in the matter of shoeing they were imitating the high heels of the "Girls of the Period," and were giving their horses high heels in order to give them a sort of graceful "Grecian bend" (laughter).

The noble CHAIRMAN said there was no difficulty in getting any number of specimens as to how horses ought to be shod. The idea of shoeing draught horses was to get the greatest amount of iron and the highest possible heel. It was not the driving of nails into the horses' feet that caused injury, but it was by making them go like the ladies did, and to which reference had been made, with the wrong muscles brought into play.

The subject was referred to the directors.

Mr. GILLOX reported that the following premiums had been awarded for papers in competition since the general meeting in January:

The medium gold medal, or £5, to George Bruce, Veensgarth, Lerwick, for a report on the Improvement of Natural Pasture without Tillage.

The medium gold medal, or £5, to Charles Paterson, Cammersey Cottage, Aberfeldy, for a report on the same subject.

The silver medal, to George Carr, Westhill of Park, Drumoak, Kincardineshire, for a report of Improvement on the Farm of Westhill of Park.

The silver medal, to C. Y. Michie, forester, Cullen House, Cullen, for a report on the Effects of the Dry Season 1863 on Trees and Shrubs.

Mr. KINLOCH (Gilmerton) moved that the Society petition Parliament against the tax upon the use of guns being applicable to persons employed in protecting crops from birds, provided they hold written authority from their employers.

Mr. SCOT-SKIRVING seconded the motion, which was agreed to.

A vote of thanks having been passed to the chair, the meeting then rose.

LOCAL TAXATION.

A dinner took place in the Poultry Market at Taunton, under the auspices of the Central Chamber of Agriculture, with the especial object of discussing this subject. The meeting, however, appeared to have excited but little interest, and, as will be seen, not a single Somerset or Dorset farmer spoke to the question.

Sir MASSEY LOPES, M.P., who was in the chair, opened the business by saying that Mr. Goschen, the President of the Poor-law Board, told us but a very short time ago that an amount of thirty millions per annum was raised by local taxation. He need not remind them that amount far exceeded the interest of our national debt; it was almost equal to the sum expended upon our army, navy, and civil service; and it was almost as much as half the amount

that was raised for imperial taxation for the whole purposes of this country. They would all agree with him that it was a question of great magnitude. From the very first its promoters had endeavoured to drag it out of the range of party politics. They did not consider it a party or political question, or a question which affected class interest; but, on the contrary, they said it was one which concerned the whole nation and the whole community. It had not been agitated only of recent times. He might say that for the last twenty-five or thirty years great and general dissatisfaction had been felt with regard to the injustice of raising what was called local taxation. Since the year 1845, which was the date of the Common Law Repeal, this question had been continually cropping up. Previous to that time the landed interest had at all events some compensation—some privileges in compensation he might say—for that large amount of rates which they were called upon to pay. They had it in the shape of protective duties. But he need not remind them that those privileges were gone, and he was bound to say that he didn't regret it. But what had raised this question and given renewed energy and activity to it of recent years? Why it was the enormously increased and increasing amount, not only of their old charges, but more than that—it was the imposition of new charges. And more than that, he said it was the contemplated, the threatened addition of still further charges upon one description of property. Let him remind them that these impositions were not only pending and threatening, but they were immediately imminent upon us now. Let him call their attention to the education rate that was proposed to be put upon one interest, one description of property alone. That additional rate of 3d. in the £ would be £125,000 a-year. Next, they were also threatened with a turnpike-charge, and he would tell them that those charges were coming upon them. They had a Turnpike Continuance Act, and only by that Act this year £200,000 a year were imposed upon the real property of this country. Well, then, he said they were not crying out before they were hurt, but, like children that had been burnt, they were very much afraid that they should be scorched a great deal more. Well, what did this enormous increase of rates amount to? During the last thirty years the increase of poor-rate alone upon real property had been 70 per cent. increase, and upon the county-rate 200 per cent. But to take a shorter period, within the last six years the increase of poor-rate had been 30 per cent. and county-rate 50 per cent. The hardship was this: that one-seventh only of the annual income of this country was paid for all that increase—one-third only of that property which was assessed to income-tax was paying for what he said were national responsibilities. Well, then, he said this was a state of things which was perfectly unjustifiable and infeasible. It was absolutely necessary that we should have some reform and some revision of this rating system; and nothing but a radical re-adjustment of it would settle it. He denied *in toto* the allegation that if the agriculturists paid more than their share of local taxation they were favoured by imperial taxation. As to the proposal of Mr. Goschen's Local Taxation Committee (Limited) to divide the rates between owner and occupier, to that he expressed decided disapproval. The first thing to be done before bringing forward a remedy for the grievance was to classify the rates, to see what were really local and what were really national; and then the next thing was to find out who ought to pay them. He laid it down as an unalterable maxim that every man in proportion to the security of his property which he received, and in proportion to the security of his person which he received, was bound equally to contribute towards those national charges which made his person and his property secure, according to the means and the ability which God Almighty had given him.

Sir LAWRENCE PALK proposed the first resolution:—"That this meeting protests against the present unjust exemption of income derived from personal property from contributing towards the various objects for which funds are now raised by local rates, and is strongly of opinion that this grievance affects owners and occupiers of house property in towns quite as much as the landed interest, and therefore that both descriptions of property are equally interested in the removal of this anomaly."

Mr. PIPER, Secretary of the Swindon Chamber of Agriculture, seconded the resolution, which was carried.

Major ALLEN, M.P., proposed "That the proposals to include within the rating area certain classes of real property hitherto exempt, and to divide the payment of rates between owners and occupiers, do not afford any remedy for the grievance complained of in the unequal incidence of local taxation; and that no settlement of the question can be accepted as final or satisfactory which is not preceded by a thorough inquiry to determine whether the objects now locally provided for are of local or national obligation."

Mr. DUCKHAM, from Herefordshire, seconded; and Mr. CLARKE, the Secretary of the Central Chamber, "supported" this resolution, which was carried.

Mr. GORE-LANGTON, M.P., proposed "That, until the question of local taxation reform has been satisfactorily dealt with, this meeting pledges itself to oppose most strenuously the imposition of any fresh rates on the present unjust basis for such purposes as national elementary education, expenses of elections, turnpike-roads, &c."

Mr. HOLLEY, of the Devon and Cornwall Chamber, seconded, and Professor WRIGHTSON, of the Cirencester Chamber, "supported" this resolution, which was carried.

YORK CHAMBER OF AGRICULTURE.

The members of the York branch of the North Riding Chamber of Agriculture held a meeting at the Queen Hotel, Micklegate, Mr. Kilby (Appleton Roebuck) in the chair.

Mr. J. SOULBY proposed, "That this meeting is of opinion that the licence to carry a gun should not apply to guns carried upon lands in the occupation of the owner of the gun, and decides to petition in favour of Mr. Read's amendment to that effect."

Mr. DUFFITT (Whitwell) seconded the motion, which was adopted unanimously.

Mr. FREER (Harton) moved, "That this Chamber is of opinion that the abolition of the foot hawkers' licence would be a great encouragement to vagrancy and of pretending to be hawkers, and would approve of the reduction of the licence but not of its total abolition."

Mr. CUNDALL (Askham) seconded the resolution, upon which

Mr. CUNDALL (Acaster) moved an amendment to the effect that the foot hawkers' licences remain as at present, and that no alteration be made in them.

This amendment, on being submitted to the meeting, was adopted by a considerable majority.

Mr. CUNDALL (Acaster) proposed that, in the opinion of the Chamber, the game-laws ought to be entirely abolished. They were rotten to the very core, and nothing short of total abolition would meet the necessities of the case.

Mr. WALKER (Hay-a-Park, Knaresborough) seconded the resolution.

Mr. DUFFITT proposed as an amendment, "That it is the opinion of this meeting that the provisions of the Government Game Bill are objectionable, and of no value to the tenant-farmers; and it considers that hares and rabbits should be omitted from the game list altogether; also, that a petition should be presented to Parliament in accordance with this amendment."

Mr. CUNDALL (Askham) seconded the proposition, and it was carried by a majority of 10 against 4.

Mr. CUNDALL (Acaster) moved, "That this Chamber regards the proposed regulations as to the allowing farmers to sprout barley, without drying or malting it, as totally useless to them, and would, therefore, urge the desirability of the total abolition of the malt-tax."

Mr. FEARBY seconded the resolution, which was agreed to.

ESSEX CHAMBER OF AGRICULTURE.

Subjoined is a summary of the proceedings at the meeting, as held at Chelmsford, Colonel Brise, M.P., in the chair.

The subject of the Game-laws was introduced at the last meeting by Mr. W. BROWN (Braintree), who now proposed the following resolutions:

1. That the landlord and tenant should have equal right of sporting over the lands that are let by one party and hired by the other.

2. That all game upon enclosed lands shall be the property of owners and occupiers of such lands.

3. That in lieu of the present Game-laws, a stringent law of trespass should be enforced against all unauthorised persons.

Mr. POWELL (Coggeshall), proposed the following amendment:

"That the Game-laws be abolished altogether; that the law of trespass be made more stringent; and that all game be considered the property of the occupier of the land on which it is."

This was seconded by Mr. HOLTON (Bures).

Mr. BROWN withdrew his original resolution in favour of the amendment, which on being put was carried unanimously.

Mr. J. S. GARDINER (Borley, Sudbury), then read a paper upon "Tenant-Right, not Landlords' wrong," moving the following resolution:

"That in the opinion of this Chamber it is highly desirable that a simply defined law of tenant-right should be passed by the Legislature for securing to the tenant compensation for unexhausted improvements on his holding."

Mr. FOSTER (Great Totham) seconded this resolution, which was agreed to unanimously.

Mr. J. SMITH (Saling) called attention to the present constitution of the Central Chamber of Agriculture, and moved a resolution:

"That the Central Chamber should consist only of representatives sent by local chambers in the ratio of the number of their members, and the amount of subscription sent by them to the Central Chamber."

Mr. JAMES YOUNGMAN (Woodham Ferris) seconded this resolution, which was carried unanimously.

THE ROYAL AGRICULTURAL BENEVOLENT INSTITUTION.

The annual general meeting was held at Willis' Rooms, to receive the annual report of the Council for the year ended on the 31st December, 1869, and for the election of officers and pensioners. Mr. Mechi in the chair.

The report having been read and adopted, the Council proceeded to the election of pensioners. The following is the list of the successful candidates:

MALE PENSIONERS AT £26 PER ANNUM EACH.			
		Votes.	
Gurney, Josh. Randall	310	Horley, Henry	259
Johnson, Robert	293	Paine, William	253
Hewett, Thomas	289	Attwater, William	247
Parris, George	266	Parsons, Aaron	245
Keer, William	266	Dangerfield, Thomas	221
MARRIED PENSIONERS AT £40 PER ANNUM EACH.			
Wm. and Sarah Legg	353	E. and E. A. Bateman	271
J. and M. Scammell	312	J. and M. Pamphilon	209
James and Eliz. Lane	305		
FEMALE PENSIONERS AT £20 PER ANNUM EACH.			
Pank, Mary Ann	567	Sadler, Susanna	292
Curtis, Ann	540	Rowson, Harriet	292
Jewhurst, Sarah	519	Nope, Elizabeth Ann	289
Bromhead, Elizabeth	504	Taylor, Ann	274
Kirkby, Jessica	463	Attrill, Elizabeth	253
Lockyer, Mary	415	Posnet, Elizabeth	223
Fever, Frances	398	Underwood, Sarah	224
Peacock, Catherine	327	Hart, Mary	221
Kniveton, Mary Ann	322	Marshall, Elizabeth H.	216
Ray, Hannah T.	313	Paine, Harriet	196
Simson, Mary Anne	298		

THE FOLLOWING ORPHAN CHILDREN WERE ALSO ADMITTED:

William Steane.	Harry Knight.
Christopher Cotching.	John Earham Turner.
John Inckle.	Arthur Wood.
John Bull.	Mary Thornton.

SALE OF MR. W. TIPPLER'S SHORTHORNS.—This herd was sold at Roxwell, on June 7th, by Mr. John Thornton. Amongst the chief prices for cows and heifers were Duchess, Mr. W. H. Walker, Shenfield, 25 gs.; Gay Lass, Barou Magnus, 37 gs.; Charmer, Mr. J. Christy, 26 gs.; Miss Bradford, Mr. A. Durrant, 26 gs.; Diana, Baron Magnus, 42 gs.; Gertrude, Mr. J. Pybus, 31 gs.; Bessy Bell, Mr. Wheatley, 25 gs.; Florence, Mr. J. Pybus, 27 gs.; Georgiana, Mr. J. Pybus, 34 gs.; Spot, Baron Magnus, 25 gs.; Grafton Lass, Baron Magnus, 30 gs.; Ringlet, Baron Magnus, 45 gs.; Geraldine, Mr. Wheatley, 33 gs.; Empress, Mr. Coleman, 28 gs. For bulls, Duke, Mr. Wenden, 39 gs.; Lord Grey, Mr. Howard, 36 gs.; General, Baron Magnus, 33 gs. The average was very low.

CALENDAR OF AGRICULTURE.

The sowing of turnips must be finished early in this month, in which the crop is thought to be less exposed to mildew than in June, and that the fly is not so prevalent as in last month. This later season is used in the eastern counties. Sow the turnips as directed last month.

Horse and hand-hoe potatoes, beet, and the earliest-sown swedes, and repeat the processes till no weeds appear. For general use, the best drill sculler is the miniature plough of wood or iron, drawn by one horse, as the narrow-pointed share pierces the hard bottom of stiff soils, which deny the same depth to the coulters of the duck-foot, and to the knives of the winged scullers. This superiority is very beneficial on any green-crop lands, but chiefly on the stiff soils that produce potatoes, beet, and cabbages, which are strong growing-plants, and require a deep working, to encourage the growth. A furrow being deeply ploughed away from the sides of the ridglet, the earth and the weeds are placed in a comb in the hollow, and present a fine operation to the light sculler of a front coultter and posterior expanding wings, with knives, which follows the first performance of the miniature plough, that precedes the first operation of the hand-hoe. The light sculler may be twice done, and after a time be followed by a second ploughing, and succeeded by sculling till no weeds appear, and the second hand-hoeing having been performed. The destruction of weeds with the following and pulverization of the soil of the intervals of the ridglets in green-crop farming, forms a chief feature of cultivation, and exhibits a very marked distinction between neglect and an approach to perfection. The ploughing and scarifying of the intervals in the driest weather raises exhalations that are imbibed by the leaves of the young plants with much benefit. Two ploughings may be sufficient, with scullings that appear necessary, to destroy the weeds and move the furrow from the plough, the last application depending on the former.

The number of coulters in any drill-sculler, whether wholly duck-footed or in the form of a single share, prevents the implements from piercing the soil, and carries it lightly over the surface; while in wet climates, and on damp moist lands that grow an abundance of weeds, the close position of the coulters collects and holds an aggregation of earth and weeds that cling to the implement, and is carried along by it with much inconvenience, and often with a total obstruction. In such cases of soils and weeds, the knives or expanding wings are not free from incumbrance in carrying along the collections of earth and weeds, and require a curved backward shape of the knives. The miniature plough, with a narrow-pointed share, with one wing or feather, will penetrate to any depth; and by laying aside the coultter when necessary, the earth and weeds are made to slip along the mould-board, and discharged without inconvenience.

Two miniature ploughs of wood, placed apart at the distance of the width of a drill, in 26 to 30 inches, and fastened in this position by slantbars, placed over the beams, form a very effective drill sculler, which is of an easy construction, simple, and cheap. The implement is drawn by two horses walking abreast, in a distance apart of an intervening drill, from the sides of which each plough lays a furrow into the interval on the right and left, thus finishing an interval of ground at each movement in the length of the field. The work is very effectually done; but the objection still remains that two points of shares are not so conveniently commanded as one in the necessary alterations of depth and width; and in the case of the under soil of the stiffest green-crop lands, the single share will be found the most effective

in piercing the soil, uprooting the weeds, and in affording earth, to be wrought and pulverized into a recipient of moisture and caloric, that is favourable to the equable distribution of those most essential agents of every organized life. The single plough moves twice in an interval, and may seem to consume time; but true economy consists, not in getting things cheaply done, but in getting them well done, a point not often considered, and seldom practised.

Clay fallows will receive the third earth of ploughing, harrowing, and rolling during this month; the softer clays will be pulverized, to permit the removal of weeds and stones, which the more waxy marine formations of that body will best bear an open exposure of the plough-furrow, to be baked by the sun, and fall into pieces from the rains and lengthening nights of the two following months. The dung and lime may be got ready that is intended to be applied.

Clovers and vetches will be abundant, and form the green food of the farm. Cut the herbage in a daily freshness for work-horses, milch cows, and swine, all which must have an ample supply of litter, in short-cut straws, in level yards and comfortable shelter sheds. The cows to go over-night into the shed and yard, and aid much in the production of manure; the pasture-field being in the nearest proximity to the farmery, for the purpose of an easy passage to and from the yard. In making manure moisture is an essential element, and must be provided by increasing the urinary liquids from animals by the use of green food. This point forms a very large consideration in the arrangement of animals and crops.

Continue the folding of store sheep, both on arable and grass lands. It forms a most valuable application in all inland situations of uplands for the growth of turnips and rape. In situations of the maggot fly depositing the larvæ on the animals, apply over the body the contents of the dredging box, as has been mentioned, and dress clean the posterior parts of the animals from the adhesions of excrements. Wean the latest lambs, and place them on the best pastures. Put mares to the stallion regularly. The cattle in the fields must have a full supply of water, with shelter shed from heats and rains; fences without any gaps, and gates in an order of being easily opened and conveniently shut, both for convenience and serving as a fence. These points and all minute applications raise the art into repute, and exhibit the artist as a professional character. Anything that is worth doing at all, is worth doing well.

The hay harvest will be concluded during this month. Make dry, and carry the herbage quickly into oblong stacks; lay it lightly together, and allow it to settle down by its own weight, rather than tread it firmly together by the pressure of treading. Pull nothing from the stacks till well settled; then dress it into any form, and thatch it without delay. For the purpose of getting up hay to a high stack when being built, use a scaffold, raised on four upright posts, resting below on a four-wheeled platform, and elevate or depress the scaffold to any height that may be required, by means of pulleys, and lay some loose straw on the top till thatched. A water-proof tarpaulin cloth will defend the stack from rain during the building, and must be removed early in the mornings, to let the sweating of the grass escape. In showery weather a light cloth may be suspended over it, by means of a rope passing the length of the stack, and attached at each end to an upright pole.

The site of hay-stacks will get a fixed position in the disposition of rick-yards of grain in rows, covered by a

roofing of zinc or corrugated iron, resting on upright pillars of cast metal. This arrangement saves the whole expense of thatching, and the risk of damage from rains that fall previous to the thatching of the ricks, which often happens in wet climates. The roofs will be formed in moveable pieces, that are fixed by screws to the platform that rests on the upright pillars, and removed during the building of the hay-rick, to prevent any inconvenience from impeding the harvest work, and immediately fixed in position when the building is finished. The tarpaulin cloth that has been mentioned will defend the stack during the building, if rains occur. It is most serviceable to make hay as green and juicy as possible, and for this end small quantities of the herbage must be placed together in daily or very frequent additions, to allow the perspiration to be gentle, and easily and quickly evaporated. A fixed roof over the stack will most powerfully lead to this end, and relieves all anxiety with respect to any damage being sustained from rains. The formation of rick-yards, arranged and covered as has been mentioned, cannot be much longer delayed, employing in addition to roofs of iron, the use of railways to convey

the grain to the barn, the use of steam to thrash the grain, to cut hay and straw into short lengths for provender and litter, and to convey the latter on a travelling carrier resting on triangular legs to the cattle yards and other places, as required. This combination uses the steam and the rail—the mightiest powers yet given to man, and, along with Free-trade (*en passant*), will overthrow the whole moral and social world. This truth is not a glow-worm, shining only in the dark, nor as a fire-fly, that shines only when it flies, and stagnates when it stops; nor is it a “Scientiæ media” that may rise above conjecture, but falls below certainty—all and every certainty bears indisputable evidence to the power of these agents.

The grain harvest will commence this month in early localities. Early peas, barley, and rye will be first cut. Peas are ripped from the earth by hand-sickle, placed in rows of bundles, that are frequently turned over till dry—but not too dry, which opens the pods. Rye and barley are tied into sheaves, placed in shocks, and carried when dry into ricks or barns, of which the stands must be ready, and the floors cleared out.

CALENDAR OF GARDENING.

KITCHEN GARDEN.

In the early days sow peas again, any short kinds, the crop “may” be fine, and therefore acceptable in September. Sow early the last crop of scarlet runners and French beans, and kidney beans, twice in the month, endive in the same way. Sow turnips and turnip-radish for succession. Sow some rows of cos lettuce, white and red turnip varieties, radish, carrots, and salading as required. Sow all onions for drawing young, and in poorish land a few large bulbs to stand the winter, and subsequently transplant for an autumn crop.

After the second week sow cabbage seed for cole-worts, called “greens,” one of the sweetest of spring vegetables. In the end of the month sow spring cabbage for early hearting in some situations.

Early in the month sow round-leaved spinach, and the winter or prickly sort; at the close of the month sow a full crop of turnips at different times, white, half-hardy, and yellow sorts, to come in early, and also stand over winter.

Transplant borecole at various periods for early and later spring supply, choosing, if possible, a moist state of soil; otherwise, if the weather be dry, every hole must be filled with water. If the ground be rich in nitrogenous manure, some soot mixed up with spit dung would be useful, as it contains salts of ammonia. May-sown cauliflower may be treated in the same manner.

Transplant celery for the last crop; the former plantings are to be carefully earthed up, and in closing this for the first and second times hold each plant compactly with one hand, while the other applies fine earth close around the lower part of the leaves, but not so high as the growing hearts. Give water copiously along the trenches if the weather be dry, for the first good start is most important.

Transplant leeks; dig and manure richly a plot for a row or two, and try with the dung 2 oz. of sulphate of ammonia to the small barrow. Very fine guano to the extent of a pint to the same bulk would confer phosphates of ammonia and of lime, several ammoniacal and nitrogenous compounds, common salt and neutral sulphate to the soils. It is the comprehensiveness of pure guano which stamps its value, and therefore may be always recommended to be mixed with manure as a

restorative to an exhausted soil after raising crops of strong vegetables. In planting leeks, make deep case-like holes and drop them in, applying water in a small stream, so as to fix the roots of each.

Transplant vegetable-marrows and cucumbers, plants already raised in heat. Dig a hole for each in a warm open spot of ground, put in a barrow or more of leafy rich manure and cover it with some rich light soil; water, and cover with hand glasses till growth be established, and then gradually train out the runners, stop the points occasionally to obtain laterals.

Propagate herbs by slips—collect camomile flowers.

The following operations are required at all seasons while crops are growing. Stick peas, top them, also broad and kidney beans; earth up legumens and potatoes. Peas require sticks feathered with branches of a moderate length, with a height of about four feet in a row on each side of the row of peas, and inclined to a top over rising tendrils. Double rows of peas are now abandoned, the thickness of the foliage excluding the necessary current of air. Place fresh soil on the sides of the rows of potatoes without covering the haulm, with the stem upright in a position of growth. Train and peg down the regular advancing shoots of vegetable marrows, gourds, and cucumbers: hoe and move the surface among crops; supply guano-water to cabbage plants, and to all plants generally with broad succulent leaves and juicy stems. Any weak plants are much forwarded by this application.

FRUIT DEPARTMENT.

Attend to the budding of wall fruit—it will succeed if done adroitly. The art is best learned by watching the mode practised by some jobbing gardener or workman, of which some are found in every country place. It is best performed when the bark rises freely, owing to the exudation of proper juice between the new wood and the bark—if the operation be timely and skilfully performed, the fluids attract each other, solidify, and cause an union between the two secreting surfaces.

Remove all wild, ill-placed, and superfluous wood from plum and cherry trees; apple and pear trees may remain untouched till August.

FLOWER GARDEN.

Take up bulbs and dry them, and pipe and layer pinks and carnations. Propagate geraniums by cuttings in

sand or leafy mould: plunging the pots in a gentle hotbed they soon root, and may be transferred to larger pots of a richer soil, as loamy sand and decayed dung of animals. Guano is extolled as a highly valuable stimulant, but may be sparingly applied to flowering plants.

Layer strawberries at the first joints into small pots of free loam—they will root speedily in moist weather, or if watered when dry.

The same remark applies to roses as in the budding of fruit trees. The art is learned by observing that both the stock and the scion be in a moist condition, one in which the bark detaches freely from the wood. Success depends upon attraction between the vital organizable juicy membranes which exudes, or is deposited between the yearling wood and inner bark.

Keep all parterres, flower borders, shrubberies, lawns, and walks in neat order, free from weeds, and duly regulated.

Fruit trees on the standards, singly or in clumps, may be favoured by the land being trenched for some months beforehand, or for a year, as may be recommended. Single trees may have a hole of eight feet in diameter dug and filled at different times with rich earths, short dung and water, and dried into an earthy consistence

before the tree is planted over it. This preparation will stimulate the growth of the plant for some years, even the tree that is inserted in the upper soil by the turf being raised by the spade; but experience has shown that the trenching of lands for general plantations is only useful for a few years, and does not repay the expense, and the small round pits present a firm wall round the sides of it to be penetrated by the roots from the moved earth of digging. But the above recommendation will be useful for fruit trees, and with standards and clumps around the homestead and in the corners of fields.

The collection and preparation of manures must have no intermission—grassy earths, tall weeds chopped into short pieces, scourings of sides of roads and ditches, soaked in the liquid pit with the soapy and urinal washings of the dwelling-house, will be a good manure for all strong growing plants; and the dry compost heap for lighter crops, composed of dry fine earths, road scrapings, droppings of animals, and similar matters, mixed with effete lime. All these ingredients are found at home, and not from any costly importation—the manure enjoys the great recommendation of being cheaply got, with the indissoluble attachment of being essential to the special purpose.

REVIEW OF THE CATTLE TRADE DURING THE PAST MONTH.

The course of the cattle trade during the past month has been free from any important interruption. The supplies of stock forwarded to market have been about an average, but a falling off has been observable in the quality. This has been more particularly noticed in the case of sheep, beasts having as yet deteriorated but little. When we come to consider the severe drought which has prevailed for the last three months, and to the consequent scarcity of food, it is not surprising that the quality of the stock forwarded to market should have undergone a change for the worse. The hay crop, so far as it has as yet been secured, has proved a miserable failure, and some anxiety has been caused by the probable difficulty to be encountered in obtaining food for winter consumption. The aspect of affairs during the past week, however, has somewhat improved. Rain has fallen in many parts, and in some instances freely, and a marked change is already apparent in agricultural prospects. Mangold wurtzels promise well. Under the most favourable circumstances, however, it is tolerably certain that food will be scarce during the winter months, especially in the Southern counties, and that the value of meat will rule higher. In Scotland the drought has been less severely felt, and store cattle have been freely purchased.

At the Metropolitan Market the show of stock has been about an average as regards number; but the condition of the animals has been less satisfactory. The trade has been free from any important feature, and the fluctuations in prices have been trifling, the best Scots and crosses generally commanding 5s. per 8lbs.

The receipts of sheep have been very heavy, large numbers having been thrown on the market in consequence of the severe drought. The demand has been by no means brisk, nevertheless a fair amount of firmness has been apparent, and the quotations have been maintained. The best Downs and half-breds have sold at 5s. 2d. to 5s. 4d. per 8lbs.

Lambs have been dull, and the top price has receded to 6s. 8d. per 8lbs.

Calves have experienced but little inquiry, whilst pigs have been dull and drooping.

The annexed figures show the total supplies of stock exhibited in the Metropolitan Cattle Market during the month:

Beasts	13,558	Head.
Sheep and Lambs	199,139	
Calves	3,757	
Pigs	625	

COMPARISON OF SUPPLIES.

June	Beasts	Sheep and Lambs.	Calves.	Pigs.
1869	20,209	167,770	2,730	980
1868	19,650	177,690	2,875	1,430
1867	16,270	146,650	2,600	2,048
1866	18,320	139,880	1,864	1,732
1865	24,050	163,720	4,278	3,210
1864	25,890	133,450	2,736	3,280

The total imports of foreign stock into London during the past month have been as follows:

	Head.
Beasts	4,794
Sheep and Lambs	25,752
Calves	2,689
Pigs	2,509
Total	33,744

The following table shows the arrivals of stock from our own grazing districts, as well as from Scotland and Ireland, compared with the two previous years:

From—	June, 1868.	June, 1869.	June, 1870.
Norfolk, Suffolk, &c.....	9,000	4,500	6,800
Lincolnshire	370	—	—
Other parts of England.....	1,920	2,420	2,300
Scotland	97	479	850
Ireland	220	161	90

Beasts have sold at from 3s. 2d. to 5s., sheep 3s. to 5s. 4d., lambs 6s. to 6s. 8d., calves 3s. 10d. to 5s. 8d., and pigs 4s. 6d. to 5s. 8d. per 8lbs. to sink the offal.

	June, 1868.			June, 1869.		
	s.	d.	s. d.	s.	d.	s. d.
Beef from	3	0	5 0	3	0	5 10
Mutton	3	0	5 0	3	0	5 10
Lamb	5	6	6 6	5	6	6 0
Veal	3	8	4 2	4	6	5 6
Pork	3	4	4 2	3	8	5 2

Owing to the warm weather which has prevailed, the supplies of meat forwarded to market have been less extensive. The trade has been quite at our quotations: Beef from 3s. 4d. to 5s., mutton 3s. 6d. to 5s., lamb 5s. 8d. to 6s., veal 4s. 6d. to 5s., and pork 4s. to 5s. 8d. per 8lbs., by the carcase.

REVIEW OF THE CORN TRADE DURING THE PAST MONTH.

The character of the month was that of severe drought, though Scotland, as well as the North of England and West, had some quantity of rain, and a few showers were generally distributed, with signs of more coming as the period closed. The temperature has varied from severe cold to tropical heat, the thermometer in the sun having risen to 110 Fahr. on the 22nd, though afterwards the cold partly returned. The consequence of the want of rain has been the almost total loss of the hay crop, many fields not yielding more than one-quarter of a load to the acre, and some not being worth the use of the scythe. The pastures have become dry and brown, though the closing rain somewhat abated their desolate appearance. Store cattle have in some cases been forced out of the graziers' hands upon the market, and this course will have to continue, unless plentiful showers are granted. But should they come and cut may partly make up for the present deficiency, which has brought the price of hay to extravagant rates. All spring-corn too, more or less, has suffered, and prices have been rising at a fearful rate—say, 3s. to 5s. per qr., this only being stopped by the more recent showers. But we have not been left to the course of our own humid climate, which seldom suffers as at present. Our neighbours—the French—having much more felt the drought, have not failed to avail themselves of our more abundant stores and plentiful arrivals, and perhaps half or more of the advance may be traced to this cause. But not only has spring-corn experienced an unusual excitement, but it has reached to wheat to the extent of about 6s. per qr.; though for the last ten days the trade evinced signs of reaction—say, of 1s. or 2s. per qr., leaving the month's gain about 4s. to 5s. per qr. There appears, however, nothing in the prospect of the wheat crop in this country to justify any apprehension. The light gravelly soils have certainly gone off under the scorching heat of the sun and the drying atmosphere; but the well-farmed loams give promise of even more than an average yield, while the high temperature has been forcing them on at an unusual rate, partly compensating for the previous backwardness of the season. Lately rain has partially fallen in France and other parts of Europe, though not abundantly, and the French demand has subsided, with falling markets there—say, at Paris of 3s. to 4s. per qr. in a week, and in some parts of the country the decline has been still greater. Our anticipations of improved rates have therefore all been fulfilled; but we think the time has come to return to a quiet trade at about, or something below, present rates. Still there need be no fear of our returning to those startling prices which were current at the commencement of March, when the general averages were only 40s. 8d. per qr., from whence we have already reached a gain of 7s. 4d. Though the rye is not well spoken of in Europe, and the wheat has partially suffered, Hungary promises a full average, also great part of Russia, California, and the whole of North America, and there is no fear that a French competition will greatly raise our prices, for the harvest in the South has already begun. The following were the recent prices of wheat at the several places named: White wheat at Paris 65s., red 61s. 6d.; white at Bordeaux 58s. 6d.; Baltic and native red in Belgium 54s. to 59s.; Zealand white at Rotterdam 53s., Mecklenburg and Saale at Hambro' 52s., red at Cologne 52s.,

at Manheim 58s. 6d., the best heavy at Pesth 47s. 6d., high-mixed new at Danzie 59s. c. f. and i., old ditto 62s., red at Romanshorn 59s., hard at Algiers 43s. No. 2, Spring at New York 48s. 6d. per 480lbs., c. f. and i.

As the requirements of the Press compelled us to close our last month's review on the 23rd May, so the present commences with the 30th May. Monday's market then opened on very small English supplies of wheat, with fair arrivals of foreign. The show of samples on the Essex and Kentish stands was the shortest of the season. English factors held for an advance of 1s. to 2s.; but the weather changing from ungenial to warm, with a south-west wind, but little was done at more than 1s. improvement. Foreign generally has held for the same advance, and America freely brought 2s. per qr. beyond the previous Monday's rates. Floating cargoes were 1s. per qr. higher, with very few for sale. The dry weather and a foreign demand made a much more cheerful trade in the country, and the smallest advance there was 1s. per qr. at many places, as Sleaford, Spalding, Lynn, Louth, Leeds, Hull, Sheffield, Birmingham, Newark, Market Rasen, Manchester, and Rotherham; while at Boston the improvement was 2s. to 3s. per qr. Liverpool only gained 2d. per cental for the week, or 10d. per qr. The principal Scotch markets were 1s. per qr. dearer, as Edinburgh, Leith, and Glasgow. At Dublin, both Irish and foreign wheat were up 6d. per brl.

On the second Monday there was another scanty English supply, but the foreign arrivals, though less than the week previous, were fair. An important demand for France had the effect to raise prices 2s. to 3s. per qr., but the continuous steady rise made our own millers cautious. Large sales of foreign, not only for France but the Rhine, caused an advance of 2s. on the lower descriptions of Russian, and American sorts were 3s. per qr. dearer. Cargoes afloat continued to rise. The suddenness and importance of the foreign demand produced great excitement in some parts of the country, some farmers thinking it best to withdraw their samples altogether, but others were willing to sell at 3s. to 4s. per qr. more, but the average price may be taken at about 2s. per qr., some places being content to accept 1s. more than on the previous week. Liverpool gained 6d. per cental or 2s. 6d. per qr. Leith and Edinburgh were both up 2s., and Glasgow 1s. to 2s. per qr. The rise at Dublin was moderate, say 6d. to 1s. per barrel both on native wheat and foreign.

The third Monday's returns only exhibited scanty English supplies, with less from abroad. French buyers again appearing on the market, the short arrivals on the Kentish and Essex stands again prompted an advance, and extravagant rates were first asked, but eventually an improvement of 2s. per qr. was accepted. Foreign being in request for export a like advance was readily obtained on Russian and American samples. Though rain fell this week rather plentifully in the north and partially in other places, there was very little abatement of the previous excitement, many farmers being so extravagant in their claims that their ordinary buyers were glad to become London purchasers, when on Friday, after the showers, holders evinced more disposition to sell. The advices, as might be expected at such a time, were very unequal, but the average gain may be fairly taken at fully 2s. per qr. In Scotland, where more rain had fallen, there were

more moderate views, but Leith was 2s. per qr. dearer, and Glasgow 1s. to 2s. The Dublin advices were without excitement, yet fair Irish as well as foreign samples were 6d. to 1s. per barrel dearer.

On the fourth Monday the English returns showed a moderate increase, and the foreign were also improved in consequence of fair arrivals from Montreal and New York. There were very few fresh arrivals on the Essex and Kentish stands, and factors generally demanded 1s. per qr. more, but with some rain fallen in different localities, and less activity in the French inquiry, it was found home millers would not exceed the previous Monday's rates, at which sales were made. Holders of foreign also found the same state of trade, and though at first they declined the previous Monday's rates they could not afterwards exceed them. Of arrived floating cargoes there were none. The dull accounts from London were not without their influence in the country, most markets were the turu casier, and several were down 1s. to 2s., as Louth, Birmingham, Bury St. Edmunds, &c.; and on Friday London was 1s. cheaper to sell.

The arrivals in four weeks for London have been 14,753 qrs. English wheat, 74,816 qrs. foreign, against 24,482 qrs. English, 65,572 qrs. foreign in 1869. The London exports in the same time have been 5,475 qrs. wheat, 2,186 cwt. flour. The imports into the kingdom for five weeks ending 18 June were 2,774,367 cwt. wheat, 536,206 cwt. flour, against 1,242,537 cwt. wheat, 136,956 cwt. flour for the same time last year. The general averages commenced at 45s. 3d. and closed at 48s.; those of London commenced at 47s. 6d. and closed at 52s. 6d. It must be remembered that the general averages only show the state of business about three weeks previously, and therefore they may be higher still though the market has now calmed down.

The flour trade as usual has been influenced by the course of wheat prices, but scarcely to the same extent, the foreign demand being almost exclusively for the latter. Norfolks have, however, improved fully 2s., the lower sorts being worth 35s., and others of a higher description in proportion, while on the 13th June town millers raised the top price to 47s., quotations at Paris for fine having risen to 48s. Foreign sorts, in sacks, have been held at 2s. per sack advance, and barrels have risen 1s. to 1s. 6d., anything extra being worth 26s. per barrel, and the offers of extra state from New York were by telegram 25s. 2d. e. f. i. The imports into London for four weeks were 80,069 sacks country, 4,473 sacks 43,925 barrels foreign, against 95,744 sacks country, 10,288 sacks 14,382 barrels foreign in 1869.

Maize, on moderate arrivals, has participated in the general advance, say to the extent of 2s. for four weeks, yellow fine being worth 33s., and the best white 34s.; and if the late rise in barley should be maintained it is likely to go dearer, though much from the Mediterranean and East has been bought for forward shipment. The imports into London for four weeks were 28,147 qrs., against 30,830 qrs. in 1869.

The arrivals of English barley have dwindled down to insignificance, and the foreign supplies for the entire month have been less than they sometimes are for a week. This being the case, with short stocks and the drought threatening to make a light crop, prices have gained 2s. to 3s. per qr., the better qualities of foreign being scarcest have risen most. In the country this grain seems to be nearly exhausted, and the lower descriptions have been wanted for feeding stock, in consequence of the failure of grass which has been very serious. There is therefore no likelihood of much abatement in prices, unless we get very plentiful and timely rains. Grinding sorts have now become worth 26s. to 30s., and foreign

malting 10s., English being in too limited supplies for quotations. The imports into London for four weeks have been 1,634 qrs. British, 25,510 qrs. foreign, against 1,016 qrs. British, 3,732 qrs. foreign in 1869.

The malt trade with little doing has hardened in value, say 1s. to 2s. per qr.

Oats have experienced a rise not known for many years in the same space of time. The want of rain has told most unfavourably on the prospects of the crop in England, and still more so in France, though lately we had samples from that country on sale in the London markets. Large purchases have now been made on French account, and though the arrivals have been unusually heavy, they failed to check the upward movement which only ceased on the fall of rain. The advance under these circumstances has been no less than 1s. to 5s. per qr. in four weeks, but on the last market there came a calm, though without any diminution in prices. Rigas, weighing 40lbs. per bushel, have become worth 25s.; Swedish corn of fine quality about 27s.; and Scotch potato, from extreme scarcity, are worth 31s. or more. The imports into London for four weeks were 3,910 qrs. English, 251,398 qrs. foreign, and it is to be noted that not a single shipment from Scotland or Ireland is included in the returns. The imports for the same time last year were 1,556 qrs. English, 1,264 qrs. Scotch, 3,300 Irish, 93,849 qrs. foreign.

The scanty supplies of English beans, and want of fodder in the country not being made up by liberal foreign arrivals, this grain has advanced likewise in value fully 4s. per qr. The news having reached Egypt there is a corresponding advance there, though previously they could have been had at 34s. f. o. b. Alexandrian qualities are now worth 42s.; ticks and Mazagaus 44s. Now hay and oats have so advanced, there seems little chance of much decline in this grain before harvest, and without abundant rains the prospects for this period are poor. The imports into London for four weeks were 1,214 qrs. English, 3,208 qrs. foreign, against 2,118 qrs. English, 68 qrs. foreign in 1869.

Peas have been coupled with beans in the fore-mentioned advance, the native supplies being quite trifling, though the foreign arrivals have lately improved from the advance in the market. The description imported has consisted almost exclusively of inferior white sorts used for horse-feed as a substitute for beans, and then lately worth only 33s. are now held at 39s.; fine boilers are not in demand at this time of year, and hog peas of English growth are too scarce to quote reliably. The imports into London for four weeks were 373 qrs. English, 11,515 qrs. foreign, against 157 qrs. English, 1,855 qrs. foreign in 1869.

The import of linseed has been remarkably small, viz., only 3,367 qrs. for four weeks, and prices have, therefore, advanced on the previously high terms 1s. to 2s., and cakes, from the drought, and have increased in value 5s. to 7s. 6d. per ton.

All agricultural seeds have found a speculative inquiry, at higher rates.

HARDING'S FLEXIBLE ROOFING.

REDUCED TO ONE PENNY PER SQUARE FOOT.

The BEST and CHEAPEST COVERING for HOUSES, SHEDS, FARM and other BUILDINGS, &c.

Suitable for all Climates, and adopted by the English and Foreign Governments, Railway Companies, Metropolitan Board of Works, &c. Awarded the Silver Medal, Amsterdam Exhibition, 1869, for its Cheapness and Superiority to Felt, although the price was then 50 per cent. higher than at present, and is proved to be a much more Durable, Efficient, and Weather-tight Roofing than Corrugated Iron, at One-third the cost, and can be most easily fixed by any unpractised person. Please send for samples of present make.

PRICE ONE PENNY per Square Foot, or 23s. per Roll of 25 yards by 44 inches wide.
DRESSING, 2s. 6d. per gal.; ZINC NAILS, 5d. per lb.
SAMPLES AND TRADE TERMS FREE.

HARDING'S COMPOUND GLYCERINE DIP.

CONTAINS NO POISON, AND IS DESTRUCTIVE TO INSECT LIFE ONLY.

It is a certain cure for Scab in Sheep, who thrive and increase in weight after the use of this Dip. It also preserves the health of all animals belonging to the homestead.

It increases the growth of the wool, and cleaves it of all offensive accumulations which always cause functional derangement, it being a well known fact that acrid and corrupt humours allowed to remain on the surface are the cause of a great many diseases which afflict animal life.

This preparation is most easily applied, perfectly harmless in use, and most deadly to Ticks, Lice, Maggots, and a sure cure for Foot Rot. It also prevents the Fly striking; avoiding the Animal being troubled with Maggots, and heals all Sores, &c.

Sold in Tins of 5lbs. and 10lbs., at 6d. per lb.; and in Drums of 25lbs., 50lbs. and upwards, at 5d. per lb.; by all Chemists, Seedsmen, Ironmongers, and others throughout the Kingdom.

A 5lb. TIN IS SUFFICIENT FOR TWENTY-FIVE SHEEP.

No Dipping Apparatus necessary, common Tubs being all required. (See the simple Directions for Use on each Tin.)

The Church of England Magazine,

A VERY CHEAP RELIGIOUS PERIODICAL.

Containing original contributions by several of the Bishops and many other distinguished Divines; Narratives; Sketches of Natural History; Biography, Missionary Proceedings, Juvenile Reading, Poetry, &c., with a Register of Ecclesiastical Intelligence; the whole combining amusement with instruction, in a style suited for all classes of readers.

A series of Parish Churches, with Illustrations of a superior kind is in course of publication. This series, which will be of a very extended character, will be found of particular interest.

Intending subscribers are requested to send their orders without delay, as the back volumes and parts are now becoming **VERY SCARCE**.

As the Magazine enjoys a circulation far exceeding that of any other church periodical, and is read by all classes of society, it will be found a very eligible medium for Advertisements, which are conspicuously printed, and inserted at the most reasonable rate.

Vol. LXVI., Imperial 8vo., Embossed Cloth, 480 pages, with highly-finished Illustrations of Parish Churches, price 5s. 6d.
London: Published in weekly numbers, price 1½d., and in monthly parts, price 9d., by S. EWINS & SON, 9, Ave Maria Lane; ROGERSON & TUXFORD, 265, Strand, W.C.; and sold by all Booksellers.

Now Ready, Cloth, in two Volumes, 782 pp., with four steel Portraits, Price 10s., uniform with
"SCOTT AND SEBRIGHT," "SILK AND SCARLET," &c.,

**FIELD AND FERN, OR SCOTTISH FLOCKS AND HERDS,
BY H. H. DIXON.**

With Steel Engravings of Mr. Hugh Watson, Professor Dick, Mr. Nightingale, and the late Duke of Richmond, &c.

The Volumes, "North" and "South" (of the Frith of Forth) may be had separately—Price FIVE SHILLINGS each.

Copies will be sent by Post on application to the Author.

PUBLISHED BY ROGERSON AND TUXFORD, 265, STRAND.

THE FARMER'S MAGAZINE.

AUGUST, 1870.

PLATE I. IN EUSTON PARK.

The lawns were dry in Euston Park ;
Here truth inspires my tale.

At any rate they must have been dry enough until very lately, and the hundred or so of polled Scots have found it hard work to get a living even over so extensive a range.

We are not quite so sure but that Polls, Devons, or more especially West Highland oxen, are a greater ornament to a nobleman's park than even the deer. Or, anyhow, they may go very well together, and share and share alike.

PLATE II.

KINGCRAFT; A THOROUGHBRED COLT.

THE PROPERTY OF LORD FALMOUTH.

Kingcraft, bred by Lord Falmouth in 1867, is by King Tom, out of Woodcraft by Voltigeur, her dam by Venison, out of Wedding Day by Camel—Margellina by Whisker.

King Tom, bred by Mr. Thellusson in 1851, is by Harkaway, out of Pocahontas by Glencoe. King Tom was a superior race-horse, and when quite off ran a good second to Andover for the Derby. His stock came out as two-year-olds in 1859, and he is the sire, amongst other winners, of King of Diamonds, Maiustone, Irene, Prince Plausible, Queen of the Vale, Tomyris, Janus, Old Calabar, Queen of Spain, Wingrave, Kean, Otho, Tom Fool, Crafton Lass, Evelina, Hippolyta, King of the Vale, Mogadore, Tomato, Breeze, King Charming, Warrior, Guinivève, Janitor, King Hal, Dalesman, Kingsley, Rhymer, Tourmalin, Warrior, Tormentor, Hippia, Contempt, Gaiety, Jasper, Osprey, King Alfred, Kingsley, Nyanza, Restitution, War Queen, Mahonia, and Kingcraft. Up to the close of last season, King Tom was the sire of more than a hundred winners, and his stock now includes one winner of the Derby in Kingcraft, and two winners of the Oaks in Tormentor and Hippia, while the best show stallion of his time is indisputably Dalesman. King Tom is of course still at Mentmore, where they will get fonder of him than ever.

Woodcraft, although bred by Mr. George Bryan at Jenkinstown in Ireland in 1861, has a good old West
OLD SERIES.]

Country pedigree—the dash of Venison, Wedding Day, and Margellina, by Whisker, with which Mr. Wreford was to be identified; and it somewhat noticeable that the Irish lass should have now settled down close to the home of her ancestors. But Woodcraft was no runner, as her two-year-old performances were not above plating form, and she was sold during the following season to Lord Falmouth for 200 gs., and at once sent to the stud. Her produce, so far, runs thus: In 1866, a nameless and worthless colt by Newminster; in 1867, Kingcraft, by King Tom; in 1868, a filly by Dundee; in 1869, a filly by Saunterer; and in 1870, a colt by Blair Athol. After the taste with Kingcraft, the mare has of course been put again this season to King Tom.

Kingcraft is a good-coloured bay horse, standing as close as can be upon sixteen hands high. He has an expressive, very bloodlike head; a strong neck, with powerful shoulders, standing with his forelegs rather under him. He is good in his girth, has great depth in his fore-ribs, is clean but somewhat light in his bone, and a trifle high from the hock to the ground. He has, however, beautifully shaped feet and fetlocks; and, if conveying something of delicacy in his general character, was a long way the most stylish-looking horse in the Derby. His preparation was perfect; clear in his coat, bright in his eye, and almost, as it would seem, flattered

in his work. He was indeed no doubt bigger when he stripped for the Derby than when he ran for the Two Thousand Guineas.

Kingcraft has started twelve times, won seven, divided once, ran second once, and third three times.

During the twelve or thirteen years Lord Falmouth has been on the Turf, he has enjoyed a degree of success which he has justly merited, for he is the very model of a sportsman in these days when money and the market have so great an influence on the doings of Lords and

Commoners. He breeds his own horses, he never bets and he acts on his own opinion in mating his mares and in engaging and running his horses. His Lordship has now won both the great races at Epsom, Kingcraft's victory having been preceded by that of Queen Bertha for the Oaks in 1863, while Lord Falmouth also bred Gamos, the winner of this year's Oaks. As an agriculturist, Lord Falmouth is famous for his Devons and Shropshires, which are as successful on the showground as his horses are on a course.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

MEETING AT OXFORD.

The Ransomes, the Garretts, and the Howards were then to be found, as they still continue, amongst the leading exhibitors of implements, when the first meeting of the Royal Agricultural Society was held in Oxford thirty-one years since. But, on the other hand, there is not one noted breeder of stock who countenanced the opening experiment again to be traced in the catalogue. It is indeed doubtful whether either through themselves or their successors any of the great herd or flock masters of those days are here to be identified. The Bates Duchesses, like "the Tenth," don't dance, at any rate not in public; Stephen Grantham is almost forgotten on the Southdowns; and Samuel Bennett and his people have passed away from the Woburn records. There are but few, as the Duke of Devonshire said at the general meeting on the Tuesday, who have now any cognizance of the Oxford Show of 1839. *Sed mihi contingit adire Corinthum*; we were amongst those few who had been to that other Oxford meeting, although possibly we then scarcely regarded a pedigree animal or worshipful judge with all the reverence we have of course since come to feel.

But there are judges *and* judges, as there are breeds *and* breeds by this time. There is stock now which can fill class after class at a national meeting, and command customers from all parts of the world, that in 1839 had little or no repute whatever out of its own immediate district. Your Shropshires, your Lincolns, and your Dorsets had hardly been heard of, and your very Oxfords never even invented. The black polls might have a name in Aberdeen as the red polls in Norfolk, while the Sussex beasts were slowly toiling towards the head-land, and the Longhorn disputed the supremacy of the Durham ox. But times have changed, and we had almost said breeds too. The brindled bull is by this well content to take a prize from the lucky-bag of the other breeds, and the Shorthorn rings are crowded three or four deep from the very moment the judges go to work. There are said to be some famous Herefords which nobody goes to see; the smaller show of Devons is, if possible, held in still less regard, and the very horses do not draw as might have been expected. There are certainly some connoisseurs in Southdown mutton to be seen about; as the over-anxious locals look to the fortunes of their beloved Oxfords, and the Shropshire men wear gamely through the four hours or so that their chosen authorities require to settle a single class. But if you wish to find a man, a monied man more especially, you must seek him amongst the Shorthorns, where our distinguished visitors are ready to pay us the most stirring of com-

pliments, and to give forthwith fifteen hundred for a heifer or two thousand for a cow, Booth or Bates, whichever you please. Mr. Cochrane, from Montreal, has just purchased two heifers, Duchess 101st and Duchess 103rd for 2,500 gs. the pair; whilst he has also taken Lady Grateful, an own sister to Lady Fragrant, of Mr. Booth, for 1,500 gs.; and when we left Oxford on Wednesday, negotiations were pending, at the corner of what was known as "the refreshment Booth," for the purchase of Lady Fragrant herself. 2,000 gs. had been refused, and Lord Kesteven was engaged in the nice duty of bringing the contracting parties together; as in fact, it was whispered that, at a meeting on the previous evening, a resolution had been put and carried, the purport of which was that henceforth no Duchess would be sold at any less price than two thousand. In the face of all this Patricia, one of the plums shipped, at 1,000 gs., died within a day's sail of New York; but although the intelligence only reached Oxford during the progress of the meeting, the effect was the very reverse of what might have been expected. Everybody was anxious to buy something to go abroad, and as the Hereford breeders were quite content to ask tens where the Shorthorn chiefs refused hundreds, business again was brisk, as our story of the week will presently show.

Otherwise, beyond the zest imparted by the extraordinary value of certain strains which were not represented here, the show of Shorthorns was by no means above an average; its merit, in truth mainly depending upon the entries of certain well-known animals, which either did or should have placed themselves, set off as these were by as ragged a rank and file as has been paraded for many a day. There were good judges at Manchester who fancied that Bolivar was then training off, although we could not share in such opinion, and his appearance at Oxford did anything but confirm any such unfavourable impression. He has thickened and furnished without growing either paunchy or patchy; his very coat has lost something of its rusty hue, and he is at all points for style and quality, with show condition not over-done, as handsome and as taking a bull as has been out for many a long day. Edgar, the second prize bull here and also second in the same class at Manchester, has also gone on well in the interim, being a true, deep, square bull, lacking something of the fashion of Bolivar, but fairly earning his place. The lengthy useful Baron Killerby has always been a favourite of ours, whether the judges looked at him or not, as too frequently they refused to do from his smutty nose, or he must often have had as good a place as he took here. At

Manchester and at Beverley last year the judges refused to pass Baron Killerby for this reason, and the line certainly looks to be rather loosely drawn, when a beast can be qualified and disqualified on a point that is after all a simple matter of fact. The famous Irish bull, Sovereign, made nothing like the impression expected, and it was by no means so clear that he would even get as near as he did. He was not very blooming, as at the best would have nothing very imposing in his appearance, while he begins badly with a mean, delicate head. The judges refused the neat Hogarth any notice, although he was kept in amongst the last half-dozen or so, while they highly commended the very showy Shuttlecock of Mr. Fawkes' breeding, but Fra Diavolo from the same herd has trained terribly off, and with no longer any pretensions in public. The eight or nine more included Royal Butterfly 20th, and Mandarin the first and second in the old bull class at Taunton, but beyond a mere commendation to the Butterfly neither made much mark here, as the white, from a mishap, is fast losing all his early promise. The best of a very moderate lot of two-year-olds, the Scotch Scotsman, a very successful animal in his own country, has been sold for 150 gs. to go away, and a well-grown, lengthy bull he is; whereas the Towneley Hubback, merely commended as a yearling at Manchester was not only plain but lame, and on very little showing worthy of being put so forward. The white Cumberland placed next has more appearance, and is altogether a smart young bull in, as we have said, a very ordinary class. Amongst the yearlings there were some better beasts, and here one of the sensations of the day occurred. At the recent meeting of the Essex Society at Saffron Walden we spoke to the great merit of a yearling exhibited by Lord Braybrooke; while at the dinner Mr. Thurnall said for the judges Heydon Duke was "the best he had ever seen, and he hoped he would be sent to Oxford, as it was well deserving of Royal honours." And he was sent to Oxford, where outside the ring everybody pronounced Heydon Duke to be manifestly the best of a very good class. Immense accordingly was the surprise when the Duke was only placed third to Lady Pigot's Bythis; whereas in Essex Heydon Duke beat Bythis. The judges at Saffron Walden were Messrs. Bowley, Lynn, and Savage, against Messrs. Aylmer, Bowstead, and Singleton at Oxford. It is as well to give these particulars, because some acknowledged good men declared that after such a decision there must be an end to all judging by rule or point. Heydon is, in fact, a very taking animal; a good roan in colour, of beautiful quality, with a deep frame, a good head, and very broad and grand to meet. He has, however, a somewhat drooping carriage, going with his head down; whereas Bythis, by the aid of long Ward, shows himself famously, and he certainly never looked better than he did at Oxford. With such well laid shoulders, by far his best point, he is bound to walk; but beyond his action and quality there is not much to be said in his favour, for he begins and ends badly, being especially faulty about his quarters. Still it is only fair to say that, with the exception of Saffron Walden, Bythis has taken the first prize on every occasion of his being shown during the present year: at Taunton, where, as we said, there was a very poor class against him; at Harleston, where, beyond Lord Walsingham's big yearling, there was nothing of "much account"; and at Royston, where he was not only the best of his class but the best bull in the show, beating Baron Killerby, Charles-le-Beau, and others. The white Yorkshire bull, Lord Irwin, was much liked, and had the prizes of Bythis and Heydon Duke been transposed there would have been little to complain of: but returned as they were on the list, we are bound to say that we never heard a more general or a stronger

expression of opinion against an award. Another Irish prize bull and a son of Sovereign, Mr. Chaloner's Sir Leopold, looked to be a very ordinary beast, but he made 250 gs. to go to New Zealand. The bull-calves ran up to a very pretty class, Mr. Dudding's best being particularly promising lengthy and stylish, as well backed by one from Burderop for second; while Messrs. Hoskyn gave a couple of hundred for the merely commended Towneley Oxford, a far higher reserve being of course put upon the reserve number, Maid of Oxford's Baronet, about as awkward a title as ever was heard of, as in the next generation it should run to Maid of Oxford's Baronet's son and heir. The class was very liberally and very deservedly distinguished by commendations; and with the sample they have, the Messrs. Hoskyn may make more mark the next time they come clean out of the West. Curiously enough, through an oversight, they were too late this year in sending their entries for both the West of England and the All-England meetings, although their stock did so well at the Cornwall show.

If one might attempt to read the human countenance as any reflex of a man's opinions, we should question very much whether any of the decisions in the Shorthorn cow and heifer classes were unanimously arrived at, as undoubtedly some of these gave as little general satisfaction as they could have done to the out-voted judge. Those famous prize animals Queene of Rosalea and Lady Anne were never, perhaps, seen to so much advantage as at Oxford. They had got rid of some of the lumpy coarseness they both threatened to feed into, and the Queene, more particularly, came out a fine, lengthy, blood-like cow. Nevertheless she was again placed no higher than second, although there was now no Lady Fragrant to eclipse the class. The best of all turned up in a red and white heifer, exhibited by Mr. George Garne, whose luck this season has been something extraordinary, while it will serve as a capital advertisement to the Churchill Heath sale that is talked of. Lady Lavinia is a deep, plain, short, stumpy beast, of little or no style in the ring, however good in her touch, and the chief points in her favour looked to be that she is but little over three years old and that she was led in by the Towneley herdsman, who might measure for inches against John Ward himself. For our own part we should have infinitely preferred Mr. Garne's best cow at Taunton, the more lady-like Pride of the Heath, whose second in the West, although unnoticed here, was sold forthwith by Mr. Stratton to go to Sydney. There were two or three more nice cows in this class, whilst in the baker's dozen or so of two-year-olds, there was another surprise, and fortune still smiling on the home bred stock. With Colonel Towneley, Lady Pigott, Mr. Stratton, Mr. Howe, the Gurnes and Mr. Eastwood exhibiting, the best of all was ultimately declared to be Mr. Mumford's Camilla, a heifer which at the county show in Oxford last summer took merely a commendation, as she did no more at Northampton, although later in the year she won prizes at such minor meetings as Aylesbury and Tring. She is already growing very unsightly behind, is short of coat, harsh and common, as the decision in her favour was altogether about the greatest fluke of the day, for we most assuredly never expect to see Camilla do so well again in anything like the same class of company. But it was a great victory, however arrived at, with a red Butterfly for second, and Mr. Stratton's big and good Peeress, the best of her class at Taunton as third; with such successful animals as La Belle Helene and Windsor's Butterfly coming in for some commendation.

Putting the sheep show out of the argument no doubt the best filled class in the catalogue was that which ran up to some thirty odd entries of yearling Shorthorn heifers, at whose disposal, the steward, Mr. Jacob Wil-

son, very judiciously put the two companion rings; and as they paraded this was certainly a sight to see. Still, from the first it was very apparent what must or should win, and we have only to hope that the award here was at any rate, so far as the best went, a unanimous conclusion. In our notice of the Essex meeting we spoke to Heydon Duke and Mr. MacIntosh's "two real gems of heifers as the cracks of the yard;" and there can be little question but that Lady Knightley 2nd was the best of all the Shorthorn cows or heifers at Oxford. She is so thoroughly fashionable, so grand perhaps rather than merely handsome in her appearance, with a rich roan coat, the very finest quality of flesh, and but for a certain narrowness in her quarters, and lightness of thigh, as true in her symmetry. Still, The Knightley won easily enough in a good class, and was sold, as it seemed to be by comparison a bargain, for 500 gs. for Australia. Not but there was something to beat. Mr. Dudding's second for instance, The Countess of Yarborough, is a wonderfully good square heifer, that looks like growing into something still better, although she has made her mark already at Northampton, Lincoln, and Beverley last year; and she goes to America at precisely the same figure as The Knightley, 500 gs. So that, with the market it making it so near a thing, the judges might have divided here also. Mr. Howe's third, Vesper Queen, has also deservedly some repute, and of Mr. Stratton's pair we thus wrote when we saw them a few weeks since in the West: "There is a vast improvement observable in the best Royal calf, Flower Girl, who has dropped to her leg, and is now growing into a really stylish charming heifer, so that the Manchester award would seem to be gathering confirmation. Not that the judges here by any means held to it, for they placed Gertrude, from the same herd, and a merely commended calf at Manchester, first, while, as second to her, they put Flower Girl the best of all at Manchester. Gertrude is some months older than the other, as she is level enough, but short and vulgar forward, and so far as the two be concerned, there can be little question but that the Royal reading was the better one." And the Royal reading was again the better, as Flower Girl was now put above the other, being the reserve number and highly, while Gertrude was never noticed, although Mr. Stratton sold her for 200 gs. to accompany Coriander to Sydney. Amongst the others a very pretty but very juvenile heifer from Mr. Fawcett's herd was deservedly commended, as with more age she might have reached to a higher rank. But the class, we repeat was a strong one, and it was something to get even a *benè* mark. The Towneley calf, full of Butterfly blood, had clearly the most promise of anything in the lot, and, in fact, the lady-judges looked to pull more together as they went on, as the yearlings and calves were declared to be as properly placed as the first cow and first two-year-old were out of all due order of precedence. Mr. Marsh's second-prize calf is, indeed, especially handsome, and Mr. Culshaw and his long friend seemed to be a deal more at ease when it was quite settled.

It was clear enough at Taunton that the white-faces were coming again in great force, and we rarely remember to have seen, at all points, a better show of Hereford cattle than that at Oxford in 1870. Three finer bulls for one, two, three, were surely never got together than those which finished in this way in the old class. The best of all, Stanway, has never been much of a show bull, although now close upon six years old, as this very fact may possibly account for his wearing so well. He won at Ludlow in the autumn of 1869, and again at Hereford, where we first saw him, and thus spoke of him: "Stanway is not a big one, or, more properly perhaps, not a high up-standing one, for he is very true and thick all

through, compactly furnished, without being cloddy, as he is stylish in his appearance, with a capital coat and a firm touch." At the first of those so-called "periodical sales" at Hereford, immediately following the show, Stanway reached the top figure of the day, 190 gs., at which price he was booked to a Mr. Child; but we took the liberty of doubting the genuine character of the transaction, as it now appears the bull was bought in, and since sold to Sir Joseph Bailey, whose people have brought him out as blooming as ever. Prince Leopold has also considerably improved, and it is difficult to understand how he could ever have been placed second to such an animal as Stow; while we testified to the great merit of the Welsh bull, Sir John the Third, when he won at Taunton, as full of style and quality, with by good size and a great back, a very orthodox coat, the activity of a kitten, and the courage of a bulldog. The weather, or the heat, however, would seem to have told on Sir John, as he was by no means so lively out as on his first appearance. With Stow as the reserve number, there was nothing else very particular in the class of old bulls, where the award, however correct, looks to read a little awkward in one way. Stanway is entered as 4 years 9 months 2 weeks and 6 days old, whereas by the *Hereford Herd Book* he was calved on September 11th, 1864, so that he is just a year older than stated. On the turf a horse whose age is wrongly given would be at once disqualified, and if Stanway's age were also wrongly given in the judges' books, some inquiry must be instituted, or we shall soon drift into a false state of things; for if Herd Books, either public or private, be of any use, nothing is of more importance than that certainty of information in this way should be insisted on. Prince Albert Edward, a very smart, stylish two-year-old, particularly good to meet, was a long way the best of his class, which was otherwise but moderate, although Mr. Baldwin got out of the merely commended Lord Ashford at 90 gs., with Australia as his destiny. Trojan, the best yearling, and always a fancy of ours, made no more than this figure, for the same country, although a very showy bull out, if not so good to the hand or square in his quarters, but still, with Mr. Evans out of the way, clearly the best of his year. Then Mr. Tudge will ship off from this meeting the prize heifers, Silver Star, Sultana, and Lady Bradon, at an average of about 100 gs. each. It will be seen that my Lady was just beaten again here, but by a heifer of Mr. Fenn's, which, although entered, was not sent to Taunton; while Sunbeam, the first at Taunton, was here only third. But it was a very excellent class, with so many superior heifers in it, that putting them about a little was scarcely to be wondered at, and the judges deservedly commended the whole entry, thus confirming what we said of many of the same animals when we saw them a few weeks since in the West—"the capital show of yearling heifers was about the best lot of Herefords we have seen got together in one class for many a day. And these were probably too much for the judges, for smart, blood-like, and wealthy as is Mr. Thomas's Sunbeam, there were many would have it Mr. Allen's second from Mr. Rogers, of the Grove, was a better, or Mr. Tudge's highly-commended Lady Brandon better than either of those placed before her." Mr. Allen's heifer was too old for the class at Oxford, and the others changed about as we have noticed. The winner, Leonora 2nd, was exhibited in pairs with Mr. Fenn's other show heifer, Duchess of Bedford 6th, at Hereford last autumn, and placed second to a brace from Bicton, when we thus protested against the award: "With the pairs of yearling heifers it was a very close thing between the first and second, and for choice we should take Mr. Fenn's two as promising to grow into most money. They are more roomy, and have quite as much fashion as the Bicton couple, and

the second was no doubt a mistake." As two-year-olds Silver Star and Livia were again first and second, but again with no competition; and Silver Star, who has lost much of her early form, is well quit of at anything like a price. It is a question, indeed, if the best of all the heifers were not Mr. Evans' calf, which wins decidedly enough in a nevertheless admirable baby show: she is so straight, so clean, and so handsome, without being overdone with mother's milk, and needs only *not* to be spoiled to eclipse even the fame of the Prince of Wales, from the same small but rapidly advancing herd. Mr. Thomas had also another place on the prize list with another daughter of Sir John, and Mr. Arkwright a nice stylish heifer that we should have been inclined to make "next best." But there were younger Hereford calves even than these on view, and the best cow, Mr. Rogers' Silk, went into the ring with one at her side only one hour or so old, for this was dropped just as the business of the day began. It would have been hard, indeed, under such circumstances, if the old lady had not won, what with her fine character and splendid forehead, if she be growing a little gaudy behind; but then she is close upon eight years old, and with the best possible proof of being still in breeding condition. The class was altogether a good one, and Lizzie, another dowager who did so well at Taunton, could now get no higher than a commendation. Another good sign is the fact of there being so many fresh faces in the entry, and with a passing word for Mr. Taylor's straight, happily-named Oxford Lad, we may record the Herefords as fast regaining their proper position as show stock. Some further proof might be offered in the readiness with which the whitefaces were selling. Thus beyond the purchases we have mentioned, Mr. Fenn's first prize yearling made 80 gs., as did Mr. Thomas' third prize; while Messrs. Hill and Fenn's bull calves went at 60 gs. each.

The Devons, with certain exceptions here and there are in small force this year, despite the very liberal commendations with which the judges illustrated their awards. They commended whole classes, although some of these were very moderately filled up. Of the two classes of older bulls Lord Falmouth's is the only animal of really fine Devon character; and in the two younger classes Mr. James Davy's entries are a long way the best on the same showing. Then the Flitton yearling heifer Tempress 2nd was, as at Taunton, the pick and pride of all the Devons, and no doubt one of the very best of all the animals of any sort shown at Oxford; but the competition was not extraordinary, and so the judges commended the class. Old Actress was not sent, and Mr. Smith, of Exeter, accordingly succeeded to the first place; but not without a bit of a bother over it. Musk, it seems, was entered at Taunton as bred by Mr. Shapland, and at Oxford as bred by Mr. Smith, and naturally an objection was lodged. On investigation, it appears that Mr. Smith had written his own name on the wrong line in the entry paper, and the award was not over-ruled, although people in this respect cannot be too particular. There were some very creditable cows at the back of Musk; but nothing so remarkable as the prize list and its elaboration would imply; while the heifers in milk with Pretty Maid, as the best of them were "ordinary enough after what I have been accustomed to," as the gentleman said of his second wife. It was much the same at Manchester; and, notwithstanding his prime roasting pieces and repute with the west-end butcher, the Devon, as farmers' stock, looks to be losing ground. We are aware that we speak under correction in saying so much, for no less an authority than *The Times* declares "that the Devon cattle were never better than at the present show." But, then, *The Times* has clearly peculiar sources of information, for beyond intimating that Mr. Walter Far-

thing should have taken all the first prizes, our contemporary points the argument in this way: "Lord Falmouth's first prize two-year-old bull, Napier, bred by Mr. Walter Farthing, and Mr. Walter Farthing's second prize bull, Sir George, are specially grand animals." This reads prettily enough, "especially" for Mr. Walter Farthing; but it will scarcely be credited that in a report published so long after the opening of the meeting as Friday the writer cannot actually follow the prize list. Lord Falmouth's bull was certainly first, as he is one of the best bulls of his time, but his name is *not* Napier, and he was bred by Lord Falmouth, and *not* by Mr. Walter Farthing, whose "specially grand animal" is, for true Devon character, not to be named in the same street with the other, as, in fact, he could not even get second to Narcissus in Cornwall. No wonder that *The Times* finds the Royal meeting to be growing too big, after such a specimen of dealing with it as this!

The Norfolk and Suffolk polls reached to some twenty odd animals in three classes; but, the show if small was good; while some previous decisions were occasionally upset. Thus, Mr. Benjamin Brown's Norfolk Duke, a bull uniting size with quality, beat as it seemed to us very deservedly, Mr. Colman's Cherry Duke, that at the Norfolk and Suffolk shows, had all the best of it. Amongst the cows again, Mr. B. Brown's "beautiful" Duchess, which was thought so much of at Sudbury, succumbed to Sprightly; although, on their previously meeting, it had been all the other way. The best of all the polls, however, at Harleston, Mr. Hammond's cow, Butler, was a long way the best of all here, and Buttercup, the best heifer, is a daughter of Butler, so that it all proved well enough; and the red polls made up an exhibition quite encouraging enough for the breeders to go on, especially in these times when so much attention is being paid to the production of milk.

In fact, whether we touch on the seaboard or not, a very growing feature in the proceedings of the national Society is the section devoted to a display of Channel Island milkers. These animals may be classified as of three kinds—stock bred in Jersey, stock bred in Guernsey, and Jerseys bred in England. Of these varieties the Jersey natives have no question the call, as the Guerneys are coarser and plainer, and Jerseys bred in England are apt to lose much of their fine purity of character. We were especially struck with this at Mr. Dauncey's sale, where his large whole-coloured cows looked to have gradually got far away from the original type of Jersey cow, as it is noticeable, notwithstanding the prices they made, that the Horwood stock has since been continually beaten on the show-ground. In fact, they did more at Oxford than they have ever done elsewhere. Thus the first prize Channel cow was Mr. Pulley's Vixen, a fawn bred by Mr. Dauncey, and purchased at his sale for 80 gs., and she well deserved her place, for she shows more refinement of breeding, and has less reason to depend upon mere size than the generality of "Buckinghamshire Alderneys." The second prize cow, a native Jersey, presents at something the same age—seven years or so—a very different appearance, being all hips, bones, and bag. But Floribrindus has been a very famous cow in her own country, where, as a prize winner, she has reached the highest price ever given on the Island for a milking cow—viz., 80 gs., precisely the sum paid by Mr. Pulley for Vixen, although others at Horwood went for even longer prices. There was a capital Guernsey in this class, exhibited by Mr. James, bred by Mr. Le Page, and commended by the judges; while Mr. Gilbey sent some of his crack Dauncey tribe, that commanded no attention whatever. There were some very capital cows in the class, and a still better lot of heifers, where public opinion did not go altogether with the judges. Thus,

although they took one of Mr. Gaudin's heifers for first, and a particularly good Guernsey for second, they did not make the most money. Mr. Huyshe sold his Guernsey well, as it was thought, for £40, whereas Mr. Middleton made 140 gs. for a couple of merely commended fawns, and we certainly thought Ringlet the sweetest looking thing of the lot; but the judges objected to her as not showing sufficient milking power or promise. In the milking cows of all kinds the Cuttleslowe Alderneys did better, the two couples taking a second prize and high commendation, being only beaten by Mr. Statter's brace of Ayrshires, one of which was a very perfect specimen of her sort. Brittany Shorthorn, Guernsey, "nearly" Shorthorn, and very highly-bred Shorthorn competed here; but the Ayrshires and the Jerseys had palpably the best of it. There was another very mixed company of "Other Established Breeds," wherein the Duke of Buckingham showed a very magnificent specimen of the Loughorn, and Mr. Tilden Smith two of his neat Sussex cows. Then there were black Scotch polls, Kerrys, and few more Loughorns, and above all a cross! None of these were of any great mark, while they ran in all, bulls and cows, to just a couple of dozen. In fact, it was more of an Old Curiosity Shop than anything else.

The average excellence of the Oxford sheep show was undoubtedly very high, although its main strength rested rather on more recent additions to the prize-sheet, like the Shropshires and Oxfords, than on any very remarkable merit in the old-established breeds of Leicesters and Southdowns. Nevertheless, nearly all the leading flocks were represented in the opening section of thoroughbred longwools, where the Turners, father and son, Colonel Inge's Executors, Mr. Cresswell, Mr. Sanday, Mr. Hutchinson, Mr. Spencer, and Mr. Borton had entries. The shearing rams were not particularly good, nor particularly well judged, Mr. Borton's first being weak in his neck, deficient in his thighs, and at best but a delicate flash sheep; while the second prize, from Thorpe Constantine, is quite the other's equal in other respects, without the weak places so apparent in the winner. About the best sheep, however, of the class is Mr. Hutchinson's reserve, uniting as he does fine quality with great strength of constitution and a large amount of *natural* flesh; some further proof of his worth being shown in the fact of this being about the first sheep let—to Mr. John Booth, of Killerby. It is only fair to add that the fourth shearing is by Blair Athol, a ram of Mr. Borton's breeding. The Borton Blue Cap, a three-shear, still wearing well, and a wonderfully good sheep, has long been winning about Yorkshire, as well as at the Royal Meetings, and no doubt he was once more the best of his class; but the placing of the second is not so clear, as, for constitution and character, we should prefer Mr. George Turner, Jun., with his old ram put in as the reserve, or Mr. Sanday's third, the crack shearing of last season. In fact, Mr. Borton looked to get more than his fair share of success in these two classes. The winning pen of ewes are a very sweet, sorry lot, and Mr. Hutchinson next, like his rams commendable for size and constitution, as they are also of the same blood, by Blair Athol. There were some other creditable entries of Leicesters; but the Ravenstone flock has manifestly gone back, for the specimens exhibited here looked more like rough Irish sheep than the smart fashionable type which has so long been regarded as the pure Leicester model.

It sounds strangely enough that at a great Oxfordshire gathering the chief honours for Cotswold sheep should be taken by a Norfolk breeder. But so it was; for the big Hill men still hold aloof, in dread as it would seem of the shearing inspector. The Marham shearing, however, is a very handsome sample

of his kind, with a good fleece, a true frame, and a capital countenance; while his lineage goes directly to the Cotswolds, the sire having been taken from Mr. Robert Garne's flock at 120 gs. At the Harleston meeting, the only occasion on which he has previously been exhibited, this ram received an accumulation of prizes as the best of all the longwools. Mr. Lane's sheep show a deal of breeding, if perhaps without the weight of some of the others; while the Gilletts had some great grand animals in the class, which still for a Royal manifesto was respectable, and nothing more. The awards over, the old rams were anything but well received, it being maintained with some emphasis how there were better sheep in the class than any of the three which took the prizes, or were even commended by the judges. The first is a stylish, showy sheep, but faulty forward, and not very good in his touch; nor did the mutton of the second or third prove well to the hand. The Marham Royal prize sheep of two years past was quite overlooked, and the Hill men proclaimed almost with one voice that Mr. Robert Garne had far away for breed, symmetry, and quality the best of the entry. The Gillett ewes were great and good, and there were local premiums which produced some very limited and moderate competition. It is, indeed, a suggestive fact that in five classes of Cotswolds the judges only appended in all two commendations to the actual awards.

Of Lincolns there was but a short show, some thirty entries or so in three classes, but with some very good sheep amongst them, more especially in the old class of rams, where Mr. Dudding had two really admirable sheep, alike to be prized for fleece and form. The Bramston flock is losing its lead here, but Mr. Cartwright maintains his repute with two pens of honestly good ewes. The Rylands and other long-wools ran up to four exhibitors and five entries in three classes, Mr. Lynn winning where there was any competition with a Leicester-Lincoln or a Lincoln-Leicester, or some such "other long-wool;" though *The Times* refers to the Stroxtan sheep as "a specimen of the Ryland."

"The Oxford Down breeders are evidently holding back the strength of their hands for Oxford, for which meeting there is an extraordinary entry, one man having, as it is said, between twenty and thirty nominations in the shearing class." It was thus that we wrote some six weeks since in our report of the Bath and West of England show; and certainly there was an extraordinary entry at Oxford, in all of one hundred and eleven pens; while Mr. Wallis sent in from Shifford twenty shearlings, five old rams, and two pens of ewes, with which he took all the chief prizes. Of course there never was such a display of this breed, and if the Oxford show had any speciality as being held in Oxford, it was the show of Oxford sheep; while the moral of this lesson is that the breeders are gradually going away from the model they began with some years since, and getting more and more to Down type in appearance and Down character of wool. The first prize sheep perhaps scarcely show this so much as some others, preserving something of a happy medium between the original standard of an Oxfordshire and the refinement carried out in later years. We are speaking here more especially to the shearing class, where in some contrast to those above him, the third prize ram from Maisey Hampton takes strongly after the latest fashion. Amongst the old sheep the three prizes all smack more of the Down than anything else; while Mr. Gillett, of Cote, shows a couple of animals that tell more of what the Oxfordshire sheep once was, but these were put aside without any notice from the judges; whereas Mr. Treadwell's good pen of ten ewes, which took a prize, also inclined to the old sort. Mr. Wallis' big prize ewes, some with not very prime legs of mutton, were again more of a

medium; and Mr. Milton Druce's second best were quite of Down character, very handsome and neat, as a photograph was taken of one of the ewes as a proper sheep for the side of Mrs. Millington's prize cup, so that we may infer from this the kind of sheep which flock-masters should carry in their eye when engaged on the nice art of breeding an Oxford Down. The awards, however, were very well received, and one of the judges, Mr. Henry Overman, backed his opinion by taking the first prize shearing ram at 50 gs. for the season. This is a very clever sheep, full of muscle, with a famous leg of mutton, and far better than the second which begins with a poor mean head, and is hardly the second best sheep of the class, save from his being of the same sort. The best old ram, a Royal winner last year, is of a great size, with a breadth of back that is almost unsightly, and as he cannot walk it looks as if they had quite over-topped him. This was in many ways a very difficult section to properly appraise, for there are still so many varieties exhibited; whilst the judges certainly did not hold altogether to one particular line, and the shearing inspectors interfered, although we did not see their condemnations, as they should have been, hoisted up. Mr. Treadwell, however, was again in the black list, as this time we hear he is prepared with plenty of evidence to prove that his sheep were fairly shorn whatever the authorities may declare to the contrary. Mr. Milton Druce, indeed, sent in again two or three of the ewes put out at Taunton, and in fresh company these managed to pass "undetected."

"They feed so as to keep the touch true, they shear and trim so as to keep the coat right and the frame correct, and they draw them for show uniform in character and all with just the same points developed. How then can you expect to beat Lord Walsingham?" So said a looker on at Oxford, and of course there was no beating Lord Walsingham, who took all the prizes for rams and the first prize for ewes with the only pen he entered. But the Merton shearlings, though neat and smart, were by no means so good as at Manchester, as they did not show so much breeding and quality, while they occasionally lacked size. Still so even was the lot that the only discussion was as to which was really the best, many preferring the second, although the first looks to be alike the heavier and handsomer of the two. After Lord Walsingham comes not the deluge but Mr. Rigden; and this brings us to a point especially pertaining to ourselves. In the report of the Taunton Meeting we were hold enough to say that "the Sussex breeders fairly stood aghast over the capricious and altogether inexplicable reading of a Southdown, as here delivered. First of all the judges took a very neat, true-shearing from Buckland, and this they placed first. They next selected a sour-headed, lop-eared animal, as all over one of the worst sheep the Heasmans have ever entered, and this they placed second; and then they commended and highly commended three rams of Mr. Rigden's, standing close along-side, any one of which for Down character, style, or quality, was better than the second prize. In fact, Mr. Rigden should have been first, if not first and second, and after him Sir William Throckmorton. All the Heasmans' sheep were below their standard." Whereupon Mr. Francis Budd, one of the short-wool judges at Taunton, wrote politely in this strain: "Had the remarks in your paper emanated from a person who really understood what a sheep should be"—how "it was a burlesque for persons who have no experience to impugn the judgment of men who if they do not, ought to know something about their business," and so forth. In answer we had only to hope "that all these Southdown sheep might come together at Oxford," where Mr. Budd might learn something from men who "know something about their business." And they came together again here, and all

that Mr. Budd did at Taunton was wrong, and all that we wrote of the Southdowns at Taunton was right. Had not Lord Walsingham exhibited Mr. Rigden would have beaten both Sir Robert Throckmorton and the Heasmans, for Mr. Rigden was *highly* commended and the other two merely commended with the same sheep exhibited in the West. Of course there is only one question more to be settled, and that is whether such men as Mr. Lugar and Mr. Henry Fookes can be considered to know as much about the business of judging a Southdown as Mr. Francis Budd, of Hatch Warren, Basingstoke? We protested as strongly against the award in the old ram class at Taunton, where they put in as second prize one of the worst sheep in the entry, and put out a famous sheep of Sir Robert Throckmorton's. Unfortunately, although entered, Lord Portsmouth did not send No. 2, the second prize at Taunton, on to Oxford; while Sir Robert Throckmorton, of course, in a far better class took the second prize! We were subjected to some most amusing abuse from Mr. Budd for the tone in which we spoke of the Southdown judging at the West of England show; but had we to write our report over again, we should of course only protest still more strongly against the very monstrous mistakes made at that meeting. People had certainly never heard much previously of Mr. Budd as a Southdown judge, but how Mr. Woods came to commit himself in this way is quite inexplicable. Mr. Rigden's good old sheep has broken down in the interim, and he reached no higher than the reserve here; and Lord Walsingham's first, the second shearing at Manchester, has also gone in his hocks, or he is otherwise far away the best of all the rams, having grown in to a really grand but still very bloodlike sheep. Mr. Humphrey from Suffolk and Lord Sondes from Norfolk showed some very neat rams in both classes, but like the Duke of Richmond they lack the size and spread to contend against Lord Walsingham, Mr. Woods, and Mr. Day. On these conditions, and these only, the Merton ewes also won; but they were mere butcher's sheep compared either to the Duke's or Mr. Rigden's lively, beautiful, bloodlike pens, where the very heads and eyes of either lot should have been sufficient to give them the call. And it is into these pens after all that we must look very much for true breeding and fine character. Lord Walsingham's are heavy, meaty, useful animals: the Goodwood and the Hove ewes veritable little ladies, against whom it must have gone to the heart of a judge to array himself. In any company his Grace's pen could hardly have been *second best*.

There were precisely as many entries of Shropshires as of Oxfordshire Downs, but the class of shearing Shropshires reached to close upon eighty sheep, which took close upon four hours in judging. There is still a very strong inclination observable here, too, for Southdown type and short wool, but the large show in the younger class was generally of a better character than that got together at Manchester last year. There were a number of deep-fleshed heavy animals which it took a deal of time to weed out, as this hard labour looked to be very conscientiously performed. The first-prize shearing ram, shown by Mr. Coxon, of Freeford, is a very neat but rather short sheep, with deep flesh and a good leg of mutton and twist; if his wool might be taken exception to as too open and not quite thickly enough set. Mr. Mansell's next best, is a very handsome one of almost too fine a type, with a beautiful fleece and good mutton, so that it must have been a very close run between the two; but no doubt the first-prize sheep has the most lean flesh. Mrs. Beach's was another very taking sheep at first sight, but he could not move. Of a very different order of merit to these prize rams were the four entries from Frodesley, true samples of the sheep once in

favour but now gone nearly out of fashion; while anything like the character of a true Shropshire, either ancient or modern, was sadly wanting in some of the things exhibited. The old class of rams was moderately good, without containing any animal of extraordinary merit. Probably the mellow touch and beautiful texture of wool caused Mr. Evans' three-shear to be preferred to Mrs. Beach's two very good sheep, the third prize being a particularly strong useful sheep, with plenty of firm and natural flesh. By way of a contrast to what they had been leaning to so far, the judges highly commended a ram from Mr. Baker, of Atherstone, of just the good old "rent paying" stamp, that some years since would have stood higher on the list. This class, however, was altogether a difficult or a delicate one to judge, for the first prize sheep was bred by Mr. Masfen, one of the judges, who, we hear, retired so soon as he recognized the ram. It would however be better, if possible, that the Judges' Committee should avoid any recurrence of such a case, as no doubt any jury of exhibitors would object on principle to a judge who had bred any horse, bull, or sheep he had been selected to act over. Then last year Mr. Masfen, in conjunction with Mr. Coxon, put Mrs. Beach's third Oxford sheep before the second, as the third let last year in Birmingham for 40 gs., and the one put over him for 14 gs.; while Standard Bearer was, we believe, sold for 38 gs. It is noticeable that whereas at Manchester none of the judges of Shropshire sheep were breeders of Shropshires, the Council have now taken the three judges for the present year all from the same county, and that not Shropshire; though no doubt many exhibitors would feel better satisfied had known good judges and breeders of these sheep been taken, one for one, from different districts. With the lists they have to choose from, and the knowledge the Council should have of these matters, some of the appointments or "sets" of judges read a little strangely, and one is half inclined to ask, with Mr. Middleton, for some explanation of the system. The pens of Shropshire ewes did not run to a very strong class, while this was so comically appraised as to defy anything like criticism. The judges seemed to have utterly abandoned any "principle" which they might so far have observed, and the public await with some anxiety the explanation which will be given through the Society's *Journal*. At Manchester loud were the murmurs at Lord Chesham's Downs getting prizes, and at Oxford again does the Latimer flock win in a class, moreover of all others, which should prove *breed*. There were two or three cases of unfair shearing in the Shropshire classes, but we never saw any return of the Inspectors put up.

There was a short entry of Hampshires, while both Mr. Rawlence and Mr. Morison have shown better sheep than they had here, and as they are the especial champions of the breed, a conclusion is very readily arrived at. The Dorset men also offered a very poor front for their special classes, there being in all only a dozen entries against thirty at Taunton. The same sheep were here pretty much in the same places, although it was discovered when too late to tutor the judges, that Mr. Mayo's otherwise big useful shearing had black eyes instead of white, and that his horns were not nearly so well curled as they should have been. And here again of course arises the question as to the judges duly appointed being quite up to this branch of their business?

The nags and agricultural horses were judged in the same ring, with a rope run down the middle, forming a temporary division, as at Bury St. Edmunds and other meetings—a very good plan, if a rail took the place of the rope. To the latter, we have always objected, as being dangerous both to horses and riders, or more particularly to foals. It was, indeed, almost in the ad-

joining meadow that we saw Conolly, the jockey, fall over the ropes and meet with his death, for this accident ultimately proved the cause of it; and glad were we to see Mr. Robert Leeds, who was assisting in the circle, order the rope to be removed as the brood mares and foals came in, although for the time this stayed the cart-horse division from proceeding with their work. The boxes were very good, but if a little more attention had been paid to the fastening, Go-ahead's foal would not have been injured by the end of a large projecting screw. In other respects the management of the ring and the telegraph board was commendable, but the fashion of allowing the little-great with their pitiful satellites to intrude and exhibit themselves in the ring as they did on Tuesday, and with their broad well-stuffed carcasses to impede the view of members, and those that pay and come long distances to see horses, is a monstrous abuse, or, perhaps, rather impertinence. Some of these intruders were the representatives of county families, and very good people, too, in their proper places, but who, when forcing themselves into the ring where they have no right to be, remind one more of "pushing young persons" in some business concern than men who should be possessed of that gentlemanly feeling, devoid of selfishness, that kept hundreds of their superiors on the outside of the ring. It would be as well, we think, if some of these great men would recollect that, like many big horses, they have nothing to commend them, not even their size, and so keep their places. "Manners, you baste!" shouts a groom in charge of a thorough-bred stallion, who comes plunging out of his box, as the clock strikes eight, and goes rearing and neighing into the ring, regardless of his number and position, like the perfect gentleman that he is, for it is no other than that handsome old son of Orlando, The Chevalier d'Industrie, from Swcliffe Paddocks. Like most of us, the Chevalier is not without his faults, but they are counterbalanced by good points and we would rather, though the old fellow is a little shrunk since we last saw him, have the favour of sending one mare to him than forty to this short, piggy, small armed, coachy-stepping, Laughing Stock, with his light girth, though he is made up and stuffed a great deal better than Dickens' old raven, Grip. Still this is altogether a capital class of thorough-bred stallions, with thirteen entries, and twelve of them before the judges—the absentee being Major Barlow's Deerfoot, the hero of Saffron Walden and Sudbury. That brown, with the Roman nose and somewhat of the Dutchman's head and middle, is Schiedam, who would make a useful country horse; while the pick of the basket is Knowsley, with a strain of Stockwell and Orlando in him, and a very compact showy animal, if those strong beefy shoulders are not exactly hunting-like to our eye, as for his top we fancy those arms fall off a bit above the knee. Otherwise you might trot about to many shows before you saw anything better than the muscular yellow bay. Then this elegant nice-topped one, rather high on the leg and light of bone for a hunter sire is Lord Portsmouth's Sydmonton, a fair performer on the turf, but out of his element here. About Lord Craven's Blackdown again there is something taking, but his forehead wants correcting; and Redoubt, though neat, with length, and by Artillery, a hunter sire, is not quite so himself, though still a useful nag. This chesnut is Petruccio, that it would be love's labour lost to cross with Bonny Kate, the shrew, or anything else, whilst possessed of such a neck and shoulders—that is with any expectation of getting a hunter. The great and grand-looking horse, with length on short limbs, but rather crooked in his forelegs, or as our Norfolk friend calls it, "cromy," though he looks like carrying Sir Watkin, and is one of the most powerful-looking thorough-breds we re-

collect, has hardly quality enough; nevertheless with some sets of judges, those lovers of an eye-full, who gave Sir George Cholmondeley Angelus prize after prize, we think General Peel might have stood a good chance of returning to Swackliffe victorious. Lord Fitzharding's Commissioner is of fair form, but there is not much of him, while Mr. Casson, the owner of the well-known prize horse Motley, in Sincerity by Red Hart has a very useful country horse, if his shoulders do not quite please us for hunting purposes; while he is rather shelly in his back, and his limbs, though great, are fleshy below knee. This varmint one-eyed old horse, with the lengthy middle on the short leg, who is trying to attract the attention of the judges by hammering away with the stringhalt is Simple Simon, whose Truelove, one William, holds out at Woodstock. To sum up, we think the second and third places might have been better filled, and on the whole that it was more of a coaching than a hunting verdict. Still the award goes quite with the lot of the late Lord Glasgow's stallions in November, when Lord Norreys took Knowsley at 820 guineas, and Mr. Gulliver General Peel at 600 guineas—the two top prices. Knowsley is now at Tetsworth, or Ryeccote, where Marsk, the sire of Eclipse, once stood, and where we have seen many a fox found. There was a very poor show of roadster stallions, with the exception of the first and second, Ambition and Sportsman, who are as well known in the ring as prize takers as the High Street is in Oxford; while in *pony* stallions the handsome Perfection, the Islington and Sudbury prize pony, was beaten by the neat good-stepping Islington prize cob, Sir George, but as it was for *pony* stallions we think Perfection answered to the description the best, and ought to have won. Now we come to the hunters and hackneys, which, with the exception of a prize horse here and there, contributed to one of the greatest failures since that of Overend and Gurney. How did it happen? Was it a want of pluck? for many did we hear say, "Oh, I wish I had sent mine!" or, "I should have sent old so-and-so if I had known there had been such a lot; but I thought this and I thought that were coming," as think what they may, the show in this respect was a disgrace to the county. What would that tub of a man in clerical hunting costume, old gruff Griff Lloyd—so well known in Oxford and with the Bicester of thirty years ago—have thought of such an exhibition? What would he have said to improving the breed of horses? Why—"You should have seen my old flea-bitten grey and my brown horse, they were something like weight-carriers!" Or the late Mr. Drake, that model both of a Master-of-hounds and a gentleman, would have told you, though no boaster, that one of his whips rode a Master Richard horse, that, for form or pace, would have distanced the lot. The Messrs. Coxes, of Craig's Court, more familiarly known as "the long Coxes," and their worthy parent, would not have looked at such cattle as hunters; while Farmer Roberts, of Waterperry's old grey, and mild-speaking Dick Harding's strain of Master Henry, were very gems of horseflesh to the things shown here. There still is Tollit, the dealer, better known as Joe Tollit—*Palnam qui meruit Tollit*—who sends nothing for the honour of Oxford, although looking as dark and wiry as ever, that we fancy, in spite of a certain tenderness of the toes, we are again breathing the air of thirty years ago! But the deception is gone, for there stand a couple looking rather long in the tooth and "eromy" about the knees, and they can only give us a year or two; while others we are told went straight and well as long as they could, and then to ground. In some village churchyard, where that lover of darkness, the owl, wakes the night with shrill quivering notes as he shrieks over them a requiem in a long continuous *whoo-oo-oo-oo-hoop!* We ourselves, however, still love

the light, and will return to the judges and the hunting brood inares, headed by that model of a hunter old Goahead, that we have so often put together in this paper, and that in the company now she is, there is about as much merit in placing first as there would be picking out a sovereign from fourpenny-pieces. The class was stronger in numbers than worth, although there were several fair samples amongst them. The second mare was a tolerably well-made one, barring her shoulders, and with more quality than the old original Marigold, a well-known prize-taker as well as dam of Sprig of Nobility, and other flash-looking horses; while the third, Heliotrope, a fine-looking mare, wanted another cross of the thoroughbred to worm the coacher out of her. Mr. Blake's Canary was of a hunting stamp; and Lord Norreys's American-bred Myrtle, a mare that appeared in the colours of Mr. Ten Broeck, was fairly framed; and the Earl of Craven's Queen of Sheba a big loose lolling goer. Then, Proserpine from the Isle of Wight, Mr. Kerby's May Queen, Mr. Parsons' Duchess, Mr. Bennett's Forest Lass, Lord Norreys's Brunette, and Mr. E. Stanton's Lady Mary had some pretensions to hunting character, but they were by no means perfect. Lord Norreys's bay hackney has length on a short leg, but is as a standstill hack not so good-looking as the second or third; the chesnut Polly being very handsome, and Lord Craven's a really pretty little hack with plenty of character. Topsy, a pony mare not exceeding fourteen hands high and in her twenty-fifth year, walked over without opposition. The four-year-olds with eleven in were poor indeed; the first turning up after considerable hesitation in the General by Big Ben, standing nearer seventeen than sixteen hands high, and who will take a considerable time to furnish, as he is thin in his thighs, and goes weak behind—if we recollect right he showed better at Islington, where there was less room. The second is the Ace of Clubs, a commended one at Islington, in a four year old class, and a prize-taker at Sudbury, where we gave a description of him. The third was nothing to look at, and Mr. Milburn's Merry Maid, though of fair form in her body and limbs, had a short neck and a knack of throwing her head up. In the next, lot Brian Boru, Mr. Booth's well known prize-horse, was pronounced the best, while Strathnairn is a useful looking provincial but nothing more; and the third, Fenian, the Sudbury prize horse, whose form and dreadfully wide-straddling hind-leg action we noticed in the report of that meeting. A very neat one of Mr. Cooks', that could move, but of no great substance, came in for nought, although she had been more successful at Gloster, Worcester, Winchcomb, and Islington. In a poor lot of Hackneys, Ada, a hardy wearing looking mare, that could move, went to the fore, as by far the best-looking; while the second was a four-year-old, by Laughing Stock, with no great pretensions to form and a slight inclination to sickle hocks. The judges had not a heavy day's work before them, and, like shining stars, spun it out accordingly, taking one hour and thirty-five minutes in coming to a verdict over the thorough-breds, "because they had nothing else to do."

The agricultural horses were better represented, though there were many very ordinary animals and a great many found wanting in soundness. The class in which that well-known model cart-horse, Honest Tom, received the winning colours was a capital one of twenty entries. The second is a very gay-coloured horse a chesnut with four white legs and a bald face, and not good in his forehead—as we could not see that Nugget of Gold was better than several behind him. Black Prince, formerly of Orlingbury, Northampton, and still high on the leg, is now the property of Lord Norreys, who

gives the farmers about him every opportunity of breeding something worth rearing by the use of his stallions. A. J., a smart horse, and well-known prize-taker, though by no means perfect in form, is as active, in his movements as a coach-horse, but an inquiry as to one of his hoofs and an odd foot caused him to be passed by, though the foot has been overlooked before, as he has often been A. I. in the prize-list. In a class of ten there were half-a-dozen good two-year-olds, Nonpareil being an active, lengthy, short-legged, handsome-looking horse, but a trifle short in the quarters, and Prince of good form but rather old-fashioned in the shoulder for these go-a-head times; while Crown Prince is a useful good-looking one, as Mr. Morrison's Black Prince and Mr. Grimham's Young Active were also nice horses. In the Clydesdale stallions Lord Beauchamp's grand specimen, the handsome Young Lofty that we never tire of looking at, put Sandy, merely a useful one of her Majesty's, and a weedy one called Aberdeen, of Mr. Terry's, entirely quite in the shade; while with no opposition, the Duke of Richmond took first and second with a couple of very ordinary-looking two-year-old Clydesdale entire colts. The Suffolks did not come out in such strong force as they are wont. In the all-aged stallions Harwich Emperor gathered fresh laurels for his brow; Royal Prince playing second who on a close inspection takes too much after Conqueror in his neck and shoulders to please us. Then the Earl is a faulty fore-legged one, that at two years old was first at Ipswich and second at Sudbury, where they swarm like bees. Mr. Badham's Hercules has a good head, neck, and limbs, and is a likely horse if put to some of the overtopped mares to get something more equally balanced. Young Emperor amongst the two-year-olds was again the force as at Sudbury, where he beat his own sire Harwich Emperor, and was now followed by a good-looking one by Cupbearer, kept at home for an accident while another by the same horse had capital thighs for a Suffolk. The third was a leggy one, and the highly-commended a dark chestnut out of Royal Moggy, was rather light in the girth. The agricultural mares and foals came out in strong force, numbering about a score; but there was nothing grand among them, although many were fair-looking and useful; still there was one thing in their favour—they all looked like work and earning their living, which many of the prize-horses do not. The Clydesdale mares were not great in numbers, Isabel being a big, heavy sample of the sort; while Colonel Lindsay's were lighter and more active, and old Mary is a favourite of the Queen's. The Suffolk mares were few but good, Matchett, that Queen of Suffolks, putting another £20 to her account with Capon's executors, the others being two well-known mares of Colonel Wilson's and Mr. Wolton's, Diamond and Pride. The three-year-old fillies, not Clydesdale or Suffolk, were good, and the two-year-old useful. Then the Clydesdale three-year-olds were not show animals; and the three two-year-olds not worthy of a prize, although exhibited by sovereigns and dukes! while the Suffolks were, both in the two and three-year-olds, very good, clever, if only mustering seven in both lots, the competitors being Colonel Tomline, Mr. Wolton, and Mr. Patmore. The business was anything but heavy in this Court, and the judges, like those on the riding and roadster bench, were not remarkable for quickness in arriving at their decisions, but they certainly had before them several ordinary animals of about equal merit.

If the district could do little for the horses it saved its credit with sheep and pigs, for, as with the Oxford Downs, there never before were brought together so many or such good Berkshires. The class of breeding sows, of this breed

more especially, was the finest ever seen, and, like the same class at Taunton, might have been generally commended. Indeed, many of the best pigs entered here were the same that showed so well at Taunton, although their places in the prize list were occasionally changed about. Thus, one of Mr. Stewart's finely bred sows now got to the head of her class, there being no doubt that Messrs. Duckering's Essex bred sow, which won at Taunton, had rather too much white about her to be quite orthodox. Nevertheless the Romford pigs are coming fast into fashion, for Mr. Griggs exhibited one on his own account which won fairly enough in a capital companion class of Berkshire boars, beating the now famous Cirencester College pig, Mr. Heber Humphrey, Mr. Stewart, and others, the whole lot of no less than twenty being generally commended. Then, in the large white breeds, Messrs. Howard's well prepared brother and sister did nearly as well again as they did at Taunton, where we gave them a character, the sow only being kept from first by some stock of very high quality exhibited by Mr. Walker, from Staffordshire. There must, however, be almost as much difficulty in settling the points and type of a white pig as of a Shropshire or Oxfordshire Down sheep. Mr. Peter Eden, for instance, can enter them as of a Large breed or of a Small breed, or as of a breed not qualified to compete in either of those classes, and yet they all seem to be of much the same character and family. In fact, they look to have been very judiciously improved into a smart Middle-breed, if we could not always mark that distinction between one variety and another which the prize-sheet would require. In the so-called small breed, however, the Cross Lane pigs were well beaten by a very handsome boar of Mr. Kershaw's breed, but exhibited by Mr. Nield, that has been winning all about the country. The Royal Windsors, from the specimen exhibited here, would seem to have gradually got away from the clever kind of pig they once were; nor were the Suffolks, either whites or blacks, so forward as might have been expected. Indeed, Mr. Sexton's white Our Mary Ann, a sow which was thought so highly of at Sudbury, only just reached to a commendation, the Leeds and Manchester fanciers having all the best of it. Then, amongst the blacks the Wherstead Kingcraft was worsted not only by Mr. Stearne but by an admirable pig bred by Mr. McCann in Worcestershire. The judges, however, passed over Mr. Sexton's entries not so much for want of merit as from being overdone, and standing, and moving very badly. Kingcraft certainly looked to be very weak behind, but he was soon sold to so good a judge of any kind of stock as Lord Portsmouth. It was not precisely the season to linger long over the pigs, of which the show, on the whole, was excellent, and the classes as ably appraised. There was scarcely a demur to any of the decisions—not even from Mr. Duckering, who enjoyed anything but his usual success, as this of itself is an implied compliment to the classes wherein he competed, and he was to be found in most of them.

The judges paid a second visit to sixteen out of the twenty-one farms entered for the 100 gs. cup; while they admit that the peculiarity of the season had much to do with the award eventually arrived at. Captain Dashwood, the Stillgoes, Mr. Denebfield, and Mr. Treadwell had been the favourites in the county, and we had certainly never heard Mrs. Millington's name mentioned until it was announced at the meeting. Her husband came from Lincolnshire, where, as Lord Kesteven said at the meeting, "they farm under a famous Tenant Right principle." The prize farm at Ashgrove, in the Bi-cester county, runs to about 900 acres, and is the property of the Duke of Marlborough; while Mr. Treadwell's occupation at Upper Winchendon, is somewhere about half

this extent; but it has long been known as "The Model Farm." The four-course system is the one adopted at Ashgrove, and a six-course on the second prize holding immediately after the award was made our contemporary, *The Gardener's Chronicle*, took time by the forelock, ran away from Oxford, and made a call on Mrs. Millington; the following passages from his report read somewhat strangely in the chronicles of a prize farm:—"The visitor will be struck by the buildings. He will see yards without sheds, generally poor accommodation for cattle; he will not see cattle boxes or elaborate barn arrangements. The stables are devoid of stalls, the design of the buildings is altogether inconsistent with those rules which should guide the architect in planning them. He may perhaps be staggered by the sight of wooden ploughs, antiquated drags, clumsy waggons, and old-fashioned utensils of various kinds: a very different assortment of implements will meet his eye from what perhaps he has recently witnessed at the Oxford meeting: and, in a word, he may be a little discouraged with what he sees. Again, when he glances at the live stock he will see a mixed and moderate class of cattle, a shabby lot of pigs, no grand sheep, and a poor lot of poultry. If he looks at the fences he will find nothing to admire particularly, and as he walks over the grass land he will be offended by the presence of rushes, unstubbed thorns, ragged ditches, and not very neatly-filled drains. Again, as he extends his observations from the buildings over the farm itself, he will fail to see the prescribed sheepfold with its hurdles and its fresh vetches or cabbages, its troughs for artificial food, its water-carts, and its shelter from the noontide heat. Lambs will be seen, still unweaned, on large bare pieces of seeds, with their mothers, looking anything but blooming, under the blaze of this tropical July sun. The land is poor, and it bears a magnificent crop of wheat and barley. The portion under corn is indeed a pleasant sight, both from its joyful luxuriance and, so far as we could judge, its cleanness. Then again, when the roots are looked at, they are surprisingly good for the season and for the district. There is nothing like them for miles around. It is, then, in these main features of corn and roots that the great charm of this occupation lies, and far be it from us to underrate their importance. There are 18 horses kept, and the work is partially performed by steam cultivation in the spring. The horses are now receiving one bushel per week of Indian corn, crushed, and straw chaff. The steam cultivation is hired, and the grubber or cultivator is preferred to the plough. The rotation followed is that pursued in Lincolnshire, and the general management partakes of that of the same county." The decision, no question, will take a deal of talking and writing about, both in and out of the Society's *Journal*.

PRIZE LIST.

HORSES.

(All ages calculated to July 1st, 1870).

JUDGES—Cart Horses.—

M. Biddell, Playford, Ipswich.
A. Turnbull, Cresswell, Morpeth.
J. C. Woolhouse, Wellingore, Grantham.
—Riding Horses.
R. Calder, Kelloe Mains, Edrom, N.B.
S. Robson, Westgate, Louth.
J. Smith, Humbarton, Boroedridge.

Cart Stallion, foaled before the 1st of January, 1868 (not qualified to compete as Clydesdale or Suffolk).—First prize, £25, W. Welcher, Mouse Hall, West Tofts, Brandon, Norfolk (Honest Tom); second of £15, J. Manning, Oringbury, Wellingborough (Young Champion); third of £5, J. Hunt, Water Eaton, Oxford (Nugget of Gold). Reserve and Highly Commended: Lord Norreys, Tetsworth, Oxon (Black Prince).

Cart Stallion, foaled in the year 1868 (not qualified to compete as Clydesdale or Suffolk).—First prize, £20, W. Wynn, Cranhill Lays, Craiton, Alcester, Redditch (Nonpareil); se-

cond of £10, T. Anger, Little Hinton, Shrivvenham (Prince); third of £5, W. Enston, Claydon, Warwick (Crown Prince). Reserve: T. Cartwright, Dunston Pillar, Lincoln (Warrior).

Clydesdale Stallion, foaled before the 1st of January, 1868.—First prize, £25, Earl Beauchamp, Madresfield Court, Malvern, Worcester-shire (Young Lordy).

Clydesdale Stallion, foaled in the year 1868.—First prize, £20, The Duke of Richmond, K.G., Goodwood, Chichester (Britain); second of £10, The Duke of Richmond (Lord Francis).

Suffolk Stallion, foaled before the 1st of January, 1868.—First prize, £25, I. Rist, Tattingstone, Ipswich (Harwich Emperor); second of £15, C. Boly, Alton Hall, Stutton, Ipswich (Royal Prince); third of £5, Colonel Tomline, M.P., Orwell Park, Nacton, Ipswich (Earl). Reserve: G. D. Badham, The Lawn, Bulmer, Sudbury (Hercules).

Suffolk Stallion, foaled in the year 1868.—First prize, £20, I. Rist (Young Emperor); second of £10, The Executors of the late T. Capon, Dennington, Wickham Market; third of £5, W. Wilson, Ballham Hall, Ipswich. Reserve and Highly Commended: S. Wolton, Newbourn Hall, Woodbridge.

Thorough-bred Stallion, suitable for getting hunters.—First prize, £50, General Peel, Marble Hill, Twickenham (Knowsley); second of £25, C. and J. Moffat, Kirklington Park, Carlisle (Laughing Stock); third of £10, J. Casson, Burgh-by-Sands, Carlisle (Sincerity). Reserve: W. Gulliver, Swadcliffe Stud Farm, Banbury (General Peel).

Stallion, not less than 14 hands 2 inches, nor exceeding 15 hands 2 inches, suitable for getting Hackneys.—First prize, £20, J. Grout, Woodbridge (Sportsman); second of £10, C. Beart, Stow, Downham Market (Ambition).

Pony Stallion, under 14 hands 2 inches.—First prize, £15, H. Roundell, Otley (Sir George); second of £10, J. A. Ransome, Ipswich (Perfection). Reserve: J. A. Doyle, Plasdulas, Abergele, Denbigh (Trump).

Cart Mare, in foal, or with foal at foot (not qualified to compete as Clydesdale or Suffolk).—First prize, £20, T. Statter, jun., Stand Hill, Whitefield, Manchester (Fanny); second of £2, H. G. Colbourn, Lower Heyford, Banbury (Star); third of £5, A. H. Thurstby, Wormleighton, Leamington (Nelly). Reserve: Lord Norreys.

Clydesdale Mare, in foal, or with foal at foot.—First prize, £20, R. Waugh, Scathill, Irthington, Carlisle (Isabel); second of £10, Lieut.-Colonel R. Loyd-Lindsay, M.P., Lockinge Park, Wantage (Darting); third of £5, Her Majesty the Queen, Windsor Castle (Mary). Reserve: Colonel R. Loyd-Lindsay (Maggie).

Suffolk Mare, in foal, or with foal at foot.—First prize, £20, The Executors of the late T. Capon (Matchett); second of £10, Lieut.-Colonel Fuller Maitland Wilson, Stowlaughton Hall, Bury St. Edmunds (Bury Empress). Reserve and Highly Commended: S. Wolton (Diamond), and Colonel Fuller Maitland Wilson (Ruby). Commended: S. Wolton (Pride).

Mare, in foal, or with foal at foot, suitable for breeding Hunters.—First prize, £25, J. T. Robinson, Leckby Palace, Asenby, Thirsk (Go-a-Head); second of £15, R. Aldworth, West Agboure, Duddo (Margold); third of £5, W. Tindall, Ashfield House, Lincoln (Heliotope). Reserve: J. C. Blake, Oxford (Canary).

Mare, not less than 14 hands 1 inch, nor exceeding 15 hands 1 inch, in foal, or with foal at foot, suitable for breeding Hackneys.—First prize, £20, Lord Norreys (Kate); second of £10, A. Sherratt, Odepitchard, Hereford (Polly); third of £5, Earl of Craven, Ashdown Park, Shrivvenham. Reserve: E. and A. Stanford, Eatons, Steyning, Sussex (Christabel).

Pony Mare, not exceeding 14 hands.—First prize, £10, G. B. Morland, Abingdon (Topsy). No competition.

Cart Filly, three years old (not qualified to compete as Clydesdale or Suffolk).—First prize, £15, C. Lister, Coleby Lodge, Lincoln (Royal Duchess); second of £10, J. and F. Howard, Britannia Farm, Bedford (Rosebud); third of £5, J. Druce, Eynsham, Oxford (Poppet). Reserve: W. Rowland, Shabbington, Thame (Jewel).

Clydesdale Filly, three years old.—First prize, £15, G. H. Head, Rickerby, Carlisle (Deborah); second of £10, The Duke of Richmond (Darting). Reserve: G. Hampton, Findon Worthing (Thistle).

Suffolk Filly, three years old.—First prize, £15, S. Wolton (Duchess); second of £10, S. Wolton (Princess). Reserve and Highly Commended: Colonel Tomline (Smart).

Cart Filly, two years old (not qualified to compete as Clydesdale or Suffolk).—First prize, £30, S. Davis, Woolashill, Pershore (Pleasant); second of £15, J. Denchfield, Burston House, Aston Abbots; third of £5, Sir H. W. Dashwood, Bart., Kiblington Park, Oxford (Lucy). Reserve: The Rev. J. Hitchcock, Chitterne All Saints, Heytesbury, Wilts.

Clydesdale Filly, two years old.—No merit.

Suffolk Filly, two years old.—First prize, £15, S. Wolton; second of £10, Colonel Tomline (Moggy). Reserve: J. Patmore, Bishop Stortford (Silver 2nd).

Hunters, four years old (Mare or Gelding).—First prize, £30, S. Berridge, Drayton Lodge, Banbury (General); second of £15, J. Grout (Ace of Clubs); third of £5, A. Sherratt

(George). Reserved: T. Milburn, Grinsdale, Carlisle (Merry Maid).

Hunters, five, six, or seven years old (Mare or Gelding).—First prize, £15, J. B. Booth, Killybegs Hall, Caterick (Brian Born); second of £10, Lord Norreys (Strathairn); third of £5, Colonel Fuller Maitland Wilson (Fenian). Reserve and Highly Commended: J. Watson, Waresley, Hartlebury, Kidderminster (General Hood).

Hackney (Mare or Gelding), not exceeding 15 hands 1 inch, under eight years old.—First prize, £15, H. S. Woodcock, The Helms, Wigan (Ada); second of £5, C. Moffat, Crosby-on-Eden, Carlisle (Fanny). Reserve: J. C. Blake (Leah).

CATTLE.

(All ages calculated to July 1st, 1870.)

SHORTHORNS.

JUDGES of Bulls.—H. Aylmer, West Dereham Abbey, Stoke Ferry.

W. Bowstead, Hackthorpe Hall, Penrith.
J. R. Singleton, Givendale, Ripon.

Bull above three years old.—First prize, £40, C. W. Brierley, Rhodes House, Middleton, Manchester (Bolivar); second of £20, G. R. Sanders, Nunwick Hall, Penrith (Edgar); third of £10, T. E. Pawlett, Beeston, Sanday, Bedford (Baron Killybegs). Reserve and Highly Commended: R. Chaloner, King's Fort, Kells, Meath, Ireland (Sovereign). Highly Commended: W. F. Faviell, Down Place, Guildford, Surrey (Shuttlecock). Commended: G. Garne, Churchill Heath, Chipping Norton (Royal Butterfly 20th).

Bull above two and not exceeding three years old.—First prize, £25, R. Bruce, Newton of Struther, Forres, Co. Elgin, Scotland (Scotsman); second of £15, Colonel C. Towneley, Towneley, Burnley (Baron Humberk); third of £5, J. Wright, Green Hill Head, Penrith, Cumberland (Man's Estate); Reserve and Highly Commended: J. Christy, Jun., Boyton Hall, Chelmsford (Duke of Babraham). Commended: R. Sneyd, Keele Hall, Newcastle, Staffordshire (Iron Master).

Yearling Bull, above one and not exceeding two years old.—First prize, £25, Emily Lady Pigot, Branches Park, Newmarket (Bythis); second of £15, W. Linton, Sheriff Hutton, York (Lord Irwin); third of £5, Lord Braybrooke, Audley End, Saffron Walden (Hoydon Duke). Reserve and Highly Commended: The Earl of Aylesford, Packington Hall, Coventry (Magdala). Commended: T. E. Pawlett (Royal Booth).

Bull Calf above six and not exceeding twelve months old.—First prize, £15, H. Dudding, Panton House, Wragby (Robin Hood); second of £10, R. Stratton, Buderop, Swindon (Master Glanville). Reserve and Highly Commended: Col. C. Towneley (Maid of Oxford's Baronet). Highly Commended: T. Garne and Son, Broadmoor, Northleach (First Wrangler). Commended: T. Garne and Son (The Proctor), Major H. M. Stapleton, Myton Hall, Helperry (Lord of the Manor), and Colonel C. Towneley (Towneley Oxford).

JUDGES of Cows.—C. Howard, Biddenham, Bedford.

S. Rich, The Cedars, Fearnall Heath, Worcester.

M. Stephenson, Fourstones, Hexham.

Cow above three years old.—First prize, £25, G. Garne (Lady Lavinia); second of £10, Emily Lady Pigot (Queenie of Rosalea); third of £5, J. How, Broughton, Huntingdon (Lady Anne). Reserve and Highly Commended: G. Garne (Pride of the Heath). Commended: W. Bradburn, Wednesfield, Wolverhampton (Miss Chesterfield), and G. Garne, (Duchess of Towneley).

Heifer in-milk or in-calf, not exceeding three years old.—First prize, £15, J. A. Mumford, Chilton Park Farm, Thame (Camilla); second of £10, R. Eastwood, Thorneyholme, Clitheroe (Double Butterfly 3rd); third of £5, R. Stratton (Peers). Reserve and Highly Commended: J. How (Windsor's Butterfly). Commended: Emily Lady Pigot (La Belle Hélène).

Yearling Heifer above six and under twelve months old.—First prize, £15, D. McIntosh, Havering Park, Romford (Knightley 2nd); second of £10, H. Dudding (Countess of Yarborough); third of £5, J. How (Vesper Queen). Reserve and Highly Commended: R. Stratton (Flower Girl). Commended: W. Bolton, The Island, Orlart, Gorey, Wexford, Ireland (Ally Gwynne), E. A. Fawcett, Childwick Hall, St. Albans (Highland Maid), and G. Garne (Genevieve).

Heifer Calf, above six and under twelve months old.—First prize, £10, Colonel C. Towneley (Baron Oxford's Duchess); second of £5, R. Marsh, Little Offley House, Hitchin (Blossom). Reserve and Highly Commended: T. Statter, Jun. (Stanley Rose). Commended: Lord Walsingham, Merton Hall, Thetford (Oxford Belle), and R. Stratton (Fair Rosalie).

HEREFORDS.

JUDGES.—G. Morgan, Lanchirabo, Hereford.

S. W. Urwick, Leinthall, Ludlow.
H. Yeomans, Stones Court, Hay.

Bull above three years old.—First prize, £25, Sir Joseph Russell Bailey, Bart, M.P., Glanusk Park, Crickhowell

(Stanway); second of £15, Her Majesty the Queen (Prince Leopold); third of £5, T. Thomas, Saint Hilary, Cowbridge (Sir John 3rd). Reserve: J. Morris, Town House, Madley, Hereford (Stow).

Bull above two and not exceeding three years old.—First prize, £25, Her Majesty the Queen (Prince Albert Edward); second, £15, W. Evans, Landowais, Usk (Monaghty 3rd); third, £5, T. Edwards, Wintcott, Leominster (Leominster 3rd). Reserve and Highly Commended: H. N. Edwards, Broadway, Leominster (Sir John). Commended: J. Baldwin, Ludington, Stratford-on-Avon (Lord Ashford).

Yearling bull, above one and not exceeding two years old.—First prize, £20, P. Turner, The Leen, Penbridge, Leominster (Trojan); second, £15, J. Harding, Bicton, Shrewsbury (Count Fasco); third, £5, R. Hill, Orleton Court, Ludlow (President). Reserve and Highly Commended: J. Morris (Cambridge).

Bull-calf, above six and not exceeding twelve months old.—First prize, £10, W. Taylor, Showle Court, Ledbury (The Oxford Lad); second, £5, R. Hill (Milton 2nd). Reserve and Highly Commended: T. Rogers, Coxall, Brampton Bryan (Student). Commended: T. Fenn, Stonebrook House, Ludlow.

Cow above three years old.—First prize, £15, T. Rogers, (Silk); second, £10, G. Pitt, Chadnor Court, Dilwyn, Leominster (Highlass the 4th); third, £5, R. Tanner, Frestley, Dorrington, Salop (Queen). Reserve and Highly Commended: Her Majesty the Queen (Flora); Highly Commended: P. Thomas (Lizzie).

Heifer, in-milk or in-calf, not exceeding three years old.—First prize, £15, W. Tudge, Adforton, Lentonwardine (Silver Star); second, £10, P. Turner (Livia). Reserve: J. Prosser, Honeybourne Grounds, Broadway, Gloucestershire (snowdrop the 2nd).

Yearling heifer, above one and not exceeding two years old.—First prize, £15, T. Fenn (Leonora 2nd); second, £10, W. Tudge (Lady Brandon); third, £5, T. Thomas (Sunbeam). Reserve and Highly Commended: J. Harding (Dahlia). The class commended.

Heifer-calf, above six and under twelve months old.—First prize, £10, H. R. Evans, Jun., Swanstone Court, Leominster; second, £5, T. Thomas (Sunflower). Reserve and Highly Commended: J. Harding (Lizzie Jeffreys). Commended: W. Tudge (Bonnie Belle); and J. Harding (Red Dahlia).

DEVONS.

JUDGES.—J. Overman, Burnham Sutton, Lynn.

T. Pope, Homingsham, Warminster.
R. B. Warren, Child Okeford, Blandford.

Bull, above three years old.—First prize, £25, W. Farthing, Stowey Court, Bridgwater (Master Arthur); second, £15, J. H. Buller, Downes, Crediton. Reserve and Commended: W. Taylor, Glynely, Westham, Eastbourne (Rifeman).

Bull, above two and not exceeding three years old.—First prize, £25, Viscount Falmouth, Tregethnan, Probus (Narcissus); second, £15, W. Farthing (Sir George). Reserve and Commended: Her Majesty the Queen (Napier).

Yearling bull, above one and not exceeding two years old.—First prize, £25, J. Davy, Flitton Barton, North Molton (Duke of Flitton 5th); second, £15, Viscount Falmouth, Probus; third, £5, W. Smith, Hoopern, Exeter (Pensylvania). Reserve and Highly Commended: J. A. Smith, Bradford Peverell, Dorchester (Duke of York). Commended: W. Farthing.

Bull-calf, above six and not exceeding twelve months old.—First prize, £10, J. Davy (Duke of Flitton 6th); second, £5, W. Farthing (Master Harry). Reserve and Highly Commended: W. Smith, Hoopern (Duke of Beaufort). Highly Commended: W. Taylor. The class commended.

Cow above three years old.—First prize, £20, W. Smith, Hoopern (Musk); second of £10, W. Taylor (Frederica); third of £5, W. Taylor (Alice Maule). Reserve and Highly Commended: J. A. Smith (Pet). Highly Commended: W. Farthing (Miss Bessie). Commended: W. Farthing (Lofty).

Heifer, in-milk or in-calf, not exceeding three years old.—First prize, £15, W. Farthing (Pretymaid); second of £10, W. Taylor; third of £5, J. A. Smith (Picture). Reserve and Commended: Her Majesty the Queen (Verberna).

Yearling Heifer, above one and not exceeding two years old.—First prize, £15, J. Davy (Temptress the 2nd); second of £10, W. Taylor; third of £5, W. Smith, Hoopern (Duchess). Reserve and Highly Commended: J. H. Buller. Highly Commended: Her Majesty the Queen (Princess Louise Victoria). The class commended.

Heifer Calf, above six and under twelve months old.—First prize, £10, J. Davy (Gay Lass); second of £5, W. Smith, Hoopern (Jessie). Reserve and Highly Commended: W. Farthing (First Fruit). Highly Commended: J. A. Smith (Picture); and W. Smith, Hoopern (Beatrice). The class commended.

CHANNEL ISLAND CATTLE.

JUDGES.—C. P. Le Cornu, Trinity Manor, Jersey.

G. Morgan, Lanchirabo, Hereford.

Bull above one year old.—First prize, £15, G. Deller, Greywell, Odiham (Delhi); second of £10, H. J. Le Feuvre, Le

Niemes, St. Peter's, Jersey (Duko 1th). Reserve and Highly Commended: W. G. Duncan, Bradwell, Stony Stratford. Highly Commended: W. Gilbey, Hargrave Park, Stanstead (Banboy); and Lieut.-Colonel Fuller Maitland Wilson (Vampire). Commended: J. and S. Salter, Folly Bridge, Oxford (Duke of Oxford).

Cow above three years old.—First prize, £15, J. Pulley, jun., Lower Eaton, Hereford (Vixen); second of £10, P. Gaudin, Spring Farm, St. Martin's, Jersey (Floribundus). Reserve and Highly Commended: J. Pulley, jun. (Spitful). Commended: W. Gilbey (Ban); G. Digby Wingfield Digby, Sherborne, Dorset (Julia); W. Chamberlin, Adderbury East House, Banbury (Ada); J. James, Les Vauxbelets, Guernsey (Dairymail); and J. James (Lassie).

Heifer, in-milk or in-calf, not exceeding three years old.—First prize, £15, P. Gaudin; second of £10, G. Huyshe, Rosenheim, Guernsey (Rosette). Reserve and Highly Commended: H. Middleton, Cuteslowe, Oxford (Ruby). Highly Commended: H. J. Le Feuvre (Duchess 14th). Commended: W. Gilbey (Banshee); C. M. Owen, Walton House, Oxford (Twilight); D. Cheminant, Sablons, Guernsey (Nanny); T. B. Le Page, Maison de Bas, Guernsey (Fanny); H. Middleton (Ringlet); and the Rev. T. K. Chittenden, Kirtlington, Oxford (Beauty).

NORFOLK AND SUFFOLK POLLED.

JUDGES.—T. Overman,
T. Pope,
R. B. Warren.

Bull above one year old.—First prize, £15, B. Brown, Thursford, Thetford (Norfolk Duke); second of £10, J. J. Colman, Carrow House, Norwich (Cherry Duke). Reserve and Highly Commended: S. Wolton (Broadback). Commended: Lord Sondes, Elmham Hall, Thetford (Bohemian).

Cow above three years old.—First prize, £15, J. Hammond, Bale, Thetford (Butler); second of £10, S. Wolton (Sprightly). Reserve and Highly Commended: B. Brown (Duchess). Commended: S. Wolton (Battersea Favourite), and Colonel Tomline, (Polly).

Heifer in-milk or in-calf not exceeding three years old.—First prize, £15, J. Hammond (Buttercup); second of £10, Lord Sondes. Reserve and Highly Commended: B. Brown (Hansom). Commended: B. Brown (Countess).

OTHER ESTABLISHED BREEDS.

JUDGES.—G. Morgan,
S. W. Urwick,
H. Yeomans.

Bull above one year old.—First prize, £15, the Duke of Buckingham and Chandos, Stowe, Buckingham (Young Conqueror—Longhorn); second of £10, T. Statter, Jun. (Polled Angus). Reserve and Highly Commended: R. H. Chapman, Upton, Nuneaton (Earl of Rollright—Longhorn). Commended: Z. W. Stilgoe, Adderbury Grounds, Oxon (The Prince—Polled Angus).

Cow above three years old.—First prize, £15, J. Godfrey, Wigston Parva, Hinckley (Red Rose 2nd—Longhorn); second of £10, T. Smith, Beckley, Hawkhurst (Betty—Sussex). Reserve and Highly Commended: R. H. Chapman (Brindled Beauty—Longhorn). Commended: T. Smith, (Fagg—Sussex).

Heifer in-milk or in-calf not exceeding three years old.—First prize, £15, T. Statter, Jun. (Polled Angus); second of £10, the Duke of Buckingham and Chandos (Lady Caroline—Longhorn). Reserve: G. Jenner, Parsonage House, Udmore, Rye (Young Cooke—Sussex).

Pair of Cows shown in full milk, specially adapted for Dairy Purposes.—First prize, £12, T. Statter (Ayrshire); second of £3, H. Middleton (Jersey). Reserve and Highly Commended: H. Middleton (Jersey). Commended: T. Garne and Son (Mozelle and Misfortune—Shorthorns).

SHEEP.

LEICESTERS.

JUDGES.—C. Clarke, Scopwick, Sleaford.
S. Jefferson, Preston Hows, Whitehaven.
G. Walmsley, Radston House, Bridlington.

Shearing Ram.—First prize, £20, J. Borton, Barton House, Barton-le-Street, Malton; second of £10, the Executor of the late Lieut.-Col. W. Inge, of Thorpe Constantine, Tamworth; third of £5, the Executor of the late Lieut.-Col. W. Inge. Reserve and Highly Commended: T. H. Hutchinson, Manor House, Catterick. Highly Commended: J. Borton. Commended: G. Turner, jun., Alexton Hall, Uppingham (for two rams); G. H. Sanday, Holme Pierrepont; and J. Borton.

Ram of any other age.—First prize, £20, J. Borton (Blue Cap); second of £10, J. Borton (Black Eye); third of £5, G. H. Sanday. Reserve and Highly Commended: G. Turner, jun. Highly commended: G. Turner, jun. (for another ram). Commended: G. H. Sanday.

Pen of five Shearing Ewes.—First prize, £15, the Executor of the late Lieut.-Col. W. Inge; second of £10, T. H. Hutchinson; third of £5, J. Borton. Reserve and Highly Com-

mended: G. H. Sanday. Commended: E. Riley, Kipling Cotes, Beverley.

COTSWOLDS.

JUDGES.—J. G. Attwater, Britford, Salisbury.
T. Porter, Barton, Cirencester.
E. Ruck, Castle Hill, Cricklade.

Shearing Ram.—First prize, £20, T. Brown, Marham Hall Farm, Downham Market, Norfolk; second of £10, R. Lane, Cottage Farm, Eastington, Northleach; third of £5, T. Brown. Reserve and Highly Commended: T. Brown.

Ram of any other age.—First prize, £20, T. B. Browne, Salperton Park, Andoversford; second of £10, J. Godwin, Troy Farm, Somerton, Deddington; third of £5, J. Godwin. Reserve and Highly Commended: T. Brown, Marham.

Pen of five Shearing Ewes.—First prize, £15, J. Gillett, Minster Lovell, Witney; second, J. Gillett; third of £5, R. Garne, Aldsworth, Northleach. Reserve: J. Gillett.

Ten Ewes, without reference to age, who have suckled lambs to June 1st.—The prize, £15, The Executors of the late T. Gillett, Kilkenny Farm, Faringdon. Reserve: J. Williams' Caerady, Cowbridge.

Ten Ram Lambs.—The prize, £10, J. Gillett, Oaklands, Charbury. Reserve: C. Gillett, Lower Haddon, Bampton, Faringdon.

Ram of any age.—First prize, £5, J. Godwin. Reserve: W. Cocher, Middle Aston.

LINCOLNS.

JUDGES (and for Ryland and other Longwool).—
W. Bartholomew, Waddington Heath, Lincoln.
J. H. Caswell, Loughton, Polkingham.
H. Mackinder, Langton Grange, Spilsby.

Shearing Ram.—First prize, £20, T. Gunnell, Milton, Cambridge; second of £10, R. Wright, Nocton Heath, Lincoln; third of £5, R. Wright. Reserve and Commended: R. Wright.

Ram of any other age.—First prize, £20, H. Dudding, Pantown House, Wragby, Lincoln; second of £10, H. Dudding; third of £10, W. F. Marshall, Branston, Lincoln. Reserve and Commended: H. Dudding. Commended: T. Cartwright, Dunston Pillar, Lincoln (for two rams).

Pen of five Shearing Ewes.—First prize, £20, T. Cartwright; second, T. Cartwright. Reserve and Commended: J. Pears, Mere, Branston, Lincoln.

RYLAND AND OTHER LONG-WOOLED.

(Not qualified to compete as Leicester, Cotswold, or Lincoln.)
Shearing Ram.—No entry.

Ram of any other age.—First prize, £20, J. Lynn, Church Farm, Stroxtun (Lincoln longwool); second of £10, J. T. Pinches, Hardwick, Pembridge (Ryland). Reserve: F. Street, Harrowden House, Bedford, Bury Royal (Norfolk longwool).

Pen of five Shearing Ewes.—First prize, £15, T. W. D. Harris, Wootton, Northampton.—No competition.

OXFORDSHIRE DOWNS.

JUDGES.—A. Edmonds, Longworth Lodge, Faringdon.
H. Overman, Weasenham, Brandon.
Z. W. Stilgoe, Adderbury Grounds, Banbury.

Shearing Ram.—First prize, £20, G. Wallis, Old Shifford, Bampton, Faringdon; second of £10, G. Wallis; third, C. Hobbs, Maisey Hampton, Cricklade. Reserve and Highly Commended: F. Street. Highly Commended: F. Street and G. Wallis. Commended: J. Treadwell, Upper Winchendon, Aylesbury (for two rams); A. F. M. Druce, Burgfield, Reading; and Sir H. W. Dashwood, Bart., Kirtlington Park, Oxford.

Ram of any other age.—First prize, £20, G. Wallis; second of £10, G. Wallis; third of £5, A. F. M. Druce. Reserve and Highly Commended: J. Longland, Crendon, Northampton. Commended: J. Treadwell (for two rams).

Pen of five Shearing Ewes.—First prize, £15, G. Wallis; second of £10, A. F. M. Druce; third, F. Gillett, Upton Downs, Burford. Reserve and Highly Commended: C. Gillett, Cote House, Bampton, Faringdon. Highly Commended: Sir H. W. Dashwood. Commended: J. Treadwell; C. Gillett; C. Howard, Biddenham, Bedford; and the executors of the late W. Button, Eynsham.

Ten Ewes, without reference to age, who have suckled lambs to June 1st.—The prize, £15, J. Treadwell. Reserve: F. Gillett.

Ten Ram Lambs.—The prize, £10, J. S. Parker, Hitley, Oxford. Reserve: W. Chillingworth, Cuddesden, Wheatley.

Ten Ewe Lambs.—The prize, £10, the executors of the late W. Button. Reserve: W. Chillingworth, Cuddesden.

SOUTH DOWNS.

JUDGES.—T. Cooper, Bishopstone, Lewes.
H. Fookes, Whitechurch, Blandford.
H. Lugar, Ingham, Bury St. Edmunds.

Shearing Ram.—First prize, £20, Lord Walsingham, Merton Hall, Thetford; second of £10, Lord Walsingham; third of £5, Lord Walsingham. Reserve and Highly Commended:

Lord Walsingham. Highly Commended: W. Rigden, Hove, Brighton; and Lord Walsingham. Commended: Lord Walsingham; H. Humphrey, Ashington, Hurst, Sussex; J. and A. Heasman, Angmering, Arundel, Sussex; H. S. Waller, Farmington, Northleach; and Sir W. Throckmorton, Bart., Buckland, Faringdon.

Ram of any other age.—First prize, £20, Lord Walsingham; second of £10, Sir W. Throckmorton, Bart.; third of £5, Lord Walsingham. Reserve and Highly Commended: W. Rigden. Highly Commended: Lord Walsingham; the Duke of Richmond, K.G., Goodwood, Chichester (for two rams); J. and A. Heasman; and Lord Sondes, Elmham Hall, Thetford. Commended: the Duke of Richmond; H. Humphrey; and Sir W. Throckmorton.

Pen of five Shearling Ewes.—First prize, £15, Lord Walsingham; second of £10, the Duke of Richmond; third of £5, W. Rigden. Reserve and Highly Commended: Lord Sondes. Highly Commended: H.R.H. the Prince of Wales, K.G., Sandringham, King's Lynn. Commended: H.R.H. the Prince of Wales; the Duke of Richmond; and Colonel Tomline.

SHROPSHIRE.

JUDGES.—B. Bond, Swansmoor, Great Haywood, Stafford. W. Kemp Bourne, Fisherwick, Lichfield. R. H. Masfen, Pendeford, Wolverhampton.

Shearling Ram.—First prize, £20, J. Coxon, Freeford Farm, Lichfield; second of £10, T. Mansell, Adcott Hall, Baschurch, Shropshire; third of £5, Sarah Beach, the Hattons, Brewood. Reserve and Highly Commended: Lord Chesham, Latimer, Chesham. Highly Commended: J. Evans, Uffington, Shrewsbury; and T. Fenn, Stonebrook. Commended: Lord Chesham (for two sheep); Sarah Beach; T. Mansell; and J. Evans (for two sheep).

Ram of any other age.—First prize, £20, J. Evans (Standard Bearer); second of £10, Sarah Beach; third of £5, Sarah Beach. Reserve and Highly Commended: T. Mansell. Highly Commended: W. Baker, Moor Barns, Atherstone. Commended: W. G. Preece, Frodesley Park, Shrewsbury.

Pen of five Shearling Ewes.—First prize, £15, Lord Chesham; second of £10, J. H. Bradburne, Pipe Place, Lichfield; third of £5, Lord Sudeley, Toddington, Winchcombe. Reserve and Highly Commended: J. H. Bradburne.

HAMPSHIRE AND OTHER SHORT-WOOLLED.

(Not qualified to compete as Southdown or Shropshire.)
JUDGES (and for Dorsets).—

W. B. Canning, Elston, Devizes.
J. R. Newton, Campfield, Woodstock.
H. Thurnall, Royston, Herts.

Shearling Ram.—First prize, £20, A. Morrison, Fonthill, House, Tisbury, Wilts; second of £10, J. Rawlence, Bulbridge, Wilton; third of £10, J. Rawlence. Reserve: A. Morrison.

Ram of any other age.—First prize, £20, J. Rawlence; second of £10, J. and M. Arnold, Westmeon, Petersfield, Hants; third of £5, S. King, Bockhampton Farm, Lambourne. Reserve and Commended: J. Robson, Bymess, Rochester, Northumberland.

Pen of five Shearling Ewes.—First prize, £15, J. Rawlence; second of £10, J. Rawlence; third of £5, J. Barton. Reserve: J. P. King, North Stoke, Wallingford.

DORSETS.

Shearling Ram.—First prize, £20, H. Mayo, Cokers Frome, Dorchester; second of £10, J. W. James, Mappowder Court, Blandford. Reserve: H. Farthing, Nether Stowey, Bridgewater.

Pen of Five Shearling Ewes.—First prize, £15, H. Farthing; second of £5, A. Bond, Hunstile, Bridgwater. Reserve: H. Mayo.

INSPECTORS OF SHEARING.—H. Bone, Avon, Ringwood.
R. Brown, Wigginton House, Tetsworth.
W. Jobson, Buteland, Hexham.

P I G S.

JUDGES.—J. Fisher, Woodhouse, Crosshills, Yorkshire.
J. Smith, Henley-in-Arden.
J. S. Turner, Chyngton, Seaford.

Boar of a large white breed, above twelve months old.—First prize, £10, J. and F. Howard, Britannia Farm, Bedford (Victor 2nd); second of £5, R. E. Duckering, Northorpe, Kirton-Lindsay (Cultivator 5th). Reserve: P. Eden, Cross Lane, Salford, Manchester (Sampson).

Boar of a large white breed, above six months and not exceeding twelve months old.—First prize, £10, M. Walker, Stockley Park, Anslow, Burton-on-Trent (Hero); second of £5, M. Walker (Alfred the Great). Reserve: G. Chapman, Seamere, Scarborough (Yorkshireman).

Boar of a small white breed, above twelve months old.—First prize, £10, H. Neild, the Grange, Worsley, Manchester

(The Doctor); second of £5, P. Eden (Young King of the West). Reserve and Highly Commended: W. Hatton, Addingham, Leeds. Commended: G. M. Sexton, Wherstead Hall, Ipswich (Young Snowball) and M. Walker (Little John 2nd).

Boar of a small white breed, above six months and not exceeding twelve months old.—First prize, £10, P. Eden (Young Prince); second of £5, W. Hatton, Addingham, Leeds (Dreadnought). Reserve and Commended: W. Parker, Bradford (Roger). Commended: G. Chapman (Robin Hood).

Boar of a small black breed.—First prize, £10, G. McCann, Court Farm, Malvern (Wallace); second of £5, S. G. Stearn, Brandstone, Wickham Market (The Parson). Reserve and Highly Commended: G. M. Sexton, (Kingcraft).

Boar of the Berkshire breed.—First prize, £10, G. Griggs, Oaklands, Romford (Prince); second of £5, R. Swanwick, of R. A. College Farm, Cirencester (Sambo 2nd). Reserve and Highly Commended: H. Humfrey, Kingstone Farm, Shrivensham (No. 293 M). The class Commended.

Boar of a breed not eligible for the preceding classes.—First prize, £10, J. E. Fox, Mansion House, Great Horton, Bradford (Young Prince of Airedale); second of £5, P. Eden, (King Lear 3rd). Reserve: R. E. Duckering (Wallace 2nd).

Breeding Sow of a large white breed.—First prize, £10, M. Walker (Thalia); second of £5, J. and F. Howard (Longville 2nd). Reserve: R. E. Duckering (Princess Royal). The class Highly Commended.

Breeding Sow of a small white breed.—First prize, £10, W. Hatton (Pride of the Village); second of £5, P. Eden (Sunshine). Reserve and Highly Commended: W. Hatton (Charming May). Highly Commended: R. E. Duckering (Lily). Commended: His Royal Highness the Prince of Wales, K.G.; J. Wheeler, Long Compton, Shipston-on-Stour (Lovely 2nd); and G. M. Sexton (Our Mary Ann).

Breeding Sow of a small black breed.—First prize, £10, S. G. Stearn (Aunt Hannah); second of £5, G. M. Sexton (Hester). Reserve: G. M. Sexton (Sunshine).

Breeding Sow of the Berkshire breed.—First prize, £10, A. Stewart, St. Bridge, Gloucester (Duchess); second of £5, R. Swanwick (Sally 6th). Reserve and Highly Commended: A. Stewart (Princess). Commended: J. Spencer, Villier's Hill, Kenilworth (Princess 6th); W. Parsons, Hill Farm, Elsie, Oxford; A. Stewart (Countess); H. Humfrey (No. 239 A); the Rev. H. G. Baily, Swindon; and E. C. Clarke, Manor Farm, Haddenham, Thame (Pride of the Vale).

Breeding Sow of a breed not eligible for the preceding classes.—First prize, £10, P. Eden (Busy Bee); second of £5, R. E. Duckering (Primrose). Reserve and Highly Commended: W. Hatton (Queen of the West). Highly Commended: P. Eden, Salford (Lancashire Lass). Commended: F. H. Everett, Bridham, Thetford (Bury Belle); and W. Parker, Leeds (Dewdrop).

Pen of three breeding Sow Pigs of a large white breed, of the same litter, above four and under eight months old.—First prize, £13, R. E. Duckering; second of £5, M. Walker (The Three Graces). Reserve: J. and F. Howard.

Pen of three breeding Sow Pigs of a small white breed, of the same litter, above four and under eight months old.—First prize, £10, G. M. Sexton (We Challenge All); second of £5, P. Eden.

Pen of three breeding Sows of a small black breed, of the same litter, above four and under eight months old.—First prize, £10, G. Turner, jun., Allexton, Uppingham (Improved Essex). No competition.

Pen of three breeding Sow Pigs of the Berkshire breed, of the same litter, above four and under eight months old.—First prize, £10, R. Swanwick; second of £5, R. Fowler, Broughton Farm, Aylesbury. Reserve and Highly Commended: R. Fowler. Highly Commended: The Rev. H. G. Baily. Commended: H. Humfrey.

Pen of three breeding Sow Pigs of a breed not eligible for the preceding classes, of the same litter, above four and under eight months old.—First prize, £10, M. Walker (Thalia, Teresa, and Tiny); second of £5, G. Chapman (Three Lilies).

Berkshire Boar and Sow, with their offspring, under twelve weeks old.—First prize, £5, H. Humfrey (Royal Oak and Beauty Bewitched). Reserve: Sir W. Throckmorton.

Pair of Berkshire Boars, from one litter, under six months old.—First prize, £10, H. Humfrey, (Nos. 314 M and N). Reserve: The executors of the late W. Hewer, Sevenhampton, Highworth.

VETERINARY INSPECTORS.—Professor Simonds.
Professor Varnell.
Assistant Inspector.—R. L. Hunt.

STEWARDS OF STOCK.

D. R. Davies, Mere Old Hall, Knutsford, Cheshire.
Jacob Wilson, Woodhorn Manor, Morpeth.
Sir Watkin W. Wynn, Bart., M.P., Wynnstay, Ruabon.

DIRECTOR OF THE SHOW.

B. T. Brandreth Gibbs, Half-Moon-street, Piccadilly, London.

FARMS IN THE OXFORD DISTRICT.

JUDGES.—Gibbons, Barnfoot, Cumberland.
H. H. Keary, Bridgworth.
W. Torr, Aylesby, Grimsby.

First prize of a silver cup, value 100 guineas, for the best cultivated farm in the district round Oxford, Mrs. M. E. Millington, Ashgrove, Ardley, Bicester; second of £50, J. Treadwell, Upper Winchendon, Aylesbury. Reserve and Highly Commended: R. Craddock, Lyneham, Chipping Norton. Commended: N. Stilgoe, and Z. W. Stilgoe, Adderbury, Banbury, and W. Denchfield, Easington. Highly praised: T. Latham, Little Wittenham, Abingdon (for sheep management).

THE ANNUAL MEETING.

The annual meeting was held on the show ground on the Tuesday, the Duke of Devonshire, the president, in the chair.

The SECRETARY, Mr. Jenkins, read the report of the Judges of Farms, which stated that the first prize, a silver cup, value £100, offered by James Mason, Esq., ex-High Sheriff of County, for the best cultivated farm around Oxford, had been awarded to Mrs. Mary Elizabeth Millington, of Ash Grove Farm, Ardley, Bicester; the second prize of £50, offered by the Society, to Mr. John Treadwell, of Upper Winchendon; and the judges also highly commended the farm of Mr. Robt. Craddock, of Lyneham, Chipping-Norton, which they recommended should have a third prize. Three other farms they commended, viz, those of Mr. N. Stilgoe and Mr. Z. W. Stilgoe, Adderbury, and Mr. W. Denchfield, Easington Farm, Banbury. The sheep management of Mr. Thomas Latham, of Little Wittenham, Abingdon, was also recorded worthy of the highest praise.

The CHAIRMAN, in presenting the prize to Mrs. Millington's brother, said this was a new feature of the Society, indebted to the liberality of the late High Sheriff.

Lord VERNON proposed a vote of thanks to the Mayor and Corporation of Oxford.

Lord KESTEVEN seconded the resolution, which was passed.

Alderman R. J. SPIERS responded.

Mr. H. S. THOMPSON proposed a vote of thanks to the Local Committee.

Mr. WREN HOSKYN, M.P., seconded the vote of thanks, which was passed.

Colonel KINGSCOTE, M.P., proposed a vote of thanks to the Railway Companies for the arrangements they had made in facilitating the transit of machinery, implements, and live stock.

Mr. J. DRUCE, of Eynsham, seconded the resolution, which was passed.

The CHAIRMAN said this concluded the formal business of the meeting, but it was his duty to ask whether any member wished to address any observations to the Council.

Mr. H. MIDDLETON as an exhibitor of cattle wished to ask who had the responsibility of appointing the judges, and how they were elected? He referred to the class of Channel Islands cattle, for which there were two judges, one being from the Island, and the other a Hereford man. Any one who examined the second prize cow, above three years old, would see the point of the question which he put.

Mr. LE CORNU said that as one of the judges of the Royal Agricultural Society of England, and also a member of the Jersey Agricultural Society, he had done his utmost to do justice to the exhibitors of the stock which he was asked to examine; and he was prepared to give at once the substance of his report on the several classes.

The CHAIRMAN said the appointment of judges rested with the Council, who took all possible pains to have men whom they thought were the best fitted to discharge the duties.

Mr. J. HOWARD, M.P., complained that the arrangement of the Show Yard did not do justice to the exhibitors of implements.

Mr. H. S. THOMPSON and Mr. BRANDRETH GIBBS explained that the Council had studied the interests of the implement exhibitors, and made the best arrangements they possibly could, having regard to the shape of the ground.

A vote of thanks was then passed to the President.

THE NEW FARM.

"More enjoyable if not your own," I murmur inwardly, as I fold up to return a most tempting advertisement of an estate in North Wales, described as a "Virgin Estate," and containing besides some three thousand acres of cultivated land, no end of gorse hills, undeveloped slate, imagined coal-beds, innumerable wild gorges and cascades, just exactly what one enjoys most thoroughly as a tourist in quest of refreshment after dusty, exhaustive work in chambers, but what one wouldn't care to invest in, considering the trouble the development of such varied resources must entail, unless one were in possession of such a glorious "accumulation during minority," as Lothair found himself possessed of when he wavered between building a cathedral and a nest of innumerable cottages. There is a time of life at which one arrives when trouble really does bore. Activity, mental no less than bodily, one reads in disquisitions on the human frame, begins to hang fire at about the period when over-trained athletics break down—that is upon the near side of fifty. Then it is that Horatian maxims influence, and Horatian pursuits absorb—deep-bodied claret—the sound of rippling waters—the glancing, lustrous leaves—the voice of birds—and the consciousness of bills paid, with a juicy baluace left. At this period it is perhaps that the amateur agriculturist is in his bloom. He has by dint of judicious ample expenditure, deep cultivation, minute over-sight, and unwearied persecution of weedlings, brought his land to yield an annually improved solid lump. He can afford to experiment in the way of thin sowing, and has pleasure in recording his experience for the benefit of the agricultural community at large—amongst whom,

as amongst all pupils, there are plenty to doubt his ability and dieta. But away with philosophic reflection, it is too hot for that. To record results: First let me resume the old story of the autumn-planted potatoes. What are above ground appeared much later—as I have always found to be the case—than the spring planted; but, when once up, they rapidly overhauled them in the race, as though they have a stronger propulsive power somewhere, either in their roots finding more moisture from being lower placed, or from the stem's muscles being firmer because of their greater age. About one-seventh have not shown, even yet; but when I stirred the soil with my spud I found lots of white tender shoots working to get clear of their immurement. I have consequently sent a man with a fork to loosen the solidified mould along the line of the invisible. It would have been well if I had run Garrett's horse-hoe over the plot in the early spring, as I fully intended doing, but was over-advised. What a nuisance is advice! It is sure to put a man wrong unless his counsellor be intimately informed of every unknown quantity in the problems, which can rarely be done. But I will not dwell further on the disagreeable, except to say that henceforth I will follow no advice that does not fit in with my own inclination; and unsolicited advice I will throw back in the giver's face. But, as my temper's boiling, I had best proceed with my story and let reflection on the past alone. I have one pool the overflow of which runs on to a ryegrass plot that helps to supply the cart stable, and around which the wild ducks build, out of which it is impossible to shut a certain muck-yard element of stained liquor. On the

bank of this I am fixing a pump, and I propose to give the potatoes a good soaking therefrom by the help of watering cans. It will be a work of time; but, as Sutton wisely prints in his catalogue injunctively to swede-growers, "Without pains no gains." The root which produced in my man's garden over thirteen pounds of potatoes was indulged with one deep drink during the drought. Another plan I am about to adopt in my orchard was suggested in the *Bath and West of England Journal* for 1859, but which I will quote as it may not have fallen in the way of some, while others may have passed it over. An American apple-grower writes: "For several years past I have been experimenting on the apple, having an orchard of 2,000 bearing Newtown pippin trees. I found it very unprofitable to wait for what is termed the 'bearing year,' and it has been my aim to assist nature, so as to enable the trees to bear every year. I have noticed that from the excessive productiveness of this tree it requires the intermediate year to recover itself, to extract from the earth and atmosphere the materials to enable it to produce again. This it is not able to do unassisted by art, while it is loaded with fruit, and the intervening year is lost. If, however, the tree is supplied with proper food it will bear every year, at least such has been the result of my experiments. Three years ago, in April, I scraped all the rough bark from the stems of several thousand trees in my orchard, and washed all the trunks and stems within reach with soft soap, trimmed out all the branches that crossed each other early in June, and painted the wounded part with white lead, to exclude moisture and prevent decay. I then in the latter part of the same month slit the bark by running a sharp-pointed knife from the ground to the first set of limbs, which prevent the tree from becoming bark-bound, and gives the young wood an opportunity of expanding. In July I placed one peck of oyster-shell lime under each tree, and left it piled round the trunk until November, during which time the drought was excessive. In November the lime was dug in thoroughly. The result the following year was 1,700 barrels of choice fruit, besides cider from refuse. In October I manured these trees with stable manure, in which the ammonia had been fixed, and covered this immediately with earth. The succeeding autumn they were literally bending to the ground with the finest fruit I ever saw, while the other trees in my orchard not so treated, were quite barren, the last season having been their bearing season."

Careful treatment of the apple I have myself found to be rewarded. Our best orchard we have dressed the last two years, once with old night-soil, compost, and lime, dug in at the roots, and once with leaf mould, of which the chesnut wood affords us annually a quantity. We have had grand crops both years since, and there is a good show for the coming season: I shall, however, try to lime around the stems. The trees are too old to derive benefit from a splitting of the bark.

Our youngsters have taken to bathing, and as our broad river abounds with rapids I thought it best yesterday to inspect the scene of their enjoyment. I took down the garden syringe to give a drink to the young grass that is springing with a melancholy slowness, where I pared the broken banks. With one end of the gutta-percha pipe immersed in deep water, I worked away until I was quite hot, pumping now lustily, now softly to the amusement of my young geese, who were splashing in a quick current just beyond my range. "Papa's squirting the bank," they cried with delighted ridicule. In faith it taught me one thing, that is, to estimate the value of a good hour's rain. Only to watch the splashing shower absorbed so rapidly by the brown bank without leaving a trace, and considering the weight of my steady exertion I felt more than ever a longing that the brazen heavens would open

and let down a refresher on the parched meadow, to which we look for our winter supply of hay. Whatever the price of this article will be I cannot dare to guess. Certain it is that hereabouts there is no bottom grass, therefore right thankful am I that I put in thirteen acres of autumn oats after wheat, which are now in full ear, and I hope to cut when three-parts ripened in a fortnight, so as to get in mustard quickly, with a strong dose of artificial, the stubble being clean. This will come partly to cut in chaff with wheat straw, partly to consume with sheep. Then, it being my own land, I shall put wheat in again, having faith in Mr. Lawes' doctrine, that every soil has its idiosyncrasy. This particular plot is locally considered "to throw a capital crop of wheat, one of the best about." Why then not meet its inclination? The idea of the several soils in various combination being adapted to special vegetable growths bears on its surface persuasion to my mind. I shall at least try it, not being *tied* to the four-course, or any other system. "Some take coffee, some take tea," is a piece of sedimentary wisdom we owe our ancestors, which should never be lightly regarded, I think. So I shall indulge the land's humour to its utmost bent.

I have had several strangers lately to inspect my plots and their success. They are universally approved, and will be copied in each case. Now that the water-volume is shrunk in the river-course, the heavy, broad, rounded banks of washed-up gravel are clearly discernible, having filled several deep holes to the brim. There was but little damage done by the strong winter floods, excepting to the one that stood somewhat lonely, on a clay bottom, nor has that suffered since I erected a second, at about thirty yards' interval, to relieve the strain at that point, there being thereon, when the torrent is full, a tremendous blow of accumulated billows.

Grand is it to get your hay cut in the early morning. My mæchie was busy at four to-day, and the swathes (light enough, certainly) are already half-withered, while the horses, having finished for the day, are (it is not noon) reposing quietly, after a fill of vetches. Sleeping in the sun with wet stockings on is good for the nether limbs of neither man nor grass.

As I went to inspect the crop last evening, I heard over the hedge a peculiar cry of evidently a nursing mother, somewhat resembling the turkey, somewhat the brown owl. For some time I watched vainly, until suddenly it ceased, she having caught, I fancy, a glimpse of me across the lane. Yet an infantine wailing went on; and on my descending through the gap I found a little nigger of a bird, fresh hatched, which bit my finger resolutely, and covered my hand with oil. I discovered then it was the offspring of a landrail, and, as it would be deserted, took it home to the children, who deposited it amongst some young pheasants newly hatched, in and out of which it runs this morning quite lively, but with a lazy, listening look, such as one might imagine a gipsy-lad would wear if caught, upon the sudden skeddaddle of poaching parents, and introduced by his captor to the mercies of the village dame.

VIGIL.

HOW TO KILL LICE ON CATTLE.—A correspondent in the *Country Gentleman* dissolved about a pint of strong soft soap in a pail of warm, soft water, and saturated the whole of a lousy cow's body with it; after about thirty minutes, repeated the operation; and in thirty minutes longer took a pail of clean, warm water, and quickly and thoroughly washed out all the soap-water and dead lice in large quantities, put her in a warm stable, and covered her with a dry blanket. The next day, after being thoroughly dried, she looked, and seemed to feel, like a new animal, more than doubled her milk within twenty-four hours, and immediately commenced gaining flesh and general thriftiness.

OUR BRITISH FRUITS.

THE NATIVE WILD RASPBERRY.

Some years ago I was at considerable pains to show what could be done with strawberries where an acre or two of stiff clay land could be got and a little cheap labour, such as that of old men and boys, with the assistance of women in summer time to gather the fruit, and I was very much pleased to see the scheme well carried out in some parts of Denbighshire, on the borders of Cheshire, where the large towns with their railway transit secure a ready market for such goods. I am sorry, however, to see that the strawberry literature still lags behind the spirit of the age; for I find in some periodicals, where better things might be expected, the scheme advocated of growing the plants for several years—whereas the whole of the crop should be from a fresh plantation every year. The plants should be treated as biennials, the runners prepared so as to be well rooted early, and have at least July, August, and September in the fresh ground, the effect of which will be fine plump crowns and strong blossoms, and in due time high-class fruit; and whilst one advocates cutting off the runners to strengthen the plants, and another mows off the leaves for some imaginary good, all this labour is saved by trenching down the whole of the strawberry lines, leaf and runner, and thus effectually clean the land for some other crop. But to return to the raspberry. This truly British plant belongs to the rose family, and the veriest briar twig is not half so beset with prickles as the cane of the wild raspberry. Now the raspberry is a shrub, but much in the same way that the elder is a shrub or small tree, for they are both as nearly herbaceous in their characters as they could well be, so as not to be entirely so; for the raspberry canes shoot up their whole length one year, bear fruit the next, and then die down to the collar, so that when a new plantation is made there is this oddity about it, that you may get a crop of fruit from it the first year but none the second, hence it is necessary in raspberry growing to secure plenty of young canes every year to be the fruit-bearers in the following year. The raspberry is not at all improved by transplanting, and dislikes all digging, forking, or other interference with its underground system; for it employs its own travellers and sends out its suckers into fresh pasture every year; mulching or liquid manuring of course must be provided to meet the heavy strain upon land bearing such a weight of wood, leaves, and fruit. But instead of going all over the details of raspberry culture, their distance from row to row and from plant to plant in the row, and stating the various methods that raspberry canes have been tied—to rails, ropes, rods of iron, and one cane tied to another for support, in order to give the suckers room to grow as well as the fruiting canes, all this the familiarity of the subject renders unnecessary. I will give two notable examples, one of the finest canes and finest fruit I ever saw produced by any gardener under any circumstances, and the medium in which they grew, and another of the wild raspberry, in a hedge-bank, itself forming the best part of the hedge, where the fruit, though small as compared with the cultivated sorts, was high-flavoured; and here let me remark that we have scarcely any fruit, whether native or foreign, of higher flavour than well-ripened wild raspberries. Near Torquay, in Devonshire, stand the ruins of a religious house called Tor Abbey, partly inhabited as the family residence of the Cary

family, and partly in ruins. The tithe barns still standing bear testimony to the extent of the Abbey; but among other changes that had come over the place, one could not be mistaken in identifying the place of burial, for in that consecrated spot, among the forgotten dead, there were here and there carvings marking the graves of men of note, with stone coffins not a few, and other articles peculiar to places of sepulture. This grave-yard had long been used as a kitchen garden; and the soil in the lower part seemed a sandy black mould, of unknown depth. In this particular locality, and elbowing the stone coffins and carvings above-named, there grew one long row of raspberry-canes. These were in height like fishing-rods, and as thick as an ordinary walking-stick. They did not appear to have been disturbed for several years, and were not likely to be so for some time to come, since all ideas of improving their condition were quite out of the question, as they yielded annually a heavy crop of high-class fruit, and plenty of runners to form fresh plantations. Whoever, therefore, would excel in raspberry-culture, must bear in mind that, although the suckers or runners necessarily live just under the surface of the soil, the real feeders of the plant, its proper roots, penetrate after food to a great depth, and are glutinous fowl feeders; indeed, raspberry-canes seldom, if ever, get enough of manure, for it should be deep in the earth, out of the way of drought and changes as well as near the surface; and this is the practical lesson to be got from the Tor Abbey canes, for it will be at a very great depth that we should now find the mortal remains of that once important community where loving hands had laid them with pious prayers, and more or less of cremonial. With a fine south-western climate, and the locality only a few feet above the sea level, and sheltered by tall trees, everything was in favour of growing fine fruit, but the prime mover was the charnel house of the ancient community, and the plants moored in that medium might well send up shoots that seemed like giants rising from their graves.

But our immediate business is not so much with the cultivated raspberry as with the wild one, and the finest example of an artificial plantation of these that has come under my observation I will now endeavour to relate: An English nobleman* who had begun life as a baronet some four score years ago had a field very near his residence, and this field had been nick-named the "*Hodge Field*," from the fact that it had given employment, nearly constant, to a small gang of labourers during his lordship's very long life-time, for his lordship had vowed very early in life that the "*Hodge Field*" should be drained and levelled regardless of expense. Now this field was only a gusset of land of some three or four acres in extent, and when the adjoining fields had been enclosed this had been left by itself, on account of a dangerous swamp into which cattle and horses at various times had sunk; and you might hear in confidence from some aged crone, that at some remote time human life had been sacrificed in this dangerous bog-hole, in proof of which it was stated that at long intervals the ghost of

* He has been dead many years ago, and his talented son succeeded to the title and estates, and died lately, so that this is no personal affair now. We speak of the character of kings after the death of their successors, and so of other men.

the deceased, whose body had not received Christian burial, visited the "Hodge Field," and the dull lines of yew hedges in the adjoining garden. I do not vouch for this digression, but "tell the tale as it was told to me." The plan for improving the Hodge Field had been duly settled as I said before by the baronet early in life, and certainly it was a magnificent idea; the chief features of the plan consisted in cutting a great ditch along its lower side of such breadth and depth as to give plenty of materials to fill up all inequalities on the surface, and also to secure a plentiful outfall for the drains. But the bog when cut into presented engineering difficulties of no ordinary kind, a shifting sand being one completely barring all drainage, and this was accompanied with a layer of very soft black peat, and when the soil had been flung on the bank from the drains it was nothing unusual to find the bank give way and choke the drain, and as the general soil of the field was a sandy loam the walls of the drains invariably fell in just at the water line, so that the wounds of the Hodge Field once opened had to be kept running in open ditches for many a year. Now, although his lordship never succeeded in draining the Hodge Field, he did succeed in making such a bank of wild raspberries as I fear I shall never see again. The perverseness of the elements in this simple affair may be seen from the fact that when water was wanted in summer there was never any in the Hodge Field, but when water was abundant this ditch was always flooded, yielding besides water a heavy layer of mud and sand. This is not to be wondered at, since no outfall had been provided; but when the ditch was dry the hedge bank was made good with a layer of mud, plastering up all inequalities, and giving an air of high finish to the raspberry hedge, that bristled out all over the steep sloping bank. By capillary attraction this hedge got any amount of moisture it might require without being stagnated, and as it faced the north, and was fortified against in-

trusion by a deep ditch in front; it had all that raspberry plant could desire, and on its part it yielded such a thicket of prickly canes, every cane being armed with thousands of sharp-pointed prickles, as secured its character for being a trustworthy hedge plant. In the shady woodland we find the wild rose, the bramble, and the raspberry enjoying the layer of fine-leaf mould, and the calm shelter of the trees overhead, and the moderate degree of shade is evidently beneficial to these three sisters of the rose family.

Plants that will thrive in the shade are especially important, and fruit-bearing ones are sure to be duly appreciated when once they are understood; surely there is no want of shady banks of earth where rich mud could be got, and a quantity of wild-raspberry plants laid on them, and kept there by a layer of earthy puddle or mortar, made of manure and earth. If a fence has to be maintained, try one of raspberries, for it has prickles like any other hedge plant, and has, moreover, fruit which no other ordinary hedge plant possesseth, for the tart bitter berries of the hawthorn would be a sorry substitute for the highly fragrant and delicious raspberry. Young amateurs find that there are a great many difficulties in the way of growing fruit. Always beginning at the top of the ladder instead of at the bottom, they try to grow exotics: one will grow early cucumbers whether or not, no matter how useless they may be, even should he succeed. Another strikes out boldly for melons, and a third struggles with apricots and peaches, all delicate, and all liable to be devoured by insects and all slippery customers, easily mismanaged; but had the beginner tried his hand first on our native fruits, on plants that could take care of themselves, such as the raspberry, the strawberry, and the plum, he would have been encouraged by his success, and would have gained experience to go on to the cultivation of greater things.

Salford,

ALEX. FORSYTH.

THE AVERAGE PRICE OF BRITISH CORN, AS AFFECTING THE TITHE RENT CHARGE.

At the last meeting of the Newbury Farmers' Club, Mr. TANNER read a paper, in which he said: This subject naturally divides itself into two questions, viz.: What is tithe rent charge? and, How that rent charge is affected by the mode in which the averages of British corn are arrived at? 1st. What is tithe rent charge? It is, as we all know, a charge on land in lieu of tithes. Then we naturally ask another question—What are tithes? I shall, with your permission, make a few remarks on tithes, as distinct from tithe rent charge, as preliminary to the subject, that of corn averages, which is more immediately before us to-day. What are tithes? I am indebted to the authors of the *Encyclopædia* published by the Society for Diffusing Useful Knowledge for much of my information. The description of tithes there given is this: "Tithes are the tenth part of the increase yearly arising and renewing from the profits of land, the stock upon land, and the personal industry of the inhabitants; and are offerings payable to the Church by law." Now, as to the origin of tithes. The first mention of tithes we find in the best of books, the Bible, and, whatever infidels or scoffers may say to the contrary, I fearlessly assert that it is the very best authority we can have on all subjects, whether for the government of a country, or for the regulation of our own conduct as individuals. Under the theocratic government of the Jews, the tenth part of the yearly increase of their goods was due to the priests by divine right. In the early ages of the Christian church, payments were enjoined by decrees of the church, and sanctioned by general usage. In England, the first instance of a law for the offering of tithes was that of Offa, King of Mercia, towards the end of the eighth century. He first gave

the church a civil right in tithes, and enabled the clergy to recover them as their legal due. This law was afterwards extended to the whole of England. At that time, although every man was obliged to pay tithes, the particular church or monastery to which they should be paid appears to have been optional. In the year 1200, Pope Innocent III. directed a decretal epistle to the Archbishop of Canterbury, in which he enjoined the payment of tithes to the "parsons" of the respective parishes in which such tithes arose. A work by Watson on tithes informs us that tithes were of three kinds—prædial, mixed, personal. Such as arise from the earth or the produce of the land, grain of all sorts, fruit, and herbs were called prædial, so called because a piece of land in the canon law was called Prædium. Things nourished by the earth, as colts, calves, pigs, lambs, chickens, cheese, and eggs were called mixed tithes. Personal tithes were paid from the profits arising from the labour and industry of men engaged in trade or other occupations, being the tenth part of the clear gain after deducting all charges. Tithes were again divided into two kinds—the great or rectorial tithe, the small or vicarial tithe. The mode of collecting tithes in kind, as adopted for many years (though scarcely in the recollection of many of the farmers of the present day), was a fruitful source of irritation, and constantly disputes arose between the clergyman and his parishioners. Dr. Paley, in his "Moral and Political Economy," chapter 12, says, "No measure of such extensive concern appears to me so practical, nor any single alteration so beneficial as the conversion of tithes into corn rent." This principle of commutation was first proposed to be applied by the legislature to Ireland. The Act of Parliament for the Commutation of Tithes in England

and Wales, is the 6th and 7th Wm. IV., dated 13th April, 1836, and which has been generally carried out. There can be no doubt that on the whole, the substitution of a rent charge in lieu of tithes has been a most beneficial change, and the fact that the general average for the last 34 years for £100 apportionment amounts to £100 19s. 5d., speaks for itself. The basis for that apportionment was—

Wheat	7s. 0½d. per bushel	56s. 2d. per qr.
Barley	3s. 11½d. per bushel	31s. 8d. per qr.
Oats	2s. 9d. per bushel	22s. 0d. per qr.

If that was a fair basis under the law of Protection, is it so under Free Trade in Corn? I think not. I think it operates against the interest of those who have to pay the rent charge. At that time £100 represented—

		Average for
		Dec. 1869.
Wheat	283 bushels	320 less.
Barley	512 bushels	442 70
Oats	720 bushels	640 80

You will thus see that while wheat has decreased, barley and oats are increased in price. I now come to that part of my subject more immediately before us to-day, viz., the mode of taking the Averages of British Corn. In obedience to the Act before mentioned for the Commutation of Tithes, the Comptroller of Corn Returns is required to give, on the 1st of January in every year, the price of a bushel of wheat, a bushel of barley, and a bushel of oats, computed from the weekly average of the Corn Returns during the seven preceding years. A rent charge is of the value of a certain number of bushels of corn—that is to say, one-third wheat, one-third barley, and one-third oats. Supposing a rent charge to be worth £300 per annum, the average price of wheat being 10s. per bushel, barley 5s., oats 2s. 6d. per bushel, the £300 would then represent 200 bushels of wheat, 400 bushels of barley, and 800 bushels of oats. Thus we see the great importance that the average price of British corn should be obtained with as much correctness as possible, both for the calculation of the rent charge and corn rents regulated by the same. The Act of Victoria, sec. 2, cap. 14, passed on the 29th of April, 1842, entitled "An Act to amend the Laws for the Importation of Corn," contains a schedule of the towns from which returns were made for ascertaining the averages to regulate the duty on corn; the same returns have been adopted for the tithe rent charge. This schedule contains the names of 273 market towns taken from the 40 counties of England, and 17 Welsh towns, making the total number 290 from which returns were made. That Act was partially repealed on the 29th of July, 1864, so far as that 140 towns and 4 counties were struck out of the schedule altogether, and also 11 of the Welsh towns. I think you will agree with me, that districts growing secondary qualities of corn are not represented, while other districts growing the best qualities are represented. [Mr. Tanner then entered into statistics, reciting the schedule of towns for making corn returns, as shown in the two Acts of Parliament.] He continued: If it is necessary to have a larger number of towns to get an average to regulate the duty on corn, surely it must be equally so for the tithe rent charge. Here, then, we have a most important Act of Parliament, affecting the averages of British corn passed, of which those who are most concerned know very little about. I think I am correct in saying so, because I have found but few men either buyers or sellers that know or are able to give me any information on the subject. At first sight it may not appear likely to affect the question, but when you consider the fact that one half of the towns, or nearly so, are now struck out of the schedule, is it likely that so correct an average can be obtained? I consider the larger the number of returns the better provided they fairly represent the district from whence they come. Every corner of the kingdom where corn is grown should be represented. The towns now left out ought to show the same average as those from which returns are made; but to get these would be an undertaking much too gigantic and expensive for a private individual, but which ought to have been done before those towns were excluded, and may have been obtained for aught I know to the contrary; but the chances I think are against it. I have taken the average from the Reading paper for eleven towns in our immediate neighbourhood, but I do not place much reliance on their correctness,

Schedule of eleven towns, from Reading paper, for the year ending December, 1869.

	Wheat.	Barley.	Oats.
Abingdon	48.8	39.5½	29.4½
Alton	49.3	34.6½	32.0½
Honey	50.8	39.10½	25.5½
Hungerford.....	47.4	37.2	27.5
Newbury.....	47.1½	36.1	27.9½
Oxford.....	46.10	30.3	26.6
Wallingford.....	47.2	34.1	26.9
Reading.....	50.7½	35.10½	27.1½
Basingstoke ...	47.9½	36.6½	27.3
Didcot.....	49.1	37.6	29.0
Wantage.....	50.5½	38.5½	26.10
	<hr/>	<hr/>	<hr/>
	48.6	36.5	26.10
	<hr/>	<hr/>	<hr/>
Willich	48.2	39.5¼	26.0
		<hr/>	<hr/>
		29.¼	

There are eight counties, and some of the large ones only represented by one market town. I think you will agree with me, that one town in any large county cannot give a fair average, because as many of us know to our cost that at times one district of a county suffers from drought or blight, or wet, while the other parts of the county are less so, or do not suffer at all perhaps. It often happens the wheat is blighted, the barley is thin, or the oats light in one part of the county and not elsewhere, particularly in wet and cold seasons. Take, for instance, our own county of Berks. Can it be right that Reading, which shows the highest averages in the list to which I have alluded to just now, and Windsor, the district for white wheat, of a good quality, should be chosen to represent the county, while Newbury and Wantage the large red wheat markets of wheat of secondary qualities should be unrepresented? Take Surrey—That is represented by Guildford, while Croydon, Kingston, and Dorking are left out.

Mr. Tanner then read the following letters he had received on the subject:

DEAR SIR,—I am surprised to find that Guildford is the only town in Surrey that sends a return of the corn sold in the market. To my mind it is clear that the county is prejudiced thereby as regards the averages, for I take it that Guildford market is about the highest of any in the county, and it is notorious for having brought to it some of the heaviest and best wheat.

Croydon, May, 1870.

Yours very truly,

ROBT. FULLER.

Wiltshire again, represented by Warminster only, leaving out Swindon, Salisbury, Devizes, and others.

My dear Sir,—I think the Warminster market a low average for wheat for the county. That I am of opinion that it is very high for barley and oats. I thought I could have sent you the average for the last six months from Michaelmas to Lady Day, but I believe the wheat was £2 ls. 11d., barley about 38s., and oats 21s. 6d. I know this is near what was sent me, and if of any service to you, you are kindly welcome to it.

I am, my dear Sir, yours faithfully,

W. FERRIS.

Manor House, Milton, Pewsey, Wilts, May 18, 1870.

Hampshire,—now we find that from some cause or other only one town was crossed off the schedule: that of Christchurch, and is represented by nine towns (I do not complain of that being too many), but if necessary for Hampshire why not for other counties? I have a letter which will give a specimen of one of the markets (that of Havant), from which a return is made:

"In reply to your questions about Havant market I have to inform you that I have seen my neighbour Mr. Gibbons. He says there is no market at all. Mr. Gibbons says he has been here 12 years, and he has never sold a sample of corn or heard of one being sold at Havant market. I think I have seen a notice about corn averages, but it must be all a farce, if there is nothing sold. Chichester and Fareham are the markets for this neighbourhood." I think this shows that the subject has not received that attention from headquarters that it ought to have. Why should four counties be left out altogether? Rutland, it is true, has a very small area. Well then, take Hereford and compare it with Westmoreland, the area of the two counties being nearly

the same. By the statistics taken from the Agricultural Returns of Great Britain (which, by the bye, I do not consider at all a good authority, but may give some approximate return sufficient for this purpose.) These statistics show that Hereford has 178,405 acres of land under corn, green crops, &c., not including permanent grass, such as meadows. This county is not represented at all, while Westmoreland, having only 50,686, is represented by two market towns. Durham, famous for coal and mustard, quite a coal district, has five selected towns; while Hertfordshire, Middlesex, and Surrey, the three counties together with a much larger area and much more of a corn-growing district, have only the same number among them, viz., Hertfordshire 2, Middlesex 2, Surrey 1. Shropshire shows 300,000 acres under corn and green crops (omitted altogether), Staffordshire 216,270 ditto, and yet Westmoreland, with only 50,000, is represented by two markets, and the area of Staffordshire and Shropshire, being nearly four times as much, not represented at all; yet Shrewsbury, Stafford, and Wolverhampton are very important markets, I know personally. Take some of the eastern counties, about the same area, and compare with some of the southern counties:

Norfolk	12	Somerset.....	4
Suffolk	9	Gloucester	4
Cambridge	3	Dorset.....	1
Huntingdon	2	Wilts	1
Bedford	1	Hants	9
Hertford	2	Berks	2
Middlesex	2	Oxford	1
Essex	3	Bucks	1
Surrey.....	1		

35 23

I may be asked what has all this to do with the Corn Averages? Simply this—Take the counties I have just mentioned, the eastern counties as a rule grow the finest barley, and some of the finest corn generally. Now, if these counties send in 35 returns against 23 in those counties where the corn generally is of an inferior character, the result is obvious. The present mode of taking averages I think tells more on the average prices of barley than either of the other sorts of grain, which averages, as I mentioned before, have increased, while wheat has gone back, and though we know barley has taken a high price for the last year or two, I do not think many of us have made an average equal to the average shown in Willich's tables for the year ending December, 1869, viz., 39s. 5d. per quarter. There is no doubt that farmers using, as they do generally, all their tilling corn, both of barley and oats (more so I think than wheat) all has its effect on the average. From these facts we have a strong argument in support of Farmers' Clubs and Chambers of Agriculture. I venture to assert that one half of the farmers of this country do not know anything about this short Act of Parliament of the 29th of July, 1864, and which I cannot help thinking very seriously affects the average of British corn. I further venture to assert that that Act would never have become the law if Farmers' Clubs and Agricultural Chambers had excited as much interest as at the present time—and why was it passed? To save a little expense *alias* trouble. The preamble of the Act runs thus: "Whereas, with a view to a diminution of the expense occasioned by the publication of accounts and averages; and incurred in the performance of the duties of the office of Comptroller of Corn returns, it is expedient that the provisions of the said Act (the Act of 1842) be altered in some particulars." Then, as here stated, it was a simple Act of economy. I think you will agree with me when I say, I think this a very legitimate way of spending public money, for what can be of much more importance to a large class of tax-payers than that every trouble should be taken and every reasonable expense incurred to obtain a correct average price of British corn? on which depends the working of this great measure—ascertaining the rent charge payable every year for the whole kingdom. You will now ask me What remedy do you propose? First.—I should say let all the counties in England and Wales be properly represented. If they are so already, the Comptroller of Corn Returns must be in possession of statistics to prove it, and if so, let our Members be respectfully requested to move for such returns to be made. Secondly.—That the sellers should make returns as well as the buyers. Why are not the sellers in the country to be trusted to do as

they do in London; there, it is the seller and not the buyer. Agricultural statistics are collected with great expense, and not very satisfactory after all. Why cannot the same machinery be used—say once a quarter let every farmer return the corn he has sold, and to whom, and the quantity of tilling corn used, and let the price be put on that, after a certain rate, 10s. below the best, or any sum that be thought right. The number of market returns need not, I think, be even so numerous as now, only with more apparent regard to the corn-growing districts, and the area—I say apparent because in looking over the list of markets I think it must strike everyone that some districts are not properly represented. I would also inflict a heavy fine, or even imprisonment, on any party who refused to make a proper return, or for making an unjust return. It has often been remarked that seven years is too long a time over which to throw the average for the rent-charge. There are some cases in which it operates harshly. Take, for instance, a man with a farm on a short lease. At the end of his lease it does so happen that sometimes he has to pay for several years a high rent-charge while taking a low price for his produce. His successor, perhaps, pays a low rent-charge, and in the meantime getting a much higher price for his produce. I think myself three years would be better, or perhaps best of all to take it annually. Some say, why not make the tithe apportionment a fixed charge? but that could not be fairly done until the annual rent-charge and the apportionment should be equal, and then if that good time, of which we have often heard as "coming" for some years past, should come, the owner of the rent-charge would not participate in it. I do not wish by any means to impute that the corn averages are otherwise than fairly taken; but with these facts before us, I do not think it unreasonable to suppose that some improvement might be made, both in the area and the present mode of obtaining the average price of British corn.

Mr. Tanner then read the following letter from the Rev. C. W. Everett, of Woolhampton: "In my paper on 'The Agricultural Interest,' which I read last year to the Club, I made these remarks on the Tithe Rent Charge—'The tithe rent charge is another impost which is usually paid by the tenant for the landlord. If this was a fixed charge, or if the tenant received back, when he paid his rent, the sum he had disbursed for tithe, it would not much matter (as between the owner and occupier of land) by whom it was paid. But as this charge, on an average of seven years, varies very considerably in amount, it may happen that an incoming tenant has to pay a high rent charge at a time when the market price of his produce is low. I have no hesitation in saying, as a tithe owner, that I should be very glad to see the annual tithe rent charge stand at its commuted value. The experience of thirty-four years has shown that, in the long run, the commuted value is very nearly a correct one; and I believe that it would willingly be adopted by the larger part of those who have to pay. I should, with pleasure, join in any move to induce the Legislature to sanction this amendment of the law.' By taking the commuted value as the fixed annual value, you would also get rid of any question as to whether the averages are now taken fairly or otherwise. In fixing the commuted value, the rule was this—for making a compulsory award the Tithe Commissioners were to ascertain the clear average value (after making all deductions on account of the expense of collecting, preparing for sale, and marketing, where such tithes had been taken in kind) of the tithes of the parish according to the averages of seven years preceding Christmas, 1835. As this was acquiesced in at the time as an equitable rule, and as the act was passed to satisfy the tithe payers, not the tithe owners, it would scarcely be just to make any objection to it at this late period. Where the tithes had been compounded for during the seven years ending at Christmas, 1835, the composition was to be taken at the clear value of the tithes, and this also seems fair, as it was binding parties to an agreement made for their mutual benefit, and voluntarily made. If in any case the tithes had been compounded for, on the principle of the composition being paid free from rates, the Commissioners had power to make such addition on that account as should be an equivalent; because the tithes were to be commuted (under the Act) as being subject to rates. You have now the full benefit of anything I might have said to-morrow.

"Believe me, yours truly,
"C. W. EVERETT."

DAIRY FARMING.

At the last monthly meeting of the Whitby Chamber of Agriculture, Mr. J. G. W. Farsydc in the chair,

Mr. KERR, jun., said the dairy occupied a most important position in the agricultural industry of this country, many large districts being peculiarly adapted and almost entirely adopted to dairy farming, whilst it formed an integral part of almost every farm in the kingdom. To the small farmer of limited means the dairy offered many inducements and advantages. The capital employed in agriculture was for the most part locked up for some considerable time, but the small portion which was invested in dairy stock brought an immediate return, and from this source money came in conveniently to meet household and other expenses. The first consideration in establishing a dairy must be the class of land and the quantity and quality of the animals it was calculated to carry. It was advisable to have them rather under than over the capabilities of the soil. In the former case, the animals would improve and the land have a better chance. This would apply to all breeds of animals, and its recognition in purchasing breeding stock would not fail to bring about a successful result. A man having a large capital might purchase a large-framed animal, and endeavour to bring his land up in condition to be able to feed it; but whatever the outlay might be, he could not so easily alter the character of the soil in a short time. In fact, some men would never be able to keep such animals with advantage. It was, therefore, important to keep the land and the stock in about the same ratio in improving condition. If the dairy was to be the principal source of profit on the farm, then, apart from every other consideration, the breed of the stock ought to be selected for its large milk-giving capacity. On the other hand, when milk, butter, and cheese were only a consideration in conjunction with the breeding and rearing of cattle as a source of profit, then a more valuable breed would be desirable—one which would reach maturity at an early age, so that in whatever condition it was sold off it would bring remunerative prices. For their quantity of milk, for keeping in good condition in such a country as this, he thought the Ayrshire breed could not be excelled, though they were little known or appreciated in this part of the country. The breed was characterised by hardness of constitution, the cows keeping themselves in good condition, whilst giving a large quantity of milk in proportion to the food they consumed. There was a great objection to keeping large-framed cattle on light land, as must be seen, and the loss was little more than covered by the whole season's produce. The Ayrshire cows had a compact frame, and were easily kept up, and at the close of the season they would invariably find the cows in good condition. He believed they could not try a better cross than one between a pure Shorthorn bull and a pure Ayrshire cow. A stock thus brought up would be very valuable, inheriting, as it would, the large milking capabilities of the one and the fattening qualities of the other. In every case where the object was two-fold, the stock should be sufficiently well-bred to be fattened and cleared off in two years, so that the permanent stock of milkers might be as little interfered with as possible. Pure breeding tended largely to economise food, and the quality of arriving at early maturity materially hastened a return of capital. A well-bred bullock would bring as much at two years old as another would a year later if its parents were coarser bred. The possession of well-bred animals afforded a certain amount of honour and pleasure. Nothing could be more unsatisfactory than putting good food into a bad skin, and no amount of care could make up for a want of breed. If the animals had to be kept as store, they were always remunerative in proportion to their quality. At some dairy farms very good results were obtained by rearing only the heifer calves, keeping them till after the second calving, and disposing of them towards their third calving time, when they could generally be sold for high prices. By adopting this plan the produce of the dairy might be lessened to some extent, but, on the other hand, there were never any old cows to be weeded out, which must be sold for less value, and thus make a great inroad on the profits of the

season. Besides, the milk of the aged cows was not so pure in quality, and therefore not so productive, as that of younger cows, whilst taking into account the greater amount of food they required, a consideration which could not be overlooked, there was an inducement to part as quickly as possible. They should seek to get a good name for turning out thriving animals, and good specimens of their respective breeds, in order to insure success. It was of the greatest consequence that no pains should be spared to procure purely-bred bulls. No cross-bred animals, no matter on what pretence, should be used for breeding purposes. However hardy the constitution, or however good-looking, the stock would go down. A most inestimable boon had been conferred on farmers by those gentlemen who, with most untiring perseverance, devoted their time and capital to the selection and improvement of different breeds of cattle, and especially in Shorthorns. Such praiseworthy examples were by no means scarce in any part of the country, and many had now the good sense neither to pamper or over-feed their animals, but turned them out in good breeding condition, such as they might be expected to be kept in by those who purchased them. At the present time, it was an easy matter to procure Shorthorn bulls of good quality at prices within the reach of men of moderate means. The extra price of such an animal now was not worth consideration, as it would very soon be covered by the improvement of the young stock, and by the time they were two years old the bull might be considered out of debt, and his influence for good would be felt for a long time afterwards. He was afraid that some people were too impatient of results on this point, because they did not see the full benefit of their outlay all at once, and would go on from year to year using the best animals they or their next neighbour happened to possess. It must be admitted that the success accompanying the breeding of good cattle under proper management would be much greater than the breeding of inferior stock. It was of great importance to the farmer owning a number of cows that his success in rearing calves should be as great as possible. Every calf lost was of great consequence. Not only had their places to be supplied, but he would find it impossible to replace them with animals of the same stamp as his own. The greatest care, therefore, should be taken during the time of gestation, and all cases of premature birth should be avoided as much as possible. All doorways should be made roomy enough to prevent crushing, and instead of the rough usage sometimes administered there should be kind and gentle treatment, and anything conducive to the comfort of the animal ought to be studied. He felt sure that only a person of very narrow mind could regard these directions as unnecessary to the remunerative working of his dairy. Parturition in the cow might be attended with difficulty and required judicious action, and ought to be well understood. It was most disgusting to see the way in which cows were treated sometimes under these circumstances. Main force was exercised, and the result of such treatment was often the death of the cow from inflammation and its consequences. Every man would agree that this conduct was cruel. A cow ought to be left to herself and kept as quiet as possible, except under extraordinary circumstances, and then only such force used as was consistent with the case. Then, a calf should never be allowed to suck its dam when she was intended for milking purposes, as there was a difficulty in teaching it to drink afterwards, and the mother having taken kindly to her offspring, refused to let her milk down when it was taken away. The calf should be fed frequently with its mother's milk, in small quantities at first, and in order to give it a fair start in life, it ought to feed on new milk for three weeks, or longer if delicate. Then oil cake gruel, sliced turnips, and a little hay should be given in sufficient quantity, according to the age of the animal. It would thus be kept in a growing and thriving condition. It was a well-known fact that quarter-ill, a disease so prevalent and fatal amongst young cattle, was less frequent where they were liberally fed on cake. No greater mistake could be made than to allow young animals to go back in condition. Wherever such was the case, and

they became stunted in their growth, they could never fairly recover the effects of it. During the first month, it would be found a safe plan to give three doses of castor oil, which might prevent many of the ailments to which the young animals were subject. Each calf ought, if possible, to have a separate compartment, and be left at liberty. They would do much better in this way than if tied up by the neck. If they could not find a separate compartment for each, they should put three or four in a loose box or comfortable shed, where they could be easily fed, and with a rack or manger for their use. The better they fed a cow the better her produce would be, and the greater the profit. Yet how many owners of dairy stock acted as if it were of little importance whether the food was up to the mark, either in quantity or quality! Such treatment was just the reverse of the teachings of reason and common sense. No animal was more grateful, and gave a more liberal return for liberal treatment. Without good food, a cow, however good her milking qualities might be, would not continue long in full profit. During the summer months, the pasture was their principal dependence, and on good land nothing else was required, but much harm was done by allowing cows to remain in the fields far into the autumn while in a milking condition. During cold and wet nights they could only seek out the best shelter the hedges would allow and there lie down, whereas a small quantity of food in the house would be as good as what they could get out of doors, and they would be kept warm and comfortable. If they lost flesh in the winter it was not easily made up again; besides, at that season butter was scarce and prices were rising, and so it paid to give both food and shelter to keep up the supply of milk. The quality of the food and the regularity of giving were most important and essential matters. There was a striking difference between the milk and cream of cows fed on hay and straw and the milk and cream of those fed on cake or meal in addition, the former being comparatively thin and poor, while the latter was thick and rich. Not only was the produce of the dairy increased by cake, but the manure made was of very superior quality. This was a fact of great importance. It could not be expected that pastures would continue to yield the same quality of milk, butter, and cheese unless some return was made to keep up their fertility. Many of the large dairy farms of Cheshire had been allowed to get into such an exhausted condition that the farmers had to resort to crushed bones, and apply them at the rate of seven cwt. and eight cwt. to the acre. The construction and careful management of the dairy demanded serious attention. If this was neglected, it was in vain that good cows and good food were provided. There were many dairies in which no expense had been spared to render them perfect, but these were principally on the home farms of gentlemen. With the ordinary farmer the case was very different. The dairy ought to have a north or north-west aspect, and away from the vicinity of manure refuse or other sources of offensive smells, which were almost inimical to dairy produce. The floor should be laid with cement or tiles, to prevent damp. They knew in how many cases the dairy was the contrary of all this. With regard to the utensils, he had not much to remark, and he doubted much whether the leaden cooler could be surpassed, except by glass. There were a great many new inventions in the way of churns, many of which cost a lot of money, and were, at the same time comparatively useless. The barrel churns, in simplicity, were scarcely to be surpassed. In making butter, the great desiderata were cleanliness, good ventilation, and the presence of pure air. The improvement in the art of cheese-making, especially in the large dairy districts, had been very great; but it could not be denied that the making of cheese was still in an imperfect state, and it was therefore desirous that men of patient research should apply themselves to this subject. It was well known that many individuals in this district had attained a high standard of perfection in this art, but many were still far behind. He believed that cheese-making was no exception to the rule which applied to other branches of agricultural industry—that science might yet do much to improve it and materially add to the practical results.

The CHAIRMAN said, with reference to the Ayrshire cattle, they were a fine breed, but there were very few of them in this district.

In reply to the Chairman, Mr. KERR, jun., said an Ayrshire heifer, in calf, could be bought for £14 or £16. They were larger than Alderneys.

Mr. PEARSON said he had had some experience with Ayrshire cows, and had been in Ayrshire, where they were kept in great numbers. He had been on two farms—one where 130 and another where 100 of these cows were kept. When the cows came in to be milked, a girl was expected to milk ten in an hour, and as soon as the cows were taken out the manure was all washed away, and there was no more smell in the cow-house than there was in that room. He believed the Ayrshire cows were better than Shorthorns for giving milk, and he thought a cross between them and the Shorthorns would be the best breed we could have for this part of the country. The Ayrshire cows were very pretty animals, but Ayrshire farmers would not sell them their best animals; still, any man who had a mind to go into Scotland would be able to get a good animal if he was willing to give the price. He had gone there to buy some tups to improve his breed of sheep. The Ayrshire land was not good pasture land, and not so good as in this part of England.

Mr. HARRISON wished to know if Mr. KERR could tell them what was the average quantity of milk an Ayrshire cow would give during the season.

Mr. KERR said he could not answer the question. He considered the Ayrshire breed to be superior, however, to the Shorthorns for dairy purposes, especially on light soils and indifferent pastures.

Mr. HARRISON said the pure-bred Shorthorns were not kept for their milking qualities, but their fine points and feeding qualities. There was a class of animal that had some relation to them called the Yorkshire cow, which was a strong hardy animal, and gave a good quantity of milk and butter, and was as well a good feeding animal; and when not kept too long was very profitable indeed. The two-year-old stores were sold at from £10 to £12 each. He had had some crosses from the Ayrshire breed, but he never considered they were equal to the Yorkshire cow, and never gave the quantity of milk.

The CHAIRMAN was afraid that the Yorkshire breed had been so crossed that it would be difficult to get a pure-bred one now.

Mr. HARRISON: They have been crossed to improve their fattening qualities.

Mr. PEARSON said, in reference to the calves, that he gave them cake as soon as he could get them to eat it. He gave them, in addition, some cold water or turnips. After the new milk he gave them a little old, and then the cake. He never gave them any gruel whatever, and he generally sold his heifers at a year and a-half old for £9 each. He sold the last for that at Malton, and the market was not good, on account of the condition of the grass.

Mr. ELLIOTT said where there was a scarcity of milk for the calves there was, do doubt, nothing like cake.

Mr. PEARSON said that when he gave £12 a ton for cake he expected £5 out of it in his cattle, and the rest went to his land.

Mr. HARRISON said it must be pure cake.

Mr. ELLIOTT could see the profit out of his calves when fed on oilcake clearer than anything else. They would eat it from the time they were a fortnight or three weeks old. He would never feed a calf for the butcher.

Mr. WIMPRA said he had lately sold two two-year-olds of the Yorkshire breed, crossed by Shorthorns, for £27.

The CHAIRMAN said, with reference to the making of cheese, he had never tasted better cheese than some that had been made in this neighbourhood.

Mr. THISTLE thought they were making as good cheese here as they were now doing in Cheshire. No doubt the agricultural shows had done much to further the improvement in cheese-making.

Mr. PEARSON said it should be borne in mind that there was nothing so susceptible as milk to bad smells, or that more readily took up any injurious gases, and this rendered it the more important that the dairy should be kept clean.

Mr. HARRISON said the tenant farmers were obliged to put up with such buildings as the landlords erected, and many of them were not at all fit for cheese-making. Good wives would take every precaution they could in the way of cleanliness, but he thought there was a great dereliction of duty on the part of landlords in not providing sufficient dairy accommodation. The dairy was often the only repository that could be found for the provisions of the house. The dairy ought to be

separate apartment, and until they had a more improved system of farm buildings they could not succeed in making good butter and cheese. He hoped the day was not far distant when the attention of the landlords would be directed to this matter.

The CHAIRMAN thought it was the duty of the tenant farmer to press it upon the attention of the landlord.

Mr. HARRISON said, with reference to the produce of the Yorkshire cow, she would average 5lbs. or 10lbs. of butter per week. He knew one that yielded 16lbs. or 18lbs.

Mr. ELLIOTT said she must be a first-class animal that would produce an average of 7lbs. of butter per week.

Votes of thanks to Mr. Kerr and the Chairman brought the proceedings to a close.

THE NORFOLK AGRICULTURAL SOCIETY.

MEETING AT HARLESTON.

The Norfolk Society this year pitched its tents—or to speak more accurately its shedding—at Harleston, a town on the borders of Norfolk and Suffolk, which divides with Bungay and Beccles the honour of ministering in various ways to the wants and wishes of the inhabitants of the rich valley watered by the Waveney. Harleston is so near Suffolk that the Suffolk element was naturally stronger than ever at the Norfolk Show this year, although it is generally found in pretty good force at these meetings. But the very irruption of Suffolk added to the character of the show, especially in the horse and cattle classes. Norfolk comprises some famous sheep breeders, but as regards Shorthorns it can scarcely be said, with the exception of her Hugh Aylmer and a few aristocratic amateurs, that her agriculturists make this stock their speciality; and, perhaps, they are wise in their generation in following this policy, as we cannot all be roaring lions in the world, and cannot all get money by producing Shorthorns, however weighty their points, or lengthy their pedigrees. Be this as it may, however, there can be no doubt that the Norfolk Society has been following of late an eminently progressive policy. Those who remember the days when the Society used to gyrate, pendulum fashion, between Norwich and Swaffham, and between Swaffham and Norwich, would probably hardly recognize it now as the same body. The classes of exhibitors continue to comprise a large Suffolk contingent, and the landlord element is yet very strong; but still there are certainly tenant-farmer exhibitors to be found now, who put in no appearance at the meetings held ten or twelve years since. The attendance at the shows has also largely increased, while the amount of the prizes has been materially augmented. The whole tone of the Society has also undergone a beneficial change. Although the welcome accorded by Harleston was warm, the means of communication enjoyed by the town are tedious and imperfect. The Great Eastern has only a small single-line branch through the Waveney Valley, and when you pour ever so many hundreds or thousands over a branch upon which but a few dozen passengers can be accommodated with comfort, it is not very difficult to anticipate and predict the inevitable result. The policy of visiting various parts of a county is undoubtedly a good one for a county society to adopt, but the town selected should always be one having a double set of rails to it, or at any rate one having more than a single line converging upon it. As might have been expected from the selection of so inconvenient a site the receipts were below those of last year.

The show of Shorthorns was numerous and good, the only drawback being that, as will be seen by the prize list, preciously few premiums for pedigree stock remained in the county. In the Shorthorn bull class, the Saffron Walden decision was reversed, Mr. Upson's Monk playing at Harleston only second fiddle to Mr. Kersey Cooper's Hogarth II., who, it will be remembered, figured with distinction at the Attleborough

meeting of the Norfolk Society last year. He does not appear to have grown much during the last twelve months, but he has undoubtedly good form and quality, although he has not the massive proportions of Monk. Lady Pigot's Charles Le Beau was only placed third in the older Shorthorn bull class, but her ladyship had her revenge in the two-year-old class, her Bythis beating Lord Walsingham's Grand Signor II. The Merton bull has size and symmetry to recommend him, but Bythis was considered to handle better. In the Shorthorn cow class, the competition was once more between Lady Pigot's Queen of Rosalea and Mr. How's Lady Anne. The decision given at Attleborough last year between these competitors was, however, reversed this year, Lady Anne being considered to have "gone off," while Queen of Rosalea has spread, without at the same time any material loss of symmetry. In the heifers it will be seen that Mr. How was more fortunate. The Society still keeps up some Devon prizes; but it can scarcely be said that Devons make any progress in Norfolk, Mr. Overman, of Burnham Sutton, making a clear sweep of all the Devon premiums, with scarcely any competition. The Society has certainly reduced its Devon classes to three—bulls, cows, and heifers; but they are so poorly filled, that it is almost a question whether they might not be dispensed with altogether. Prizes to the amount of £25 were distributed among just four animals. "Touch the Devons, and down comes the Society," said one of its departed members, with an air of great gravity and wisdom some years since. Touch the Devons, indeed! Why, there are scarcely any left to touch. The most business-like feature in the show-yard—which stood out in pleasing contrast with the languishing Devon classes—was the substantial *bond fide* exhibition of Norfolk and Suffolk red polled cattle, of which there was a capital entry. Norfolk held its own manfully, and the prize animals of Mr. Brown of Thursford, and Mr. Hammond of Bale, showed that the breed is making progress in the county, both as regards purity and quality. A new exhibitor appeared amongst the red-polls in Mr. J. J. Colman, the principal partner in the famous Carrow Works near Norwich. Mr. Colman showed Cherry Tree, a bull of Suffolk descent, bred by Mr. Wolton of Newbourn, that attracted great attention, and secured a little fortune in prizes. He has a good head, and his symmetry is generally creditable—in fact he was considered a model two-year-old "red polled." It is clear that the men of Norfolk will do well to cultivate this red-polled speciality; for if they have not courage enough to go in as a body for Shorthorns, they will still acquire considerable fame if they succeed in further developing and improving a good serviceable local breed. There were some nice dairy cows on the ground, and some Ayrshire-Shorthorn crosses brought Mr. H. Overman, of Weasenham, several prizes. Among the few fat cattle shown, Mr. Barcham exhibited a good red Highland Scot.

In the cart-horse classes—that is, such of them as were open—Suffolk appeared as usual in overpowering force; the strength of Norfolk being reserved for some local classes in which there was a better competition than in former years. There is still a comparative absence in Norfolk of that professional cart-horse breeding which may be said to distinguish Suffolk; nevertheless, more interest is taken in the matter in Norfolk than was observable twelve or fifteen years since. In the open class, the most noticeable cart stallion was the Shire horse, Honest Tom, shown by Mr. Welcher, of Toft, that figured with some distinction at Bury, Leicester, and Manchester, in 1867, 1868, and 1869. He was only placed second-best, however, at Harleston, the chief premium going to Mr. Rist's well-known Harwich Emperor, who seems to have worn quite sound again. As regards the Norfolk cart stock, properly so called, the cart mares and plough-horses comprised some very good specimens, and the trials of the latter excited considerable and justifiable interest. Some of the best Norfolk cart-horses on view came from the Fens or the districts bordering on the Fens.

The competition for the thoroughbred stallion prizes was weak, but feeble as it was it upset the Saffron Walden award in favour of Deerfoot. At Saffron Walden it will be remembered that Deerfoot won altogether no less than £45, but he was placed second-best at Harleston to Little Hastings, who was second at Attleborough to Dalesman. There was a sad falling-off in the number and character of the hunters shown, but there was a fair amount of competition in the hackney classes. Several of the hunting prizes went into Suffolk, but in the hackneys Norfolk fared better, and rather more interest appears to be taken in the county in hackney breeding than was to be met with some years since, although there is still considered to be room for further improvement. The principal prize for cobs was taken by Mr. H. Overman, of Weasenham, who achieved great success during the day in almost every department of the Show, taking in all 21 premiums, besides silver medals.

Amongst the Southdowns, Lord Walsingham* thought fit to make no sign, and Lord Sondes had, to a great extent, a walk over with his handsome highly bred sheep. His Royal Highness the Prince of Wales, who breeds from Lord Walsingham's and Lord Sondes' stock, was however the recipient of two or three prizes. The long-wooled prizes were nearly all carried off by Mr. Brown, of Marham, although Mr. Giblin, of Essex, did not put in an appearance altogether without success: as it would have been strange, indeed, if it had been otherwise, since Mr. Brown and Mr. Giblin were the only exhibitors in this department. The lambs in most of the classes were moderate, the season not having been a favourable one. In the miscellaneous sheep classes victory remained almost unchallenged with Mr. H. Overman's Oxford Downs.

The pig classes were good, but nearly all the prizes were attached to the well-known names of Duckering, Sexton, and Stearn. Still Mr. H. Aylmer and Mr. T. L. Taylor were not unsuccessful as Norfolk exhibitors.

As regards implements, Harleston offered a special prize of £10 to the exhibitor of the best newly-invented or improved implement for the purpose of agriculture; but this was put out in portions to Holmes and Sons, Norwich, Murton and Turner, Kenninghall, and Robey and Co., Lincoln. Annexed is a complete list of the exhibitors in this department: Amies and Barford, Peterborough; Baker, Lynn; Barnard, Bishop, and Barnards, Norwich; Bentall, Heybridge; Bone, Framlingham; Bradford and Co., Fleet-street, London; Burrell, Thetford; Dodman, Lynn; Gardiner, Mendham; Garrett and Son, Leiston; Gidney, East Dereham; Harper, Beeches; Holmes and Sons, Norwich; Knights, Harleston; Le Pevre, Norwich;

Leggett, Elsing; Loveday, Old Buckenham; Marshall, Sons, and Co., Gainsborough; Murton and Turner, Kenninghall; Mullenger and Sons, Pulham St. Mary; Pashley, Titvetshall; Randall and Sons, North Walsham; Rands and Jekell, Ipswich; Readyin, Fakenham; Riches and Watts, Norwich; Robey, Lincoln; Savage, Lynn; Stringer, Diss; Sweetman, jun., Diss; Thorn, Norwich; Teigh and Smith, Limehouse; Turner, Ipswich; Woods, Cocksedge, and Warner, Stowmarket; Wheeler and Wilson, Regent-street, London; Cheavin, Boston; Townshend, New Buckenham; Smith, Halesworth; Anderson and Co., Ipswich; the Singer Manufacturing Company, Cheapside; Howes and Son, Norwich; Humphries, Pershore; Leggett, Eye; Packard and Co., Ipswich; Cann, Harleston; Townsend, Fordham; Freeman, Norwich.

The dinner in the evening was attended by about a hundred, and there was some vigorous practical speech-making on the occasion. In this respect Norfolk contrasted most favourably with the recent Essex meeting. Mr. Sewell Read was on his native heath, and supplied the oratorical *pièce de resistance* of the evening. Sugar production, taxation, hedgerows, rabbits, labourers' cottages—all the stock subjects of the agricultural world, were handled in turn by the various other speakers, whose utterances we have reproduced below to some little extent.

PRIZE LIST.

CATTLE.

JUDGES.—J. Clayden, Littlebury, Saffron Walden.
C. Howard, Biddenham, Bedford.

Shorthorn bulls above three years old.—First prize of £10 and Harleston prize of £20, G. Kersey Cooper, Bowbeck House, Ixworth, Suffolk (Hogarth 2nd); second of £7, J. Upson, Rivenhall, Essex (Monk); third of £4, Lady Pigot, Branches Park, Suffolk (Charles le Beau). Highly commended, N. Catchpole, Bramford, Suffolk (Sorcerer). Commended, R. Barcham, Thargarton, Norfolk (Brilliant).

Shorthorn bulls not exceeding three years old.—Prize of £10, Lady Pigot (Sidus).

Yearling Shorthorn bulls.—First prize of £10 and silver medal, Lady Pigot (Bythus); second of £7, Lord Walsingham, Merton Hall, Norfolk (Grand Signor 2nd); third of £4, Lady Pigot (Great Gun). Commended, W. Goulder, Wimbotsham.

Shorthorn cows, in-calf or in-milk, above three years old.—First prize of £10 and silver medal and Harleston prize of £10, Lady Pigot (Queen of Rosalea); second of £7, J. How, Broughton, Hunts (Lady Anne); third of £4, N. Catchpole, Bramford, Suffolk (Buttercup). Highly commended, J. Upson, Rivenhall, Essex.

Shorthorn heifers, in-calf or in-milk, not exceeding three years old.—Two premiums of £5 and silver medal, J. How (Windsor's Butterfly); second of £7, Lady Pigot (La Belle Hélène). Highly commended, Lord Walsingham and J. Upson.

Shorthorn heifers not exceeding two years old.—First prize of £8 and silver medal, J. How (Vesper Queen); second of £5, Lady Pigot (Dame); third of £3, N. Catchpole (Coronet). Highly commended, Lady Pigot. Commended, G. K. Cooper and W. How.

Devon bulls.—Harleston premium of £10 and silver medal, J. Overman, Burnham Sutton (Wellington).

Devon cows, in-calf or in-milk, above three years old.—Prize of £10, J. Overman (Violet).

Devon heifers, in-calf or in-milk, not above three years old.—Prize of £5, J. Overman, Fuchsia).

Norfolk and Suffolk red polled bulls, above three years old.—First prize of £10, B. Brown, Thursford (Norfolk Duke); second of £7, R. C. Symonds, Aylmerton. Highly commended, J. F. Palmer, Wilby.

Norfolk and Suffolk red polled bulls above two years old.—First prize of £10 and Harleston prize of £20, J. J. Colman, Norwich (Cherry Duke); second of £7, S. Walton, Newbourn, Suffolk (Broadback). Highly commended, W. T. Mullen, Swafeld.

Norfolk and Suffolk red polled yearling bulls.—First prize of £10 and silver medal, Lord Sondes, Elmham; second of

£7, B. Brown (Young Duke); third of £4, T. L. Taylor, Starston (Richard III.). Commended, B. Brown.

Norfolk and Suffolk red polled cows, in-calf or in-milk, above three years old.—Harleston prize of £10 and cup, J. Hammond, Bale (Butler); second of £7, J. Hammond (Lady Davy); third of £4, Sir W. Jones, Bart., Cranmer Hall (Primrose). Highly commended, S. Wolton, and class generally commended.

Norfolk and Suffolk red polled heifers, in-calf or in-milk, not exceeding three years old.—Harleston prize of £10 and silver medal, J. Hammond (Buttercup); second of £7, Lord Sondes; third of £4, B. Brown (Hanson). Highly commended, S. Wolton.

Norfolk and Suffolk red polled heifers, above one year old.—First prize of £8 and silver medal, J. Hammond (Davy the 4th); second of £5, Lord Sondes; third of £3, Lord Sondes. Highly commended, Sir W. Jones.

Cows, in-calf or in-milk, above three years old, cross-bred or any pure breed not being Shorthorn, Devon, or Norfolk and Suffolk red polled.—Harleston prize of £10 and silver medal, H. Overman, Weasenham (Doat's Eye); second of £7, W. T. Mullen, Swafield (Kathleen); third of £4, H. Overman (Alexandra). Commended, C. Boby, Stutton, Suffolk.

Heifers, not exceeding three years old, not being Shorthorn, Devon, or Norfolk and Suffolk red polled.—Harleston prize of £10 and silver medal, H. Overman (White Rose).

Yearling heifers, cross-bred or any pure breed, not being Shorthorn or Norfolk and Suffolk red polled.—First prize of £8 and silver medal, H. Overman (Gay Lass); second of £5, J. Overman (Elegance).

Calves, steers or heifers, not exceeding six months old, bred in the county.—Prize of £5 and silver medal, Lord Sondes.

Steers of any breed, above three years old.—Prize of £8 and Harleston prize of £10, R. Barcham, Thurgarton. Highly commended, J. J. Colman.

Steers of any breed, not above three years old.—Prize of £8 and silver medal, H. Overman.

Cows or heifers above three years old.—Prize of £5 and silver medal, G. Hart, Pulham. Commended, G. Hart.

Heifers not above three years old.—Prize of £5 and silver medal, H. Overman.

AGRICULTURAL HORSES.

JUDGES.—J. Thomas, Bletsoe, Beds.

W. Thompson, jun., Thorpe-le-Soken, Colchester.

Cart stallions not under four years old.—First prize of £10 and silver medal, I. Rist, Tattingstone, Suffolk (Harwich Emperor); second of £7, W. Welcher, Tofts, (Honest Tom). Highly commended, C. Boby. Commended, J. Waite, Martham.

Two year old stallions.—First prize of £6 and Harleston prize of £20, W. Wilson, Baylham, Suffolk; second of £4, the executors of T. Capon, Demington, Suffolk. Highly commended, I. Rist, and the executors of T. Capon. Commended, S. Wolton.

Yearling entire colts.—First prize of £5, J. Grout, Woodbridge; second of £3, S. Wolton. Commended, A. Noble, Creeting St. Peter, Suffolk (Hero).

Mares not under four years old.—Harleston prize of £10 and silver medal, and extra Harleston prize of £10, the executors of T. Capon (Matchet); second of £7, A. Noble (Duchess); third of £4, executors of T. Capon (Darby).

Three year old fillies.—First prize of £6 and silver medal, S. Wolton (Duchess); second of £4, J. Lines, Thorpe Parva (Doughty).

Two year old fillies.—Prize of £5, S. Wolton. Commended, executors of T. Capon.

Foals.—Prize of £5, J. Lines.

NORFOLK AGRICULTURAL HORSES.

JUDGES.—R. G. T. Howard, Temple Bruer, Lincoln.

G. M. Sexton, Wherstead, Suffolk.

Norfolk cart stallions not under four years old.—First prize of £20, J. Tingay, Ellingham (Young Briton); second of £10, H. Overman (The Norfolk Lion).

Three year old Norfolk cart stallions.—First prize of £12, C. Tidman, Blofield (Young Thumper); second of £8, W. Kirk, Attleborough (Volunteer).

Two year old Norfolk cart stallions.—First prize of £10, W. Durrant, Brunstead; second of £8, J. Read, Mendham (Premier).

Yearling entire Norfolk cart colts.—First prize of £8 and

silver medal, L. J. Palmer, Snetterton; second of £5, F. Spelman, Tivetshall (Proctor). Highly commended, C. W. Spelman.

Norfolk cart mares not under four years old.—First prize of £5 and Harleston prize of £10, E. Crowe, Denver (Smart); second of £10, C. Edwards, Stow Bardolph (Pink); third of £5, H. Overman (Brag). Highly commended, H. Overman and E. Beck. Commended, T. L. Taylor and W. Betts, Tibenham.

Three year old Norfolk cart colts.—Harleston prize of £7 and silver medal, H. Overman (Sharper); second of £4, W. Betts (Short).

Three year old Norfolk cart fillies.—First prize of £10 and silver medal, T. Calver, Burnham Thorpe (Blossom); second of £7, H. Overman (Brandy). Highly commended, J. Tingay.

Two year old Norfolk cart fillies.—First prize of £8 and silver medal, T. L. Taylor (Countess); second of £5, W. How (Beauty); third of £3, T. Calver, Burnham Thorpe (Bounce).

Yearling Norfolk cart fillies.—Harleston prize of £8 and silver medal, E. Betts; second of £5, W. Allen, Little Ellingham (Smart); third of £3, H. Overman.

Norfolk cart foals.—First prize of £8 and silver medal, E. Crowe, Denver; second of £5, J. Carman, Weston.

Pairs of cart horses (mares or geldings).—Melton Constable cup and silver medal, J. Tingay (Smiler and Prince); second of £10, H. Overman (Gilbert and Jolly); third of £7, H. Overman (Boxer and Gipsy).

THOROUGHBRED AND HUNTING HORSES.

JUDGES.—F. Oldaker, Upper Brook-street, London.

S. J. Wellitt, Tathwell, Lincoln.

Thoroughbred stallions.—Cup and Harleston prize of £10, E. Jolley, Banham (Little Hastings); second of £10, Major Barlow, Hasketon, Suffolk (Deerfoot).

Mares or geldings adapted for hunting, equal to carry not less than 14 stone.—Harleston prize of £15, J. Grout, Woodbridge (Lady Charlotte); second of £10, R. Bircham (Prince).

Mares or geldings adapted for hunting, not equal to carry 14 stone.—First prize of £10, silver medal, and Prince of Wales's cup, Major Barlow (Brunette); second of £5, T. Everitt, Creakle (Rupert).

Three or four years old colts or fillies adapted for hunting.—Harleston prize of £10 and silver medal, G. Rolfe, Hingham (Colleen); second of £5, T. Everitt.

Brood mares adapted for breeding hunters.—Prize of £10, H. Smith, Honingham (Honesty).

HACKNEY AND RIDING HORSES AND PONIES.

JUDGES.—H. Beevor, Blyth, Notts.

H. Thurnall, Royston.

Stallions for saddle or harness.—Harleston prize of £15, J. Grout (Sportsman); second of £10, C. Beart, Stow Bridge (Ambition). Commended, R. A. Westropp, Ongar, Essex; C. T. Smith, jun., East Winch, Norfolk.

Riding mares or geldings above 15 and not exceeding 15 hands and 3 inches high.—Harleston prize of £10 and silver medal, Rev. W. F. Thurstby, Bergh Apton (Nevill); second of £5, J. Grout (Alice).

Hackney mares or geldings not exceeding 15 hands high.—First prize of £10, H. Overman (Jenny Lind); second of £3, E. Jolley (Fanny). Highly commended, J. J. Clark, Southacre. Commended, R. C. Rising, Costessey (Elderton).

Hackney brood mares.—Harleston prize of £10, W. H. Jillings, Thetford (Favourite); second of £5, Major Barlow (Gipsy).

Cobs under eight years old not exceeding 14½ hands high.—Harleston prize of £10, H. Overman (Liberality); second of £7, G. K. Cooper; third of £4, G. K. Cooper. Commended, R. Smith, Kimberley, Norfolk.

Ponies not under 13 nor above 13 hands and 3 inches high.—Prizes of £5 and £3, T. L. Taylor (Tom Noddy); second of £5, R. G. Beart, Rainham (Tommy Dodd); third of £3, C. Groucock, Stanfield, Norfolk (Puss). Commended, J. B. Pratt, Mendham, and H. G. Nelson, East Somerton, Norfolk.

Ponies not above 13 hands high.—First Prize of £5, W. Rose, Wymondham, Norfolk (Lily).

SOUTHDOWN SHEEP.

JUDGES.—H. Fookes, Whitechurch, Dorsetshire.

W. Rigen, Hove, Sussex.

Southdown shearing rams.—Harleston prize of £10 and

silver medal, Lord Sondes; second of £4, the Prince of Wales. Highly commended, J. Overman.

Southdown rams of any age.—Prizes of £5 and silver medal, and Harleston prize of £10, Lord Sondes; second of £7, C. Boby; third of £4, C. Boby. Highly commended, Lord Sondes. Commended, J. Overman.

Shearling ewes.—First prize of £7 and silver medal, Lord Sondes; second of £4, the Prince of Wales. Highly commended, Lord Sondes. Commended, J. Overman.

Southdown ewe lambs.—First prize a cup, value £5, and silver medal, Lord Sondes; second of £3, Lord Sondes. Highly commended, the Prince of Wales.

Southdown wether lambs.—First prize of £5 and silver medal, Lord Sondes; second of £3, the Prince of Wales. Highly commended, Sir Willoughby Jones.

LONG-WOOLLED AND CROSS-BRED SHEEP.

JUDGES.—E. Little, Lanhill, Wilts.

R. J. Newton, Campsfield Farm, Woodstock.

Long-woolled shearling rams.—Harleston prize of £10 and silver medal, and a like prize for the best long-woolled animal in the yard, T. Brown; second of £7, T. Brown; third of £4, T. Brown.

Long-woolled rams.—First prize of £10 and silver medal, T. Brown; second of £7, J. Giblin, Little Bardfield, Essex.

Long-woolled ram lambs.—Prizes of £5 and £3, and silver medal, T. Brown; second of £5, T. Brown.

Long-woolled shearling ewes.—Prize of £7 and silver medal, J. Giblin.

Ewe or wether lambs of any breed.—First prize not awarded; second prize of £5, F. Spelman.

Shearling wethers of any breed.—First prize of £7 and silver medal, H. Overman.

Ewes of any age or breed.—Harleston prize of £10 and silver medal, H. Overman.

Ewes of any age or breed, not being Southdown or long-woolled.—First prize of £10 and silver medal, H. Overman.

Five shearling ewes of any breed.—First prize of £7 and silver medal, H. Overman.

Twenty shearling ewes of any breed.—Prizes of £5 and silver medal, H. Overman.

PIGS.

JUDGES.—H. Fookes, W. Rigden.

Boars of large breed above twelve months old.—First prize of £6 and silver medal and extra prize of £5 for the best boar in the yard, R. E. Duckering and Son, Northorpe, Lincolnshire. Highly commended, R. E. Duckering and Son.

Boars of large breed not above twelve months old.—First prize of £5 and silver medal, R. E. Duckering and Son; second, £3, R. E. Duckering and Son.

Breeding sows of large breed.—First prize of £6 and silver medal, R. E. Duckering and Son; second, £3, F. H. Everett, Bridgham, Norfolk. Highly commended, F. H. Everett. Commended, F. Spelman, Tivetshall, Norfolk.

Boars of small breed (black) above twelve months old.—Prize of £6 and silver medal, G. M. Sexton, Wherstead, Suffolk.

Boars of small breed (black) not above twelve months old.—First prize of £6 and silver medal, S. G. Stearn, Brandeston, Suffolk; second, £3, G. M. Sexton. Highly commended, S. G. Stearn.

Breeding sows, small breed (black).—First prize of £6 and silver medal, R. E. Duckering and Son; second, £3, G. M. Sexton. Highly commended, S. G. Stearn. Commended, S. G. Stearn.

Breeding sows, small breed (black) not exceeding nine months old.—First prize of £6 and silver medal, T. L. Taylor, Starston.

Boars of small breed (white) above twelve months old.—First prize of £6 and silver medal, R. E. Duckering and Son; second, £3, H. Aylmer, West Dereham, Norfolk. Highly commended, G. M. Sexton.

Boars of small breed (white) not above twelve months old.—First prize of £6 and silver medal, G. M. Sexton; second, £3, R. E. Duckering and Son. Highly commended, S. G. Stearn.

Breeding sows, small breed (white).—First prize of £6 and silver medal, R. E. Duckering and Son; second, £3, G. M. Sexton. Highly commended, S. G. Stearn.

Breeding sows, small breed (white) not exceeding nine months old.—First prize of £6 and silver medal, G. M. Sexton; second, £3, R. E. Duckering and Son. Highly commended, H. Aylmer. Commended, S. G. Stearn.

IMPLEMENTS.

JUDGES.—T. Chambers, Colkirk, Norfolk.
J. Fergusson, Brettenham, Norfolk.

Harleston premium of £10 for the best newly invented or improved implement divided between Holmes and Sons, Norwich (£3 for a single winnower portable thrashing machine with chaff sacking apparatus); Newton and Turner, Kenninghall (£3 for their straw, hay, and corn elevator); and Robey and Co., Lincoln (£4 for apparatus for the self-feeding of thrashing machines.) Silver medal: Woods, Cocksedge, and Warner (for an arrangement to be applied to turnip cutters for cutting the last piece). Highly commended, Riches and Watts (grinding mill); R. Knights, Harleston (horse rake). Commended, T. Le Fevre, Norwich (portable horse works for driving elevator or chaff machine); Holmes and Sons (horse gear for driving stacker.)

THE DINNER.

The chair at the dinner was to have been taken by Mr. E. Howes, M.P., but the hon. gentleman was unable to attend by reason of indisposition, and his place had to be made good by Colonel Fitzroy. In the course of the proceedings

Sir W. JONES said he could not see why the entire sugar duty should not be taken off, and why we should not grow sugar in this country as well as on the continent of Europe. He would point out that our climate was manifestly becoming dryer and hotter as it was certain to do by the throwing down of hedges, and in the cutting down of hedge-row timber. He would also observe that no one who had been through the country this year, and looked at the mangold fields, could doubt what he was saying—that the hotter the weather and the dryer the spring, the finer the crop of mangold would be. There was no reason why they should not have in this county very fine crops of Silesian beet, and he would remind them that 10 per cent. of Silesian beet was purely crystallisable sugar, and if they could grow ten tons of Silesian beet in one of their fields (it varied from nine to eleven tons, and the mean average he took to be ten), but when the soil was very wet, as in the west of England, the average probably would not be more than 8 per cent., but then let them remember that if Silesian beet would grow 10 per cent. of sugar, a ten ton crop would grow a ton of sugar, which, at a penny a pound, would bring £9, and at twopence a pound £18. In one respect this was exactly like wheat, because they would have one mill for a district or parish, and every labourer, however small his garden, might grow a hundred-weight or two of beet, and if they had proper mills a hundred-weight of sugar would be just as saleable as a bushel of corn was now. Speaking of this fact reminded one of the great facilities with which fortunes were acquired on the continent by the making of sugar; and he could not see for the life of him why fortunes should not be made here by the same process. Sugar was a thing which old and young could eat with pleasure, and the consumption of which would increase to any amount. He did not see why we should not be able to manufacture it here as well as in Belgium.

Mr. C. S. READ, M.P., said: Sir Willoughby Jones rightly says that it is very important indeed that we in Norfolk should have, if possible, some new crop on which to fall back to meet our present deficiency. There can be no doubt whatever that the potato crop in Scotland has been a perfect God-send to them after free trade was introduced, and the only thing I can say is, that I look upon agriculture in Norfolk, and in the Eastern Counties generally, as going from bad to worse; that whereas they, in Scotland and Ireland, can grow roots and grass to the best advantage, and the proceeds they make are not at all affected by free trade, we in this county, being entirely a corn-growing district, do feel the depression most severely. I have never myself had any experience in the growth of beet-root sugar, and I may say it is a problem that has not yet been solved whether it may be advantageously grown in this district; but I do say that we have one article, and that our chief, in the growth of which we can compete not only against the United Kingdom, but against the whole world—that is to say, our barley. And without saying what I should

wish to be done with the sugar duties, I can only say I should like to have first a very sensible repeal of the malt-tax. Why, sir, we had a very large surplus this year, and we naturally expected that there would be some reduction of that tax, which presses so much upon the agriculturists of Norfolk; but instead of that we were told we were going to receive a great boon, and that boon was that we were to be permitted to germinate our barley as in days of yore. Well, how was this great boon given to us? Not only were we when we were going to germinate barley to give notice to the exciseman of what we were going to do—not only was he to come into our houses where the grain was being germinated and where it was kept, but if we steeped any corn we were also to give that gentleman notice of our intention that we were going to steep it. Now, you would hardly fancy that this great boon should be clogged by such a most iniquitous restriction as this, yet I can assure you it took all my whole time one night to convince the House of Commons that there was really in this boon a most oppressive restriction imposed upon us, and all that I have been able to obtain is this, that we may steep our corn as we please, but that if any of you will germinate your grain first of all you must give the exciseman notice of your intention of what you are going to do, and next you must let him have access to the place where that grain is being germinated and being kept, and if you fail in any one of these particulars you will be liable to the small penalty of one hundred pounds. ["Oh?"] Whether or no you will like to incur that risk, I don't know; I can only answer for myself; I shall not avail myself of this very great consideration. Well, we have lately had in the House a very sensible concession granted to us, and that is with regard to agricultural horses. It was said in the House that this was an extension of the exemption which the farmers enjoyed. I entirely repudiate that idea. It is no extension whatever. It is simply a definition of that exemption. If the Parliament of the country exempts agricultural horses from the payment of a licence of ten shillings, or whatever it may be, the Parliament of the country at the same time tells you that the farmers have to repair the roads. I need not say that in nine parishes out of ten the only persons who can cart materials on the roads are farmers; therefore it is perfectly monstrous that, in doing what Parliament puts upon us, we should entirely abrogate the small exemption which Parliament had previously conferred upon us. I can only say that if it had not been for Mr. Speaker, I don't think even that small concession would have been made. There is one other subject I will mention. We are told that we agriculturists ought to be greatly pleased that we have in Prince's-street, Westminster, what they call a veterinary department. Now, that veterinary department will this year cost the country £10,000 for the payment of salaries, without any estimate at all being made for the legal expenses, stationery, and such like little matters. Now, I will ask you, as practical farmers, whether you believe the Veterinary Department of the Privy Council has ever been of any benefit to you whatever ["No?"], or, on the other hand, whether, instead of costing you £10,000, it has been of ten thousand pence benefit to you? Mind you, I am quite ready and willing to admit the great service the veterinary profession themselves—Professor Simonds and Professor Brown—have rendered to us; but, on the other hand, when I come to consider the extraordinary salaries that are paid for this department, and that in addition to this there are £15,000 a-year spent annually for the collection of statistics, I mean to say that if we had that £25,000 devoted, as it ought to be, to some agricultural department of the Board of Trade, that we really might have then some substantial benefits conferred upon us. Sir, it is just twelve months ago that I, at Attleborough, drew a somewhat gloomy picture of agricultural prospects. I then said that the very cold, wet weather which we had experienced was telling most unfavourably upon the county of Norfolk. It pleased Providence to send us a change of weather, and we had a most beautiful harvest, but enough injury had been done to us in Norfolk for us to grow only a small crop of corn and to sell it at a small price. This, following upon the drought of 1868, was enough to break the backs of many farmers; but now we have, unfortunately, another drought, and what the result of these three disastrous years will be I cannot contemplate without serious fears. I should like to say a few words with regard to the Show itself, and upon our Agricultural Society. I think we must congratulate ourselves that in

this very pleasant, but somewhat out-of-the-way part of the world, we have had so successful a show. It only confirms my idea of what a county show ought to be. You cannot make a county show a great national agricultural exhibition. What you ought to do is to endeavour to confer the greatest possible amount of good upon the county in which you live. It was this idea that always pervaded my mind when I was a somewhat active member of the committee of the Norfolk Agricultural Society. Another idea I had was this—how necessary it was to improve the native breeds of stock, and this we have in a measure succeeded in doing. I would ask anyone to look back fifteen years and think what the Norfolk homebreeds were then, and in what condition were our Norfolk cart horses. As a Norfolk man, and in the presence of so many of our Suffolk brethren, I hope I shall not be considered egotistical, but I say that our Norfolk cart horses, especially the mares and plough horses, are a credit to any country, and for work and endurance they are equal to any county, and, perhaps, I may say, superior to some of the highly-fed Suffolks.

Mr. CHARLES HOWARD, in speaking for "the judges," said; The Shorthorns, in some of the classes, were, perhaps, some of the finest specimens you could see in any show-yard; but I only regret to tell you, gentlemen, they don't come from Norfolk. They are what I call outsiders. They are sent here to show you gentlemen in Norfolk what you should do. I don't believe that any progress is made when people wrap themselves up in supposed excellence; and I should not be doing my duty towards you, after you have done me the honour of asking me to come here and act as judge, if I allowed some observations to pass unnoticed. I have had the honour and privilege of attending very many agricultural shows in this kingdom, and although excellent as your Show is—exceedingly good—yet I would not have you lay to yourselves the flattering union that you are pre-eminent in this matter. If you do, you may depend upon it success won't follow your efforts. I have disposed of Shorthorns; I only wish you would keep those outsiders away—at least, you may allow them to come, but don't allow them to take your prizes away. But there is a class of stock, the Norfolk Fells, which is famous in Norfolk, and which I think does the breeders and feeders of that stock infinite credit. I have watched that stock, having attended your shows for some years past, with great interest, and it is a class of animal worthy of being cultivated in other districts besides Norfolk, and as it succeeds so well here I am surprised that gentlemen in other parts don't take it up. I am sure what I say to-night you will not suppose, nor do I intend it so, that I say it in a spirit of unkindness; but you have long been held up to us in distant counties as patterns of agriculturists and as a county in which there is the best farming in the world. Now, I have had the opportunity of seeing a good deal of farming in Norfolk during the last few days. I am not going to find fault with your farming, but I should tell you this—that if you don't look out you will no longer hold the position you have done—that other counties will very soon trip you up, and you will lose that position you have so long and so worthily held. There is one other point to which Sir Willoughby Jones has referred—the change of climate produced by the cutting down of hedge-row timbers and woods. Well, it is certain that has not had that effect in Norfolk, for I never was in a county in my life where I saw so much useless hedge-row timber. I am quite certain of one thing—that the farmers of Norfolk do all they can to meet the exigencies of the times; it now rests with the landlords to help them. The first thing they should do would be to allow them the privilege of cutting down this beastly rubbish—pieces of timber which if they stand fifty years will never be worth a sovereign—to cut down many of the hedge-rows and to destroy the great pest of the farmers—the tenants of these wild hedge-rows, the rabbits.

Mr. H. OVERMAN, in responding for the "Successful Exhibitors of Sheep," said; It had pleased Mr. Howard to make a few remarks on the Norfolk Show, and he thought much to the point, but he did not agree with all that he had said. He told them that they must not think so much of themselves. [Mr. HOWARD: I did not.] If he did not put it in that way he inferred it; he took them down a little. As far as the Shorthorns were concerned, he (Mr. Overman) said that when they considered the Norfolk Show stood second to none in England, being second only to the Royal Show, they ought not to expect people to come from distant counties and not to

take away a single prize. A much more important subject was that of the hedge-row timber. They were living in critical times, and unless the landlord went a-head as fast as the tenants had done, good-bye to their having any tenants at all. As to hedge-row timber and hedges, Mr. Howard would not have made the remarks he had done if he had visited West Norfolk, for there the landlords were going a-head, taking down the fences by wholesale and thereby the timber. If landlords persisted in over-preservation of game he did not hesitate to say they would have to farm the land themselves. The misery of this might first of all fall upon the tenants, but it would afterwards come upon the landlords, and perhaps many of them would be able to find

neither the capital nor the ability. Before sitting down, he must refer to the remarks made by Mr. Clare Read. It was very pleasant to some to find fault with the taxes made by others—in fact it suited them sometimes—but as regarded the tax on agricultural horses he looked upon it as a matter of no importance whatever, for if stones were carted off the land, that was a matter of the tenant farmer—he must cart if he had got a large quantity of stones, and if he carted them from the land he did so from an agricultural point of view, and he could shoot them down wherever he pleased, and if he put them on the roads, as they ought to be, they could be placed by the side of the roads and put upon them after they were broken. This he regarded as the far better plan.

THE ESSEX AGRICULTURAL ASSOCIATION.

MEETING AT SAFFRON WALDEN.

The thirteenth annual show of the Essex Society was held for the second time at the ancient little town of Saffron Walden, capped now with its new and elegant market-place, about as much in keeping with the rest of the place as a Lincoln and Bennett would have been to the farmer of days gone by—what with the brown tops, and high-collared, long-skirted, everlasting drab great coat, impervious alike to heat or cold, sunshine or rain, that he wore in all his outings both winter and summer, to church, markets, fairs, or feasts, at the rent-roll or going a courting. The Society pitched their tents close to the town, on ground evidently chosen more for the beautiful view from it than to show off the animals to advantage. Horses more particularly cannot show well when either standing still or going through their paces on the side of a hill, to say nothing of this being unfair to the judges, or the danger the riders risk. The judges were on the ground and at work soon after the early bird had proclaimed the morn; for a little before eight we found the popular member for Bedford in an entirely new character—as a judge of hunters, hacks, and thorough-breeds, assisted by Justice Thurnall and another, whose commanding figure and gentle whisper are as well known to the frequenters of the Hall at Islington as ever that posturing genius of the Ring, Mr. Widdicomb, was to the admirers of Scenes in the Circle. In another ring close by were the judges of the agricultural horses. The ground was nicely laid out, and the shedding good, while of agricultural implements and machinery there was a capital display. To swell out a catalogue, and as a kind of decoy for exhibitors, it is now becoming pretty general to allow the same animal to be entered in several classes, in the belief that he will stand a better chance of a prize. This is in most cases but a delusion, as shown by the prize-list; but that is not all, for it confuses and wearies out the public and endangers the popularity of horse shows, which have hitherto been the most interesting of exhibitions.

Here the privilege was granted to the full, and many of the riding horses came into the ring with their heads smothered in numbers relating to the different classes; and as there was no telegraph board to denote either the number of the class or the prizes, the public was left in a state of bliss, if it be a folly to be wise, as were the judges who kept continually crying aloud "what class is this?" Then the horses came in anyhow, and just as the Bench had agreed upon their verdict in would drop another. In the shedding the prizes were posted thus: the numbers relating to the classes in which the animals were entered were nailed at the head of the stall, and the prize or commendation, without any number as to

class, by the side, so that you could not tell in which class the animal had been successful. The mystery of Edwin Drood, alas! will always remain a mystery, and so will the mysteries concocted for the visitors to the Saffron Walden show, as they would have done with us if it had not been for the kindness of the judges and officials who favoured us with a sight of the returns. Surely, with a little forethought these things might be managed so that the public, catalogue in hand, could know as much as anybody else, or this revolving world for the last thirteen years must have been wearing out its own axis for nought.

The strong part of the show was most decidedly not in the riding classes, as there were few horses of any character. Then, the lamentable accident at Islington had something to do with this, for Mr. Barker, the well-known Essex dealer, always had a good string, and in this year's catalogue several entries, which of course were all absentees. For the thorough-bred stallion prizes there was nothing so grand as Dalesman of last year, although Major Barlow, with another from his inexhaustible string contrived to carry off both the open prizes. Deerfoot by Viudex, out of Tranquillity, is a black and a very flashy light corky gentleman, with almost as much white as False Alarm, the Bury prize horse. He stands sixteen hands high, of great quality, and very handsome, with a nice head and neck, capital ends, good limbs, and a free springy mover; but he was light, and tucked up in his middle, which made him appear higher on the leg than he is. Little Ben, by Big Ben, out of Flame, the only other competitor that we thought stood a chance with Deerfoot, and that it was hard to get away from, is the very model of a light-weight hunter, worth going from London to Saffron Walden to see. He was shown in hunting condition, and, taking him from his head to his tail and down to his knees and hocks is about one of the neatest we ever saw. He is very muscular, stands fifteen-two, but he has not the clean flat legs of Deerfoot, nor can he move so freely; but then the horse has done a deal of work, and Deerfoot ran thirty-eight times, so there we are again. Deerswold in colour takes a little after Orlando, but in nothing else, for there is no symmetry about him. He is heavy before, with a short waspy middle, all of a heap, and we hate the sight of him, although bred by her Majesty. Bay Volunteer, by Alarm, struck us as a coach-horse, or best adapted for getting machiners, while of Buckfoot by Acrobat, out of Heirloom, although second to Dalby for the Chester Cup, what with the little there is of him, is of a very hackish appearance. Then Weathercock, by Weatherden, in length like a longboat and as high on the leg as the steeple, is a nice sort of horse for a party of tourists to take through a country, as they could get

a grand view from him anywhere. His card says that he was awarded the £15 prize at Colchester, for the best thoroughbred horse in the county. True enough this, but then he was the only one exhibited, and quite enough too of the sort. There is something very good throughout the groggy old Knight Templar; but a black three-year-old by Vedette looks more like an Improved Essex than a thoroughbred horse.

Of the hunters, what shall we say for the lot? Why, that there were very few worthy of a bid for the Noble Science. In the first class, without conditions, the prizes were withheld; while Villager, a chesnut four-year-old of breed, in the light weights, was all over a very nice horse, that could gallop. He was again victorious in the three and four-year-olds, beating the prize four-year-old mare, by Frogmore, of Mr. Sparrow's, a light wiry mare that could move but with nothing grand in her appearance. She was also first in an open class for hunters, where she beat a bay with white heels of Mr. Patmore's, that could go a bit, but was badly ribbed up and goose-rumped; if this droop, though not quite pleasing to the eye, is to be found in many of our best hunters. Mr. Patmore had another bay by Trumpeter, that, if not perfect in form, looked like getting over the ground. Silvertail, a provincial in style and up to more weight than pace, beat the Bishop of Stortford's bay with the goose rump for weight-carriers, and as there was nothing else in, it was entirely "twixt the two" as the gipsy dealer replied when asked which was the pick of a couple of fearful screws? Of hackneys, like the hunters, there were very few good-looking; Mr. W. Gilbey's Quadroon, with breed, has fussy tutored park action and is waspy in her middle piece; then Quicksilver, a strong weight-carrier with a little too much of the trotter stamp, looks like bowling along at a good pace. Mr. W. Clayton's Needlewoman is a neat hack, but not improved by a mean tail; while Mr. H. Taylor showed a fair-made bay. In the next lot, an open class, Quadroon was again to the front; but with Mr. Badham's Eclipse, Mr. Egerton's varmint old weight carrier, the Brewer, and Quicksilver, we thought a second prize too much of a sacrifice to tutored park action. Baronet from Bulmer, as well as Eclipse, was shown, and we were sorry that Mr. G. D. Badham was unable, through a bite from a boar, to ride them himself. Although it kept him within doors and from the show, we were glad to hear that the mishap was thought more curious than serious by his friends. There were two fair-made brood mares and foals, one Lizzy a bay, and a hardy wiry looking chesnut of the right material from Mr. Portway's stud. There were three or four cobs, the best by a long way, being Mr. Saville's, as she could go. The weight-carrier was a chesnut by Strathmore a lengthy strong cob with a head not well set on, and a strong heavy forehead. In the ponies Mr. Archer's cream-coloured mare was a wonderful showy goer, but the prize went to a skewbald because the cream had been down on her knees.

The strong part of the horse show was the agricultural classes, and as Suffolk is the adjoining county, the Pauches came down upon Saffron Walden like locusts, and the chesnut hue prevailed. These animals like the riding horses, were in several classes. Mr. Badham was to the fore with Hercules and Great Eastern, both by Royal George, and a strain of Chester Emperor, that most gentlemanly of cart horses. In an open class old Harwich Emperor, as the Professor did not put his mark against him, cleared the way with some good horses behind him, including Great Eastern. The local two-year-old entire colts were nothing out of the way, while in the open class were several very good, nearly all being commended. Then in the yearling entire colts the judges thought there was nothing worthy of

being placed second to Mr. Badham's colt by Great Eastern, and witheld the prize. The cart mares under four year's old did not muster in any strength, but three or four were very good. Mr. Capon's grand mare Matchett, by the late Mr. Crisp's Conqueror, in a capital open class, with Mr. Wolton's Diamond at her heels, carried off the blue riband, the whole class being commended. The three-year-old local filly is a short-legged lengthy useful iron grey; while the open prize filly under four years is a two-year-old fine-grown roan, rather high on the leg, by Quilhampton's Horse; and the highly-commended, a short compact-made Suffolk three-year-old by Mr. Wolton's Warrior, if anything, is rather short in the quarter. The gelding Jolly is a level-made bay that looked like stepping along. The roan Quilhampton filly was again first in the two-year-old fillies, the second and reserved being some light coloured Suffolks of very fair form by Clayden's Horse. The yearling fillies were not much to look at, and the first, though fine-grown and having a crest like a stallion, has not the best forelegs, while the second was a very leggy one of Lord Braybrooke's, by Clayden's Horse. It is a pity that breeders cannot find names for their nags; for there is nothing easier than to borrow an old stud-book or a hound list. Here we have three of them all of a heap: "Clayden's Horse," "Quilhampton's Horse," and "Harvey's Horse." We have heard of the sauce, but not of the horse; and really any one would think that these gentlemen were bold warriors at the head of a troop, or that they never had but one horse. There were some good mares and foals, and some very capital pairs of plough-horses.

The exhibition of cattle was a decided success, there being a large entry of pure-bred Shorthorns, but to many of these a show-yard was no novelty; while there were a few very nice things without pedigree, and such a herd of Alderney, Jersey, and Guernsey, that, coming suddenly upon them, we thought by some contrary wind we had been driven upon one of the Channel Islands. Mr. Upson's Monk, bred by Messrs. Garne and Son, and as well-known as a prize-taker at Southampton and elsewhere as he is for his neat form and quality, was the hero of the local class for bulls of any age, with Whipper-in, who got a commendation at Colchester last year, a bad second, as he is still; for, as we then said, he is nothing to look at; while Monarch, with a capital back, who was second at Colchester came in for empty honours. The Monk was again to the fore in the open all-aged class, with Mr. Kersey Cooper's Hogarth the Second, bred by the Reverend Holt Beever, and showing more quality than ever, close up. Of a very different character is Mr. Catchpole's Soreerer, who is a big coarse animal, and a bad handler. Mr. Hutley's King Lear, Mr. J. Christy's Brabraham, and Mandarin, prize takers at Colchester, were down in the entries, and Lady Pigot's Bythis, who in the yearling bulls had to succumb to Heydon Duke, over which was quite the sensation scene of the day, although Bythis does not require a very crack animal to beat him. He is anything but an elegant gentleman, for although full of quality and very deep, he has a coarse horn, a short neck, and a rump that needs a deal of squaring to fit him as an illustration for the Herd Book. Mr. Kersey Cooper, with Hogarth the Second and Christabel with Hogarth the Third by her side, in the place of the deep level Christina, was again, as at Colchester, the owner of the best bull, cow, and calf. The third edition of Hogarth is very rich in colour, with quite the Shorthorn line of beauty in his back. But why have so many editions of Hogarth? What is the pull? Why not call them after some of the painter's works? The Rake, The Politician, or The Idle Apprentice, for a prize bull has a nice time of it. Or for a pair of heifers what could you have better than

Industry and Idleness, or for a single one Sigismunda, which would be a rare mouthful for a hungry cowman? Bythis, with Matelina 2nd by Windsor Fitz-Windsor and Dame by Prince of Buckingham to assist him, was more fortunate in the yearling bulls and pairs of heifers, and there turned the tables on Heydon Duke with Grand Duchess of Oxford 2nd, and Keepsake and a nice trio, Rolla, Nectar, and Pattern, of Messrs. Garne and Son to oppose him. Heydon Duke and Mr. MacIntosh's two real gems of heifers, Charmer and Knightley 2nd, were considered to be the cracks of the yard; and at the dinner Mr. Thurnall, for the judges, declared that the Shorthorns "were the best collection he had ever seen in his life at a local show. He was fortified in this opinion by that of his brother judges. As for the bull shown by the noble President, it was the best he had ever seen, and he hoped it would be sent to Oxford, as it was well deserving of royal honours." When we remember how much Mr. Thurnall has seen, this must be taken as a very high compliment. Mr. Marking's cow is very handsome, and though with no pedigree, shows better than many with one as long as your arm. The Sort, is a good short square-built heifer, had nothing to oppose her, and Mr. Upson's yearling is a well-famed one, but with a bad head, while the second was not a prize animal. In dairy stock Mr. Morris' cow, of a mixed breed, is a curiosity that one might expect to find in the Zoological Gardens, while the second was by an Alderney bull out of a Shorthorn cow, and the third a very nice pure bred Alderney, with a good bag of Mr. Gilbey's, who has gone into Alderney's of the right sort with great spirit, and the struggle for the honour of the Channel Islands lay between him and Lord Braybrooke. But still Mr. Dauncey's sort does not tell altogether with the judges.

The show of sheep was better than last year, with a fair sprinkling of Southdowns, a few Cotswolds, and goodly number of black-faces. Lord Braybrooke's Southdowns came off with flying colours, taking nearly all the prizes, while Mr. Giblin was great in Oxford Downs and Cotswolds. The shearlings appeared rather small, while there was a fair sample of ewes and some good lambs.

The pigs, as a lot, were but an ordinary entry, although there were some pearls amongst them, Messrs. Duckering taking all the open prizes, and there were several grand specimens of the Berkshire breed, but we think all worthy of notice will be found in the prize-list—if not, merit like virtue has its own reward.

There was a dinner at which Lord Braybrooke presided, but where, beyond the few words we have quoted from Mr. Thurnall nothing worth preserving was said. On the second day Mr. Rand, the auctioneer, attempted a sale by auction of some of the stock exhibited, but this we are almost rejoiced to say proved a complete failure. Nothing would threaten to lower the character of a good county show like this more than the habit of getting a lot of inferior things shoved into the catalogue with the chance of selling these at some price on the close of the proceedings.

There were two useful premiums for collections of implements, which were won respectively by Ward and Silver, of Melford, and Davey and Paxman, of Colchester. Mr. Hunt, of Earl's Colne, objected to the second award on the ground that Davey and Paxman's collection comprised certain implements not of their own manufacture, as required by the conditions, but of Hunt's own make. The committee, on consideration, confirmed the decision of the judges in favour of the Colchester firm. Amongst the other exhibitors of implements were Ransomes, Sims, and Head, Ipswich; Burrell, Thetford; Amies and

Barford, Peterborough; Woods, Cocksedge, and Warner, Stowmarket; Robey, Lincoln; Garrett, Leiston; Pash, Chelmsford; Foster, Lincoln; Maynard, Whittleford; Catchpool and Thompson, Colchester; Ray, Saffron Walden; Colman and Morton, Chelmsford; Penny, Lincoln; Peene, Rayne; Baker, Wisbeach; Sworder, Bishop's Stortford; Foster, Witham; Smyth, Peasehall; Hunt, Earl's Colne; Le Butt, Bury St. Edmund's; Headley, Cambridge; Pertwee, Boreham; Darby, Little Waltham; Wilderspin, Elsworth; Green, Saffron Walden; Cottis, Epping; Johnson, Saffron Walden; Barford, Fleet-street; Hitchcock, Bury St. Edmund's; Singleton and Nicholson, Saffron Walden; Dodge, Upper Thames-street; Shelwell, Saffron Walden; Teighe and Smith, Limehouse; Rand and Jeckell, Ipswich; Hilton, Wandsworth; The Farmers' Supply Association, London; King, Coggershall; Johnson, Saffron Walden; Cote, Ipswich; Kent, Saffron Walden; Warren, Maldon; Greenslade, Maldon; Man, Earl's Colne; Hawkes, Aldham; Angleton, Islington; Eddington, Chelmsford; James, Royston; Guivey, Saffron Walden; and the Central Cottage Improvement Society, London.

PRIZE LIST.

HORSES FOR AGRICULTURAL PURPOSES.

JUDGES.—G. M. Sexton, Wherstead Hall.
W. C. Spooner, Southampton.
J. Thomas, Bletsoe, Beds.

Cart stallions.—First prize, £20, G. D. Badham, Bulmer Tye (Hercules); second, £10, E. Emson, Littlebury (Captain).

Open to all England.—Prize, £25, G. D. Badham (Great Eastern). Highly commended, W. Botts, Broomfield (Champion).

Open to all England.—Prize, £25, J. Rists, Tattingstone, Ipswich (Harwich Emperor). Highly commended, N. Catchpool, Whitton, Braunford (Emperor); W. Wilson (2 yrs. old); J. Rist (Young Emperor); S. Wolton, Woodbridge (2 yrs. old), and C. Boby's Conqueror. Commended, G. D. Badham (Great Eastern).

Two-year-old colts.—First prize, £15, J. A. Piggott, Beckingham Hall (New England); second, £10, C. Burnards, Harlow.

Two-year-old colts (open to all England).—Prize, £15, W. Wilson, Ipswich. Highly commended, J. Rists (Young Emperor), and R. Capon's Executors. Commended, N. Catchpool, S. Wolton, and J. A. Piggott.

Yearling colts.—First prize, £7, T. Taylor; second, £5, withheld.

Cart mares, 4 years and upwards.—First prize, £8, S. Jonas, Chrishall Grange; second, £5, G. H. Cant (Colchester); J. Jillings (Chesterfield Park).

Open to all England.—Prize, £10, R. Capon, Dennington, Framlingham (Matchet). Highly commended, S. Wolton, Woodbridge.

Three-year-old filly.—Prize, £5, J. F. Bolt, Morrell Roothing.

Open to all England.—Prize, £10, T. Taylor, Earl's Colne. Highly commended, S. Wolton.

Gelding.—Prize, £5, J. F. Bott, Morrell Roothing.

Two-year-old fillies.—First prize, £8, T. Taylor, Earl's Colne; second, £5, Lord Braybrooke, Audley End, and highly commended.

Yearling fillies.—First prize, £7, W. Thompson, Thorpe; second, £5, Lord Braybrooke, Audley End.

Mares and foals.—First prize, £12, G. H. Cant, Colchester (Suffolk); second, £12, Lord Braybrooke (9 yrs. old). Highly commended, D. A. Green, Donyland Place (Bonny), and commended (Darby).

Foals.—First prize, £5, G. H. Cant; second, £3, P. Portway.

Plough-horses or mares, pairs.—First prize, £10, R. Marking, Saffron Walden; W. Livermore, Elsenham.

Mares, pairs (open to all England).—S. Wolton (Diamond and Doughty). Highly commended, D. A. Green (Brock and Bonny), and G. H. Cant.

RIDING AND COACHING HORSES.

JUDGES.—J. Howard, M.P., Bedford.
R. Leeds, Castle Acre, Norfolk.
H. Thurnall, Royston.

Thoroughbred stallion.—Prize, £15, W. H. Bowtell, Elsenham (Little Ben).

Open to all England.—Prize, £25, Major Barlow, Haske-ton (Deerfoot).

Thoroughbred and halfbred.—Prize, £20, Major Barlow (Deerfoot).

Halfbred.—Prize, £10, F. Butcher, Colne Engaine (Young Morgan Lightfoot).

Yearling colt by a thoroughbred horse (open to all Eng-land.—H. D. Raincock (by Yellow Jack).

Hunters, light weight.—Prize, £10, J. Cassidy, Harlow (Villager). Highly commended, B. Sparrow, Gosfield Place (bay mare).

Unrestricted (open to all England).—Prize, £20, B. Sparrow (bay mare).

Weight-carrier.—Prize, £10, E. Cunliffe, Ongar (Silvertail).

Hackney mares, not exceeding fifteen one.—First prize, £6, W. Gilbey, Stanstead (Quadron); second, £4, J. J. Simp-son, Heybridge (chesnut mare).

Hackney gelding, not exceeding fifteen one.—Prize, £10, F. Rust, Good Easter (Shooting Star).

Hackneys, not exceeding fifteen two (open to all England).—Prize, £10, W. Gilbey, Stanstead (Quadron). Highly com-mended, J. J. Simpson (chesnut mare); G. D. Badham (Eclipse). Commended, H. G. E. Green, Colchester (The Brewer).

Four-year-old mares or geldings.—Prize, £7, B. Sparrow (bay mare). Highly commended, G. D. Badham (Baronet).

Colts or fillies, three or four years old (open to all England).—Prize, £10, J. Cassidy (Villager). Highly commended, G. D. Badham (Baronet), B. Sparrow (bay mare), and M. A. Free-stone (brown).

Three-years-old mares or geldings.—Prize, £7, J. Christy, jun., Roxwell (brown filly). Commended, W. Barker, Elm-stead (Maria Day), J. Christy (brown gelding), and A. Smith, Thaxted Lodge (Rob Roy).

Two-year-old mare or gelding.—Prize, £7, J. Archer, Saffron Walden (filly).

Yearling filly by a thorough-bred horse (open to all Eng-land).—Prize, £7, J. Clayden, Littlebury (by Cambuscan). Highly commended, J. Cassidy, Harlow (by Mainstone).

Half-bred yearling (by Mainstone).—Prize, £5, J. Cassidy. Mares and foals.—First prize, £10, W. Tipper, Roxwell (Lizzy); second, £5, P. Portway, Great Sampford (chesnut).

Cobs.—Prize £5, G. Saville, Wenden (bay mare). Com-mended, T. Newman (Peggy).

Weight-carrying cobs, above 4 years, and under 14 hands and a-half.—Prize, £5 5s., J. B. B. Elliott, Chesterford (by Strathmore). Commended, T. Newman (Great Bardfield).

Ponies, under thirteen hands.—First prize, £4, W. Clayton, Dunmow (Lucy Glitters); second, £2, J. Archer, Saffron Wal-den (cream).

CATTLE.

JUDGES.—E. Bowley, Cirencester.

J. Lynn, Croston, Grantham.
M. Savidge, Sarsden, Churchill Heath.

PURE SHORTHORNS.

Bull.—First prize, £15, J. Upson, Rivenhall (Monk); second, £10, Lieut.-Col. Erise, Spains Hall (Whipper-in).

Bull of any age (open to all England).—J. Upson, Riven-hall (Monk). Highly commended, Kersey Cooper, Ixworth (Hogarth 2nd).

Bull, two years old.—First prize, £12, J. Hutley, Rivenhall (King Lear); second £8, J. Christy (Duke of Brabraham).

Yearling bull.—First prize, £10, Lord Braybrooke (Heydon Duke); second, £7, R. H. Crabb, Baddow Place (Old Sam). Commended, C. Barnard (Diadem).

Yearling bull (open to all England).—Lord Braybrooke (Heydon Duke). Highly commended, Lady Pigot, Branches Park (Bythis).

Bull, not exceeding 12 months old, and not under 6 months.—First prize, £6, J. Christy, jun., Roxwell (Rosolio); second, £4, Lord Braybrooke (Santa Cruz).

Cow.—First prize, £12, J. Christy, Roxwell (Polyrose); second, £8, J. Clayden (Erigoue). Highly commended, G.

Frere, Royal Hull, Diss (Countess Sandor); J. Upson, Riven-hall (Lilac), and Lord Braybrooke (Memento).

Two-year-old heifer.—Prize, £10, R. H. Crabb, Baddow-place.

Yearling heifer.—First prize, £7, D. McIntosh, Havering, Romford (roan); second, £5, J. Christy, jun. (French Aster). Highly commended, J. R. Chaplin, Ridgewell (Charlie le Beau); J. Clayden (Gertrude). Commended, C. Barnard (Coronella).

Heifer not exceeding twelve months old, and not under six months.—First prize, £6, D. McIntosh (Charmier); second, £4, C. Barnard (Thorndale Sugar Plum). Commended, J. Christy, jun. (Anemone and Portulacca).

Bull cow and calf (open to all England).—Prize, £20, G. Kersey Cooper (Hogarth 2nd, Christabel, and Hogarth 3rd). Highly commended, J. Clayden (Captain Knightly, Erigone 2nd, and roan twins).

Yearling bull and pair of heifers.—Prize, £20, Lady Pigot (Bythis, Maldina 2nd, and Dame). Highly commended, T. Garne and Son, Churchill Heath, Northleach (Rolla, Nectar, and Pattern), and Lord Braybrooke (Heydon Duke, Grand Duchess of Oxford 2nd, and Keepsake).

SHORTHORNS WITHOUT PEDIGREE.

Cow.—First prize, £8, R. Marking, Saffron Walden; second £5, W. Bott, Broomfield.

Heifer, two years old.—First prize, £6, J. Upson (The Sort).

Yearling heifer.—First prize, £5, J. Upson, and second, £3.

DAIRY CATTLE.

Cow or heifer.—First prize, £8, J. Weston Morris (Chig-well); second, £5, C. M. Wade, Saffron Walden (Buttercup). Highly commended, W. Gilbey, Stanstead (Curfew).

FAT CATTLE.

Ox or steer, not exceeding three years old.—Prize, £5, J. R. Chaplin, Ridgewell (steer).

Cow or heifer.—Prize, £5, J. Archer, Saffron Walden. Commended, J. Clayden (Jessamine).

OTHER PURE BREEDS.

Bull.—Prize, £5, Lord Braybrooke (Chesham).

Two-year-old bull.—Prize, £5, W. Gilbey (Dolphin 2nd). Highly commended, J. Clarke, Saffron Walden.

Cow.—Prize, £5, W. Gilbey (Ban), and highly commended (Victoria and Mus). Commended, Lord Braybrooke.

Two-year-old heifer.—Prize, £4, W. Gilbey (Banshee). Highly commended, W. Belcher, Chelmsford (Lord Boreham). Commended, J. Clarke.

Yearling heifer.—Prize, £4, C. Swann, Colchester (Suffolk). Highly commended.—J. L. Taylor, Saffron Walden (Alderney).

ALDERNEY, JERSEY, OR GUERNSEY.

JUDGES.—J. Game, Watford.

Major Wilson, Stowlangtoft.

Bull, over twelve months old.—First prize, £10, J. R. Vaizey, Attwoods, Halstead; second, £5, W. Gilbey (Ban-bury). Commended, Lord Braybrooke (four years old).

Cow over three years old.—First prize, £10, W. Gilbey (Ban); second, £5, Lord Braybrooke (Torchlight).

Heifer under three years old.—First prize, £10, W. Gilbey (Banshee); second, £5, J. L. Taylor. Highly commended, W. Gilbey (Curfew).

SHEEP.

JUDGES (and for pigs).—T. Horley, jun., Leamington.

W. Sanday, Radcliffe on-Trent.
J. Turner, Seaford, Sussex.

Southdown ram.—First prize, £10, and second, £5, Lord Braybrooke.

Ram of any other short-wooled breed.—First prize, £8, J. Green (black-faced Suffolk); second, £4, P. Portway (Suffolk Down).

Short-wooled ram (open to all England).—Lord Bray-brooke. Highly commended, C. Boby.

Shearling Southdown ram.—First prize, £10, and second, £5, Lord Braybrooke.

Shearling short-wooled ram, any other pure breed.—First prize, £8, J. Green, Shadishall (black-faced Suffolk); second, £4, P. Portway (Suffolk Down).

Pen of five pure shearling Down ewes.—First prize, £6, Lord Braybrooke; second, £4, S. Jonas, Chrishall Grange.

Pen of five shearling short-wooled ewes.—First prize, £5,

Nockolds and King, Saffron Walden; second, £3, W. Thompson, Thorpe.

Cotswold, Lincoln, or Leicester ram.—Prize, £7, J. Giblin, Little Bardfield.

Oxford or Shropshire ram.—Prize, £7, J. Giblin, (Oxford Down), and highly commended and commended.

Long-woolled ram (open to all England).—Prize, £10, J. Giblin (Cotswold).

Shearling, Cotswold, Lincoln, or Leicester.—Prize, £8, J. Giblin (Cotswold).

Shearling, Oxford, or Shropshire ram.—Prize, £8, J. Giblin (Oxford Down).

Pen of five shearling long-woolled ewes.—Prize, £5, J. Giblin.

Pen of five ewes and lambs.—First prize, £6, J. Giblin. Highly commended, J. Archer, Saffron Walden.

Pen of 5 shearling short-woolled wethers.—First prize, £5, Nockolds and King; second, £5, Lord Braybrooke. Highly commended, H. Sworder, Hallingbury. Commended, H. Trigg.

Pen of five fat Hampshire Down shearling wethers.—First prize, £5, Nockolds and King; second, £3, H. Sworder. Commended, H. Trigg.

Pen of five shearling crossbred or long-woolled fat wethers.—First prize, £5, J. Spencer, Clavering; second, £3, J. Rolfe, Wenden, Saffron Walden.

PIGS.

Boar, large breed.—Prize, £5, C. Sturgeon, South Ockendon (Berkshire).

Boar, large breed (open to all England).—Prize, £10, Duckering and Son, Northorpe, Lincoln (Cultivator 6th).

Boar, large breed, not exceeding 12 months old.—Prize, £5, Lord Braybrooke (Berkshire).

Boar, small breed.—Prize, £5, G. D. Badham, Bulmer (Young Whersted).

Boar, small breed (open to all England).—Duckering and Son (The Hermit).

Sow in pig.—First prize, £5, Lord Braybrooke (Improved Essex); second, £3, G. Griggs, Romford (Queen Bess). Highly commended, Lord Braybrooke.

Sow, large breed (open to all England).—Prize, £5, Duckering and Son (Princess Royal).

Sow, small breed (open to all England).—Prize, £5, Duckering and Son (Lily). Highly commended Lord Braybrooke (Essex).

Sow, with pigs; pigs not to exceed 12 weeks old.—First prize, £5, G. D. Badham (Jane); second, £3, D. R. Emson, Wimbish (Improved Essex).

Pen of 3 sow pigs, of the same litter, under 9 months old.—First prize, £5, Lord Braybrooke; second, £3, G. Griggs, Romford (The Three Sluts).

VETERINARY INSPECTOR.—Professor Simonds.

IMPLEMENTS.

JUDGES.—W. Impey, Branfield.

F. Whiteloch, Yeldham.

Collection of implements, being the *bona fide* property of the exhibitor.—The prize of £9, Ward and Silver, Melford, Suffolk.

Collection of implements, manufactured in Essex, the exhibitor being the manufacturer.—The prize of £8, Davey, Paxman, and Davey, Colchester.

HANTS AND BERKS AGRICULTURAL SOCIETY.

MEETING AT BASINGSTOKE.

The show of cattle was a great improvement upon former exhibitions, not only as regards numbers, but likewise in quality. The sheep stock was very good, particularly in the Hampshire Down classes. The Down rams in the aged class were fair, but no better than we have often seen them. The ewe tegs were worthy of especial notice. The ewes altogether may, however, be considered the best of the show, but the ram lambs exhibited were in fine condition as taken from the flock, and were certainly very meritorious, and indicated the excellence of the flock, from which they were drafted. In the classes where different breeds competed there were some very good specimens of the mixed breeds, and we especially noticed the ewe tegs of a long wool breed exhibited by Mr. Atkins, as being of great size and weight for age, and also the Shropshires.

The Shorthorn classes were creditably contested for a local show. The aged bull class was well filled; and it is worthy of note that the second-prize animal, although entered in the wrong class, yet took the second prize, his own sire taking the first. The Alderney cows were not very commendable. The show of horses was good. The pigs were fairly represented, but there was nothing worthy of special comment. The entries of poultry, pigeons, and rabbits were numerous, and the poultry was of a superior class. The show of agricultural implements was on a larger scale than usual.

P R I Z E L I S T .

CART HORSES.

JUDGES.—J. B. Spearing, Reading.

W. C. Spooner, Eling, Southampton.

J. White, Odiham.

Stallions.—First prize, £5, R. Grinham, Shalden, Alton; second of £2 10s., T. W. Habin, Chichester, Sussex,

Two-year-old stallions.—First prize, £3, R. Grinham; second of £1 10s., W. Goring, Hook, Winchfield.

Mare and foal.—First prize, £5, J. H. Morgan, Basing; second of £2 10s., Lord Ashburton.

Cart mares.—First prize, £5, J. Atkins, Bishopstoke; second of £2 10s., A. Budd, Overton.

Three-year-old filly.—First prize, £3, J. Stubbs, West Tisted, Alresford; second of £1 10s., E. Cobden, Preston, Candover.

Two-year-old filly.—First prize, £2 W. Follett, Pamber; second of £1, E. Cobden.

HIUNTERS.

JUDGES.—The Earl of Portsmouth.

W. H. Deacon, Ropley, Alresford.

Sir Paul Hunter, Beech Hill, Reading.

Mare or gelding four years old and upwards (jumping the point of merit).—First prize, £5 5s., R. P. Fitzgerald, Preston, Candover; second of £3, A. Booth, Sydmonton.

CATTLE.

JUDGES.—J. B. Spearing.

W. C. Spooner.

James White.

Shorthorn bull.—First prize, £5, John Atkins, Bishopstoke; second of £2, Richard Soffe, Ham Farm, Winton.

Bull of any other breed.—First prize, £3, Geo. Deller, Greywell; second of £2, John Turvill, Hartley, Alton.

Two-year-old bull of any breed.—First prize, £3, H. Armstrong, M.D., Peckham-house, Peckham; second of £1 10s., H. E. Raynbird, Basing.

Yearling bull.—First prize, £3, Wm. H. Dunn, Standen-house, Hungerford; second of £1 10s., John Atkins, Bishopstoke.

Cow in milk of any breed.—First prize, £5, J. Aubrey Mumford, Chilton Park Farm, Thame; second of £2 10s., J. Turvill; third of £1, J. Aubrey Mumford.

Heifer above two years old and under three years old—

First prize, £2, John Atkins; second of £1, H. E. Raynbird, Basing.

Heifer under two years old.—First prize, £2, W. Nicholson, M.P., Basing Park, Alton; second of £1, H. E. Raynbird.

Cow of the Channel Islands breed.—Prize of £3, Edward Curtis, Dunmer.

PIGS.

JUDGES.—J. B. Spearing,
W. C. Spooner,
J. White.

Berkshire boar.—First prize, £3, H. Humfrey, Kingston Farm, Shrivensham; second of £2, J. H. Clark, Altwood Farm, Maidenhead; third of £1, the Marquis of Ailesbury Savernake.

Berkshire breeding sow.—First prize, £3, H. Humfrey; second of £2, J. H. Clark; third of £1, the Marquis of Ailesbury.

Boar of any other breed.—First prize, £3, W. H. Dunn, Standen House, Hungerford; second of £2, W. A. Box, Basingstoke.

Sow of any other breed.—First prize, £3, J. Wheeler, Long Compton; second of £2, R. Solfe, Hams Farm, Winchester.

Boar of any breed under six months old.—First prize, £3, H. Humfrey; second of £1, J. H. Clark.

Sow of any breed under six months old.—First prize, £3, H. Humfrey; second of £1, J. H. Clark.

Boar of any small breed under nine months old.—Prize, £3, J. Wheeler, Long Compton.

HAMPSHIRE OR WEST COUNTRY DOWN SHEEP.

JUDGES.—H. Bone, Avon, Ringwood.
H. Fooks, Abbey Newton, Blandford.
Edmund Olding, Woodford Cottage, Salisbury.

Ewe tegs not having been separated from the flock.—First prize, £10, Jame Crimble, Overton; second of £5, W. E. Fitt, Littleton, Winchester.

Ewe tegs without restriction as to separation.—First prize, £6, John Barton, jun., Hackwood Farm; second of £3, John Palmer, Cliddesden.

Ewes of any age.—First prize, £5 5s., John Palmer, Cliddesden; second of £2 10s., F. S. Schwann, North Houghton, Stockbridge.

Rams of any age.—First prize, £5, James Rawlence, Bullbridge, Wilts; second of £2 10s., Stephen King, Bockhampton, Lamborne.

Shearling rams.—First prize, £10, A. Morrison, Fonthill House, Tisbury; second of £5, Stephen King, Bockhampton; third, £3, S. King.

Ram lambs.—First prize, £5, G. Edney, The Manor, Whitechurch; second of £3, Thomas Moore, Viabes Farm, Basingstoke.

Hampshire Down ram lamb.—First prize, £10, A. Morrison; second of £4, A. Budd, Overton.

Rams of any age, not having been housed since the 1st day of October last.—First prize of £5 5s., James Rawlence, Bullbridge; second of £2 2s., W. Lunn, Whitechurch.

Ewe lambs.—First prize, £3, F. S. Schwann, North Houghton, Stockbridge; second of £2, John Palmer, Cliddesden.

SHEEP OF ANY OTHER BREED.

Rams of any age.—First prize, £5, Earl of Portsmouth; second of £2 10s., John Wheeler, Long Compton, Shipston-on-Stour.

Shearling lambs.—First prize, £5, Earl of Portsmouth; second of £2 10s., A. F. M. Druce, Burghfield, Reading.

Ram lambs.—First prize, £2, Charles Barton, Sherborne St. John; second of £1, Mrs. Clift, Sherborne St. John.

Ewe lambs.—First prize, £2, John Atkins, Barton Peveril, Bishopstoke; second of £1, Mrs. Clift.

Ewes of any age.—First prize, £2, and second of £1, John Atkins.

Ewe tegs.—Prize, £2, Henry Wood, Pucknell Farm, Romsey.

SHROPSHIRE DOWN SHEEP.

Ram of any age.—Prize, £5, H. Wood.

EXTRA STOCK.

One ewe and twin lambs.—Prize, £1, J. Moore, Littlecott, Pewsey.

THE UTILIZATION OF BOG LAND IN IRELAND.

At the monthly meeting of the Council of the Royal Agricultural Society of Ireland in Dublin on Thursday, the Hon. CHARLES FRENCH, the chairman, read the following letter:

London, 12, De Beauvoir-square, N., June 15, 1870.

Dear Sir,—I have recently visited Ireland for the purpose of obtaining information as to the practicability of reclaiming the bogs of Ireland, as proposed by Mr. Samuel Morley, M.P. for Bristol, in an amendment he intended to move to the Land Bill. During my sojourn I had the pleasure of spending a few days at the Castle at Geashill with Mr. Trench, one of the members of your Society. Mr. Trench, without being opposed to the reclamation of the bogs, is one of those who think that much of good would be the result if the peat of the bogs could be cheaply converted into portable fuel, both for domestic use and for exportation. He suggested, therefore, that it might be well if a prize were offered through the Royal Agricultural Society of Ireland for the best essay or invention for utilizing in the most economical way the waste fuel of the bogs, with other prizes for the second and third best. I have submitted this proposition to Mr. Morley, and I am authorized by that gentleman to say that he will have pleasure in presenting the sum of £100 for that purpose, provided the Royal Agricultural Society will present another £100, so that £100 may be given for the best, £75 for the second best, and £25 for the third best. In order to make the prizes more worthy of the attention of the best men of science, and in order to bring all the more honour and influence to bear upon the subject, I would respectfully suggest that the Royal Agricultural Society should present £100, and that the Royal Dublin Society should be asked to present another £100. In such case the first prize might be £150, the second £100, and the third £50. I shall write to Dr. Steel by this post to the like effect, and I

shall be very happy to learn that the proposition meets with the cordial approbation of your Society.

I have the honour to be, dear sir, your faithful servant,

H. BROOKES.

The Secretary, Royal Agricultural Society of Ireland.

The CHAIRMAN said that Mr. Brookes had called upon him, and he (the chairman) had explained to him that the only way of reclaiming the bog land was to cut it away. The ground he (Mr. Brookes) went upon was, that a machine could be got for utilising the peat.

Sir ALLAN WALSH said there had been numerous companies established in Ireland for the purpose of utilising peat, and they had all failed.

The CHAIRMAN said that he saw by a scientific paper that a machine had been invented in America that had been found most successful in utilising the bog land. It was a moveable Archimedian screw, which pressed the bog together and formed it into cakes. If they succeeded in America it might be worth trial here; but he thought they had no funds to spare for the purchase of a machine of this kind. As to pressing the water out of the turf without pressing the fibre out also, he thought that could not be done.

Mr. DONNELLY thought it a pity that such an offer could not be availed of. He would be glad to subscribe £1 himself, and he was the more easily induced to do so by the chairman's statement of the success of the machine in America. They should communicate with the Royal Dublin Society before rejecting this offer. They had not funds to devote to this purpose, but he thought that perhaps the members would subscribe at least £50 for the purpose. He was sure that fifty members would subscribe.

The following towns are about to apply their sewage for irrigation, or they contemplate doing so:—

Towns.	Population discharging into sewers.	Area of land to be irrigated. Acres.	Character.	Additional land.	
W.-C. general.					
Tunbridge Wells.....	12,800	123	170 acres.	
Sarabon.....	7,100				
Kingston-on-Thames.....	12,000				
Nottingham.....	86,000				
Inverness.....	19,000?		Light loam.		
Perth.....	16,000		Sandy.		
Aberdeen.....	60,000				
Norwich.....	57,000	700	Light.	500 "	
Skipton.....	5,500				
Reigate.....	9,000				
Aylesbury.....					
Evesham.....					

At Tunbridge it is stated that the application of the sewage for irrigating land would be almost impossible, and the local authorities believe all trials that have been made to apply sewage in this way are failures, and a source of dissatisfaction on account of nuisance and expense. Lincoln is also said not to admit of this application of sewage. At Cambridge the subject is under consideration. Comparing the extent of land irrigated and the population discharging into the sewers at the places above named, it appears that in the case of Birmingham there is only $\frac{1}{4}$ of an acre per 1000 of population; at Edinburgh there is 1.7 acre per 1000; at Carlisle, Bedford, and Chorley there is from 3 to 3.5 acres; at Harrow, Reigate, and Chelmsford there is from 5 to 6.6 acres; at Epsom, Rugby, and Malvern from 7.5 to 10 acres; at Tunbridge Wells, Banbury, and Norwich, from 10 to 12 acres per 1000. There does not appear to be any provision in most cases for additional land for irrigation except at Carlisle and Norwich. At Chelmsford there is some, but it is too high to be reached; and at Tunbridge Wells the purchase of additional land is contemplated. At Carlisle, Reigate, Epsom, Inverness, and Tenterden, the land selected for irrigation is situated within the district under control of the local sewer authorities, at a distance of from one-fifth of a mile to half a mile from the centre of the town, and within a quarter of a mile of the outskirts. At Edinburgh, Bedford, Rugby, Chelmsford, Harrow, Skipton, Norwich, Perth, and Bury St. Edmunds, it is outside the district, at a distance of from half a mile (Perth) to 3 miles (Norwich) from the centre of the town, and from half a mile (Bury St. Edmunds, Harrow, Chelmsford, Bedford) to 1 $\frac{1}{4}$ mile (Norwich) beyond the outskirts; at Birmingham, Chorley, Braintree, Banbury, and Malvern, the land is partly within and partly outside the district under the sewer authorities. The distance of the irrigated land from the lowest sewer-outlet of the town varies from 100 yards to upwards of a mile. In some cases land has been purchased, as at Harrow, Reigate, and Tunbridge Wells; but in most cases it has been leased. Sometimes it is occupied by the sewer authorities, sometimes let to a farmer, as shown in the accompanying Table, which shows also the mode of delivery to the land by gravitation or pumping, and other details.

Name of Town.	Distance of irrigated land			Irrigated land has been	Occupation of the irrigated land		Sewage applied to land
	from the centre.	from the town outskirts.	from the lowest sewer-outlet.		by the sewer authorities.	let to farmers.	
Edinburgh.....	1 mile.

At most places the application of the sewage to land has been found to exercise a most beneficial influence on the condition of the streams and rivers receiving the drainage of the district. At Epsom there was some damage done to the Hog's Mill River, but no complaint is now made. Even where only the solid portion of the sewage is separated by filtration or precipitation, the state of rivers receiving the discharge is to some extent improved. At Northampton an application for an injunction has been made by a miller resident on the stream. Generally speaking no objections appear to have been made to the application of sewage for irrigation; and where such objections have been urged, on the ground that the application was offensive and injurious, they do not appear to have been supported by medical authority, and in several instances they have ceased. As regards the sanitary condition of these districts, it appears that in most cases the application of sewage for irrigation has not been attended with any apparent change; but there is said to be a marked improvement at Braintree.—*From the First Report of the British Association Sewage Committee,*

THE SUFFOLK AGRICULTURAL ASSOCIATION.

MEETING AT SUDBURY.

With a "welcome to the ancient and loyal town of Sudbury," the associates made it the fixture for their fortieth annual meeting, which we are glad to proclaim a success. That the Society through mere lethargy had a tendency to recede instead of advance there is no denying, as it was no lack of liberality on the part of the county; for no sooner did some of the committee, like the Buffs and Blues of the ancient and loyal borough of Eatonswill, display a little devotion to the cause, and become "energetic" in a canvas for prize money, than their call was freely responded to and the premiums doubled. The show-field was close to the town, and the arrangements good, with the animals nicely protected from the heat; and in this respect they had decidedly the best of the lookers-on, as the sun made one "the colour of the nutmeg and as hot as ginger." Then the prizes in the shedding were duly posted, so that those who could may read; in fact, it only wanted some poor fellow in the horse-ring with eighteen-pence a-day and his board to hoist the numbers of the winners on to make the thing perfect; for it is not everybody that has an eye for colour, more especially if the rosette happens to be on the opposite side of the horse's head. In adjoining rings on the level and of fair dimensions were Sir Thomas Lennard and Messrs. Wake and Blake, three very fair performers across country, and chosen to preside over the merits of the riding and coach horses; while Messrs. Clayden, Sewell, and Giles, considered to have an eye to the form of a team, gave verdicts in the agricultural classes. The strongest part of a Suffolk show is its Punches—the famed "sorrel" cart horse; "for in my younger days," said an ancient agriculturist, "we never called them chesnuts;" and again, "but we had not such grand horses as these." Grand as they are and free in their movements, for thankful are we that the prejudicial stickers to old fashions and forms, who always think as their fathers thought, are so far vanquished that we seldom see in a showyard one of the drooping-headed tumble-down dead-puller sort, with his scapula or blade-bone pointed for the ear—or in the words of the antiquated, "all his weight by nature thrown into the collar." But the improved Punches have their faults; in fact, the Suffolk breeders, like bad bakers, have paid more attention to the tops than they have to the bottoms. Their horses are overtopped, small and tied at the knee, and many with feet adapted for anything but supporting their weight. A Suffolk not faulty in the forelegs is a rare exception, from which even the grand Matchett is not free. But, with all their faults, we love them still; and as these deficiencies run more in some strains than others, we think, with judgment and careful crossings, these eyesores to a lover of form may to a certain extent at least be corrected. But here is the lengthy, double-backed, flat-sided, free-moving Harwich Emperor, just awarded the £20 in the class of eight, including Mr. Badham's useful, good-limbed Great Eastern, and his Hercules, the well-made Monarch of Mr. Wolton's, and Mr. Boby's good-looking Royal Prince by his Conqueror. Conqueror we call to mind as a deformity at Framlingham in '68, when with Harwich Emperor he had to succumb to Cupbearer, a compact really good-made one of the late Mr. Crisp's, now in the stable of Messrs. Garrett, who gave a twenty-guinea prize here for the best

foal by him, the best turning up in one bred by Crisp's executors, as this also proved to be the best foal in the open class. In a good lot of mares the dam of the Cupbearer foal, a low mare of character, played second to Mr. Wolton's Moggy, the winner of many prizes, her fine form being made more conspicuous among the reds by her dark chestnut coat. Mr. Grout, the well known dealer and exhibitor from Woodbridge, in a good class of yearling entire colts, was to the fore with a Harwich Emperor, while Young Emperor, by Harwich Emperor, was pronounced the best two-year-old entire colt, and eventually awarded the cup as the best stallion in any class, as not only better than the flat-sided old gentleman, but better than Mr. Wilson's rich-coloured, fine-grown colt, by Monarch, and the prize two-year-old of Saffron Walden and Harleston. There were many who differed with this verdict, but it is one in which we entirely coincide, as the colt is a deep, compact, well-built, good-limbed, active-looking horse, though a little stronger shoulder might improve him. There were only two three-year-old entire colts put in for the two prizes, the first being a big one and no mover, while the second had length and quality on a short leg, and another of the condemned flat-sided Emperor's progeny. In a capital class of "gast" mares, a word we should have thought as obsolete as sorrel, the grand Matchett takes her usual place, admired by all Suffolk; so plump and Punch-like is she all over, so even and so true from any point of view, that an owner of a stud of racing pigs and a reverend judge look on her with delight, while another of the porcine tribe evidently contemplates her with an eye to a model. There were a few nice three-year-old fillies, Mr. Wolton playing first with one called Smart, and Colonel Tomline with another of the same name. After this we should suggest that they be christened in the prevalent bull fashion, Smart the First and Smart the Second. The Capon executors two-year-old filly, who was second at Harleston to a fine filly of Mr. Wolton's, with hocks so near together as not to part with sixpence, was here, with the turn of the tide in her favour, first, while the cow-hocked one was not even placed; so much for a land of liberty and the freedom of opinion. A high-crested yearling filly, and a winner at Saffron Walden, was, with seven other fair-formed candidates nominated for the Member of Bury's guineas, returned at the head of the poll. Mr. Wolton's pair of handsome mares, Diamond and Doughty, distanced a pair of leather-plating looking bays of Mr. Jennings, of Newmarket; and then with a capital team of four, Victory, Princess, Moggy, and Scott, upset the pretensions of a very decent string from the Newmarket stable.

Although steam and the telegraph have brought all the world together, and a man now takes his ticket from London Bridge to the Antipodes with half the fuss, and only a percentage of the great-coats, rugs, and wrappers, that he did to engage the box-seat to Sudbury, yet we are still as fond of our riding horses and roadsters' form and pace as ever. This love of the nag, or "everybody's horse," is seen at the agricultural shows by the numbers of all sorts and conditions of men that swarm round the ring. Why here is even old Milo, with his mellow elastic touch, who has deserted the edge-bone and the judges

over the grand bull class, while Ploughshare turns his back on the agricultural bench and gast mares, and here come Longwood and Shortwool Berkshire, Large and Small, with all the ladies pall mall, as the thoroughbred nags make their appearance. But there is only one stallion here for the two prizes for those calculated to get hunters. It is a walk over, and Deerfoot in Kiugcraft's colours—black and white—goes dancing round the ring, looking some pounds heavier than he did when victorious at Saffron Walden. There, alone in his glory, in an extra class, is the light bay Volunteer, by Alarm, one of Deerfoot's opponents at Saffron Walden, and who we then put down as a horse calculated to get machines. With three half-breds to oppose him in the coaching stallions, is another thorough-bred, Donald Caird by Annandale, a draft from the Husketon stud, and a prize taker, as King of the Dales at Framlingham in 'sixty-eight. But why change his name? No animal who has a pedigree in a Stud Book or Herd should be re-christened without some particularly good reason. Donald is a big horse, fit for the purpose, and as he bends his knee as a coacher should, took the red ribbon and ten, after deducting expenses, to Flixton. Following up Sir Shafto Adair's victory, the Duke of Hamilton, with a very handsome pair of rather cobby dappled browns, defeated a weedy couple of bays, of Mr. Ogilvie's, for the cup for carriage or phaeton purposes. There were only three hunting mares with foals entered, the winner being a short-legged provincial-looking hunter of some character but lacking breed; while the dam of the prize hunting foal, Sir Shafto Adair's Gem, is a hollow-backed chestnut of great quality and good limbs, of Irish extraction, and Mr. Barton's Topsy but a clever-looking cobby hackney. The Marquis of Westminster's roan hackney is a mare that Mr. Branwhite, who now and then sends some nice cobs to Knightsbridge, won a prize with at the Royal Battersea meeting. She is a very nice one, and perfect, with the exception of her knees being a little too back and high from the ground. The Bury prize roadster Gipsy was also in, a well-known prize taker of Royal Barlow's, and full of character, though age in sharp angular lines begins to tell on the wasting frame of the game-looking varmint old mare. Sir Shafto Adair had a thick-set roan of good form, and the Duke of Hamilton a bay mare called "Sewell," we should fancy after the well-known dealers of Prince's Row, whose foal was proclaimed as the best. Eclipse, with some of his fat off, went more airy, showing himself to advantage, and beating Kitty, a well-made mare, with her legs nicely placed. Mr. Badham having recovered from his set-to with the Comet, was on his old favourite Major, who looks as well as ever, and as white as snow.

There was a poor class of three-year-old hackney mares, with the exception of Attraction, and in the two-year-olds only three, the winner turning up in a strong-made iron grey, from Bowbeck. In a fair class of yearling hackneys, Mr. Grout won with a promising one by his horse Quicksilver, the reserve number being a nicely-made roan of Mr. Branwhite's. Mr. Grout was again to the front with his ladylike Nelly, beating a nice grey from Captain Bence's stable. Mr. James, Allen, Catchpole, Nathaniel Ransome, better known as Mr. Allen Ransome both in the manufacturing and the horsey world, came off with flying colours with his very handsome Islington prize pony, Perfection, although it was scarcely fair to show a stallion with mares and geldings. Tomtit was proclaimed the king of the little ones. For a local show there was a very fair exhibition of hackneys, though among the hunters the good ones were few and far between; but then Suffolk is not famous as a hunting country, or, if so, the owners take particular care to keep the best under lock and key. The first prize hunter,

Fenian, at a side view is a rather taking horse, but not up to much weight, while he is a sprawling mover, going so wide behind that he would scarcely find room in some of the Suffolk lanes to indulge in what we suppose was meant for a gallop. Mr. Sparrow, of Halstead, showed a bay mare of breed with a fired hock that could move. Then, the Duke of Hamilton's Turk had some form, as had a grey of Mr. Bryant's, of Ipswich. Mr. Grout's chestnut, by the Ace of Clubs, who was commended in a large class at Islington, here beat Mr. Badham's Baronet and four or five others, while Mr. Mumford with another well-made one by the Ace came in for a cup in a class of seven. The member for Bury, with a two-year-old chestnut by Musketeer of good form and a fine drooping quarter, beat a three-cornered one of Mr. Sparrow's. Peru is a lengthy low horse, showing breed and character, who only wants a little setting to rights to make him very hard to beat; he was here the pick in a lot of seven, including Mr. Sparrow's bay four-year-old by Frogmore that took several prizes at Saffron Walden, and another of Mr. Harvey's, of Tinworth; also The Queen of Clubs, a strong made one, but not exactly hunting form, of Mr. Mumford's; and Brunette, a very neat light made mare of Major Barlow's, that won the Prince of Wales's Cup, at Harleston. The judges rode some of them, but Brunette, in strange hands, did not settle down in her paces kindly. The prize horses were paraded during the day, while there was a wind-up with some jumping to amuse the ladies, and, judging by the beaming smiles that played over the features of the fair occupants of the grand stand, and the buzzes of delight that were ever and anon wafted across the yard, this must have been a great success!

The weak part of the show was the cattle, there scarcely being a shorthorn cow in the yard; and for the bulls, Monk had it all his own way with half-a-dozen fair animals pitted against him, Mr. Crabbe's Old Sam coming in for a high commendation. Hogarth the 2nd and some others from the Bowbeck herd through error were not entered in time, and their absence was very palpable in so small a show. Mr. Catchpole's Buttercup, the cup cow, is an ordinary cow, of a taking colour, with not a good head or eye, or anything very wonderful about her, and taking into consideration the ages of Buttercup and Daisy and the quality and symmetry of the second, we should have been more pleased had the decisions been reversed. The Shorthorn heifer had quality and form, with nothing to oppose her. There were several very beautiful specimens of the Polled Suffolk, both male and female, and the judges honoured the lengthy well-made Cherry Duke with the cup for the best bull of any age in preference to The Monk, who did not look in high form. As they did this with the Suffolk bull, surely they might have given the beautiful Duchess the cup in preference to Buttercup if form or quality have anything to do with it. The pure-bred Devon of Mr. Rodwell's was as ugly a specimen as we ever saw. There were something like a score of Alderneys, with some very pretty ones among them, the Rev. M. Shaw exhibiting eight out of the twenty. There was a good show of sheep for Suffolk—Lord Braybrooke in the Southdown tups being opposed by three entries of the Marquis of Bristol's, two of Mr. Boby's, two of Colonel Tomline's, and one of Lord Sondes'. In the shearing tups Mr. Boby, with three entries, defeated three of the Elmham flock, and one each from the Audley End and Orwell flocks. Then in the shearing ewes, Colonel Tomline beat pens from Audley End, Elmham, and Ichworth Park. In blackfaced tups, or the Suffolk, Mr. Green, with a coarse uneven one, beat Mr. Dobito and Mr. Woodgate. For shearing tups, Mr. Green with four strings to his bow

upset Messrs. Dobito and Woodgate's pick. Mr. Gazeley won with a very nice pen of shearing ewes, opposed by some of Mr. Dobito's. In the longwools, with some fine specimens of the Cotswold, the judges reversed the Harleston decision by placing Mr. Giblin's sheep before Mr. Brown's, and in the shearing tups placed Mr. Brown's second sheep before his Norfolk first! We believe Mr. Brown objected to the shearing of Mr. Giblin's sheep before the judging commenced. In short wool lambs the judges preferred the blackfaced Suffolks to the Hampshire and Southdowns. There was an excellent show of pigs from the sties of Messrs. Sexton, Stearn, and Duckering, names that are household words in the piggery, and who run in and out, first, second, or third at the different meetings, like George the Fourth, Mr. Graham, or John Scott. Mr. Wilson and the Rev. W. Holt Beever were asked to pick out the best—the former a large buyer, and the latter a true lover of form in the horse, shorthorn, sheep, or pig, and a breeder of all. They commenced with the boars of the black breed, and Kingcraft repeated his Norfolk victory, Mr. Stearn being well-up with The Parson, M'Gregor from Sexton's stud getting highly commended. Then a black sow and pigs of Mr. Stearn's, by King Tom, walked over. In the breeding sows Mr. Sexton had Sunshine—that was beaten at the Harleston Meeting by Mr. Duckering's Black Bess—a most excellent pig, with which the judges had no fault to find. They are both capital, and as the judges had to pick one, the preference was given to Sunshine. These racing names remind us of many a dead heat; and it strikes us as rather extraordinary when animals come together so equal in merit, that there are not oftener dead heats in the show yard, and the prize or two prizes put together and divided. Mr. Wolton's pen of three young sows of the black breed was a walk over, there being no other entry. In the white boars Mr. Stearn beat Mr. Sexton's Norfolk prize pig, which was second, while he was highly commended for another. Then the Comet, who is now looked on as the Cruiser of the pigs, is very good before, but falls off lank and lean in the hind quarters. Mr. Petit, with a very nice sow and pigs of the Sexton breed, beat a very good-looking lot of Mr. Stearn's, while, for real beauty or perfection, the pig of the show was the breeding sow Our Mary Ann of Mr. Sexton's, who vanquished Mr. Duckering's Lily, sister to Little Queen, that has taken prizes from the Land's End to Harleston, in Norfolk; but Lily is not equal to Little Queen, and is as different in the snout as a Hottentot from the Venus de Medicis. The three young sows of Mr. Sexton's were excellent, in fact, from the three piggeries they were all good, and no doubt they will fight their battles over again at Oxford; where, if we were to prophesy, we should say Our Mary Ann would be a very good investment for a place.

P R I Z E L I S T.

H O R S E S

FOR AGRICULTURAL PURPOSES.

JUDGES.—J. Clayden, Littlebury.
D. Sewell, Beaumont Hall.
H. Giles, Croxton, Thetford.

Stallion, having served 20 mares in the county.—First prize, £20, Isaac Rist, Tattingstone (Harwich Emperor); second, £10, C. Boby, Stutton (Royal Prince).

Three year old entire colt.—First prize, £15, J. Ward, East Mersea; second, £5, Colonel Tomline, M.P., Orwell (The Earl).

Two year old entire colt.—First prize, £15, and cup value £15, I. Rist (Young Emperor); second, £5, N. Catchpole, Ipswich (Emperor).

Yearling entire cart colt.—Cup, value £10, J. Grout, Woodbridge. Highly commended: S. Wolton, Newbourn.

Mare with foal at foot.—First prize, £15, S. Wolton (Moggy); second, £5, executors of the late T. Crisp, Butley Abbey.

Foal of 1870.—First prize, £8, Executors of T. Crisp; second, £4, A. J. Smith, Sutton.

Foal by Cupbearer.—Cup, value £21, executors of T. Crisp. Gast mare.—First prize, £10, and cup value 10 guineas, T. Capon (Matchett); second, £5, Major F. Maitland Wilson, Stowagtoft (Empress). Highly commended: Executors of T. Crisp (Darby).

Three year old filly.—First prize, £10, S. Wolton (Smart); second, £5, Colonel Tomline, M.P. (Smart).

Two year old filly.—First prize, £10, executors of T. Capon; second, £5, Colonel Tomline, M.P. (Bonny).

Yearling filly.—Cup, value 7 gs., 5 gs., and 2 gs., W. Thompson, jun., Thorpe, Colchester.

Pair of mares or geldings, or mixed.—Prize, £10, S. Wolton (Diamond and Doughty).

Team of four agricultural horses, either mares or geldings, or mixed.—First prize, £20, S. Wolton (Victory, Princess, Moggy, and Scott); second, £10, T. Jennings, Phantom House, Newmarket (Diamond, Boxer, Shot, and Sharper).

RIDING AND COACHING HORSES.

JUDGES.—Sir T. Lennard, Bart., Belhus.

H. W. Wake, Bramford.

G. W. Blake, Newton, Bury St. Edmund's.

Thorough-bred stallion for hunting purposes.—Prize, £20, Major F. Barlow, Hasketon, Woodbridge (Deerfoot).

Stallion for coaching purposes.—Prize, £10, Colonel Sir R. A. S. Adair, Elixton Hall, Bungay (Donald Caird).

Roadster stallion mares.—First prize, £10, J. Grout (Sportman); second, £5, H. Bultitoff, Bedwellhay Grange, Ely (Cleartheway). Highly commended: J. Grout (Rapid Roan).

Match pair of geldings or mares, for carriage or phaeton purposes, not less than 15 hands high.—Silver cup, 12 gs., Duke of Hamilton, Easton Park, Wickham Market (Tommy and Charhe).

Hunting mare, with foal at foot.—Prize, £10, S. Palmer, Barham. Highly commended: Colonel Sir R. A. S. Adair (Gem).

Hackney mare with foal at foot.—Prize, £10, Marquis of Westminster.

Hunting foal.—Prize, £5, Colonel Sir R. A. S. Adair. Highly commended: S. Palmer.

Roadster foal.—Prize, £5, Duke of Hamilton.

Weight-carrying mare or gelding, not less than five years old.—Prize, £10, and silver cup, value 10 guineas, Colonel Wilson, Stowlangtoft Hall (Fenian).

Weight-carrying hunting mare or gelding, not less than four years old.—Prize, £10, J. Grout (Ace of Clubs).

Weight-carrying hunting mare or gelding, three years old.—Prize, £7, Maurice Mumford, Creeting, Needham Market (Queen of Hearts).

Weight-carrying hunting mare or gelding, two years old.—Prize, £5, E. Green, M.P., Bury St. Edmund's. Highly commended: B. Sparrow, Halstead, Essex.

Light-weight hunting mare or gelding.—Cup, 10 guineas, W. Cooper (Peru); second, £4, Major F. Barlow (Brunette). Highly commended: B. Sparrow.

Best hunting mare or gelding in the yard.—Silver cup, value 10 gs., Lieutenant-Colonel F. M. Wilson (Fenian).

Gelding or mare of not less than 14 hands, nor more than 15-2 hands high, to be exhibited in single harness.—Silver cup, value 10 gs., Duke of Hamilton.

Riding mare or gelding, not under 15 hands high.—First prize, £10, G. D. Badham, Bulmer Tye, Sudbury (Eclipse); second, £5, J. Grout (Kitty).

Hackney mare or gelding not under 14 hands high, and not exceeding 15 hands.—First prize £10, G. D. Badham (Major); second, £5, G. K. Cooper.

Three year old hackney mare or gelding.—Prize, £5, C. S. Scott, Thorpe, Biddlestone (Attraction).

Two year old hackney mare or gelding.—Prize, value £5, G. Kersey Cooper. Highly commended: Duke of Hamilton.

Yearling hackney colt or filly.—Prize, £5, J. Grout (Quick-silver). Highly commended: F. Branwhite, Long Melford, Sudbury (Young Ambition).

Pony, not under 13 hands high, and not exceeding 14 hands.—Prize, £5, J. Grout (Nelly).

Pony, not under 13 hands high, and not exceeding 13 hands.—Prize, £5, J. A. Ransome, Ipswich (Perfection). Highly commended: W. Kersey, Reydon.

Pony, not exceeding 13 hands high.—Prize, £5, G. M. Sexton, Wherstead Hall, Ipswich (Tomtit).

The hunter jumping prize over three flights of hurdles.—First prize, £10, R. Allen, Bulmer, Sudbury (Kathleen); second, £5, J. H. Bryant, Ipswich.

CATTLE.

JUDGES.—M. Biddell, Playford.

W. Dodds, Keelby, Ulceby.

—Horne, Tabraham, Norfolk.

Suffolk bull, not under two years old.—First prize, £10, J. J. Colman, Norwich (Cherry Duke); second, £5, B. Brown, Thurstford, Thetford (Norfolk Duke). Highly commended: S. Wolton (Broadback).

Suffolk bull, under two years old.—Prize, £10, W. Harvey, Timworth, Bury St. Edmund's.

Best Suffolk bull of any age.—Cup, value 10 gs., J. J. Colman (Cherry Duke).

Suffolk cow, in milk or in calf.—First prize, £10, B. Brown (Duchess); second, £5, Colonel Tomline, M.P. (Polly). Highly commended: S. Wolton (Sprightly).

Suffolk heifer under three years old, in milk or in calf.—First prize, £10, J. J. Colman (Nelly 2nd); second, £5, B. Brown (Haudsome). Highly commended: S. Wolton (Wide-awake).

Suffolk heifer, under two years old, in milk or in calf.—Prize, £10, Colonel Tomline, M.P. (Red Rose). Highly commended: S. Wolton (Bridesmaid); B. Brown (Countess).

Best Suffolk cow.—Silver cup, value 10 gs., B. Brown (Duchess).

Shorthorn bull, not under two years old.—Prize, £10, J. Upson, Rivenhall, Witham (Monk). Highly commended: R. H. Crabbe, Baddow-place, Chelmsford (Old Sam); N. Catchpole, Ipswich (Sorcerer).

Shorthorn bull, under two years old.—Prize, £10, N. Catchpole (Champagne Charley).

Shorthorn cow, in milk or in calf.—First prize, £10, N. Catchpole (Buttercup); second, £5, N. Catchpole (Daisy). Highly commended: J. Upson (Lilac).

Shorthorn heifer, in milk or in calf, under two years old.—Prize, £10, N. Catchpole (Coronet).

Bull of any pure breed (not being Suffolk or Shorthorn), under two years old.—Prize, £10, H. Rodwell, Ampton Hall, Bury St. Edmund's (Devon).

Bull of any pure breed (not being Suffolk or Shorthorn), under two years old.—Prize, £10, C. Boby, Sutton, Ipswich (Ayrshire bull).

Bull of any age or breed.—The President's Cup, J. J. Colman, Suffolk (Cherry Duke).

Cow of any pure breed (not being Suffolk or Shorthorn), in milk or in calf.—First prize, £10, Rev. M. Shaw, Rougham Rectory, Bury St. Edmund's (Jersey); second, £5, Rev. M. Shaw (Jersey). Highly commended: C. Boby (Ayrshire); E. Greene, M.P. (Channel Islands). Commended: I. Rist (Channel Islands); S. Hanbury, Wickham Place, Witham (Alderney heifer, Daisy).

Heifer of any pure breed (not being Suffolk or Shorthorn), in milk or in calf, under two years old.—Prize, £10, Rev. M. Shaw (Jersey).

Cow of the Channel Islands breed.—Prizes, £10, £5, £3, and £2, Rev. M. Shaw (Lilac).

Cow of any age or breed.—Cup, value 5 gs., N. Catchpole (Shorthorn, Buttercup).

SHEEP.

JUDGES.—J. A. Hempson, Erbarton,

H. Sallows, Gilston, Harlow.

SOUTH-DOWNS.

Top of any age.—Prize, £10, Lord Braybrooke, Audley End. Highly commended: Lord Sondes, Elham, Norfolk. Commended: Colonel Tomline, M.P.

Shearling tup.—Prize, £10, C. Boby, Stutton.

Pen of five shearling ewes.—First prize, £10, Col. Tomline, M.P. Highly commended: Lord Braybrooke.

BLACKFACED.

Top of any age.—Prize, £10, J. M. Green, Stradishall, Newmarket.

Shearling tup.—Prize, £10, J. M. Green.

Best short-wooled tup.—Prize, £10, and cup, value 10 gs., Lord Braybrooke. Highly commended: J. Gilpin, Bardfield, Braintree (Oxfordshire Downs).

Pen of five shearling ewes of the blackfaced breed.—Prize, £10, G. King, Gazeley, Newmarket.

Long-wooled tup of any age.—Prize, £10, and 10 gs., J. Giblin (Cotswold).

Shearling long-wooled t up.—Prize, £10, T. Brown, Marham (Cotswold). Highly commended: T. Brown (Cotswold).

Pen of five long-wooled shearling ewes.—(No award).

Pen of ten short-wooled lambs.—Prize, £6, R. Woodgate, Great Waddingfield.

Pen of ten cross-bred lambs.—Prize, £6, A. Nicholson, Ipswich.

PIGS.

JUDGES.—W. Wilson, Baylham.

Rev. W. H. Beaver, Pencraig, Ross.

Boar of the black breed.—First prize, £8, G. M. Sexton (Kingeraft); second, £4, S. G. Stearn, Brandeston, Wickham Market (The Parson).

Sow and pigs of the black breed.—Prize, £8, S. G. Stearn.

Breeding sow of the black breed.—First prize, £8, G. M. Sexton (Sunshine); second, £4, R. E. Duckering, Northorpe, Kirton-in-Lindsey (Black Bess).

Pen of three young sows of the black breed, pigged since November 1st.—Prize, £5, S. Wolton, jun.

Boar of the white breed.—First prize, £8, S. G. Stearn (Cock of the Walk); second, £4, G. M. Sexton. Highly commended: G. M. Sexton.

Sow and pigs of the white breed.—Prize, £8, J. Pettit, Aldeburgh. Highly commended: S. G. Stearn.

Breeding sow of white breed.—First prize, £8, G. M. Sexton (Our Mary Ann); second, £4, R. E. Duckering (Lilly). Highly commended: S. G. Stearn.

Pen of three young sows of the white breed.—First prize, £5, G. M. Sexton (We Challenge All); second, £3, R. E. Duckering.

Pair of white boar pigs, pigged since November 1st.—Prize, £5, G. M. Sexton. Highly commended: S. G. Stearn (Twin Brothers); R. E. Duckering.

Pair of black boar pigs, pigged since November 1st.—Prize, £5, S. G. Stearn.

The best black boar, of any age.—Cup, value £5, G. M. Sexton (Kingeraft).

FARM IMPLEMENTS.

JUDGES.—G. Nunn, Eldo House, Bury.

W. Biddell, Lavenham.

Special prize cup, presented by the Lavenham Farmers' Club, for the best collection of agricultural implements, 10 guineas, Ward and Silver, Melford.

Special prize, pair millstones, 5 guineas — Bear, Ipswich and Sudbury.

The dinner was held in the Town Hall, the Marquis of Bristol, the President of the Association, in the chair, who said he earnestly desired that the English farmer might never have occasion to go, what he might call creeping to Parliament in order to ratify the bargains which they had made, be they good or bad, with their landlords, which he could not help thinking was very much like taking a slice of what somebody else had got. He was not speaking as a landlord to tenant-farmers, but as an Englishman to Englishmen, and he hoped it would be very long before we in England had to go to Parliament to redress those wrongs which are very much our own fault. Nor did he speak as a landlord desirous of making all he could out of his land, nor as being jealous of every right. His motto had always been and always would be with regard to the letting of land, "Live and let live." He held that one implied condition of letting land was this, that them an who took the land and farmed it should make out of that land not only sufficient to educate his children, but lay something up for their advancement in life at some future day, and to lay something by against a day of distress, which might come by reason of death or sickness. He did not think that there ever would come a time when such a measure as the Irish Land Bill would be required for England. The whole system was different in England to that in Ireland, but if at

any time the tenant farmers in the former country felt that they were lying under any injustice they had very much the remedy in their own hands. If they were only firm and outspoken with the landlords he felt sure that everything would go on smoothly and prosperously. Take the question of game for instance. Game was the right of the tenant by the law of the land, and the tenants had very much the matter in their own hands. A great deal was said about the landlords preserving game, but it was the tenant preserved it. Let them agree amongst themselves about, for instance, the preservation of rabbits, and he had no doubt that what they wished would be conceded to them. Landlords, in the generality of cases, would not be willing to lose a good tenant for the sake of a few destructive animals.

Col. WILSON said associations of this kind often made a great mistake in one direction. They did not hold shows for butchers' meat, nor were they a Christmas Fat Cattle Club, but they offered prizes for breeding animals; in order, however, to obtain a prize, it was necessary to get them into such a state of fatness that it was almost impossible for them to breed. He would ask any practical man if it was not the case that in many instances they not only injured their animals, but absolutely ruined them by the great amount of fat they were obliged to place upon them. This applied more to the female animal than to the male. They had this year made one great step in advance, but they had not yet gone far enough. Previously to this year they had only two classes for cattle, there was the Suffolk in one class, and Shorthorns and Alderneys, &c., in another. This year there was a separate class for Shorthorns, but still there were different breeds in the same class. He happened to show an Alderney bull, and he was obliged to do so against a Devon, and he should like to have the judges explain how they were able to compare the merits of the Alderney and the Devon bull? This difficulty might in future be obviated in two or three ways, either increase the prize in the classes, or they might say a prize should be given for each different description of animals if there was sufficient merit represented. In to-day's entry there were no less than fifteen Channel cows, and that brought him to the point whether there should not in future be a separate class for Channel cows or any other dairy breed.

Col. PARKER, M.P., said, happily in England, as had already been remarked, landlord and tenant were perfectly competent to enter upon their own engagements and undertakings without legislative interference. There was not a man in that room, but what would feel highly indignant at the suggestion of any interference of the kind. He fully concurred with the excellent sentiment expressed by the noble president as to the saying, "Live and let live," and there was no need for legislative interference where there was such a kindly understanding between the parties. Amongst other questions under consideration was the one of Game, and there were no less than four Game Bills before the House of Commons. Rabbits were animals that had been once or twice before the House of Commons, and he was struck with the observations of one gentleman who was very much offended because the rabbits were called *vermin*! From his experience of these animals he could for his own part call them by no other name. He would take every opportunity—always bearing in mind that the agriculturists and reasonable men would never destroy partridges' and pheasants' nests in the season—during the winter months of February and March, with ferret, net, and dogs, of extirpating them.

Mr. EDWARD GREENE, M.P., was of opinion that after all there was a great deal of sham legislation in the House of Commons; and but for letting off the steam, if the House was shut up for the next twelve months England would be a far happier and prosperous country. He could not commend the riding class. He would say, "If you attempt to breed riding horses get a distinctive breed of mares." Mares whose grandmothers were never seen were used for breeding purposes, too many went to the cart tail, and a great horse was used. But he believed there was one way in which riding horses might be bred with some success, and it was to use for mares horses of grand action; because if you get action it was astonishing how the public would put up with other defects. Although in a hunter and other horses it was possible to have too much breed, with a mare that could be depended upon, put blood upon it; where,

however, nothing was known of the mare use a good trotting horse. He confessed he could not see the necessity of making animals so beastly fat, fit to be sent to the butcher. What was wanted in this Association was an instruction to some one to discard stock which did not come under the proper definition. He saw to-day the South and other Downs shown for one prize. He also noticed amongst the two year-old hackney fillies, an animal take the prize fit for an omnibus, and it was exhibited against an animal fit to carry a lady. He would defy a judge to give a fair opinion under such circumstances; and he would say if animals come in like that send them back. He was an advocate for sending animals back, for there was no way of teaching a man his business like giving him experience, and there was no experience so good as that which was bought, if not bought too dearly.

Mr. D. SEWELL must congratulate some of the exhibitors in having kept up the credit of the Suffolk cart-horses. He considered the gait mares a fine collection, but he could not say much for those with foals.

Mr. M. BIDEDELL had looked over a better exhibition than they had seen to-day. The Suffolks were very much improved of late years, and this was the first instance that a Suffolk bull had beaten a Shorthorn, and he, for one, never gave a prize with greater pleasure than he did in the open class. Though the prize went into Norfolk, yet the bull was bred in Suffolk, and consequently he reflected as much credit upon the county as if he had remained in the county. He thought the animals amongst the Suffolks were the best he had seen in that class—the four-year-old cow class and the young bull. He quite agreed with the remarks made by Lieutenant-Colonel Wilson about the Alderney having a separate class, and he thought that if they came in in the numbers they did it was necessary, for there was otherwise great difficulty in deciding the prizes for Alderney cows. As to showing the animals in a fat state, one of the most successful breeders, the late Mr. Crisp, said he never would breed from an animal unless he had seen it as fat as it could be made. It was the best test an animal could have. If there was any weakness in an animal it would come out by high feeding sooner than with any other treatment. No one needed to fear breeding from the fattest horse that he could find, as it proved it to be an animal of an excellent constitution, and an animal which had gone through a system of training which none but such an animal could stand. With reference to the noble President's remark as to "Live and let live," he (Mr. Biddell) spoke as a tenant-farmer only. He farmed under the noble President, and a more liberal family there could not be, and there was no doubt whatever but that the noble Marquis thoroughly meant what he said about living and let live. There had been a great deal of nonsense talked lately upon the subject of game, and some men advocated legislation to prevent a man doing as he thought proper with his own. If a gentleman owned an estate, surely he had a right to do what he liked with it. He admitted that he had seen a great deal of injury done by game, but it was done in a small district in comparison with the whole kingdom, and if Parliament was going to legislate in the manner proposed by some, he considered, with Mr. Greene, that it had better shut up altogether for twelve months.

SMUT IN WHEAT.—Uredo, pepper-brand, rust, bunt, burnt-ear, smut, and blight or mildew, are terms somewhat indifferently applied to disease in cereal grain, especially in wheat, which consists of a black or dark coloured powder inside the corns, often not showing outside, and which is really a microscopic fungus having several distinct stages of growth, and is transmissible by the germination of the seeds so affected to future plants; corn so diseased loses about 50 per cent. of its nutritive properties. The word "*Bunt*" seems the original of these names; it means simply "burnt," which describes the appearance of the fungus, and is the past participle of the old English verb "*to bren*," or as we now write it, "to burn." When the mischief is caused by sudden cold or heat or insects, the term "blight" is generally applied; the term "burnt-ear" is generally applied to the external, and the term "smut" to the internal manifestations of the fungoid disease.—R.

THE CHESHIRE AGRICULTURAL SOCIETY.—Sir Harry Mainwaring has announced his intention of moving at the general meeting, that this Society be amalgamated with the Manchester and Liverpool Society.

PETERBOROUGH AGRICULTURAL SOCIETY.

MEETING AT PETERBOROUGH.

This show was held on Thursday, July 7. The prize list was better by £63 than last year. The beasts were 14 in number, but the sheep were weak, the extra prize failing to induce a greater show than 29, against 33 last year. In pigs there was a large increase, amounting up from 10 last year, to 28 this. The horses showed a decrease, the total being 10, against 125 last year. The falling-off was principally in the five-year-old hunters and the hackney classes. The cart mares with foals were 9, being 2 less than last year; while the 13½-hand ponies rose from 4 to 15. In the small ponies there was a decrease from 13 to 8. The aged-hunter class was not up to the level of former shows, but it was said to be better than the corresponding class at Royston. The young hunters were altogether superior, a better lot not having been seen here. Hackneys were equal to former years. The small ponies were a very nice lot, and there were some smart yearlings. There were some good cart colts and fillies, the young colts being the best of their sex, as were the older fillies. The cart mares were a meritorious class, but the foals, it was thought, did not, as a rule, equal their dams. Cattle were fairly represented, fat beasts being limited, but fine. The bulls, taken together, were a good class; and in young ones there was a close run between the Marquis of Exeter and Mr. Wood, the latter winning. There was an average show of cows, and a good one of heifers; Mr. How taking the first prize and Mr. Gates's cup. Sheep were unusually good for Peterborough, though not as numerous as last year. Why they should not always be as good and more numerous it is impossible to say, as there are plenty of good sheep in the district. Mr. Cartwright's three-shear ram was a capital sheep. The show of pigs was one of the best and largest ever seen here, Mr. T. H. Vergette beating Mr. J. Turner for the blue riband of the large breed, and Mr. S. Deacon carrying off that for the small breed. There was a much better competition for the butter prizes, Miss Wagstaff and Mr. E. A. Skrimshire carrying off the prizes. Poultry was about an average, the Dorking chickens being a fine class, with a good show of game, and the Black Spanish excellent; Lady Grace Gordon taking the prize for over a year old, and running a very near race with Mr. Collingwood for the first pair of pullets. The Cochins were limited, but meritorious. Not much could be said for the Hamburgs, but there was a good deal to attract in the mixed breeds. What turkeys were shown were good, and the geese rare. Ducks were an excellent class. Pigeons were few in number, and of rabbits, thank heaven! there were none. Among the miscellaneous exhibitors in the show grounds were Amies and Barford, Vergette, Ashby and Jeffrey, and Baker, with machines and implements, and Bradford's washing machines; while Hayes and Son exhibited a collection of prize carts.

P R I Z E L I S T .

HORSE-SHOEING.

JUDGES.—J. D. Barford, Southampton.

R. D. Culver, Downham Market.

Shoeing hunters.—First, J. Newton; second, M. Cox; third, — Clarke.

Apprentice shoeing hackney or carriage horses.—First, J. Clay; second, G. Forth.

RIDING HORSES.

JUDGES.—Lord Kesteven, Casewick, Stamford.

S. J. Welit, Tathwell, Louth.

G. Bland, Coleby, Lincoln.

Open to all England.—Hunter, 5 years old or upwards.—A silver cup, value £20, S. J. Welit, bay horse (Loverer); second of £10, T. Percival. Commended, T. Percival.

Gelding or filly, 4 years old, for hunting purposes.—First prize, £10, R. Stokes (black). Commended, C. D. Newton (chestnut).

Open to all England.—Hackney mare or gelding, not exceeding 15½ hands high.—Prize of £7, J. Hornsby, bay (Odd Trick). Highly commended, J. Hornsby (Beda).

Open to all England.—Pony, not exceeding 13½ hands high.—Prize, £5, J. Burnham (Lady Mary). Highly commended, C. W. Chuplin (Odd Fellow); E. Calthorpe (chestnut).

Open to all England.—Pony, not exceeding 12½ hands high.—Prize, £5, J. Goodliū (blue roan). Commended, T. Wenlock (chestnut.)

Yearling colt or filly for hunting purposes.—Prize, £10, A. Goodman, jun. (colt by Richmond). Commended, J. Goodliū (colt by General Hess).

Mare suitable for hunting purposes, and foal at foot got by a thorough-bred stallion.—A silver cup, value £10, J. Goodliū. Commended, S. Middleton.

CART HORSES.

JUDGES.—J. Plowright, Manca.

L. Foster, Irthingborough.

Cart colt rising 3 years old.—Prize, £3, E. Vawser.

Cart filly, rising 3 years old.—Prize, £3, R. Hopper.

Cart colt, entire or otherwise, rising 2 years old.—Prize, £3, Isaac Cooke.

Cart filly, rising 2 years old.—Prize, £3, J. W. Moore.

Cart mare and foal at foot.—First prize, £5, and cup, B. W. Grounds, jun. (brown mare); second of £2, T. H. Vergette (chestnut mare).

CATTLE.

JUDGES.—C. Howard, Biddingham, Bedford.

W. Little, Littleport, Ely.

Fat ox, without restriction.—Prize, £10, T. Pulver; second of £5, R. Wood. Highly commended, Marquis of Exeter and W. Sisman.

Fat cow or heifer.—First prize, £5, Messrs. Dudding (roan cow); second of £2 10s., R. Wood (roan heifer). Highly commended, Marquis of Exeter (Scotch heifer). Commended, J. J. Sharpe (white heifer), and G. F. Baker (roan heifer).

Bull, above 2 years old.—First prize, £10, Marquis of Exeter (Telemachus). Highly commended, R. Wood (Lord Chancellor).

Bull, under 2 years old.—First prize, £5, R. Wood (Lord Aberdeen 2nd); second of £2 10s., Marquis of Exeter (Grand Pippin). Highly commended, W. Sisman (Paris); commended (The Worster Knight).

Cow, having a calf and in-milk or in a breeding state.—First prize, £5, R. Searson (Magnolia); second of £2 10s., R. Searson (Winter Rose). Highly commended, J. Lynn. Commended, S. Vergette.

Heifer, in-calf, under 3 years old.—First prize, £4, and cup, J. How; second of £2, R. Searson. Commended, A. Goodman, jun.

Heifer, under 2 years old.—First prize, £2, J. How; second of £1, J. Lynn. Highly commended, J. J. Sharp. Commended, Messrs. Dudding (Virginia), and J. Whitwell (Musedora).

Special prize, for the best animal exhibited, £10, J. How (2 year old heifer).

SHEEP.

JUDGES.—T. Cartwright, Dunstan, Lincoln.

G. E. Daintree, Fenton, St. Ives.

Longwooled ram, of any age.—Prize, £10, T. Cartwright. Highly commended, Messrs. Dudding.

Twenty longwooled ewes.—First prize, £3, and cup, D. Webster; second of £1 10s., S. Middleton.

Ten longwooled shearing ewes, bred in the district.—First prize, £3, S. Middleton; second of £1 10s., A. Aitken. Commended, W. W. Pearce.

Ten longwooled ewe lambs.—Prize, £3, S. Middleton.

Five wether lambs of any breed.—Prize, £3, R. Webster.

Three shearing wethers of any breed, open to all England.—Prize, £3, J. Wheeler.

PIGS.

JUDGES.—T. Cartwright.
G. E. Daintree.

Boar of the large breed, open to all England.—First prize £3, J. Wheeler (Lincoln); second of £1, J. Turner. Commended, G. Harris (white).

Boar of the small breed, open to all England.—First prize £3, S. Deacon; second of £1, J. Lynn. Highly commended, J. Lynn. Commended, J. Wheeler.

Breeding sow of the large breed.—Prize, £2, T. H. Vergette (white).

Breeding sow of the small breed.—Prize, £2, S. Deacon.

Extra Stock.—Highly commended, for fat pig, W. Dainty.

BUTTER.

JUDGE.—J. Douglas, Clumber, Worksop.

Fresh butter (Alderney excluded).—First prize, £1, Miss C. Wagstaff; second of 10s., E. A. Skrimshire.

At the dinner the chair was taken by the Earl of CARYSFORT, who expressed some surprise that no prize of any sort had been offered for flax, and that so little appeared to be grown in the district. There was Whittlesey, a perfect land of Goshen; and there were the hills of Huntingdon, now scarcely less fertile than the valleys of Northampton. He considered the growth of flax was certainly increasing. Notwithstanding the many changes which had lately taken place in agriculture, he must, as a true liberal, warn them against the adaptation of new principles. He had thought the country was too ready to run into extremes without reckoning upon the results, and he was quite sure great

risks were involved by the too sudden over-draining of the land (No, no). If they attempted to stop a drunkard all at once, they would in all probability kill him. He strongly advocated the preservation of water, when in some dry time like that lately experienced it served to fertilize the otherwise almost barren land (A VOICE: No, no). He repeated it, adding that the water was now carried away, and was useless for evermore (dissent and approbation), and the gifts of Providence were not sent to be wasted, however much they might be improved upon. In India and other hot countries it was the common custom during the wet season to save what rain fell in large tanks made for the purpose, from which in times of drought the water could be transferred to the land as required. Why could not this be done in England? He was opposed to the practice of cutting down of trees, and their best motto in a flat fenny country would be to economise water and spare wood.

Mr. J. BIRD, contrary to the chairman, was one of the greatest advocates for draining both high and low land to the uttermost, and yet he could grow as good, if not better, crops than his neighbours. It was impossible to keep the land free of weeds when there was water too near it.

Lord KESTEVEN said the chairman had alluded to the growth of flax. He (Lord Kesteven) had seen large quantities of it growing, but for his part believed the promise of this year's crop was not such as to encourage its cultivation. He strongly advocated the system of draining now so much in favour. His friend on the left (Mr. Wells) had drained land to a considerable extent. He (Lord Kesteven) had sailed, rowed, and fished on Whittlesey Mere, but he thought there was but little to catch there now.

Mr. H. T. WRENFORDSLEY strongly advocated a closer connection with the county show, and expressed the pleasure he felt on being informed that the shows would be held together in future (A VOICE: "For next year only").

THE CAMBRIDGESHIRE AND ISLE OF ELY AGRICULTURAL SOCIETY.

MEETING AT ROYSTON.

This show was held on Wednesday July 6, when amongst the cart horses the first prize for stallions went to Mr. Welcher's Honest Tom, a Royal winner. He might have taken the £20 cup on this occasion as the best entire horse for agricultural purposes, but having done so previously, he could not do so, again, and the latter premium was awarded to Mr. J. Roach, of Gretton, for England's Glory. The Suffolk horses were a handsome class, but they had not size and bone enough for the judges. The riding and coaching horses were fairish; and there were some good brood mares. The prize given by Lord Royston for hunters did not elicit that competition which is desirable, and his lordship has withdrawn the premium.

There was a good show of stock, and Lady Pigot was again pre-eminent; Mr. Pawlett also being extremely successful. Her ladyship secured first honour for the best bull not exceeding two years old with Bythis, which also took the chief honour as the best Shorthorn of any age in the yard, and carried away the cup given by the Right Hon. H. Brand. Her Queen of Rosalea took first prize for the best cow in calf or milk, Lady Ann being absent. Charles-le-Beau obtained her ladyship's second prize for two-year-old bulls, the first going to Mr. T. E. Pawlett's well-known red bull Baron Killerby. There were other victories for her ladyship, La Belle Hélène being second among the heifers, Mantaini the second second among two-year-old heifers, and Imperial Rose the best of the yearling heifers. Mr. How met with some success, his first prize being a three-year-old heifer, Windsor's Butterdy, and there were some very good dairy cows competing for the premium offered by the town of Royston for the best pair.

As a whole the sheep were good, though in some of the classes less merit was shown than others, the Southdowns being limited. The Shropshires took everything away from the Hampshires and Southdowns among the shearing short-wooled ewes. Lord Chesham's pen was pronounced a very matchy lot, of nice quality, and got up to perfection. Mr. Cooke's pen was also a very nice lot, but larger, and not so well sorted in form and style. Among the Southdown rams of

any age the decision of the authorities at Saffron Walden was reversed, Lord Braybrooke being now "nowhere," and Mr. Jonas first. The best fat shearing long-wooled or cross-bred wethers was a grand pen of sheep; they were bred from Cotswold and Hampshire Downs, and took the prize to Bedford. Lord Braybrooke showed some very nice sheep as shearing short-wooled wethers, but apparently they do not possess size enough to obtain the fiat of the judges. There was some spirited competition for the best shearing short-wooled rams, there being no less than 17 pens. The judges had out for final examination four lots, and they awarded the prize to Lord Chesham, the second prize going to some beautiful sheep shown by Mr. F. Street, of Maulden. It will be seen by the prize list that Mr. Street was successful in several other classes. Captain Catling was not able to exhibit sheep up to the usual form of those he sends; and Mr. Gunnell very easily ran away from him with first and second for shearing Leicester or Lincoln ram; Mr. Gunnell also taking the special prize given by Royston for the same class.

The show of pigs was not a large one. In the large breed there was nothing to come near Messrs. Howard of Bedford, who showed a boar which carried off first prize, besides a sow which was also out of all comparison the best. There was a good small black boar and some breeding sows of the small breed, some of them having litters.

The exhibition of implements took place at the extremity of the showyard, where there was a good collection for a county show; Mr. Innes, of Market-hill, Royston, taking the prize for the best collection.

PRIZE LIST.

HORSES.

FOR AGRICULTURAL PURPOSES.

JUDGES.—J. Cox, Sandbridge, St. Alban's;
J. Henley, Ruckland, Louth.

Stallion.—First prize, £10, W. Welcher, Tofts, Brandon;
second, £5, D. Camps, Haddenham.

Entire two-year-old colt.—First prize, £5, F. Richardson, Chatteris; second, £3, W. Hurrell, Newton.

Cart mare, not under four years old.—First prize, £5, J. Warth, jun., Sutton; second, £3, C. Male, Cottenham.

Mare and foal.—First prize, £5, J. Warth, jun.; second, £3, T. Gunnell, Milton.

Two-year-old cart gelding.—Prize, £4, G. Inskip, Kneesworth.

Two-year-old filly.—First prize, £4, E. Murfitt, March; second, £2, Capt. R. C. Catling, Needham Hall.

Plough team.—First prize, £6, J. Linton, Westwick Hall; second, £3, J. Warth, jun.

Pair of mares for agricultural purposes.—First prize, £5, J. Warth, jun.; second, £3, W. Hurrell.

Three-year-old cart colt or gelding.—Prize, £5, J. H. B. Maris, Hinxton.

Three-year-old cart filly.—Prize, £5, W. Beard, Chatteris. Pair of team horses.—Prize, £10, J. Linton.

Entire horse for agricultural purposes (open to all England), the exhibitor being a member or paying an entrance fee of one guinea.—A cup, value £20, J. Roach, Gretton.

Extra Stock.

J. Linton.—Filly, one year three months.
W. Batterson, Girton.—Mare, seven years.

FOR RIDING AND COACHING.

JUDGES.—H. J. Boulton, Putnoe, Bedford;
J. Hutelinson, Catterick.

Thorough-bred stallion, which in the opinion of the judges is calculated to get weight-carrying hunters (open to all England), the owner being a member or paying an entrance fee of one guinea.—A cup, value £20, A. Fisher, Royston. Commended, J. Linton.

Hackney stallion.—Prize, £10, R. Joselyn, Ely. Commended, J. W. Gosling, Newmarket.

Mare, calculated to breed weight-carrying hunters, and foal.—First prize, £5, T. Briggs, Babraham; second, £3, H. Hurrell, Harston. Commended, R. Hubbard, Marshland Fen.

Mare or gelding, under five years old, adapted for hunting purposes.—First prize, £5, W. Goulder, Wimbotsham; second, £3, W. Hurrell. Commended, T. Garner, Moulton.

Hackney mare or gelding.—First prize, £4, E. Durrant, Wimbotsham; second, £2, H. Thurnall, Royston. Commended, F. J. Fordham, Royston.

Brood mare, calculated to breed hunters, with foal at foot or in foal.—First prize, £5, T. Briggs, Babraham; second, £3, H. Hurrell. Commended, J. Ellis, Triplog.

Two-year-old colt or filly, likely to make a hunter.—First prize, £5, H. Thurnall; second, £3, J. Linton.

Yearling colt or filly, likely to make a hunter.—First prize, £5, H. Thurnall; second, £3, J. Phillips, Royston.

Horse, mare, or gelding that shall leap hurdles and water in the best and safest style as often as the judges may direct.—First prize, £10, W. Goulder; second, not awarded.

Three-year-old colt, likely to make a hunter.—Prize, £5, T. Briggs. Commended, T. Kemp, East Hatley.

Three-year-old filly, likely to make a hunter.—Prize, £5, H. Hurrell. Commended, H. Thurnall.

Hunter not exceeding five years old at the time of the entry, the *bona fide* property of a resident or occupier in the Isle of Ely or county of Cambridge, and which shall have been in the possession of the exhibitor for the six months previous to the day of exhibition.—A cup, value £20. Not sufficient merit.

Pony, mare, or gelding not exceeding 13 hands.—A cup, value £5, S. Smith, Fen Ditton. Commended, E. B. Nunn, Royston.

Extra Stock.

Commended, C. Gabb, Bishop Stortford.—Pony.

CATTLE.

JUDGES.—C. Howard, Biddenham, Bedford;
J. Robinson, Clifton Pastures.

Bull, exceeding two years old.—First prize, £8, T. E. Pawlett, Beeston; second, £4, Lady Pigot, Branches Park, Newmarket.

Bull, not exceeding two years old.—First prize, £10, Lady Pigot; second, £5, T. E. Pawlett. Commended, C. Ellis, Meldreth.

Bull, not exceeding one year old.—First prize, £4, T. E.

Pawlett; second, £2, Lady Pigot. Commended, Lord Braybrook, Audley End.

Cow, in calf or in milk.—First prize, £6, Lady Pigot; second, £3, G. E. Frere, Roydon Hall. Highly commended, J. Clayden, Littlebury; commended, G. E. Frere.

Heifer, not exceeding three years old, in calf or in milk.—First prize, £4, J. How, Broughton; second, £2, Lady Pigot. Commended, Captain R. C. Catling.

Heifer, not exceeding two years old.—First prize, £4, J. How; second, £2, Lady Pigot. Highly commended, J. R. Chaplin, Ridgewell, Halstead; commended, Captain R. C. Catling and J. R. Chaplin.

Heifer, not exceeding one year old.—Prize, £3, Lady Pigot. Pair of dairy cows belonging to the same person, in milk or in calf.—First prize, £5, T. Rush, Babraham; second, £4, J. Miller, Royston. Highly commended, S. Strickland, Steeple Morden.

Fat ox, steer, or heifer.—First prize, £5, T. Pulver, Broughton; second, £3, Captain R. C. Catling. (This class was generally commended.)

Shorthorn bull of any age.—Prize, £20 (cup), Lady Pigot.

SHEEP.

JUDGES (Long-wooled).—C. Clarke, Scopwick, Sleaford;
W. Sanday, Ratcliff-on-Trent.
(Short-wooled and cross-bred): H. Overman, Weasenham;
H. Woods, Merton.

Shearling Leicester or Lincoln ram lambs.—First prize, £5, T. Gunnell; second, £3, T. Gunnell.

Pen of five Leicester or Lincoln ram lambs.—First prize, £4, R. Sparrow, Chesterton; second, £2, T. Gunnell.

Shearling long-wooled ram, not Leicester or Lincoln.—First prize, £4, J. Gibbin, Bardfield.

Pen of five Leicester or Lincoln ewes, certified to have brought up a lamb this year.—First prize, £5, R. C. Catling; second, £3, F. Allwood, Walsworth.

Pen of five shearling Leicester or Lincoln ewes.—First prize, £5, T. Gunnell; second, £3, F. Allwood.

Pen of five Leicester or Lincoln ewe lambs.—First prize, £4, T. Gunnell; second, £2, F. Allwood.

Shearling short-wooled ram.—First prize, £5, Lord Chesham, Latimer, Chesham; second, £3, F. Street, Bedford.

Pen of five short-wooled ram lambs.—First prize, £4, Lord Daere, Kimpton; second, £2, J. P. Nunn.

Pen of five short-wooled ewes, certified to have brought up a lamb this year.—First prize, £5, Lord Daere; second, £3, G. Jonas, Tekleton.

Pen of five shearling short-wooled ewes.—First prize, £5, Lord Chesham; second, £3, G. Cooke, Horseheath Park. Highly commended, Nockolds and King, Saffron Walden.

Pen of five short-wooled ewe lambs.—First prize, £4, Lord Daere; second, £2, W. Hurrell. Commended, F. Street.

Pen of five cross-bred wether lambs.—First prize, £4, G. Jonas; second, £2, W. Hurrell. Commended, J. I. Ellis.

Shearling Leicester or Lincoln ram.—First prize, £10, T. Gunnell; second, £5, T. Gunnell.

Southdown ram of any age.—Prize, £5, S. Jonas, Chrishall Grange.

Pen of five fat shearling short-wooled wethers.—First prize, £5, G. Street, Maulden; second, £3, Nockolds and King.

Pen of five fat shearling long-wooled or cross-bred wethers.—First prize, £5, H. Purser, Bedford; second, £3, T. Rush.

Pen of five fat short-wooled lambs.—Prize, £5, S. G. Jonas, Duxford.

Pen of five fat long-wooled or cross-bred lambs.—Prize, £5, E. Pigge, Barkway.

PIGS.

JUDGES.—C. Clarke; W. Sanday.

Boar, large breed.—Prize, £3, J. and F. Howard, Bedford.
Boar, small breed.—First prize, £3, E. King, Ashley Hall; second, £1 10s., R. Chaplin.

Sow, in pig or suckling, large breed.—First prize, £3, J. and F. Howard; second, £1 10s., H. F. Everett, Bridgham, Thetford.

Sow, in pig or suckling, small breed.—First prize, £3, R. Pyne, Royston; second, £1 10s., H. F. Everett.

IMPLEMENTS.

JUDGES.—H. Long, Carlton;
J. P. Nunn, Royston.

Collection of agricultural implements (10 entries).—Prize

£10, G. H. Innes, Royston. Highly commended, L. Gimson, Royston.

At the dinner the Right Hon. H. BRAND, M.P., the president of the Society, in the chair, said they had done well in framing the basis of the Society on a large scale, and not committing the mistake which was seen in many districts, where agricultural support was frittered away in a considerable number of small Societies. He knew of no part of the kingdom where a Society of this kind had accomplished greater progress. The northern part of Cambridgeshire had been reclaimed from the sea, and in the southern part there might be some old enough to remember that a large portion was a wild down, where the rabbit had it all to himself. What had brought about a reformation in those things? The capital and skill of the farmer. Those who had travelled abroad knew that nothing was to be seen there equal to the capital and skill of the British

farmer. The British agriculturist was a long way ahead of the foreign one.

Lord ROYSTON said his experience in Cambridgeshire was that it was very little use in giving prizes for competition of any kind in which hunters might be considered to be engaged. The reason of it was doubtless this, that a considerable part of the county was not a hunting country, and in that part which you might call a hunting country the owners of horses had great difficulty at the different times at which the show was held to produce those animals in a state they might consider satisfactory to themselves and to the judges. Therefore, in giving the prizes to hunters this difficulty always arose; and, for the future, having last year failed to gain sufficient competition at March, and having failed at Royston, he thought he should forward the views of gentlemen who competed at this meeting in giving the small sum he had devoted to hunters for some other object which would receive actual and successful competition.

LIGHT AND HEAVY DRAUGHT MOWING MACHINES.

EVERCREECH FARMERS' CLUB.

The second machine mowing match in connection with this Club was held at Doulting. The long-continued drought had rendered the grass-crop light here, as everywhere else; but the ground was as fair a specimen as could be found in the district. It was a large field of new clover, and the crop was perhaps about 13 cwt. to the acre. As in last year's competition, there were prizes offered to two classes of competitors, viz., the manufacturers of machines, and the sons or servants of farmers in the neighbourhood owning machines. The following were the entries: In class 1.—Bamlett, Woods, Burgess and Key, Hornsby, Howard, Samuelson, and Lewis and Hoole; in class 2.—J. Candy (Doulting), C. Welch (Ditchcat), R. Norton (Ditchcat), J. R. Welch (Redlands), T. Reynolds (Doulting), J. Bennett (Wanstrow), R. Harding (Cranmore), and G. Dyke (Shepton Mallett). It will be seen that nearly all the great makers in the kingdom were represented; but it unfortunately happened that Messrs. Howard were unable to compete, through the non-arrival of their machine. Last year, when there was a far better general crop of grass than we can this year expect, a hope was expressed that this year the relative merits of the light-draught and heavy-draught machines would be tested in the heaviest field that could be found in the neighbourhood—a crop say of about two tons to the acre. It was evident that that such a trial could not take place this dry season, and it was even suggested that the matches might be temporarily abandoned. But, although there was an example in the course adopted by a neighbouring Society at Frome, the Evercreech Club decided not to discontinue the events which proved so interesting. The judges were—Mr. Richard Yeoman, of Cranmore; Mr. Charles Harding, of Montacute; and Mr. John Brook of Preston, Yeovil. There was a close run for first place in the manufacturers' class, and the award which was given was understood to be only for superior delivery of the swathe, the cut of the first and second machines being equal. In the farmers' class there was no difficulty in deciding the first prize, the winner having made an excellent start, and worked well through his ground. The competition was witnessed by a large number of spectators, estimated at 1,300 or 1,400. The prizes were awarded as follows: Class 1.—Open to all England. To the manufacturer of the mowing machine which shall mow and leave in swathe in the best manner one acre of land in one hour: First prize, £4, Messrs. Burgess and Key, Brentwood, Essex (time, 45 minutes); second, £2, Messrs. Woods, London (49 minutes). Class 2.—To the managers of the mowing machine, the owner of which being a farmer, and the competitor a farmer's son or servant—the latter having been in the employ of the owner not less than three months previous to the match—which shall mow in the best manner one acre of land in one hour: First prize, £2, Mr. G. Dyke, Shepton Mallett (with Bamlett's machine); second, £1, E. Collins, servant to Mr. T. Reynolds, Doulting (with Hornsby's Paragon machine); third, 15s., J. Candy, Broadpool, Doulting (with Burgess and Key's machine); fourth,

5s., W. Batt, servant to Mr. R. Harding, Cranmore (with Woods' machine).

At the Dinner, Mr. WHATLEY, the Secretary, said that when the Society met upon a similar occasion to this, in June, 1869, he then promised to look out a heavy crop of two tons to the acre to try the merits of the machines upon; but he had not yet been able to find such a piece, and he was sure that none of those present could boast of it upon their farms. The committee had therefore arrived at the conclusion that the question of the relative value of the heavy and light machines had not yet been properly solved. It was an important question to consider as to the amount of work that could be accomplished in a given time by the various machines with one or more horses. Manufacturers would say, perhaps, that it required a big hammer to break a big stone, and *vice versa*, and others would say that the light machine could compete on equal terms with the heavy. That at present remained for them to determine, and another year might prove to them the fact, should they be enabled, as he hoped, to put the machines into a suitable crop.

Mr. R. YEOMAN, one of the Judges, said the manufacturers' class had given them the most difficulty to decide upon. In the farmers' class there was not so much to occupy their attention; for the work was in some instances not so well done as they could have wished. However, that was accounted for by the lightness of the crop, and the wind which beat it down so that it would not stand against the knives, it being very difficult to cut unless the knives were in the highest state of perfection.

Mr. BROOK, another of the Judges, thought they should not take the mowing of that day as a sample of what the machines were really able to do; for he had seen those which had seemingly done the worst to-day, excel on other occasions. He believed there was nothing like having a good start, and setting the machine properly at the beginning, in order to make a good finish; but if the competitor were up to the mark, he would narrowly watch his work throughout, and if he saw anything going wrong, not hesitate to put it right.

Mr. HARDING, the third Judge, gave it as his opinion that looking at the crop and circumstances over which they had no control, the work was as well done as might be.

Mr. C. WELCH called attention to a fact with which he was much struck, viz., that this year as well as last year the prizes in the first class were won by light machines, and in the second or farmers' class by heavy draught machines. He could not understand why the light machine in the hands of the mechanic should always win the first prize, whilst in the hands of the novice the heavy sort was always successful. Now the thing they wanted was the machine that was most complete in the hands of their labourers. They didn't generally want to get machines to work them themselves, although he had a very good machine which he had worked all the season, and no doubt many others had done the same. He saw a young man present, a farmer's son, who had worked a

light machine and won a prize to-day in the manufacturing class. Of course that gentleman was possessed of more knowledge and intelligence than the generality of labourers, and therefore his success was no proof of the superior usefulness of any particular machine for labourers' use. He should be glad if any manufacturer present would give him an explanation of the fact he had stated with regard to the heavy and light machines.

Mr. BURGESS, in reply, ventured to dispute the fact that heavy machines were always the winners in the farmers' class. Last year at Radstock the first prize in the manufacturers' class was taken by Woods, and the second by Burgess and Key; and then in the drivers' class the first three prizes were taken by Burgess and Key's machines in a competition with eight others—and theirs was a very light-draught machine. It was a question simply of the driving-rod. If they had a long driving-rod brought down at an angle, they must have undue friction—and that was the only way he could account for the difference referred to.

Mr. WELCH said it seemed to him that Woods' machine was working on the same principle—from a long driving-rod.

Mr. BURGESS replied that it was not so much of an angle. He explained that the reason why some machines were so heavy in draught was because they were badly proportioned. At the present time all the machines were got up to work very well; and the points to be looked to in selecting a machine were light draught—which was very important as a question of expense—and the easy and inexpensive renewal of any part that became worn.

Messrs. WOODS' representative denied that it was the length of the driving-rod which was a disadvantage to the heavy machines; but at the same time he believed it would not be long before the superiority of light-draught machines

was a general conclusion. The heavy machines would be laid aside, and light ones brought into general use. He did not mean to say there might not be some extraordinary crops in certain seasons—perhaps even $2\frac{1}{2}$ tons per acre—which would require heavier machines than were used upon ordinary occasions. But he did say that if they had got one field out of ten where they wanted a heavier machine—speaking from experience, he could tell them that if they took off the boy, when they found the machine did not work so well as it should, and put on a heavy man in his place, they would find it an improvement. He argued that it would be better for a farmer to wear out a light machine a year or two sooner than to wear out his horses by using a heavy one.

Mr. BROOK said he had suggested to the committee that in awarding manufacturers' prizes they should take into account the draught of the machines; but they told him the judges had nothing to do with anything except the best cutting. Another consideration which he would recommend to makers was this—which he was sure they could carry out with the greatest ease—that they should fix swathe-boards to their machines, so as to take the swathe out of the way of the wheels and the horse's feet, and so prevent it from being pressed into the ground, which with a heavy crop was often very injurious.

Mr. YEOMAN, referring to the superior success of the competitors in class 1, said the reason was very simple. In the manufacturing class they were all in good order—the knives in first-class condition, and they were generally new machines; whereas in the farmers' class perhaps the machines had been in use many years, and the knives were not in the best condition. He thought that might account in a great measure for the discrepancy. One of the successful machines to-day had been in use seven years.

“FARMS TO LET.”

There are, it is said, in the far-famed county of Norfolk some fifteen thousand acres of land in one certain district that would threaten to be very shortly unoccupied. On the lighter soils, ranging away from Brandon to Watton, many of the tenants find it quite impossible to go on any longer. Not that the Local Taxation sleight-of-hand has already been tried upon them, or that they have come to protest against paying an equivalent in rent for a set-off in rates. Not that they have precisely succumbed to “the three disastrous years” to which Mr. Sewell Read spoke so feelingly at Harleston. Not that they have allowed the cattle-plague to beat them, or a run of low prices to quite starve them out. These are, no doubt, serious difficulties against which the farmer has had to contend, but even these are scarcely sufficient to account for the curious fact of there being so much land to let in the highly cultivated county of Norfolk.

Let us turn again for a moment to that very useful discussion at the Harleston dinner, where the key-note was struck, perhaps unwittingly enough, very early in the afternoon. Sir Willoughby Jones in advocating the growth of sugar in this country essayed to show how “our climate was manifestly becoming dryer and hotter, as it was certain to do by the throwing down of hedges and the cutting down of hedgerow timber;” and climate, as we take it, will ever be a serious consideration in thoroughly testing such an experiment. But Sir Willoughby's argument was nipped in the bud; they don't throw down hedgerows and don't cut down hedgerow timber in Norfolk. Mr. Charles Howard, a stranger who seems to “have had his eyes about him” during his travels, said: “I never was in a county in my life where I saw so much useless hedge-row timber. I am quite certain of one thing—that the farmers of Norfolk do all they can to meet the exigencies of the times; it now rests with the

landlords to help them. The first thing they should do would be to allow them the privilege of cutting down this beastly rubbish—pieces of timber which if they stand fifty years will never be worth a sovereign; to cut down many of the hedge-rows; and to destroy the great pest of the farmers—the tenants of these wild hedge-rows—the rabbits.” And what did the natives, the farmers of Norfolk say to this? Luckily, it came to the turn of two or three leading men to speak after Mr. Howard sat down. And Mr. England was “quite sure if they did not grow too much timber, they harboured too many vermin;” while Mr. Henry Overman said as to the “more important subject of hedge-row timber, they were living in critical times; and, unless the landlords went a-head as fast as the tenants, good-bye to their having any tenants at all!” We have had no communication whatever with Mr. Overman on the subject of his speech, as it is not from him the rumour reaches us, but it does look as if he had those fifteen thousand acres of worse than waste in view when he said so much. But Mr. Overman said more, or said so much again with still greater emphasis: “If the landlords persisted in the over-preservation of game they would have to farm the land themselves. The misery of this might first of all fall upon the tenants, but it would afterwards come upon the landlords, and perhaps many of them would be able to find neither the capital nor the ability.” This is pretty plainly put, but it all brings us back to our opening fact that some of the Norfolk farmers are beaten at last, not by the times, not by any lack of means or ability, but from being denied fair play by their own landlords.

The continual discussion of this evil for some years past has no doubt tended to its occasional correction in some quarters, but in Norfolk, always a game-ridden county, the abuse is with many landlords rather on the increase than

otherwise; and, indeed, "An Aggrieved Norfolk Farmer" offers a very likely reason for this. He says in so many words: "Now, I am a right loyal subject, and wish well to my Queen and all her family. But one fact I cannot shut my eyes against; that is, since his Royal Highness became a landowner in Norfolk we have double the game we had before, and this is caused by the eagerness of our country gentlemen to have the Prince for their guest, whilst the tenant-farmers have to pay the extra expense incurred by rearing an extra quantity of game for market, for the Prince, of course, must have an extra good day's shooting." Putting His Royal Highness quite out of the question, there is no possible doubt but that as a rule the higher the rank of the so called sportsmen the greater the slaughter.

It is well to take a district so celebrated for its superior cultivation as "the frightful example" of such excesses, and it is wholesome to have the plague-spot pointed out by a man in many ways so successful in his vocation as Mr. Charles Howard. The Norfolk farmers may not take to Shorthorns, perhaps, as Sir Willoughby Jones would put it, the *climate* of the eastern counties does not altogether go to ripen these high-bred animals; but they can grow polls, and Devons and Downs, and horses and barleys, all of the very best, and yet still Mr. Howard significantly shakes his fore-finger at them, and says "I am not going to find fault with your farming, but if you don't look out you will no longer hold the position you have done; other counties will soon trip you up." No, no, Mr. Howard, it will not be any other county, not even Bedfordshire that will trip Norfolk up; but what will drive the Norfolk farmer from "the position he has so worthily held," will be the hedge-rows, the rabbits, the battues, and the landlords. Down in Devonshire the other day, Mr. Knowles, when following Canon Girdlestone said, "The large landowners cultivated their land in the outset, but finding it did not pay, let it off. He would ask what was the reason it did not pay? Because it was so over-run with hares and rabbits. The owners of coppices and preserves ought to pay much heavier taxes than they did." It would so seem that here, once again, from the same causes we arrive at very different results. In the West the owners have been in the habit of farming the land themselves until they can do so no longer, when they let it out to tenants. In the East the tenants have been in the habit of farming the land until they can do so no longer, when they return it to the owners; the reason being precisely the same. As Mr. Knowles says, they find that holding land does not pay, because it is so over-run with hares and rabbits. Sir Massey Lopes has, if we recollect aright, in his scheme for the re-adjustment of local burdens, some sort of penalty in store for these coppices and preserves which they are denouncing in the West almost as energetically as they are hedgerows in the East; but how would such a proposition fare with the county members of the House of Commons? On this subject there is no class in Parliament so thoroughly selfish, or so unmindful of those they are supposed to represent. The Farmer's Friends would tax the farmer's gun, or if they do not dare say so much they carefully keep out of the way. It should be the business of Mr. Sewell Read and Mr. Pell, who, acting for Mr. Read, carried the occupiers' exemption from the gun licence, to have the division list extensively circulated, and then Suffolk and Wiltshire may see how much it has to hope for and how little to depend on. In Norfolk, to be sure, if the heavy game-preservers turn farmers they can represent their own interests in this way, and that will tend very much to simplify the matter. As some people are arguing out the business of betting just now, "every man has a right to ruin himself if he likes."

THE GAME EVIL.

TO THE EDITOR.

SIR,—I have read with pleasure, for months past, your able articles on the game question, and feel mortified at the apathy and indifference of my own county on this momentous question, and disappointed beyond measure with our "farmer member," Mr. C. S. Read, for it is seldom he opens his mouth on the subject, and then generally says nothing, or worse than nothing. Our Scotch brethren are alive to the prize at stake, and speak out with that manliness which ought to put to the blush many of our English counties, especially Norfolk, which, as yet, has done nothing towards the amelioration or repeal of those grinding laws that nine-tenths of our farmers would delight to see, not modified, but repealed. Yet they stand still, quietly looking on, *afraid* of their landlords, afraid to risk anything, but keep in the background, hope others will do the work; and, when the battle is over, if a victory is won, would then valiantly come to the front and reap the benefit.

If we look closely into the matter we shall find there is a cause why our large farmers, or rather leading farmers, do not speak out on the game question—it is, they are sporting men themselves. They ape the Esquire, and in some circles are very extensive gentlemen on a small scale. Many landlords know the weak side of these gentlemen, and, as it were, propitiate them by giving them a few days' shooting during the season. I am sure it would amuse you, Mr. Editor, could you see and hear these would-be gentlemen-sportsmen the following market-day at dinner—how they take every opportunity of showing their position and standing in society, by informing the company what they did, how they did it, and how many they bagged to their own gun when they shot with the Squire, Sir John, or my Lord so-and-so.

But I will leave the Norfolk farmer to the consolation of his own thoughts, for you must bear in mind no set of men in any county, from the inmost recesses of their hearts, have a more bitter hatred of the game-laws than the men who till the soil of Norfolk.

To return to the game-laws, which every honest and fair dealing man must regard as being as unjust and demoralizing to the poor man as they are injurious to the tenant farmer, I say the injury they inflict upon the tenant is incredible, to say nothing of the heartburnings occasioned by the insults he is continually subject to from that tenants' pest, keepers, who generally are more arrogant than their masters.

But there is another reason for reform, and that is, the enormous amount of food destroyed. In this county it is immense, as it is no exaggeration to say it is 10 per cent. on all grain and root crops, with a like proportion on all artificial and natural grass. And all this waste, in the face of an increasing population, for what? Why, to provide the upper crust of society with amusement at the tenants' expense. Perhaps some may say this is a matter between landlord and tenant; but I beg to say it is not the case, for if you find here and there a landlord who deals justly and truly with his tenants, and keeps his word (which too many do not) as regards the amount of game to be preserved, he cannot protect you from the neighbouring landowner, and from his swift-footed army of devils called hares and rabbits, which invade his land by night, and devour and destroy his crops like locusts. It is a lamentable and incontrovertible fact that the generality of landlords, however estimable their characters in other respects, have no hesitation in breaking faith with their tenants on the game question, keeping double and treble the number agreed upon at the time of hiring; and this intolerable injustice has to be endured from the man having invested his capital in the land. The most the tenant dare to do is to make a quiet and respectful complaint; for a manly and stout determination to have the terms of his agreement carried out would in most cases be followed by a notice to quit; and poor, helpless John Hodge would have to budge, and leave his capital in the soil behind him, whilst the worthy landlord can chuckle over the game he has played, and look out with soft and honeyed words for another dupe.

The remarks that I have made refer more especially to ground game; but the well-being of society demands that the game-laws should be done away with altogether, in consequence of the demoralizing effect they have upon the lower classes. Just suppose an industrious, contented, respectable

labouring man is set to trim a hedge in June, and in the course of his work he falls in with a pheasant's nest with ten or twelve eggs. It is well known (for it is no secret) that gentlemen buy each other's eggs and, without doubt, some of their own. The price is generally 1s. each; so that such a nest would be worth at least 10s. See what a temptation this is to a poor man who works all day for 2s., and sometimes less. He takes it, and, if not found out, looks for more, until he becomes a night poacher; and the man who would otherwise have been an honour to the sphere of life he moved in has, through the cursed game-laws, become a poacher, a thief, a burthen to society, and perhaps a murderer. How much longer in this enlightened age are those things to be tolerated? Are we to be compelled to give such an education to our labourers' children as will make them dissatisfied, and unfit them for the work they have to do? Are we to be prevented from employing the hands we like in our fields in consequence, as it is alleged, of the contamination of the sexes, when it is well known, if separated in the day, they will mix together at night? Is it not a farce there should be all this motherly care for the good training of the humble classes, and yet allow the monstrous game-laws to remain untouched? And why is this so? Because it interferes with the interests and amusements of the law-makers themselves.

Now, I am a right loyal subject, and wish well to my Queen and all her family. But one fact I cannot shut my eyes against: that is, since his Royal Highness became a landowner in Norfolk we have double the game we had before, and this is caused by the eagerness of our country gentlemen to have the Prince for their guest, whilst the tenant-farmers have to pay the extra expense incurred by rearing an extra quantity of game for market, for the Prince, of course, must have an extra good day's shooting.

It is this excessive preservation of game that produces straitened circumstances and great privation amongst many of the tenant-farmers; some quite ruined, and some, driven to the depths of despair, have lost their reason. Think of this, you game-preserving landlords, and draw what comfort from it you can. Hoping you will insert this in your valuable journal,

I am, Mr. Editor,

AN OBSCURE AND AGGRIEVED NORFOLK FARMER.

West Norfolk.

THE GAME EVIL IN NORFOLK.

TO THE EDITOR.

SIR,—I should not have considered it necessary to reply to the personal observations of your "obscure and aggrieved Norfolk farmer," but as chairman of the Norfolk Chamber of Agriculture I must call his attention to the important and spirited meeting of that Chamber on the Game Laws held about a month ago. Both the amendment and resolution, which were carried, emphatically condemned the over-preservation of ground game, and suggested practical means to remedy the evil. Almost all the speakers denounced the present game laws, and there was no shirking responsibility and no endeavour to break the discussion. I think the Norfolk farmers at that meeting and elsewhere have spoken out manfully, yet respectfully, and I am not aware that the Scotch tenantry have done more, for at present all their efforts to amend the grievance have ended in the production of some half-dozen bills which, instead of showing an unanimity of opinion, display a singular amount of division upon the subject.

I would also state that I moved the Norfolk resolution as an amendment to one of the propositions of the Central Chamber of Agriculture. Finding the meeting greatly in favour of the original proposal, I withdrew it, and it is possible that what I said may not be regarded by all my brother farmers as "worse than nothing." At any rate I have since had the cold shoulder from sundry game preservers, and also, I am thankful to say, the thanks of many tenant-farmers.

I am, sir, your obedient servant,

CLARE SEWELL READ.

The Farmers' Club, Salisbury Square, London, July 7.

MOWING MACHINE TRIAL IN DEVONSHIRE.

A trial took place at North Molton of mowing machines, under the auspices of the North Molton and Twicken Farmers' Club.

Out of the thirteen entries nine appeared. The makers and who entered the machines were as follows: Samuelson, those Wood (wood frame), Wood (iron frame), Howard (Bird, North Molton), Bamlett (Bird, North Molton), Burgess and Key, Page, Lewis and Hoole (Bird), Wood (Dockings). The trial ground was steep and ridgy, and the judges ordered a second trial of the following machines: Samuelson, Burgess and Key, Wood (iron frame), Wood (wood frame), and Bamlett's. With the exception of Messrs. Samuelson's and Wood's machines they were worked by labourers of the district. After a long and patient trial the judges awarded the prizes as follows: First prize of £10 to Samuelson, second of £5 to Wood (iron frame), and commended Bamlett. The judges were Messrs. Buckingham (Aller), Passmore (Whitcott), and Breally, machinist (Molland).

MOWING MACHINE MATCH AT PRESTON.

The following decision was given, on Friday the 8th, for the Challenge prize of £50 by the judges—Mr. W. Clarke, Bishopham Farm, near Ormskirk; Mr. Henry Neild, The Grange, Worsley; and Mr. Christopher Richmond, Elm House, Thornton, near Liverpool. Their Report ran as follows:—

Trial of mowing machines near Preston, in the match between Messrs. Picksley, Sims, and Company, of Bedford Leigh, Lancashire, and Mr. A. C. Bamlett of Thirsk, Yorkshire:

	A. R. P.	Lot.	Lot.
Field No. 1, consisting of	3 2 33	allotted A and B.	
Field No. 2, consisting of	3 1 30	allotted C and D.	
Field No. 3, consisting of	6 2 24	allotted E and F.	
Field No. 4, consisting of	6 0 25	allotted G and H.	

Lot A fell to Mr. Bamlett, whose machine commenced at 6 12 and finished at 8 10. Lot B fell to Messrs. Picksley and Sims, whose machine commenced at 6 21 and finished at 8 14, and we unanimously decide the work on Lot B is such the best.

Lot 2, divided into lots C and D: Both machines commenced work at 8 40. Lot C fell to Messrs. Picksley, Sims, and Co. and was completed at 11 9. Lot D fell to Mr. Bamlett, which was completed at 11 44. The work done is pretty equal in merit, but slightly in favour of Messrs. Picksley and Sims. This field had been very imperfectly picked, and abounded with stones and clinkers; the manure had been badly spread, and the machines were very severely tested by this neglect.

No. 3, divided into E and F: Both machines commenced operations about one o'clock. This is an awkwardly shaped field for a mowing machine abounding with grips and other irregularities of surface. Lot E fell to Messrs. Picksley, Sims, and Co., and lot F to Mr. Bamlett. Both parties completed at one and the same time. A singular quality of work was manifested, our decision being that both sides of the field were equal; but the centre portion is in favour of Messrs. Picksley, Sims, and Co.

No. 4, divided into lots G and H: Lot G fell to Mr. Bamlett, who commenced at 6 5, and finished at 8 59, and lot H to Messrs. Picksley, Sims, and Company, who commenced work at 5 55, and finished at 8 56. We decide that G, on the whole, is the best work we have seen during the day; but it is only just to say it is the most favourable portion of the whole ground for the operation; while lot H had some open cross drains of a most trying description for a machine to encounter. The time actually occupied in the work by Messrs. Picksley, Sims, and Company, was 11 hours and 55 minutes, and by Mr. Bamlett, 12 hours and 31 minutes, being 33 minutes in favour of Messrs. Picksley, Sims, and Co. While we acknowledge the remarkably close competition in this unparalleled trial to be almost a tie, we are unanimous in declaring our award to be, under the conditions of the agreement between the competitors, in favour of Messrs. Picksley, Sims, and Co. The terms of the trial were: The mowing of ten acres with one and the same machine, with two knives only, with one driver, and same pair of horses; no assistance of any kind allowed, such as sharpening the knife, oiling, or the like—all of which conditions were rigidly carried out. Quantity, time, and quality of work were the tests of excellence.

One of the judges writing to us says; "You will agree

with me it is an unparalleled test, not only to machines, but to horses especially, as also to man. You will note that the judges were finally thoroughly unanimous, and the contest almost a tie, but still fairly and well won by the Lancashire firm. I coveted all the long day that yourself had been eye-witness amongst the great concourse of assembled farmers and others; but the details will explain

the salient points of this most important contest and achievement of mechanical skill over the rough uneven ground. It was marvellous that the machines did not smash; no one could credit the test they underwent unless by witnessing it. After what was seen yesterday, in small, rough, out-of-shaped fields, with gutters, &c., no old prejudice can be tolerated against using these machines."

TENANT RIGHT.

At the last meeting of the Ixworth Farmers' Club Mr. HARRISON said he would divide his subject into four different heads, viz.: First, the Landlord; second, the Tenant; third, the Labourer; fourth, the Community at Large. First as to the landlord. It has been said that if tenants are to be compensated for the outlay of their capital upon their different occupations when leaving the same, that the landlord will be injured thereby. Now to this argument I emphatically demur, and how the landlord is to be injured by the outlay of the tenant's capital, in the improvement of his occupation, I certainly have yet to learn. It is certainly true there might not be so many applicants for farms as at present; so much the better, for the landlord and his agent too. Instead of having 30 or 40 applicants as is frequently the case, would not three or four practical men of business to choose from, be much better for all parties concerned? I cannot find words of my own to prove the fallacy of such a statement, equal to a quotation I saw in print a short time since. A gentleman (Mr. Caird), as long ago as 1850, writing to the *Times* newspaper, and speaking of the Lincolnshire Compensation Clauses, says, "Till the reign of George III., the county remained in a neglected state, the fee simple of the now cultivated wolds and heaths, worth little more than their present annual rent." He says further in the parish of Lincoln, six years ago, four tenants renting 4,000 acres of land at £125 each, or 2s. 6d. per acre, became bankrupts. This same land is now let for upwards of £4,000 a-year, paid by prosperous tenants, and it is the custom of landlords to refuse any tenant that objects to the payment of compensation for unexhausted improvements. Perhaps some gentleman may be led to think that corn was very cheap at that time, but it was not the case, for in looking for the price of that year, I find it £5 13s. 10d. per qr. I could bring forth many proofs from my own experience, to show that this Tenant-right question would prove of equal benefit to the landlord as to the tenant, but I forbear as I have already exceeded the limits I intended for this part of the subject. Next as to the tenant. Being an humble tenant farmer myself, I should have preferred passing over this part of the subject altogether, but then a link would have been wanting to have made this paper at all a reasonable one. I cannot, therefore, forbear to say a few words, to prove to you, gentlemen, that it is a great injustice that one man shall sow, and another reap the fruits of the other's outlay. I will suppose a case, and are there not a great many to be found? of a man hiring a farm in a thorough bad state of cultivation; he throws all his energies and all his capital into it, and perhaps spends the best part of his life in the improvement of his occupation. The hand of death strikes him down, he is numbered with the dead, and the farm he has spent his health and his wealth upon, passes into other hands, with only a common valuation. Now if the Lincolnshire system was generally adopted, this crying evil could not take place, and it would be far better for both landlord and tenant, inasmuch as there would be encouragement for the outlay of capital. I pass on to the third part of this subject, the labourer, and I believe this part of this paper to be of the utmost importance, and I do feel it needful to say a few things upon the different modes of letting land, to show how the labourer is benefited or injured thereby. There are several modes of letting land in this country, but the principal ones are these, viz., by lease, and by six months' notice. Now both these are unsound in principle, standing alone. If you take the lease, without compensation clause, what does it do for an enterprising tenant beyond securing to him his occupation up to the time for which he had bargained for the same. Suppose we say the lease is for twelve years, and the farm in a bad state when he enters, it will take four years to get it into only middling order, and without being

able to pay any rent for it out of the profits; then four years more to bring it up to the mark, and what then? Why, eight years gone, the tenant begins to ask himself a few questions about the remaining four years—several labourers are discharged, the grazing stock is suspended, and all kinds of little improvements laid aside. Then there is the six months' notice. This is much worse than the lease standing alone; no security whatever, and but little chance of any quantity of labour being employed. I don't say but that there are a few cases, with noblemen and gentlemen that are desirous to do justice under such agreements, but they are the exception and not the rule, consequently the labourer must suffer thereby. The question will then arise, how are we to improve on the present system? To this question I would reply, give two years' notice, make it binding by law, pay for all unexhausted improvements, such as draining, mucking, claying, seeding, and cleaning land, all kinds of feeding stuffs consumed upon the farm, in proportion to time. While I strongly urge the justice of this state of things, I would call upon the negligent tenant to compensate for all dilapidations, and I firmly believe if such were the case the poor would be much better employed than at present; but I must not dilate any longer on this part of the subject, but pass on to the fourth and last part, being the community at large. I need not say much upon this head. It is well known that the consumers must be losers, if the land is not half cultivated and the poor not half employed. The quantity of corn and meat required for this country is enormous, consequently every effort ought to be made, and every encouragement ought to be given for the full development of the capabilities of this our sea-girt isle. It is well known that the working population are the consumers, both of food and raiment; and I firmly believe that if greater security was given for the outlay of capital than at present, that a great boon would be conferred upon the community at large, and that large tracts of land not yet cultivated at all, and a very large portion as yet not half-farmed, would be made to yield large crops of all kinds for the well being of our fellow-creatures.

Mr. W. MATTHEWS was in favour of doing away with the landlord's priority of claim to rent. This would lead to Tenant Right, because the landlord's interest would then be the same as that of the tenant. What was wanted was security, and without that outlay could not be expected.

Mr. MANFIELD held that alterations might be made which would be for the benefit of landlords, tenants, and labourers. This might be either by a lease of the most liberal kind, a system of Tenant Right, by which a farmer was compensated for unexhausted improvements, such as draining, marling, and claying, and also for feeding stuffs used. He would give no compensation for artificial manures used, because he believed they were taken out of the land almost as fast as they were put in; but when a farmer had spent a good deal in oilcake, and was called upon to leave at very short notice, it was a great injustice to him, because there was a lot of money left in the land. The valuation, however, should not be in proportion to the price paid for the food, but according to its nature. He would make it as nearly impossible for a tenant to lose by being subject to six months' notice the capital he had put into the land, as it was now for a landlord to lose his rent.

It was asserted by several members that the effect of the landlord's priority was that farms were sometimes let to men of straw; whereas without it they would get better tenants—men of capital, who would farm the land better.

Mr. HATTEN said he always endeavoured, in hiring a farm, to make the best bargain he could, but so long as there was so much competition as there was at present one could not hire exactly as one liked. They could not get paid for unexhausted

improvements unless the landlord consented to it, for if one would not take a farm, another would. In his opinion it would be for the interest of the tenant and also of the landlord if unexhausted improvements were paid for, but then they must be real ones valued by a disinterested person, for some of them had fancies in farming, and what one considered an improvement, another would not.

Mr. MILLER said the present position of affairs was not satisfactory, and was capable of some considerable improvement. It seemed to him a matter completely of private arrangement between the parties, and one in which no outsider could interfere. When a tenant had no definite holding, but hired from year to year, they fell back upon the custom of the country, and it might be a question whether that was sufficiently defined. It offered certain compensations, and the question was—were they sufficient? Valuations might be brought down by the landlord paying the rent and charges upon falls himself, and thus room would be made to allow for unexhausted improvements, without materially enhancing the amount of the valuation. It was a great evil if a young man's whole capital was locked up by a valuation, for his resources were thus weakened, and he was crippled for want of capital.

The CHAIRMAN, Mr. E. Green, M.P., said he had a difficulty in deciding whether he should prefer a lease or a tenancy from year to year, with two years' notice to quit, and a compensation for unexhausted improvements, suitable to the farm he occupied; for what were unexhausted improvements on one farm would not be on another. When a man was going out he should have two years' notice, but it was a hard thing for all—the outgoing and incoming tenants and the labourers. They also know that the suffering generally fell upon the labourers, for at the end of a lease there were not so many men

employed. Again, it was stipulated in every lease that a farm should be cultivated in a husband-like manner, but what remedy had a landlord against a tenant if he left a farm in bad condition. If a tenant had broken the covenants, he had known of a landlord's recovering, but never when, while fulfilling his agreement, he had left the farm in a bad condition. Yet this was a loss to the landlord, for he must let it at a lower rent. There was one covenant he would never insert in a lease if he were letting land—that about selling hay off the farm, as he held there were times when the tenant could make much more of it by selling it than by consuming it, and afterwards bring the price back again in feeding stuffs. As to priority of claim, he believed it would be a great evil to do away with it, for in the first place the landlord would in all probability, if it were abolished, require a bond for the rent, and would insist upon having the rent punctually; and although it was desirable that men of no capital should not be allowed to take farms, yet how many hundreds of men had risen by being allowed to take a farm with borrowed capital added to some little of their own! As to the covenants, he did not think they could depart from the four-course system with advantage; he knew if he did on his own land he saw the difference in his crops. His only covenants in a lease would be as to the last two years—supposing two years' notice to be given—for excepting at that time he did not believe a man could farm badly and not injure himself. He thought they had come to the conclusion that they would desire to make their own bargains with their landlords, but that if they could make an improvement in the relation of landlord and tenant, or in that of the incoming and outgoing tenant, they would be doing good. He did not see how they were to legislate in the matter, but he was in favour of giving as much liberty as possible to tenant farmers.

BUYING BY ANALYSIS.

Whatever may be the eventuality of the next harvest as regards cereals, it is quite certain that there will be a great deficiency of the fodder-crops for winter—viz., straw, hay, and swede turnips. What white turnips may grow to—anything or nothing—is uncertain. Now these are the crops which make milk, mutton, and beef in the first instance, and in the second place result in a supply of manure for the growth of future crops upon the farm. It is quite clear, therefore, that a demand for imported feeding-stuffs will spring up to some extent proportionate to the deficiency of the home crop of fodder; and a similar increased demand for artificial manures will arise from the deficiency of home-made manure, consequent on the same case and circumstances. The necessity for great attention to this part of his business is now imperative upon the farmer; nor is it the least important element in the state of affairs that we now contemplate that the farmer is called upon to bring in fresh capital to make these necessary purchases immediately after the loss of his crops, and in consequence thereof. The loss this year, in fact, however considerable it may be in itself, entails a further investment of capital for next year's purposes. In addition to this, we have the announcement of the advance of price of guano; and this must be taken in company with the well-known decrease of quality in the article. All these facts combine to make it clear that upon the manner in which this great and costly necessity of the farmers' occupation is carried out his position and profits will greatly depend.

The prevalence of the system of adulteration in nearly all articles of commerce, and especially in articles of consumption, has been recently exposed in the papers and discussed in the House of Commons, as such revelations have assisted to make public opinion ripe for legislation. The doctrine that the mixing of materials of a low quality with those of a higher quality, and even that lower-

ing the saleable price of goods by admixture with a cheaper article, though the same be a harmless ingredient, and the compound a necessity of trade, has been in force some time. The fallacy is, however, now apparent, when the evils that it has led to are fully developed. That the public will have low-priced articles may be admitted; and natural it is that the labourer, who earns his money, should be careful in its expenditure. He gets the low-priced, because he thinks it the cheapest article; as such it professes to be, but such it is not.

There can be no doubt that at this moment equally reprehensible modes of manufacturing spurious manures and feeding-cakes are very prevalent. The immense number of dealers and agents for manures and feeding-stuffs who are to be met with in every market bear witness, not only to the extent of the trade, and its importance to the farmer, but also to the facilities afforded by it for making profit out of the farmer's necessities. It could not otherwise have covered the large commissions paid to travellers and the enormous incidental costs as well as the expenses proper of the manufacturer. Enormous charges over prime cost have thus been paid by the farmer, even though the article sold was what it professed to be.

The lessons taught us by the inquiry into the adulteration of seeds last year are before us; when the leading merchants and growers came forward to state that they should be glad of legislation to put a stop to the nefarious practices of the trade, by which they were compelled, wittingly or unwittingly, to sanction the arts of deception, by selling adulterated and kiln-dried seeds purchased to sell at a low price. Similarly, we believe, there are yet many manufacturers and merchants who have invested considerable sums in works for the preparation of manures, oil-cakes, and feeding-meals, who would be glad indeed if we could by any legislation get rid of those

"Free Lancers" in the trade, who are unscrupulous as to what they offer the farmers, provided that it will sell.

Incidentally then, we say, follow the example of the great seed houses, and aid us in detecting and exposing that low practice in the trade which depends on selling the farmer an article by a name to which it is not entitled. If the leading houses agree to sell by analysis with a warranty only, they will do much towards purifying the trade, and Parliament will be induced to set a trap to catch the night-hawks who are abroad to pounce upon the unwary pigeon.

In a similar manner it is for the intelligent farmer to realize his true position at this moment, and to take cognizance of the increased call upon his purse for the articles of manure and food, the prevalence of adulteration, and the willingness of the best houses to co-operate with him in putting down the imposters in the trade; and this he can do by dealing only with those houses that sell by analysis, with a warranty.

We are not going to trace the details of the adulterations that are now prevalent in the trade connected with agriculture. The great evil is that most articles are not made properly, and then at the lowest price compatible with their cost; but are mixed before sale with cheaper substances, so as to be sold at a certain figure, which is low enough to captivate the farmer, and to leave a great profit. Some years ago these adulterations were manipulated so clumsily that detection was easy. Stones and shells were added to bones, gypsum and water to guano, mud and sand to linseed-cake; but now lower qualities of guano are mixed with the best, inferior linseed-cakes with the higher priced, and various kinds of meals, braus, and pollard with feeding-cakes of every description, so that it is impossible to detect by cursory inspection, or, indeed, by any examination short of chemical and microscopic analysis, the true value for agricultural purposes of the article—be it manure or feeding-cake—that is offered to the farmer.

We are aware that want of self-confidence is not a common trait in the farmer's character; but in this instance modesty will be a merit. If he attempt to buy his artificial manures and feeding stuffs as he buys his pigs and his sheep, according to his own judgment, he will certainly come to grief, and pay for more than he buys, and less than he bargained for. We cast no general censure on the trade in which iniquities, we are sorry to say, exist. There are many "honourable men" in the commercial department of agriculture; and many respectable men, who sell these articles to farmers, are not the parties who make them, and they may possibly be ignorant of the exact composition of what they do sell. They unwittingly, however, assist in a system which is prejudicial to agriculture and inconsistent with commercial morality; and it is for them to become aware of the nature of the article they *do* sell, and to sell it as such; as it is equally the duty of the farmer to ascertain, by a proper analysis, the composition and com-

mercial value of what he is about to buy. This once done, the seller will soon look out for himself, and no longer utter counterfeits, and escape consequences, on the plea that he did not *coin* them.

It is only, then, for the farmer to assume the modesty which should accompany ignorance, and say to the dealer, "I am profoundly ignorant of the composition of the article that you offer to sell, but I will buy it subject to the analysis of a chemist, and to his opinion as to its being the article you call it." We are aware that it may appear humiliating to confess ignorance, but it is not so really. Newton felt how narrow were the confines of the known compared with the unknown when he described all the knowledge he had acquired as a few pebbles gathered on the shore of the sea of knowledge; and the English agriculturist must not be too proud to confess his own inability to contend with the sharp practice of the unscrupulous trader; while he must, at the same time, seek the protection which science only can give. The manufacture and composition of artificial manures is a scientific process, and as a study is interesting and instructive; but the art of adulteration, so as to secure cheapness, and escape detection is one that is equally dependent on scientific knowledge and skilful manipulation. It is only, therefore, by the aid of science that such attempts can be foiled. The same hand that shaped the sword can forge the shield.

To a considerable extent, then, the prevention of adulteration is in the hands of the farmer; for he is sure of the assistance of the best houses in the trade in carrying out a system which will do away with the unfair traders by doing away with the means by which they live; that is, the system of buying cake and manures by the sight, the touch, and the smell, all of which senses, however acutely the farmer may be endowed with them, may be deceived.

It is no use, however, waiting until Chemical Societies are established in all the rural districts. They will one day be as plentiful as parish schools. In the meantime, however, the steed may hunger while the grass grows, and the farmer, in the position he now occupies, with an important outlay to make, must act as other traders do who are compelled to use all the means in their power to obtain information as to the quality and real value of the merchandise which they buy. The trader who buys brandy, cloth, or tea, employs agents, travellers, or brokers of special skill to ascertain the all-important point of the quality and value of the goods in question, and the chemist is the only agent the farmer can employ, to secure him his money's worth of the article which he has to buy of the *trade*.

With the fact of the great outlay absolutely necessary under the circumstances of the present crops, and the fact that special efforts will be made by the trade to make the most of the opportunity, it is in the farmer's power, and it should now be his practice, by the simple mode we have proposed, to encourage the fair trader, and to protect himself,

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

MONTHLY COUNCIL: *Wednesday, July 6.*—Present, the Duke of Devonshire, K.G., President; the Earl of Lichfield, the Earl of Powis, Major-General Viscount Bridport, Lord Kesteven, Lord Tredegar, Lord Vernon, Sir Massey Lopes, Bart., M.P., Sir A. K. Macdonald, Bart., Sir H. B. Vane, Bart., Sir Watkin W. Wynne, Bart., M.P., Mr. Bowly, Mr. Cantrell, Colonel Chaloucr,

Mr. Davies, Mr. Dent, M.P., Mr. Druce, Mr. Holland, Mr. Wren Hoskyns, M.P., Colonel Kingscote, M.P., Mr. Leeds, Mr. Pain, Mr. Randell, Mr. Ridley, M.P., Mr. Shuttleworth, Mr. Statter, Mr. Stone, Mr. Thompson, Mr. Torr, Mr. Webb, Mr. Wells, M.P., Mr. Whitehead, Mr. Jacob Wilson, Professor Simonds, and Dr. Voelcker.

Earl Howe, of Gopsall, Atherstone, Warwickshire, was elected a Governor of the Society.

The following new members were elected :—

Allix, W. Townley, Campsea Ash, Wickham Market.
 Baker, Rev. R. Loubridge, Ransden, Emsstone, Oxford.
 Bayley, Rev. W. R., The Vicarage, Cassington, Oxford.
 Blgrave, Edward, Oxford.
 Bowen, Edward H., Kingslow, Bridgnorth, Salop.
 Bowen, Humphrey C., Chesterton, Bridgnorth, Salop.
 Boydell, Harry S., Sulham, Reading.
 Bridgland, Stephen, Springfield, Tooting.
 Briggs, D. Grant, Calcethorpe, Louth.
 Coley, Henry, Neachley Hall, Shifnal.
 Croysdale, John, Whitley Bridge, Pontyfract, York.
 Devaux, Alexander, 20, Avenue Road, St. John's Wood, N.W.
 Douglas, James Bryant, 1, Hampden Street, Nottingham.
 Ellett, Robert, Cirencester.
 Everett, William Spencer, Carlton Colville, Lowestoft.
 Fox, John, Coalbrookdale, Wellington, Shropshire.
 Furness, Captain M. W., Rugby.
 Garland, T. Bland, Hillfields, Reading.
 Gibson, Joseph, Wheelprigg, Kirkby Lonsdale.
 Gillart, Richard, Llynhoeld, Machynlleth, Montgomery.
 Greenaway, George Cattell, Binswood Cottage, Leamington.
 Griffin, George, Torton, Kidderminster.
 Hathorathwaite, W., Lower Lee House, Higher Wyersdale, Dolphinholme, Lancaster.
 Hill, John, Wistaston Manor House, Nantwich.
 Howman, Henry A., Halloughton, Coleshill, Warwick.
 Humphrey, Arthur, Walpole St. Peter, Wisbeach.
 Isham, Arthur C., Weston Turville, Tring, Bucks.
 Jones, Thomas, English Frankton, Ellesmere.
 Kelsall, George, Marton, Baschurch.
 King, John Robert, North Ormsby, Louth.
 Knight, William Edward, 14, Carter Gate, Newark, Notts.
 Marker, Richard, Combs, Honiton, Devon.
 Martin, Antoine, Mahagon, Geneva.
 Martin, Henry W., Littleport, Isle of Ely.
 McHattie, John, Chester.
 Meredith, David, Yeatsall, Rugeley.
 Middlemore, Colonel, Thorngrove, Worcester.
 Mildred, Daniel, Preston, Cirencester.
 Miller, T. H. Singleton, Kirkham, Lancashire.
 Mort, William Martin, Baschurch, Salop.
 Moss, Benjamin, Ashington Hall, Rochford.
 Newton, John, Manor Road, Bermondsey, S.E.
 Nevell, Edward, Chawley Farm, Cunnor, Oxford.
 Noel, Captain Charles Ferratt, Bell Hall, Stourbridge.
 Norris, W. G., Coalbrookdale, Wellington Salop.
 Pickstock, Henry, Baschurch, Shrewsbury.
 Pratt, Frederick, Westmeon, Petersfield.
 Ridley, William Wells, The Abbey, Southam.
 Spiers, Richard James, 14, St. Giles Street, Oxford.
 Stratton, James, Chilcombe, Winchester.
 Stunt, Walter C. Brogdale, Ospringe, Faversham.
 Teece, Richard, Weston Villa, Baschurch, Salop.
 Thompson, T. Warren, 1, Claremont Bank, Worcester.
 Thorpe, Henry, Buckingham.
 Turner, E. Weston, Brereton, Rugeley.
 Waldo, E. Waldo Meade, Stone Wall, Edenbridge.
 Walker, Joseph, Chorlton, Nantwich.
 Ward, William, 41, St. Giles, Oxford.
 Weaver, William Richard, 108, Eastgate Street, Chester.
 Welch, Alfred, Southall, Middlesex.
 Weston, Philip, Coalbrook Hall, Wellington.
 Williams, Hugh, Chesterton, Bridgnorth.
 Worley, William, Stanton Harcourt, Eynsham, Oxford.

FINANCES.—Major-General Lord Bridport (chairman) presented the report, from which it appeared that the Secretary's receipts during the past month had been duly examined by the committee, and by Messrs. Quilter, Ball & Co., the Society's accountants, and found correct. The balance in the hands of the bankers on June 30 was £2,308 9s. 3d., and £3,800 remains on deposit. The quarterly statement of subscriptions and arrears to June 3, and the quarterly cash account, were laid on the table.

JOURNAL.—Mr. Thompson (chairman) reported that the Secretary had received a letter from the Secretary of the Société des Agriculteurs de France, stating that subscriptions promised to defray the expenses of the Congrès International of 1871 already amounted to a large sum, and that it has been decided to hold the Congrès during the last fortnight in May.—This report was adopted.

CHEMICAL.—Mr. Wells, M.P. (chairman), stated that the Secretary having reported to the committee that Messrs. Bradburn and Co. had addressed a letter to the Editor of the *Agricultural Gazette*, threatening him with legal proceedings, in consequence of his publication of the quarterly report made by the Chemical Committee of the Council last March, the committee therefore recommended that the Secretary inform the Editor of the *Agricultural Gazette* that the Society are prepared to hold themselves responsible for the publication of their own proceedings, and the reports of their committees, as furnished by the Secretary. The committee also reported that Professor Voelcker had reported to the committee the papers which he had furnished since 1855, based upon actual experiments made by himself or under his direction. Up to the year 1865 these experiments were carried out on the farm of the Royal Agricultural College at Cirencester; since then, by friends of the Professor, under his direction, and the papers published in the *Journal* are the result. The committee and the Professor request the co-operation of any member of the Society who will suggest and assist in carrying out further experiments of the same nature. The following is the list of papers published :

In 1855—Experiments on the comparative value of different artificial manures for raising a crop of Swedes.

In 1858—Experiments upon Swedes, with remarks on the manures employed, made in 1856 and 1857.

In 1860—Experiments with different top-dressings upon wheat, made in 1859.

In 1860—Experiments on Swedes.

In 1862—Experiments with different top-dressings upon wheat, made in 1859-'60 and '61.

In 1863—Experiments with different top-dressings upon wheat, made in 1862.

The preceding experiments were done on the farm attached to the Royal Agricultural College, Cirencester.

In 1864—1, Salt experiments on mangels; 2, field experiments on cloverseeds; 3, field experiments on clover in relation to the changes which take place in the field and stack in haymaking; 4, field experiments on crude German potash-salts and common salt on mangels; 5, field experiments on root crops; 6, field and laboratory experiments in relation to the causes of the benefits of clover as a preparatory crop for wheat; 7, field experiments on seeds and permanent pasture; 8, field experiments on mangels for the last *Journal*.

At present there are in hand for publication in the forthcoming *Journal*: Experiments on potatoes. And have in hand the results of several series of experiments in cloverseeds and permanent pasture, extending over several years.

Experiments are in progress this season on swedes and turnips, potatoes, artificial grasses, and permanent pasture. They are undertaken by Messrs. Coleman and Hull, York; Mr. Roberts, Haslemere; Mr. Cadle, Gloucester; Mr. B. Lloyd Baker, Hardwick Court, Gloucester; Mr. Norman, Aspatria, Carlisle; Mr. Wall, Durham; Mr. Lloyd, Hertford; Mr. Sharpley, Stiltthorpe, Louth; Mr. Kimber, Abingdon, who also has in progress experiments on the different forms in which phosphates are most beneficial to vegetation; comparative experiments with coprolites, precipitated phosphates, bones, soluble phosphates, &c.

The question of the variation in quality of guano having been again brought before the committee, and suggestions having been made that some standard of quality should be settled by the importers, and all cargoes valued accordingly, the committee advise that a communication be addressed to Messrs. Thompson, Bonar, and Co., the agents of the Peruvian Government, calling their attention to the many complaints sent to the Society as to the variable and inferior quality of guano as now imported, and asking them if they can propose any method of placing the trade on a more satisfactory footing, and giving some more certain guarantee of the quality of the cargoes imported.—This report was adopted.

GENERAL, OXFORD.—Lord Kesteven reported the following recommendations of the committee: That Professor Simonds be allowed the travelling expenses of not more than three veterinary assistants at the Oxford meeting; that the charge for additional land at Oxford, obtained at the request of the Council, amounting to £43 2s. 6d., be paid by the Society; and that a further sum, not exceeding £100, be granted for advertising the Oxford meeting.—This report was adopted.

SHOWYARD CONTRACTS.—Mr. Randell reported that the committee recommended that the approaching termination of the existing contract for showyard works be advertised before the Oxford meeting; that certain additional works at Oxford be executed according to the suggestions of the honorary director and the surveyor; and that the surveyor be instructed to prepare a draft plan of the showyard for Wolverhampton.—This report was adopted.

IMPLEMENT.—Mr. Thompson reported that, after full discussion of the different modes of dealing with the trials of steam-cultivating machinery, and of the kinds and amounts of prizes to be offered, it was resolved to refer to the Council the following questions:

- (1). What sum shall be allotted to the implement trials for 1871, bearing in mind that the published rotation restricts these trials to "machinery for the cultivation of the land by steam-power and traction-engine?"
- (2). When shall the meeting of the committee be held which shall fix the classification and conditions of the trials at Wolverhampton?

The committee recommended that the exhibitors of steam cultivating machinery at Oxford be invited to attend a meeting of the Implement Committee to be held in the showyard on Saturday, the 16th, at 3 p.m., and to offer for the consideration of the committee any suggestions which seem to them advisable with reference to the prizes to be offered at Wolverhampton. This report having been adopted, it was moved by Mr. Thompson, seconded by Col. Chaloner, and carried unanimously, "that a sum not exceeding £800 be granted for implement prizes in 1871." The special meeting of the Implement Committee to fix the classification and conditions of the trials to take place at Wolverhampton was fixed for Saturday, the 16th, at 3 p.m.; and the committee were ordered to report to a special Council meeting to be held in the showyard at Oxford, on Tuesday, the 19th inst.

A deputation, consisting of the Mayor of Wolverhampton and Mr. R. H. Masfen, on behalf of the authorities of Wolverhampton, was then received, to present an application for leave to substitute other fields for those which were originally offered, for the trials of steam cultivators in 1871. The question having been carefully discussed, it was moved by M. Randell, seconded by Mr. Jacob Wilson, and carried unanimously, "that this application be granted," it being understood that the Society could obtain, if required, 50 acres of strong land, at a cost not exceeding £10 per acre.

The following noblemen and gentlemen were appointed a General Wolverhampton Committee:—Duke of Devonshire, K.G.; Earl of Lichtfield, Earl of Powis, Viscount Bridport, Lord Chesham, Lord Kesteven, Lord Vernon, Lord Walsingham, Sir Massey Lopes, Bart., M.P.; Sir A. K. Macdonald, Bart.; Sir Watkin W. Wynn, Bart., M.P.; C. E. Amos, T. C. Booth, Edward Bowley, Charles S. Cantrell, John Clayden, D. R. Davies, Joseph Druce, W. I. Edmonds, W. F. Fryer, B. T. Brandreth Gibbs, Richard Hornsby, C. Wren Hoskyns, M.P.; Col. Kingseote, M.P.; Robert Leeds, R. H. Masfen, Richard Milward, Charles Randell, R. C. Ransome, M. W. Ridley, M.P.; William Sauday, Joseph Shuttleworth, Thomas Stratton, William Torr, Sir H. R. Vane, Bart.; F. Walton, James Webb, William Wells, M.P.; Charles Whitehead, Lieut.-Col. Wilson, Jacob Wilson; Mayor of Wolverhampton for 1870 and 1871, the Stewards.

On the motion of Mr. Thompson, the following rotation of districts,* recommended by the Country Meeting Districts Committee, was unanimously adopted:

Years.	Present Designation of District.	Proposed future Order of succession.	Place of last or future fixed Meeting.	Date of same.	Interval between last Meeting and the next, as per the proposed scheme.	Gain or loss to each district according to same.
1873	A	1	Newcastle ...	1864	9	- 1
1874	D	2	Bury ...	1867	7	+ 1
1875	F	3	Plymouth ...	1865	10	- 2
1876	C	4	Leicester ...	1868	8	- 0
1877	B	5	Manchester ...	1869	8	- 0
1878	G	6	—	1872	6	+ 2
1879	E	7	Oxford ...	1870	9	- 1
1880	H	8	Wolverhampton	1871	9	- 1

Mr. J. Dent, M.P., having withdrawn the motion of which he had given notice, Mr. Holland (chairman of the Education Committee) gave notice that at the next monthly Council he would move for a renewal of the education grant.

Mr. C. Whitehead gave notice that at the next monthly Council he should move that implements and machines used in the cultivation and preparation of Hops be inserted in the Society's classification of implements for which prizes are offered.

A letter from Mr. A. Welch in reference to a patent cattle truck, was referred to the Implement Committee.

A memorial from exhibitors of carriages was received, and the Secretary was instructed to inform the memorialists that the conditions of the Society's prize-sheet must be complied with.

* The districts, with their present denominations, are the following: (A.) Durham, Northumberland and North and East Ridings of Yorkshire. (D.) Bedfordshire, Cambridgeshire, Essex, Hertfordshire, Huntingdonshire, Norfolk, and Suffolk. (F.) Cornwall, Devonshire, Dorsetshire, Somersetshire, and Wiltshire. (C.) Derbyshire, Leicestershire, Lincolnshire, Northamptonshire, Nottinghamshire, Rutlandshire, and Warwickshire. (B.) Cumberland, Lancashire, Westmoreland, and West Riding of Yorkshire. (G.) Gloucestershire, Herefordshire, Monmouthshire, Worcestershire, and South Wales. (E.) Berkshire, Buckinghamshire, Hampshire, Kent, Middlesex, Oxfordshire, Surrey, and Sussex. (H.) Cheshire, Shropshire, Staffordshire, and North Wales.

THE FARMERS' CLUB IN BEDFORDSHIRE.

On Tuesday, July 12, following the example set by some previous chairmen, Mr. James Howard, M.P., invited a party of the members of the Farmers' Club to spend a day with him in Bedfordshire. These invitations, it should be understood, are mainly confined to the committee, to past chairmen, and to other members who have read papers at the monthly discussion meetings. The company on Tuesday was increased by the presence of certain other leading tenants who farm in the vicinity of Bedford; while the agricultural element of the House of Commons had not been passed over, although a morning sitting on the Irish Land Bill detained some of the honourable gentlemen who had promised to come. M. Lavcley, a well-known Belgian agriculturist, who wrote the paper in the recently-published Cobden Club series on Land Tenure in Belgium and Holland, was a close observer of the scene; and if the opening business at Oxford accounted for the absence of some members of the Club, English agriculture was still well represented in this way:

BEDS.—W. Armstrong. G. Battams. E. Crouch. W. Hipwell. C. Howard. W. W. Kilpin. J. Purser. M. Reynolds. C. Stephenson. J. Thomas. H. Trethewy. F. Wythes.
 BERKS.—T. Owen. J. B. Spearing.
 BUCKS.—E. M. Major Lucas. T. Morris.
 CAMBRIDGESHIRE.—A. S. Ruston.
 ESSEX.—J. Clayden. C. Hope (Barking).
 HERTS.—J. Bailey Denton. N. Rix. J. Ross. J. Weall.
 HUNTINGDONSHIRE.—T. H. Murfin.
 KENT.—R. Marsh.
 LINCOLNSHIRE.—T. B. Dring. G. Martiu. F. Sowerby.
 MIDDLESEX.—G. M. Allender. H. Corbet. W. Eve. J. N. Lee. T. Scott.
 NORFOLK.—R. Leeds. C. S. Read, M.P.
 NORTHAMPTONSHIRE.—Owen Wallis.
 OXFORDSHIRE.—Captain Dashwood. J. Innes. R. J. Newton.
 SHROPSHIRE.—G. Smythies.
 SUFFOLK.—E. Greene, M.P.
 SURREY.—L. A. Coussmaker.
 SUSSEX.—James Wood.
 WILTSHIRE.—W. J. Brown.
 BELGIUM.—Emile Loveleye.
 HOLLAND.—Baron Melvii Van Lynden. Smidt Van Gelder, sen. Smidt Van Gelder, jun.

Having ourselves so frequently enjoyed the opportunity of looking round Bedford and about Bedfordshire, we were desirous rather of gathering some first impressions than of repeating our opinions on all there is to be seen here. We consequently the more readily avail ourselves of the note-book of a member of the Club, a practical farmer who has written prize essays on agricultural subjects, and also distinguished himself by the able papers he has read at meetings of the club.

The party assembled at the Britannia Iron Works, about ten o'clock, and at once proceeded to inspect the works, which for space, uniformity of design, and general convenience, are scarcely to be equalled, and in which about seven hundred hands are employed. Passing from the landing wharf, where all the materials are landed, we enter a side door of a large building which is called the casting-house; here the coals, and iron, are raised by two hydraulic lifts to an apartment above, which communicates with three large vertical furnaces for melting the iron.

After witnessing the different processes of casting plough tops, wheels, riggers, and other small castings used in the various departments, we pass on to another building where the different castings are converted into wrought or malleable cast iron, by being heated in ovens; this is a most valuable improvement, and is of especial service to those who emigrate or live in lone places long distances from works, as the chance of breaking the old brittle castings, by carriage, putting together, or in after use, is avoided, as well as the vexatious expense and hindrance occasioned by having to send continually for fresh castings. Attention is next directed to a very small and ingeniously constructed two-horse portable engine used for pumping water, and worked at the small cost of 3s. 6d. per day. Next is a new patent for generating steam in separate tubes instead of all in one large boiler, the steam being conveyed by a small pipe communicating with the general receiver and applicable both for fixed and portable machinery. Then an engine is in course of construction for the purpose of steam ploughing; it has 42 vertical tubes, which strikes one on first sight as adding to the weight, although on inquiry we find such is not the case, but that the engine will be at least one ton lighter than the ordinary engine of the same size; while the increase of power gained will be very great, as it can be driven at a very high pressure with perfect safety. This is a most valuable invention, and is doomed to displace the old boiler, with its liability to burst. At this point we are painfully reminded that time, like ourselves, will not linger; as there is a long programme, we therefore pass on with a hurried step, through the different buildings for fitting-up reaping and mowing machines, for packing and for painting, and take a passing glance at the system of accounts, the revolving machine for polishing castings, the American steam hammer, the horse rakes, the double-furrow ploughs, and various other ploughs and harrows of every denomination for which this establishment has been so long and so justly celebrated.

The clock strikes twelve, and we find numerous vehicles waiting to convey us to other scenes. First there is the Bedford Town Sewage Farm, where about 100 acres are at present receiving the sewage from the town, but this will shortly be applied to 80 acres more. The crops of Italian rye-grass and cabbages are looking exceedingly well. The effluent water, after percolating through the soil, passes into the stream to all appearance perfectly pure. We are next conveyed to the Hoo Farm, Park Farm, and Clapham Farm, containing together about 629 acres, belonging to Messrs. J. and F. Howard, and farmed by them. After viewing the excellent stock, especially the pigs, and the various luxuriant crops of roots, wheat, and barley (there being but few oats, and those not so good), we pause in amazement and wonder how it is that dry as the season has been, none of these crops want rain! Is it because there has been an unlimited amount of artificials used to produce them? No; for we find that only 3s. 6d. per acre has been spent. What is it then? Why, the simple fact which most English farmers are daily opening their eyes to, that deep-draining and the steam-plough or cultivator have converted a cold barren clay soil, which only a few years ago was thought to be scarcely worth cultivating at a few shillings per acre, into a most fertile and productive one;

while the deep cultivation in a dry season like the present enables the roots of the plants to luxuriate and penetrate to a great depth, and thus obtain sufficient moisture, as the same means would in a wet season be equally serviceable in carrying off quickly any superfluous supply of water without materially lowering the temperature of the ground or retarding the growth of the plants. In estimating the wheat at 6 qrs. per acre, and the barley at 7½ qrs., with as much straw as can just stand up without rain, this seems to be put within bounds. Before returning to Bedford we drove round by Biddeham and viewed Mr. Charles Howard's beautiful flock of Oxford Downs, for which he is so deservedly celebrated, and his crops of corns and roots which are very good, the mangolds, swedes, and kohl rabi being the most luxurious we have seen this season.

The Britannia farms are worked on the eight or double four-course system, namely: 1, winter roots—kohl rabi and mangel wurzel; 2, barley; 3, beans; 4, wheat; 5, summer and autumn keep, as white turnips, rape, mustard, tares, cabbage, &c.; 6, wheat; 7, clover; 8, wheat, the end of the course. This course is subject at times to variations; if, for instance, sheep are on the autumn feed, too late barley or oats may be substituted for wheat. Two fields, which have been thrown out of course in consequence of drainage, are this year cross cropped. The area of cultivated land is over 330 acres, of which 40 acres are plauted with kohl rabi and mangel wurzel; 40 acres with white turnips and rape, and part fallow after tares eaten off, to be sown again with mustard and rape. The far field of roots were devoured by the fly, and had to be resown, but in consequence of the long dry weather they have grown slowly, each shower of rain bringing up a few more plants, so that until the last few days they were unable to hoe them. There were fatted on the land last year about 450 sheep, besides keeping a breeding flock of 200 ewes. In the yards are usually wintered between 60 and 70 head of horned stock of all ages. The Hoo farm is kept apart for weaning purposes, the young Shorthorn steers from which, this year in the month of May, realised 14 guineas each, the average age being little over 11 months. £105 worth of artificial manure is the bill for the whole farm, or 3s. 6d. per acre on the average; 334 acres arable (28 more just purchased, but not yet in hand), 230 acres of pasture, 47 acres of wood, total 629 acres. For this year's crops there have been applied 24 tons of soot; 15 tons were sown on land in preparation for barley, from which roots were carted off, and where barley is sown after wheat, while the remainder is put to the fallows where rape and white turnips are growing. The kohl rabi and wurzels have received dissolved bones at the rate of from 3 to 4 cwt. per acre.

There is but little to add to this, the general feeling being one of admiration at the excellence of both the corn and the root crops, the more especially when the difficulties of the season were taken into consideration. After leaving the sewage town farm the visitors were "hit very hard" at the outset by the appearance of the first field on the Britannia farms adjoining the high road. This was a piece of good ground planted in alternate drifts of mangold wurzel and kohl rabi, all as healthy, true through, and flourishing as if there had been the most genial of times for the growth of roots. The wheats, as our correspondent says, looked equally well; but although he and other strangers would put the yield at six quarters or more, those who know the land would rate five quarters at any time as a very capital crop. The day's drive was rendered more delightful by the beautiful views and "bits" of scenery by which the business of the occasion was here and there relieved—the Clapham Park fox-cove and the range over the Grand National Steeple-

chase Course—the peeps through the oaks and the elms in Bromham Park, and the gay water-party drifting lazily down the Ouse by Biddeham, and wondering much at the excited people who were studying the Oxford pen of ewes, or following the renowned John Brown up his double furrow. Perhaps, however, at the close of a long drive on a summer day as grateful a scene as any was the nicely shaded tent on the very brink of the river, and in the centre of the Caldwell Priory grounds; although still not to be quite oblivious of all commercial relations you enter through the Works, while ever and anon the noisy rattle of a goods train on the transpontine rail gives an over-eloquent orator a chance of re-collecting himself and his ideas. Shall we stay to say here how nicely the wines were tempered, how artfully the lobster salad was concocted, or how the very beef smacked of the Shorthorn, as the mutton was true Down—Oxford, if you please? But Mr. James Howard, as his venerable father before him, has often served the office of mayor, and the hospitality of the Corporation of Bedford has been famous since Goldsmith wrote or Captain Plume fretted his hour upon the stage.

THE DINNER.

Mr. James Howard, M.P., of course presided, the vice-chair being taken by Mr. C. Howard.

The toast of "The Queen" having been duly honoured,

Mr. E. GREENE, M.P., in proposing "The Farmer's Club," observed: Permit me to say how much I have enjoyed this day in looking over this beautiful country and witnessing the success of that system of agriculture in which I myself entirely believe. We have arrived at a time when we meet with high rents, high charges, and competition on all hands, but I believe the nature of Englishmen is to rise to the difficulties set before them. If we are to be successful as agriculturists we must have more than the five inches of soil on which we have depended. The hon. member proceeded to advert to the harmonious action of agriculturists of different political opinions, and having expressed his admiration of the great iron works close by, concluded by coupling the name of the chairman with the toast.

Mr. JAMES HOWARD, M.P., in the course of his reply, said: I cannot express the gratification I have felt in seeing you here to-day, and can only hope that when you return to your homes you will not look upon this day as having been misspent. Many present have in former years looked over the farms which you have seen to-day, and I believe they will agree with me that good as the crops are on my own farm they have upon the whole seen better in former years and in more genial seasons. The crops you have seen to-day are not the result of very heavy applications of artificial manure, but, as has been expressed, of deep cultivation. When I tell you that we have 629 acres, and about 600 under crop and in grass, and that the sum we have spent for artificial manure is £105, for the past year, or 3s. 6d. per acre, you will agree with me that we have not been very extravagant upon that head. Although the crops in this immediate neighbourhood look very promising, I regret we cannot rejoice together over the prospects of the British farmer for the ensuing year. With so little stock in prospect or in hand for the winter, and with a vast number of animals sold off during the drought for killing, meat, though at a high price at present, must during the ensuing year be much higher than now. When we look at the deficiency of the crop upon the light lands, on the Continent as in England, and the large importation of grain, the staff of life must be very dear; and you all know that a large importation of grain means a disturbance in the money market in this country, and whenever the money market is disturbed it means diminished employment for the people and the general depression of commerce throughout the country. The prospects of the times I believe to be gloomy indeed, but let us hope the unseen hand of a beneficent Providence will avert the dangers we see ahead. There was a time not far remote when men in this country who aspired to a knowledge of political economy treated it as a matter of indifference whether this should be a grain-producing country or not, but

time has proved the utter hollowess of such a doctrine. At the present day the importance of British agriculture and its scientific status are recognised by all intelligent men in the commercial and scientific world. It is true that now and then a sneer is hurled at the "bucolic mind," but that proceeds from ignorance or prejudice. The life of a farmer of late years, with fickle seasons, long drought, and increased taxation, has not been an enviable one. One of our poets says:

"How blest the farmer's humble lot,
How pure the joys it yields,
Far from the world's tempestuous strife,
Free 'mid the scented fields."

But however true that might have been in former years, I don't think it applies in the present day. With regard to the Farmers' Club, no one could tell how it had promoted agriculture in the past generation. He was one of those who believed that no agricultural association had done so much, in a quiet way, to promote a knowledge of the true principles of practical farming in this country as the club. He had said in a quiet way because it was no political organisation, and did not advance the interests of agriculture at the expense of other classes—its only object being to promote good agriculture throughout the counties of England, not interfering with those classes which were not mainly connected with agriculture. In looking over the papers read in years back, which he had often done, he had been surprised to find such a mass of information contained in them, which had proved useful to himself. It would be good service if those papers were revised and published. He commended that idea to some of the rising generation in agriculture.

Mr. H. CORBET gave the next toast, "Foreign Agriculture." He said that for many years past he had had the honour of attending several meetings of this kind, and he looked upon them as of special value, because they brought together men from all parts of the country, who, being more or less practical, could act as critics upon what they saw. He had the pleasure of knowing Bedfordshire for many years, and had seen with great interest every improvement which had been carried out, and he should like to invite the whole world to come there and say what they thought of Bedfordshire through the medium of this Club. As Secretary of the Club he was proud to see what the Chairman and his brother, who was a past Chairman, had been able to show to-day to the visitors, English and foreign. Throwing to the winds at once all invidiousness, foreign agriculture and English agriculture, through the medium of the railway, the telegraph, and the advanced state of science, had become more and more identified, and if there is anything to be gathered from foreign agriculture we should be the first to adopt it, while our visitors in turn might profit from something they saw here. With the toast accompanied the name of M. Laveleye, a distinguished Belgian, who had written upon the small farm system on the continent, the tenure of land, and other subjects.

M. EMILE DE LAVELEYE, who responded in French, said: Permit me to express to you my gratitude for the toast which Mr. Corbet has been kind enough to propose, not only with reference to foreign agriculture, but also in connection with its representatives amongst you this evening. I thank you, also, gentlemen, not only in my own name as a Belgian, but in the name of our brothers of Holland who are present, for the very kind manner in which you have received the toast. Allusion has been made to what I have published concerning the land systems, in which I have shown the beneficial results emanating from small estates and small cultivation (*petite culture*) in Belgium. I confess, however, that in going to-day over the farms so admirably cultivated by Messrs. James and Chas. Howard, while admiring their superb animals, the steam application, or the tillage, and perceiving such extraordinary results during a year which has been so unfavourable, I was almost on the verge of recognising the superiority of farming on a large scale (*la grande culture*) had I not called to mind that in this respect England constitutes a very remarkable but unique exception. I have studied the rural economy of agricultural systems of nearly all the continental nations, and everywhere—in Prussia, Austria, Italy, Spain, Portugal, France, and Holland—I have found large estates far less well cultivated and less taken care of than small estates. If it is otherwise in England, the difference arises from the fact that there exists in this country a class of men who are wanted elsewhere, that

you have farmers who devote themselves to cultivation, that you are a nation of capital, and possess an intelligence, perseverance, and practical genius which are truly worthy of admiration. I have always recognised the services which the large farming of England has rendered to the world at large, not only by creating improved breeds, but by producing agricultural implements of great excellence. On this head I would principally set forward the gratitude which is due to a man who, like Mr. Howard, has been instrumental to so remarkable a degree in promoting the progress of mechanical science in its application to agriculture. Everywhere I have been—not only in Belgium and Holland, but in Hungary, Italy, Spain, and Portugal—I have found agricultural implements which were sent out from the ironworks which now surround us. The benefits resulting therefrom are incalculable. The marvellous improvement of farming implements represents hundreds of thousands. Supposing it allows only the production of a half hectolitre more per acre, multiply that by the number of acres under cultivation, and you will realize an enormous amount. It is for this reason, gentlemen, one can say that men who apply their inventive genius, as Mr. Howard has done, to the promotion of agriculture, are in truth benefactors of humanity. By exerting themselves to lower the price of bread they contribute to the riches and wellbeing of nations and individuals. One can the more vividly feel the gratitude we owe to those who thus labour for the economic development of peoples when, perhaps, we are on the eve of seeing the evil genius of war set loose to destroy those riches which agriculture and industry conspire to produce. In conclusion, therefore, I give you the toast of the "Agriculture of England and the Messrs. Howard," as a mark of grateful acknowledgment for the incalculable services which they have rendered to the agriculture of the Continent.

Mr. O. WALLIS proposed "Success to the Royal Society's Meeting at Oxford," responded to by Captain Dashwood, who gave "The Father of the Firm," Mr. Howard, senior.

Mr. Alderman HOWARD replied in a very effective and humorous speech.

Mr. HOPE proposed "The House of Commons," coupled with the name of Mr. C. S. Read, M.P., in whose hands, he remarked, such questions as the game-laws and the malt-tax might be left.

Mr. C. S. READ, M.P., in responding, adverted to some valuable hints which had been given at the late Norfolk show by Mr. C. Howard to the farmers of the county, and spoke strongly on the advantages of steam cultivation. He proposed the health of Mr. C. Howard in connexion with Bedfordshire farming.

Mr. C. HOWARD, in the course of his reply, referred to the remarks he had recently made at Norfolk and justified them, warning agriculturists that no man was so unsafe as he who considered himself safe, and humourously describing some of the implements he had seen in that county as curiosities which might have come from Noah's ark. He condemned the Game Preservation and Poaching Bill as a class legislation, and said 99 out of every 100 farmers in the country were opposed to it.

Mr. E. GREENE, M.P., supported the Bill in the interests of the farmer. The power given to policemen operated for the suppression of poaching, and in a parish of Suffolk in which he resided there had not been a conviction for poaching during the last twelve months. If a man had no right to take game that game must be preserved. The hon. member concluded by proposing "Success to the Britannia Works."

The CHAIRMAN responded, and said he differed from Mr. E. Greene on the Game Poaching Bill, and hoped to see the day when there would be a clean sweep of the Game Laws and game placed on the same footing as other property.

Mr. TRETWEY proposed the health of the Secretary, Mr. Corbet, in complimentary terms, and took occasion to offer a few remarks as to the beneficial influence exercised on agriculture by the Club.

Mr. CORBET, in responding, said, with regard to the question between Bedfordshire and Norfolk, there was a gentleman present who felt that it had not been argued out, and with the permission of the chairman, he would give the health of Mr. Leeds, of Castle Acre, one of the past chairmen of the Club.

Mr. LEEDS, in responding, observed that Mr. Chas. Howard had not visited Norfolk in reality, for the show had been held in a yard which was actually in Suffolk. In no county did the

landlord do more to benefit their tenants than in his own, and the nobleman under which he lived had compelled all his tenants to cut down all the vermin, beginning with rabbits. Even though the Prince of Wales shot over the estate, the tenants of that nobleman were allowed to shoot hares and rabbits. He trusted the show would be held near his own place next year, and he should be happy to receive those of his audience who might attend it.

The CHAIRMAN remarked that the development of agriculture in Norfolk or Bedfordshire was due to the exertions of the late Earl of Leicester and the Duke of Bedford.

The other toasts were, "The Past Chairmen," proposed by Mr. Scott, and responded to by Mr. James Wood; the health of Mr. Nutter, who had given the use of his grounds, proposed by Mr. C. Howard; and the health of Mrs. James Howard, proposed by Capt. Delf.

SELBY AGRICULTURAL SHOW.

The annual show of stock and implements of the agricultural society established for Selby and the district took place under very favourable circumstances. The day was fine, and there was a numerous attendance of company.

The cattle generally were a magnificent lot of animals, particularly the bulls of any age, eight in number. They had to contend for Lord Londesborough's £10 prize, and Mr. Linton, of Sheriff Hutton, was the conqueror with his white bull, Lord Irwin. The bulls not exceeding three years old were good. W. T. Markham, of Becca Hall, Aberford, secured first honours, and Lord Londesborough took the second prize.

The display of horses was in every respect first-rate, and fully equal to all anticipation.

The following gentlemen officiated as the judges:

SHORTHORNS, SHEEP, AND PIGS.—George Smart, Laxton, Tadcaster; George Mann, Scawsby, Doncaster; and Thomas Willis, Capersby, Wensleydale.

HORSES.—Henry Jewison, Raisthorpe, Malton, and Thomas Colton, Eagle Hall, Newark.

PRIZE LIST.

SHORTHORNED CATTLE.

Best bull of any age.—Prize, £10 (given by Lord Londesborough), Wm. Linton, Sheriff Hutton Park.

Bull not exceeding three years of age.—First prize, £10, W. T. Markham, Becca Hall, Aberford; second of £3, Lord Londesborough.

Bull not exceeding 18 months old.—First prize, £5, C. T. Tunnard, Thorganby Hall; second of £2, A. Hathorn, Birkin.

Cow of any age, in calf or milk.—First prize, £5, W. Linton; second of £2, J. Hutchinson, Selby.

Cow, in calf or milk, not exceeding four years of age.—First prize, £3, C. M. Weddall, West Bank, Carlton; second of £2, J. Pearson, Cleek, Selby.

Heifer not exceeding three years of age.—First prize, £2, Lord Londesborough; second of £1, H. Hutchinson, Flaxley Lodge.

Heifer not exceeding two years of age.—First prize, £2, W. Linton; second of £1, Lord Londesborough.

CATTLE OF ANY BREED.

Cow for dairy purposes.—First prize, £3, W. Briggs, Hirst Courtney, Selby; second of £2, W. and R. Jewitt, Brackenholve.

Cow for dairy purposes, the property of a labourer.—First prize, £3, G. Tomlinson, Selby; second of £2, M. Brady, Selby.

LONG-WOOLLED SHEEP.

Shearling ram.—First prize, £5, E. Riley, Kipling Cote Farm, Beverley; second of £2, Jno. J. Simpson, Pilmoor House.

Aged ram.—First prize, £3, and second of £1, E. Riley.

Pen of five breeding ewes.—First prize, £3, J. Ris'worth, Lotherton Park, South Millford; second of £1, W. Brown, Higgate, Holme-on-Spalding-Moor.

Pen of five shearling gimmers.—First prize, £5, W. Brown; second of £2, E. Riley.

Pen of five shearling wethers.—First prize, £5, W. Brown; second of £2, Riley Briggs, Osgodby Hall, Selby.

Pen of gimmer lambs.—First prize, £2, J. Banks, Wressle, Howden; second of £1, J. Smith, Brayton.

Pen of wether lambs.—First prize, £2, Jas. Banks; second of £1, S. Ris'worth, Cold Hill, South Millford.

PIGS.

Boar, large breed.—First prize, £2, Wilson Lister, Arnley, Leeds; second of £1, G. Sedgwick, York.

Boar, middle breed.—First prize, £2, Wilson Lister; second of £1, G. Sedgwick.

Sow, large breed, in pig or milk.—First prize, £2, G. Chapman, Scamer; second of £1, T. Renison, Scaife, Market Weighton.

Sow, in pig or milk, of the middle breed.—First prize, £2, G. Chapman; second of £1, T. Renison.

Three store pigs, not more than twelve months old.—First prize, £2, C. Hutchinson and Jos. Vollans, Selby; second of £1, J. Banks, Stainer Hall, Selby.

Labourer's store pig.—First prize, £2, J. Houfe, North Duffield; second of £1, R. Bradley.

HORSES.

Hunter of any age.—Prize, £10, J. Robson, Old Holme.

Four year old hunter.—First prize, £10, J. Reader, Holme; second of £3, R. Metcalf, Malton.

Roadster nag or mare of any age.—First prize, £10, J. Robson, Old Malton; second of £3, F. Mason, Malton Road, York.

Pair of horses, of either sex, for agricultural purposes.—First prize, £5, and second of £2, Thompson, Skipwith.

Brood mare, for breeding weight-carrying hunters.—First prize, £5, J. Richardson, Selby; second of £2, G. C. Smith, Esrick Grange.

Brood mare, for breeding coaches.—First prize, £3, J. Reader, Holme; second of £1, H. Thompson, Whitmore.

Brood mare, for breeding roadsters.—First prize, £3, J. Wild, Holme-on-Spalding-Moor; second of £1, Riley Briggs, Osgodby Hall.

Brood mare, for breeding agricultural horses.—First prize, £3, T. Makin, Fairburn; second of £1, J. and T. Appleyard, Wistow, Selby.

Three year old hunting gelding.—First prize, £3, R. R. Blanshard, Aughton, York; second of £1, J. Burton, Selby.

Three year old hunting filly.—First prize, £2, J. Burton, Hill Field, Selby; second of £1, W. Taylor, Ryther.

Two year old hunting gelding or filly.—First prize, £3, J. Denison, Sherburn; second of £1, J. Foster, Wistow.

Three year old coaching gelding.—First prize, £3, H. Thompson, Whitmore; second of £1, W. Beckett, Deighton.

Two year old coaching gelding or filly.—First prize, £3, E. Appleyard, Wistow; second of £1, G. and J. Swinbank, Riccall.

Three year old roadster gelding or filly.—First prize, £3, T. Dales, Kearby, Wetherby; second of £1, W. Thompson, Skipwith.

Two year old roadster gelding or filly.—First prize, £2, W. Prince, Chapel Haddlesley.

Pony, not exceeding 14 hands, of any age.—First prize, £3, J. M. Backhouse, Wistow; second of £1, W. White, Arnthorpe, Doncaster.

Pony, not exceeding 12 hands, of any age.—First prize, £3, W. White; second of £1, H. Robinson, Camblesforth.

Three year old agricultural gelding.—First prize, £3, J. Watson, Barlow Grange, Selby; second of £1, G. Braithwaite.

Three year old agricultural filly.—First prize, £3, J. Wood; second of £1, W. Banks, Babthorpe.

Two year old agricultural gelding or filly.—First prize, £2, J. Ringrose, Hillam; second of £1, J. Smith, Brayton, Selby.

BANFFSHIRE CATTLE SHOW.

The series of cattle shows in the North opened on July 12, with the show in connection with the United Banffshire Agricultural Society. The show was the largest and in every respect the most successful ever held under the auspices of the Society. The Shorthorns were forward in large numbers, and comprised some very superior animals, though generally perhaps the quality was not so equal as in the polled. The majority of the cattle were not of the colour which experienced breeders prefer in Shorthorned stock, that is dark red or roan; the prevailing colour seemed to be light red and red-and-white intermixed in such a manner that it could hardly be called roan. The polled stock were very superior as a class, and seemed to be the most attractive to the visitors. Only two aged bulls were brought forward, but these would have done credit to any show yard, and were so evenly matched that it was not the easiest of matters to decide which had the prior claims. There was also a large and creditable turn-out of crosses, many of them very meritorious animals.

JUDGES: CATTLE, William Wallace, Chapel of Seggat; Thos. Garland, Ardlethen; James Cochrane, Little Haddo.—HORSES, SHEEP, AND SWINE: John Sleight, Strichen Mains; Thomas Turnbull, Smithstown; A. K. Leitch, Inchstelly.

CATTLE.

SHORTHORN BREED.

Bulls not exceeding eight years old.—First prize, Mr. Bruce, Burnside; second, Mr. Adam, Seafeld; third, J. Pirie, Newton, Culvie.

Bulls calved after 1st January, 1868.—First prize, Mr. Longmore, Rettie; second, Mr. Scott, Glendronach; third, Mr. Cantlie, Keithmore; fourth, Mr. Bruce, Broadland.

Bulls calved after 1st January, 1869.—First prize, Mr. Longmore, Rettie; second, Mr. Bruce, Broadland; third, the Earl of Seafeld.

Highland Society's Medium Silver Medal for the best bull.—Mr. Bruce, Burnside.

Cows of any age.—First prize, Mr. Scott, Glendronach; second and third, Mr. Longmore, Rettie; fourth, Mr. Turner, Arradoul.

Sir G. S. Abercromby's Silver Challenge Cup for the best cow.—Mr. Longmore, Rettie.

Heifers calved after 1st January, 1868.—First and second prize, Mr. Bruce, Broadland; third, Mr. Longmore, Rettie.

Heifers calved after 1st January, 1869.—First and second prizes, Mr. Bruce, Broadland; third, Mr. Longmore, Rettie.

Highland Society's Silver Medal for the best heifer.—Mr. Bruce, Broadland (yearling heifer).

POLLED BREED.

Bulls not exceeding eight years old.—First prize, Mr. Tayler, Glenbarry; second, Mr. Gordon, Tullochallum.

Bulls calved after 1st January, 1868.—Mr. Walker, Mountbleton.

Bulls calved after 1st January, 1869.—First prize, Mr. Paterson, Mulben; second, Mr. Bruce, Burnside.

Cow of any age.—First prize, Mr. Skinner, Drummin; second, Mr. Paterson, Mulben; third, Mr. Tayler, Glenbarry.

The Earl of Fife's Silver Challenge Cup for the best cow.—Mr. Walker, Mountbleton.

Heifers calved after 1st January, 1868.—First prize, Mr. Paterson, Mulben; second and third, Mr. Walker, Mountbleton.

Heifers calved after 1st January, 1869.—First prize, Mr. Skinner, Drummin; second, Mr. Paterson, Mulben; third, Mr. Duff, Hillcock-head.

CROSS BREED.

Cows of any age.—First prize, Mr. Turner, Arradoul; second, Mr. Longmore, Baldavie; third, Mr. Milne, Corse of Kinnair.

Pairs of cows of any age.—First prize, Mr. A. Wilson, jun., Tochieneal; second, Mr. Longmore, Baldavie; third, Mr. Ogilvie, Tillynaught.

Heifers calved after 1st January, 1868.—First prize, Mr. Shand, Ordens; second, Mr. Rust, Paddocklaw; third, Mr. Smith, Thriepland.

Pairs of heifers calved after 1st January, 1868.—First prize, A. Wilson, jun., Tochieneal; second, Mr. Smith, Thriepland.

Heifers calved after 1st January, 1869.—First prize, Mr. Findlater, Crama; second, Mr. Ogilvie, Tillynaught; third, Mr. Shand, Ordens.

Pairs of heifers calved after 1st January, 1869.—First prize, Mr. Shand, Ordens; second, A. Wilson, jun., Tochieneal; third, Mr. Shand, Ordens.

ANY BREED.

Oxen calved after 1st January, 1868.—First prize, Mr. Scott, Glendronach; second, Mr. Bruce, Broadland; third, Mr. Longmore, Hilton.

Pair of oxen calved after 1st January, 1868.—First prize, Mr. Scott, Glendronach; second, Mr. Longmore, Hilton; third, Mr. Longmore, Baldavie.

Oxen calved after 1st January, 1869.—First prize, Mr. Shand, Ordens; second, Mr. Ogilvie, Tillynaught; third, Mr. Murray, Pittendreich.

Pairs of oxen calved after 1st January, 1869.—First prize, Mr. Ogilvie, Tillynaught; second, Mr. Smith, Thriepland; third, Mr. Shand, Ordens.

Animals showing most symmetry, fat, and weight.—First prize, Mr. Scott, Glendronach; second, Mr. Shand, Ordens.

Cattle belonging to Tenants whose Rents are under £50.

Dairy cows of any age.—First prize, Mrs. Murray, Burnervie, Marnoch; second, Wm. Lauder, Nethermills; third, James Riddoch, Gledsgree.

EXTRA STOCK.

Cross cows.—Mr. Turner, Arradoul.
Cow and calf.—First and second prize, A. Wilson, jun., Tochieneal.

HORSES

Draught stallions having had produce during the year 1869.—Mr. Tait, Brankanentham.

Draught entire colts foaled after 1st January, 1868.—First prize, Mr. Tait, Brankanentham; second, Mr. Mackie, Cummerton.

Draught mares without foals.—First prize, Major Gordon, Park; second, Mr. Murray, Faichfolds; third, Mr. Wilson, Kilmillook.

Mares for breeding draught horses, having foals at foot.—First prize, Mr. Longmore, Rettie; second, Mr. Leslie, Corskellie; third, Mr. Walker, Mountbleton.

Draught horses.—First prize, A. Wilson, jun., Tochieneal; second, Mr. Scott, Glendronach; third, J. Morrison, Loanhead.

Draught fillies, foaled after 1st January, 1867.—Mr. Smith, Thriepland.

Draught fillies, foaled after 1st January, 1868.—Mr. Walker, Mountbleton.

Draught geldings, foaled after 1st January, 1868.—First prize, Major Gordon, Park; second, Mr. Walker, Mountbleton.

Draught fillies, foaled after 1st January, 1869.—First and second prizes, Mr. Walker, Mountbleton; third, Mr. Longmore, Hilton.

Draught geldings, foaled after 1st January, 1869.—First prize, Mr. Longmore, Baldavie; second, Mr. Longmore, Hilton; third, Mr. Morrison, Loanhead.

Extra Stock.—First prize, Mr. Longmore, Baldavie; second, Mr. Ogilvie, Bankhead; third, Mr. Longmore, Hilton.

PIGS.

Sows.—First prize, Mr. Ogilvie, Bankhead; second, G. Bilenoch, Carnoch.

SHEEP.

LIVESTOCK BREED.

Tups of any age.—First prize, Mr. Hannay, Corskie Bank; second, Mr. Bruce, Burnside; third, Mr. Leslie, Corskellie.

Shearling tups.—First prize, Mr. Bruce, Burnside second and third, Mr. Hannay, Corskie Bank.

Pens of five ewes, not less than two-shear, having had lamb, during the season.—First prize, Mr. Hannay, Corskie Bank; second, Mr. Longmore, Rettie.

Pens of five gimmers or shearling ewes.—First prize, Mr. Bruce, Burnside; second, Mr. Hannay, Corskie Bank; third, Mr. Longmore, Rettie.

ANY OTHER BREED.

Six ewes having had lambs during the season.—Mr. Longmore, Rettie (Leicester ewe).

Six shearling gimmers.—Mr. Smith, Threipland.

The dinner took place in a marquee erected on the grounds, and the chair was taken by W. J. Taylor, of Glenbarry.

After the usual loyal and other toasts, in giving the toast of the evening the CHAIRMAN said: I am now about to propose "The United Banffshire Society, and continued success to it." I say continued success to it, because from the statistics that were read to you by the Earl of Fife, when proposing this toast last year, there can be no doubt of its success hitherto. I find that the entries of this day exceed, by a great number, those of any former year. Last year we thought we were very well off, but we had then only 275 entries, as against 344 this year. Therefore, I think I am fully justified in saying that we are going on prosperously. And, as the numbers of the stock have increased, I am quite sure everyone will agree with me that the quality has not, at all events, fallen off. I find my friends the black polled, as usual, in the minority in point of numbers; we are overcrowded by these great Shorthorns which are now pervading the country, so that we seldom see a black beast. However, I shall always adhere to the creed that however good the Shorthorns may be, we should always keep up the black breed for the purpose of crossing, and I am sure my friend, Mr. Paterson, will agree with that sentiment. There can be no doubt as to the great advantage of such meetings as the present, and of such societies as that to the prosperity of which we are now drinking. Breeders who remain at home, and seldom see any stock but their own, are apt to get conceited about their beasts, and they will never get out of that conceit until they come to such an exhibition as the present, and get the shine taken out of them. Then they see that it is necessary to go home and try to improve their stock. I say, therefore, to the Banffshire,

and to all similar societies, "Go on and prosper." Afterwards in giving "The Tenantry of Scotland" he said: It is to them, gentlemen, and to their exertions, that it is mainly owing that Scotland, instead of being as formerly, in the words of our poet, "Land of brown heath and slaggy wood," and one of the poorest countries in the world, is now, notwithstanding its rigorous climate, famed for its agriculture, and for the abundant product of the soil. The relations of landlord and tenant, founded on equitable contract, strictly adhered to, are productive of mutual benefit and of kindly feeling between the classes—a happy contrast to the state of things which unhappily prevails in parts of the sister country of Ireland, where it has been found necessary to introduce the legislative measure now before Parliament, in order to enforce justice between landlord and tenant. This has been done at the expense of what I consider a great violation of the principles of political economy, and of the grand principle of free contract between man and man, which, I trust, will always be maintained in its entirety in Scotland.

Mr. SCOTT, Glendronach, proposed "The landed proprietors of the county." The chairman had said that a great deal had been done by the tenantry in improving "the land of brown heath and slaggy wood;" but they all knew that the tenants' influence on many occasions would have been futile unless they were supported by wise and judicious landlords. He was happy to think that a great number of our landed proprietors could be included in that category. He was very sorry that so few came to see their shows, which had now become great institutions. He believed, and he was sure he would be borne out by the agriculturists around the table, that if it had not been for their cattle shows, and the improvement in breeding, the rent-roll of the landlords would not have stood so high as they did. He trusted that the landlords would perform the duties devolving on them, and that they would profit by experience and come amongst them more than they had hitherto done, when they would find that their tenants were not so bad fellows to meet with.

Mr. CANTLIE proposed the health of the Chairman. As a landlord himself, and as commissioner for a vast landed property in this county, he was well known and respected; and his conduct in all business matters, his upright and straightforward conduct never failed to call forth the greatest admiration.

The CHAIRMAN returned thanks. "Good Night" was then given by the Chairman, and the company separated.

NEWTON-ON-DERWENT AND DISTRICT AGRICULTURAL SOCIETY.

This society held its sixteenth annual show at Dunnington, four and a-half miles from York.

Especially deserving of favourable notice were the bulls of any age and the bulls under twelve months old. The cow classes, too, were equally good, the cows of any age in-calf or milk, and the heifers under three years old being a prime lot of beasts, and very much admired.

In wool and mutton, no less than in form, the sheep classes were irreproachable.

The pigs were equally good; the boars of any breed and the sows or gilts for breeding purposes being fully up to the mark for display at an agricultural show.

The judges were: For cattle, pigs, and sheep—H. Peacock, Mount Vale, York, and J. Kirby, Skirpenbeck. For horses—T. Bowman, Croom, Sledmere, and R. Robson, Deighton.

PRIZE LIST.

SHORTHORNED CATTLE.

Best bull of any age.—First prize, G. Harrison, Newton-on-Derwent; second, T. Harrison, Dunnington.

Best bull under twelve months.—Prize, J. Stephenson, Wheldrake.

Cow, of any age, in-calf or milk.—First and second prizes, J. Stephenson.

Cow, of any age, in-calf or milk, for dairy purposes.—First prize, J. Stephenson; second, Julia Hart, Dunnington Lodge.

Heifer, under three years old, in-calf or milk.—First prize, R. Roundlwaite, Buttercrambe; second, J. Stephenson.

Heifer calf, under one year old.—First and second prizes, J. Stephenson.

SHEEP.

Ram, of any age.—First prize, G. Harrison; second, W. White, Full Sutton.

Pen of five ewes, that have suckled lambs to the 1st July.—First prize, G. Harrison; second, J. Stephenson.

Pen of five shearling gimmers.—First prize, J. Kirby, Skirpenbeck; second, Thomas Etty, Sutton-on-Derwent.

Pen of five gimmer lambs.—First prize, G. Harrison; second, J. Stephenson.

HORSES.

Nag of any age, to be ridden in the presence of the judges.—First prize, F. Mason, Calm Farm, Malton-road; second, H. R. W. Hart, Dunnington Lodge; third, H. Dudding, Haxby.

Three-year-old nag gelding or filly.—First prize, H. R. W. Hart; second, Mr. Watson, Grimston.

Two-year-old nag gelding or filly.—First prize, J. Stephenson; second, T. Harrison.

Yearling nag gelding or filly.—First prize, J. Penrose, Newton-on-Derwent; second, J. Snowball, Stockton.

Nag foal.—First prize, W. Willsthorpe, Appleton; second, G. Dickson, Heslington.

Coaching mare and foal.—First and second prizes, J. Stephenson.

Three-year-old coaching gelding or filly.—First prize, W. Becket, Deighton; second, J. Kirby, Burton Fields.

Two-year-old coaching gelding or filly.—First prize, W. Wharram, Skirpenbeck; second, Mr. Newton, Sutton-on-Derwent.

Yearling coaching gelding or filly.—First prize, R. Staveley, Scrayingham; second, T. Saltmarsh, Stamford Bridge.

Horse or mare for agricultural purposes.—First prize, E. Jewitt, West Cottingworth; second, J. Long, Skipwith.

Two-year-old agricultural gelding or filly.—First prize, T. Braithwaite, Newton-on-Derwent; second, T. Palfreman, Kexby.

Foal, colt or filly, for agricultural purposes.—First prize, J. Butler, Malton-road; second, W. J. Ware, Skirpenbeck.

Foal, by any roadster horse.—First prize, G. Dickson, Heslington; second, T. Harrison.

Foal, by any coach horse.—First prize, J. Kirby, Burton Fields; second, T. Harrison.

Colt or filly foal by "Elvington Wildfire."—First prize, G. Barker, Elvington; second, T. Ety, Sutton-on-Derwent.

Colt or filly foal by "Bucephalus."—First prize, W. Dewar, Groves, York; second, J. Watson, Grimston.

Sweepstakes of 5s. each, for best three-year-old hunting gelding.—Prize, J. Kirby, Skirpenbeck.

Sweepstakes of 5s. each, for the best pony under 14 hands.—First prize, J. Wood, Newton-on-Derwent; second, J. Williamson, Elvington; third, J. Hatfield, Oshaldwick.

PIGS.

Boar, of any breed.—First and second prizes, J. Sedgewick, The Grove, York.

Sow or gilt, of any breed, for breeding purposes.—First prize, T. Nicholson, Lawrence-street, York; second, R. Taylor, Holby.

Cottagers' pig.—First prize, J. Tesseyman, Dunnington; second, T. Porteus, Murton; third, M. Shepherd, Dunnington.

SALE OF MR. MEADOWS' SHORTHORNS AT THORNVILLE, WEXFORD, IRELAND,

ON THURSDAY, JUNE 30.—BY MR. JOHN THORNTON.

This "small but distinguished herd," which has been of gradual growth since 1830, was comprised chiefly of tribes that had a good local celebrity. The fine grazing district in the Barony Forth, in the county of Wexford, is much indebted to Mr. S. Armstrong, of Enniscorthy, who introduced Shorthorns from Cumberland some five-and twenty years ago. Mr. Bolton, of the Island, has also a good stock, with two bulls of Mr. Booth's in service, while Mr. Meadows started first with the Fanny tribe from Mr. Conolly. Many animals had been bred from this line, and Fanny 30th was the last in the catalogue. It is only of short descent, going back to the bull Duke (3633), but the sort have been remarkable for their sweet heads and thoroughbred looks, all duly appreciated in the Wexford showyard, where they won a number of prizes. The Bloom or Blossom tribe was got from Mr. Armstrong, and traced back to No. 22 at the Chilton Sale. This was by far the best family. In 1867 Mr. Meadows bred Bolivar (25649) from this tribe, exhibited him in Dublin, and sent him to England, where he was quite the best yearling at the Royal at Leicester in 1868. He was sold there to Mr. Brierley, who now backed up the family, and purchased his own sister Bloom (lot 10) for 50 gs.; but she was thin and low in condition from recent calving, and milking heavily too. Her calf, a very good one, made 51 gs., and went to Mr. Bolton; whilst his half-sister, Bloom of the May, a heifer in good condition, exceedingly stylish, and symmetrical, fetched 90 gs. for Australia. Chansonette, a fine, large cow, and a prize winner, went to Mr. Maxwell Gumbleton, County Cork, for 64 gs., and her heifer, Chaumontel, the first prize yearling at the Dublin Spring Show, was kept in the county by Mr. Bolton for 63 gs. Polly Hopkins, the highly commended heifer at Dublin, went cheap enough to Mr. Gumbleton for 42 gs. Mr. Meadows also sent over to this country the bull Charlie (25745) who won several premiums, but his line of blood was not greatly appreciated, his dam, low in condition, fetching only 41 gs., and his half-sister, a yearling heifer, 20 gs. Prince of the Realm, purchased from Mr. Carr, in use for the last two years, was bought to go to Mr. J. How, in England, for 70 gs. A very large company assembled, and Mr. Meadows entertained a great number in the house. The auctioneer, in opening the sale, remarked on the success that had attended Mr. Meadows in his endeavours to compete in England for prizes, which

was received with cheers, and the sale all through was of a most lively and animated description. Many of the cows being heavy milkers were low in condition, and Mr. Meadows reserved two at 30 gs. The calves were also a little thin, but the heifers were remarkably good, and brought out excellently under Tom Quin, the well-known herdsman. Subjoined are the prices;

COWS AND HEIFERS.

- Chemisette (has bred nine calves).—R. J. Devereux, M.P. 20 gs.
- Fanny 7th (has bred ten calves).—W. M. Gibbon, 26 gs.
- Fanny 9th (has bred six calves).—W. J. Bryan, 31 gs.
- Primrose 4th (has bred four calves).—W. J. Boxwell, 21 gs.
- Polly Fortune (has bred four calves).—W. J. Bryan, 30 gs.
- Fanny 14th (has bred four calves).—Reserved.
- Chintz (has bred four calves).—J. King, 41 gs.
- Amelia (has bred three calves).—Reserved.
- Chansonette (has bred two calves).—Mr. Gumbleton, Cork, 64 gs.
- Bloom (has bred two calves).—C. W. Brierley, Manchester 50 gs.
- Primrose 6th.—W. J. Bryan, 28 gs.
- Fanny 23rd.—Earl Fitzwilliam, 36 gs.
- Fanny 24th.—A. Keating, 24 gs.
- Fanny 25th.—W. J. Bryan, 55 gs.
- Chenille.—C. Furney, 23 gs.
- Aelaide.—S. Armstrong, Enniscorthy, 22 gs.
- Fanny 26th.—F. Boxwell, 26 gs.
- Bloom of the May.—Fait, for Australia, 90 gs.
- Cumbric.—W. A. Caulfield, 20 gs.
- Chaumontel.—W. Bolton, The Island, 63 gs.
- Polly Hopkins.—M. Gumbleton, 42 gs.
- Fanny 27th.—C. Furney, 15 gs.
- Bloom of the Heather.—W. Bolton, 51 gs.
- Cashmere.—J. Thomas, 13 gs.
- Primrose 8th.—A. Cannon, 18 gs.
- Fanny 30th.—W. T. Taylor, 10 gs.
- Chèvre Fenille.—M. Gumbleton, 13 gs.

BULLS.

- Prince of the Realm (22627).—J. How, Broughton, 70 gs.
- Fitz-Charles.—R. Devereux, M.P., 30 gs.
- Charlemagne.—W. J. Bryan, 20 gs.

SALE OF MR. D. R. DAVIES' HERD,

MERE OLD HALL, KNUTSFORD, CHESHIRE,

WEDNESDAY, JULY 13, 1870.—BY MR. STRAFFORD.

Manchester seemed to be the head-quarters overnight for the Shorthorn fraternity, who were bound for Mere Old Hall, to see the sale, not so much of Mr. Davies' herd as the sale of old Moss Rose, her daughter, and the Cleopatras. The "Queen" coffee-room was as full of the Shorthorn *elite* as a commercial-room could be of business men. Mr. Drewy (Duke of Devonshire), Mr. Lency, Mr. Tracy, Mr. Merton, and Mr. Trafford, had preceded Mr. Oliver, Mr. Foster, Mr. Larking, Mr. Rand (Lord Braybrooke), Mr. Lynn, Mr. Thornton, and the Australian contingent, Mr. White and Mr. Langdale; and there was the felt but unspoken suspicion that everyone was bound upon the same purpose. It was, however, reported that Mr. Cochrane, in company with his clever assistant, Simon Beattie, had been there and gone down overnight, after having been to Wetherby and Warlaby, making some extraordinary purchases, so that all chances of a bargain seemed gone. The old cow was freely put to make two to three hundred, and the heifer at least five; but the company had not reckoned upon the Squire of Gaddesby, who was not down overnight either in person or by deputy, in Mr. Bland.

A few slight showers only refreshed the hot, bright morning, and cheered the hearts of the burnt-up south countrymen. The cattle were conveniently placed in a large field, where the ring was pitched, and some pens secured the sheep and pigs, upon which Messrs. Clarke and Lythall operated afterwards.

By noon there was a large and thoroughly Shorthorn company, among them being Mr. Cochrane and Beattie; Mr. Gibson, on the part of Messrs. Walcott and Campbell; Mr. Downing, Mr. Slye, Mr. Knowles (Capt. Gunter), Mr. Slatter (Lord Derby), Mr. Roper (Lord Skelmersdale), Mr. Pumehard (Lord Kenlis), Mr. Bland (E. I. Cheney, Esq.), Mr. Culshaw. (Col. Towneley), Mr. Lowndes, Mr. Atherton, Mr. Tunnilliffe, Mr. Baxter, Mr. Fawcett, Rev. P. Graham.

Old Moss Rose and Wellingtonia grazed near the gate, as if they knew the object of the company; Cleopatra 5th, being in season, was kept in the house, and the rest grazed in the field. The white Moss Rose 2nd was a little difficult to find among many white ones, as her splendid pedigree was not fully borne out in her appearance. A white Cleopatra was once or twice mistaken for her; but when found, Moss Rose 2nd's appearance was keenly scanned, inasmuch as a little doubt prevailed as to her productiveness. She had a tumour when a yearling, and had been served by Twelfth Duke of Thorn-dale, but not holding to him she had been sent to Wetherby, and served Jan. 12, by Third Duke of Wharf-dale. It was also said that, in the event of her not breeding, Mr. Davies would meet the case. The other animals, save a pretty roan heifer from Candidate's Duchess, were not particularly admired, and the two by the Twelfth Duke of Thorn-dale were deemed weedy and delicate. The bulls in the houses were considered, and some went even so far as to say they would have made inferior steers; still just before lunch they were paraded in a ring and showed to more advantage.

A very elegant luncheon was served, with Mr. Tatton in the chair, who proposed her Majesty's health, and also Mr. Davies', whose popularity and zealous efforts in bringing out another herd, after thirty-six—the whole

herd save four—had been lost in the plague, were one general theme of discourse.

The ring was pitched a long distance from the sheds, and a spacious raised stand erected behind the auctioneer. During his preliminary observations and the reading of the conditions of sale, Old Moss Rose, looking as young and as fresh as at Preston Hall, paraded the ring for the fifth time, and seemed, with her head up and gay carriage, to be as well aware as she was proud of it. The history of this remarkable cow is as follows: Bred by Mr. Harvey Combe, she was sold as a calf, and a great beauty too, at Cobham Park sale, 1857, for 260gs. to Mr. Hales, who resold her to Mr. Betts for 245gs. in 1862, her bull-calf Marmion selling for 155gs. to Mr. D. R. Davies. At the Preston Hall sale she was bought by Mr. Davies for 230gs., and her calf Moss Rose 2nd by Mr. Foster for 160gs. It was agreed, however, they should toss for choice; and Mr. Foster took Moss Rose, Mr. Davies buying her at his sale for 400gs. There was much elegance and fine character about her—a sweet head, with long, tapering horns, fitted well on to her neat shoulders. Age had made her lumpy behind; but her lovely roan and thoroughbred stylish look at once commended her even to the sceptical. Mr. Drewry bid a hundred for her, and Mr. Foster fifty more. Mr. Lency came in at 200gs., and then followed quiet bids behind the rostrum up to 350gs., when Mr. Elt Cheney, of Gaddesby, was announced the buyer. She has thus realised 1,485gs. at various times.

Cleopatra 8th, a fine, large, deep roan cow of beautiful quality, and a 130 gs. purchase at Ilolker, was re-purchased by Mr. Drewry at 80 gs. Harmony, a short-legged, long-bodied cow, went cheap enough and in-calf to Mr. Ilomer. Wellingham, a 120 gs. purchase at Ilavinger, kept up her good looks, and fell to Mr. Slye, after some opposition from Mr. Thornton, for 40 gs. over cost price. Mr. Thornton, however, got the next at 41 gs., and she was a 90 gs. purchase of Mr. Logan, who won the first prize at the Plymouth Royal with her. In symmetry, colour, and fine quality she was unequalled, and seemed a cheap in-calf investment. Candidate's Duchess, by Capt. Gunter's Duke of Wharfdale, was not in a breeding state. Cleopatra 9th, coughing, but a nice-coloured stylish cow, was re-purchased by Mr. Downey for Mr. Harward at 65 gs. Then came some quite second-rate animals until lot 12, a Bracelet, a 40 gs. lot at Mr. Wythes in 1867. Although a deep, short-legged, fine-coloured cow, she had a low loin, supported with good round ribs. Mr. Drewry, after opposition from Mr. Thornton, secured her at 70 gs., and her sister, not so good but in-calf, at 45 gs. Then came in Moss Rose 2nd, a sweet-headed, long-quartered, stylish-looking heifer—200 gs. was the first bid. Mr. Beattie for Mr. Cochrane bid 400 gs., and Mr. Oliver got in at 450. Then followed a succession of bids from the stand up to 700 gs., when Mr. Oliver was in again: "ten," said Mr. Beattie, and then arose a clapping of hands and slight cheers; "twenty," from Mr. Bland; "thirty," shouted out Beattie; "five," said Mr. Oliver; and "fifty," came Mr. Bland; "eighty," said Mr. Oliver; "eight hundred;" "the glass runs." "Who's the buyer?" Mr. Cheney; and a good cheer and much murmuring talk and surprise arose on this extraordinary animal,

which is by far the dearest sold this year. The succession of inferior animals fetched inferior prices, and Mr. Thornton for Mr. James had quite a single guinea run with Mr. Homer for Cleopatra 12th. The 13th, put up at 50 gs., was a fair, deep-fleshed heifer, and Mr. Foster got her at 62 gs. Candidate's Duchess 2nd, by Grand Duke of Essex 4th, out of lot 6, was by far the prettiest lot in the sale; there was much competition for her, and she went eventually for 105 gs. to Mr. Thornton. Mr. Fawcett got a very pretty Cleopatra yearling from lot 2, cheap at 57 gs.; and Wellingtonia 2nd by 12th Duke of Thorndale was anything but handsome; a peculiar roan, and evidently light fleshed, she seemed dear at 200 gs. to Mr. Leney.

Lot 10, of the bulls, Royal Chester, a plainish, growing bull with a nice colour, inferior head, and good flank, was brought in first and put up at 100 gs. There was little competition for him. Mr. White, however, who evidently fancied him for his sister's sake, opposed Mr. Strafford, who got him at 200 gs. for Mr. Barnes, of West Sydney. Lot 1, Grand Duke of Essex 4th, had not improved on his yearly appearance when Mr. Davies gave 170 gs. for him, and went at a trifle over market price. Then came in lot 16, by far the handsomest calf in the sale, and one of great promise; he was own brother to Royal Chester, and Mr. Knowles got him cheap enough at 130 gs.

With this the interest of the Shorthorns ceased, and Messrs. Lythall and Clarke discoursed to an almost local company on the merits of the very superior Shrops, which had been selected from some of the best flocks. A few were passed, but on the whole fair prices were obtained, from 5½ to 18½ gs. Five pounds per head was paid for a pen of shearling ewes, and the first saw, a handsome lot bred for Mr. Atherton, made 10½, whilst her daughter fetched £13. This concluded a very successful and pleasant though somewhat tedious business. Subjoined are the prices:

COWS AND HEIFERS.

Moss Rose, roan, calved July 2, 1858, by Marmaduke (14897), out of Cambridge Rose 6th by 3rd Duke of York (10160).—Mr. E. H. Cheney, 350 gs.
 Cleopatra 5th, roan, calved January 2, 1861, by 9th Duke of Oxford (17738), out of Cleopatra 3rd by C'dge Barrington 2nd (14224).—Duke of Devonshire, 80 gs.
 Harmony, red and white, calved November 2, 1861, by Cherry Duke 3rd (15763), out of Floret by Douglas (12714).—Mr. C. M. Hamer, 46 gs.
 Wellingtonia, roan, calved May 5, 1862, by 3rd Duke of Thorndale (17749), out of Waterloo 24th by Grand Duke 3rd (16182).—Mr. W. W. Slye, 160 gs.
 Charlotte 4th, roan, calved March 29, 1863, by Duke of Knowlmore (19623), out of Charlotte by Noble Arthur (16621).—Mr. John Thornton, 41 gs.
 Candidate's Duchess, red and white, calved July 17, 1863, by Duke of Wharfedale (19648), out of Candidate by Jasper (11609).—Mr. J. Hallsall, 35 gs.
 Cleopatra 9th, roan, calved November 15, 1863, by Lord Oxford (20214), out of Cleopatra 4th by Duke of Buckingham (14428).—Mr. J. Harward, 65 gs.
 Rose of Thorndale 2nd, red and white, calved April 5, 1864, by 2nd Duke of Thorndale (17748), out of Rose of February by May Duke (13320).—Mr. Thorn, 49 gs.
 Flirtation 2nd, white, calved February 3, 1865, by Garibaldi (17919), out of Flirtation by Rakish (15127).—Mr. Watson, 31 gs.
 Leonora 2nd, red and white, calved July 18, 1865, by Garibaldi (17919), out of Leonora by Homer (14714).—Mr. Thorn, 36 gs.
 Rose of Thorndale 2nd, red and white, calved August 13, 1865, by Medora's Grand Duke (22337), out of Rose of Thorndale by 2nd D. of Thorndale (17748).—Mr. Thorn, 31 gs.
 Bracelet, roan, calved March 23, 1866, by Sir James (22902),

out of Blanc Mauge by Magistrate (13274).—Duke of Devonshire, 70 gs.
 Bland, roan, calved January 21, 1867, by Sir James (22902), out of Blanc Mauge by Magistrate (13274).—Duke of Devonshire, 45 gs.
 Moss Rose 2nd, white, calved January 19, 1867, by 4th Duke of Thorndale (17750), out of Moss Rose by Marmaduke (14897).—Mr. E. H. Cheney, 809 gs.
 Flirtation 3rd, roan, calved May 10, 1867, by Young Hopeful (24159), out of Flirtation 2nd by Garibaldi (17919).—Mr. Thorn, 33 gs.
 Princess Royal 2nd, red and white, calved May 29, 1867, by Young Hopeful (24159), out of Princess Royal by Garibaldi (17919).—Mr. Highfield, 25 gs.
 Charlotte 7th, red, calved September 29, 1867, by Golden Duke 2nd (21837), out of Charlotte 4th by Duke of Knowlmore (19623).—Mr. Owen, 27 gs.
 Rose of Thorndale 4th, red and white, calved March 6, 1868, by Grand Duke of Essex 4th (24068), out of Rose of Thorndale 2nd by Medora's Grand Duke (22337).—Mr. Thorn, 30 gs.
 Cleopatra 12th, white, calved April 13, 1868, by Grand Duke of Essex 4th (24068), out of Cleopatra 5th by 9th Duke of Oxford (17738).—Mr. J. A. James, 47 gs.
 Flirtation 4th, white, calved June 25, 1868, by Grand Duke of Essex 4th (24068), out of Flirtation 2nd by Garibaldi (17919).—Mr. Robinson, 20 gs.
 Cleopatra 13th, white, calved October 18, 1868, by 3rd Duke of Claro (23729), out of Cleopatra 9th by Lord Oxford (20214).—Mr. Foster, 62 gs.
 Rose of Thorndale 5th, roan, calved February 14, 1869, by Grand Duke of Essex 4th (24068), out of Rose of Thorndale 2nd by Medora's Grand Duke (22337).—Mr. Brooke, 21 gs.
 Candidate's Duchess 2nd, roan, calved February 15, 1869, by Grand Duke of Essex 4th (24068), out of Candidate's Duchess by Duke of Wharfedale (19648).—Mr. John Thornton, 105 gs.
 Leonora 3rd, red, calved February 15, 1869, by Grand Duke of Essex 4th (24068), out of Leonora 2nd by Garibaldi (17919).—Mr. Cooke, 27 gs.
 Princess Royal 3rd, rich roan, calved April 28, 1869, by 12th Duke of Thorndale (26020), out of Princess Royal by Garibaldi (17919).—Mr. Highfield, 25 gs.
 Cleopatra 14th, white, calved April 26, 1869, by Grand Duke of Essex 4th (24068), out of Cleopatra 5th by 9th Duke of Oxford (17738).—Mr. J. Fawcett, 57 gs.
 Wellingtonia 2nd, rich roan, calved May 9, 1869, by 12th Duke of Thorndale (26020), out of Wellingtonia by 3rd Duke of Thorndale (17749).—Mr. F. Leney, 200 gs.
 Charlotte 8th, red and white, calved January 16, 1870, by Grand Duke of Essex 4th (24068), out of Charlotte 4th by Duke of Knowlmore (19623).—Mr. Ratcliffe, 16 gs.
 Rose of Thorndale 6th, roan, calved March 1, 1870, by Grand Duke of Essex 4th (24068), out of Rose of Thorndale 2nd by Medora's Grand Duke (22337).—Mr. T. Statter, 26 gs.
 Leonora 4th, red and white, calved March 28, 1870, by Grand Duke of Essex 4th (24068), out of Leonora 2nd by Garibaldi (17919).—Mr. Jabez Hart, 12 gs.
 Cleopatra 15th, rich roan, calved May 8, 1870, by Grand Duke of Essex 4th (24068), out of Cleopatra 5th by 9th Duke of Oxford (17738).—Dead.
 Charlotte 9th, roan, calved June 5, 1870, by Grand Duke of Essex 4th (24068), out of Charlotte 7th by Golden Duke 2nd (21837).—Mr. Thorn, 15 gs.

BULLS.

Grand Duke of Essex 4th (24068), roan, calved May 2, 1866, by Grand Duke 4th (19874), out of Lady Bates 3rd by 4th Duke of Oxford (11387).—Mr. Thorn, 43 gs.
 Freebooter (26198), red, calved July 2, 1867, by Garibaldi (17919), out of Candidate's Duchess by Duke of Wharfedale (19648).—Mr. Statter, 29 gs.
 Enthusiast (26106), red and white, calved July 7, 1867, by Garibaldi (17919), out of Surmise 4th by 2nd Duke of Kent (19620).—Mr. Howard, 50 gs.
 Leonardo (26579), red and white, calved March 16, 1868, by Grand Duke of Essex 4th (24068), out of Leonora 2nd by Garibaldi (17919).—Mr. Middleton, 29 gs.
 Safeguard (27409), roan, calved May 29, 1868, by Grand

Duke of Essex 4th (24065), out of Sarmise 4th by 2nd Duke of Kent (19620).—Mr. F. Murton, 40 gs.
 Patriot (27048), roan, calved July 17, 1868, by Patricia (24728), out of Harmony by Cherry Duke 3rd (15763).—Mr. Ratcliffe, 27 gs.
 Don Carlos (25908), red and white, calved October 8, 1865, by Grand Duke of Essex 4th (24068), out of Charlotte 4th by Duke of Knowlmere (19623).—Mr. Thorn, 30 gs.
 Thorndale Oxford Duke, red and white, calved February 12, 1869, by 12th Duke of Oxford (19633), out of Rose of Thorndale 2nd by 2nd Duke of Thorndale (17748).—Mr. Harrison, 35 gs.
 Prince Thorndale, red and white, calved April 15, 1869, by 12th Duke of Thorndale (26020), out of Bracelet by Sir James (22902).—Mr. White, 31 gs.
 Royal Chester, roan, calved April 25, 1869, by Grand Duke 10th (21848), out of Moss Rose by Marmaduke (14897).—Mr. Barnes, 200 gs.
 Pretender, roan, calved July 21, 1869, by Grand Duke of Essex 4th (24068), out of Flirtation 2nd by Garibaldi (17919).—Mr. Robinson, 36 gs.
 Songster, rich roan, calved August 11, 1869, by Grand Duke of Essex 4th (24068), out of Harmony by Cherry Duke 3rd (15673).—Mr. Wyatt, 36 gs.
 Red Rover, red and white, calved December 7, 1869, by Enthusiast (26106), out of Princess Royal 2nd by Young Hopeful (24159).—Mr. Platt, 27 gs.
 Snowstorm, white, calved January 20, 1870, by Grand Duke of Essex 4th (24068), out of Bland by Sir James (22902).—Mr. Wright, 8 gs.
 Duke of Wellington, roan, calved May 19, 1879, by 12th Duke of Thorndale (26020), out of Wellingtona by 3rd Duke of Thorndale (17749).—Mr. Tindal, 30 gs.
 Royal Lancaster, roan, calved June 20, 1870, by 10th Grand Duke (21848), out of Moss Rose by Marmaduke (14897).—Capt. Gunter, 130 gs.
 Thorndale Baronet, roan, calved July 1, 1870, by 12th Duke of Thorndale (26020), out of Bracelet by Sir James (22902).—Mr. Thorn, 13 gs.

SALE OF MR. DRAKE'S HERD,

AT SHARDELOES, AMERSHAM, BUCKS,

JULY 15, 1870.—BY MR. STRAFFORD.

As a popular master of hounds Mr. Drake was better known than has a breeder of Shorthorns. His herd had, however, been in existence for nearly twenty years, "being long and carefully bred from the famed herds of the late Captain Dilke, the Rev. F. Thursby, and Mr. W. Torr: the sires formerly used were of the famed Knightley sort, such as St. Patrick (12038) and Scapulary (15244), followed by Final Hope (17848) from Aylesby, Lord Lieutenant (22167) from Bushey Grove, and Wizard (25468) from Sholebroke Lodge"—who was still in blind-fold service. For large fine frames and great milking properties the cattle looked excellent, and were brought out in excellent condition, especially some of the two-year-old heifers, which were a fine lot, though they all somewhat lacked that style which now seems of such high value. Mr. Torr and Mr. Gibbon rested their weary judicial labours for a day, and were present; also the Rev. J. Micklethwaite (Norfolk), Mr. Sartoris (Farnish), Mr. Aubrey Mumford (Chilton), and a small local company. A magnificent lucheon, in the true hearty old

English style, was served in a marquee, and had it been a "meet" instead of a "sale" would doubtless have been filled quickly enough; as it was the attendance was remarkably small.

The cows accordingly sold low, often under market price, going from 18 gs. to 33 gs. Mr. Micklethwaite secured the best bred cow at only 24 gs., Madrigal 6th, with three crosses of Booth blood on a Robson origin, milking heavily after calving. Mr. D. Hill of Pinner, and Mr. Heanley of Croft, also got some.

The heifers went better, lot 24, Lælia 8th, was a fine white heifer in capital condition in calf. She made but 40 gs. from Mr. Hugh Dunn, who also got Lælia 9th at 41 gs., and opposed for lot 29, Meadow Flower 13th, a thick roan, up to 37 gs. Lot 32, a very handsome roan heifer, Madrigal 18th, fetched the top price, 63 gs., and was bought by Mr. Thornton for Mr. Cochrane, Canada.

A few of the calves were very pretty and fetched from 8 gs. to 20 gs. each. Wizard (25468), a short-legged, good, red, bull, and quite active, made beef prices, and Valorous, a red yearling of the Vestris tribe, went for 40 gs. Some bull calves made as high as 8 gs. each, and the eight bulls averaged about £19 10s., the whole herd realising not quite £1,400, or about £24 a piece. The country is much burnt up, the crops look fair, and promise well, but a steady down pour for four-and-twenty hours would be of immense service.

THE INCIDENCE OF LOCAL TAXATION.

Where tenant-farmers (as is now common) are disposed to talk strongly about game and the game laws, chambers of agriculture and analogous societies are very apt to be entertained with long disquisitions on local taxation, and the various phrases wherein it is unpleasant to the landowners. Farmers are urgently asked to direct their attention to that subject. Agitation is required at their hands, and some of those alarmist tactics, which, in days gone by, rendered the farmers' interests the stalking horse of the landowners, are put in motion. But somehow or other farmers turn a heedless if not a deaf ear to such invocations. They begin to see that, as yearly tenants at all events, to shift the local burdens to the Exchequer, or to personal property, or anywhere else in relief of the landowners, would be shifting the burthen from one shoulder to the other. What they ceased to pay as taxation would be added to rent. This was exemplified lately at a meeting of the Yeovil Board of Guardians, where Mr. Andrews, a labourer guardian, strongly advocated a charge of poor rates on the owners of personal as well as landed property. Thereupon Mr. Shore asked "where the tenant-farmers were going to get the advantage of it?" As Mr. Andrews felt constrained to admit, it was more easy to ask than to answer a question. After using sundry lengthy arguments, Mr. Andrews was told by several farmers that he had not answered Mr. Shore's question. No doubt this was hard. But Mr. Parsous put the objection plainly when he said—"If he had a house to let, nearly always the first question was—'What are the rates?' Then if the rent was £100, and the rates £20, of course the applicant would take that into account; but he did not see that it affected the tenant in any other way." Then Mr. Marden said—"Supposing his (Mr. Andrews') scheme were carried out, and the tax reduced to 6d. in the pound, didn't he think that the difference would be added to the tenants in the shape of rent? He believed landlords in general would do so at once." Commenting on this meeting, the *Mark Lane Express* fairly tells its agricultural readers—"Attempt to disguise it as we may, rates and taxes with the farmer are very much a matter of rent. There is nothing so susceptible, nothing so buoyant, as rent. Only free it from its burthens, and up it goes in a moment like a balloon." All this the farmers are finding out, and it is every year becoming more difficult to make them the catspaw of the landowners in attempts to shift the taxes falling on land to other property.—*Economist*.

THE SOCIETY OF AGRICULTURISTS IN FRANCE.

TRIAL OF REAPING MACHINES.

It is some months since we noticed the origin and due recognition of this Society, under whose auspices a grand national Congress will be held in Paris in May, 1871. In the meanwhile M. Drouyn de Lhuys, the President, arranged for an international trial of reaping machines, which commenced on Monday last, on the farm of the brothers Decanville, at Petit Bourg, some twenty or thirty miles from Paris, on the Lyons line of railway. This occupation is over 3,000 acres of land in extent, not precisely in a ring fence, for there is not a fence upon it; such boundary lines as there are dividing the fields into some hundreds of acres each. There was, for instance, one of three hundred acres in wheat, another adjoining still larger in beet, while in a third of as great a range a double set of steam plough apparatus was at work breaking up the new stubble. There are water works that pump up a supply from the Seine, there are gas works, and a beet-root distillery, with boys', girls', and infants' schools for the children of the five hundred men employed on the farm.

It was here that the Messrs. Decanville received the officers of the Society and other visitors with magnificent hospitality. Professor Wilson had been nominated on the part of the Royal Agricultural Society of England, and Mr. James Howard, M.P., went over by special request of the president to "co-operate" in conducting the trials and drawing up the rules and regulations. There were twenty entries, but many of these, from the want of railway accommodation, or more properly of competition, were not sent; whilst amongst those on the field were machines from Messrs. Hornsby, Howard, Samuelson, and Mattison, together with sundry copies of the English and American machines, but made on the Continent. Some of the English firms brought over their own teams, and of course their own men. Before commencing, the jury made known the rules by which they should be guided; thus they would reckon 10 points for clean cutting, 10 for delivery of sheaves, 5 for quickness of execution, 10 for lightness of draught, 5 for lowness of cut, 10 for mechanical arrangements. Thus the exhibitors knew the points which would be most valued. Some of the implements made capital work, but the competition was ultimately reduced to the three self-delivering machines of Messrs. Hornsby, Howard, and Samuelson, which will be tried again on heavier crops immediately after the Royal Meeting at Oxford. The dynamometer test was applied to the several implements by M. Tresca.

INTERNATIONAL AGRICULTURAL SHOW AT LILLE, FRANCE.

PRIZES AWARDED TO ENGLISH EXHIBITORS.

A large gold medal, value 600 francs (£20), to Aveling and Porter, Rochester, for their double engine steam cultivating apparatus.

A gold medal, value 100 francs (£4), to Aveling and Porter, for their steam road roller.

PLOUGHS.—A bronze medal to J. and F. Howard, Bedford, for their plough for deep work. The first prize gold medal to J. and F. Howard, for their champion plough, mark B.B. The silver medal to J. and F. Howard, for their subsoil plough.

HARROWS.—The only prize, a bronze medal, to J. and F. Howard, Bedford, for their collection of harrows.

ROLLERS.—The only prize, a bronze medal, to Aveling and Porter, Rochester, for their roller and Crosskill's clod crusher.

RIDGING PLOUGHS.—The only prize, a bronze medal, to J. and F. Howard, for their ridging plough.

GRASS MOWING MACHINES.—The first prize, gold medal, to Samuelson and Co., Banbury. The second prize ("ex æquo") to W. A. Wood, London, and to J. and F. Howard, Bedford.

HAYMAKING MACHINES.—The first and only prize to J. and F. Howard, Bedford.

HORSE RAKES.—The first and only prize to J. and F. Howard, Bedford.

REAPING MACHINES.—The first prize, gold medal, to Samuelson and Co., Banbury. The second prize, silver medal, to J. and F. Howard, Bedford. The third prize, bronze medal, to Brigham and Bickerton of Berwick on Tweed.

A gold medal, value 100 francs (£4), to Aveling and Porter, Rochester, for their road locomotive.

A silver medal to Woods, Cocksedge, and Warner, Stowmarket, for their collection of machines and notably for their crusher.

THE SUGAR-BEET BUSINESS.

At the Harleston dinner, Sir W. Jones, as he always does, spoke to the purpose, and endeavoured to elicit some remarks from the member for South Norfolk on the desirability of the farmers of this country turning their attention to growing the Silesian beet and having it manufactured into sugar. The worthy baronet's argument was very ingenious, but he will, we think, find farmers slow to move in the sugar-beet business, simply because they, like ourselves, are at present unable to see that it would answer the purpose to go to a great expense in growing a crop of beet, cart it perhaps several miles to the manufactory, and then be paid but a small sum per ton, and this too, when (if we are correctly informed) every bit of top, dirt, and root must be carefully cleared from the bulbs before they are weighed. The cleaning would not only be a tedious and expensive matter on heavy soils, but would reduce the weight per acre very considerably, not that we want to sell the soil, only when persons make out that they have grown a great weight of mangold per acre, a tolerable amount of soil sometimes hangs to the roots when they are weighed. Then, again, we apprehend that, in other respects, "all is not gold that glitters;" for we fancy that if a farmer made a practice of selling his mangold from his farm every year, the landlord would soon demand heavy compensation for damage sustained. Would it not also necessitate the keeping of less cattle upon a farm if the food upon which the farmer mainly depends for his sprig grazing was sold? Feeding stuffs may always be bought, but there will be some difficulty in finding a substitute or an equivalent for mangold. Even if it is found to answer on the strong land about Lavenham, in Suffolk, is it at all likely that it would answer on the bulk of the land in Norfolk? We should like to know what the farmers who have tried this sugar-beet growing think of it, and if, as a rule, they are going on with it? We happen to know a very good tenant on a farm in every way adapted for growing the sugar-beet, and situate within a few miles of a beet-sugar manufactory, where beet is bought at a fixed price per ton, delivered at the works. Now this tenant is a sharp, intelligent, keen observing, practical man, and knows how to make the most of things as well as any man, and has, consequently, watched the sugar business pretty closely. His landlord, wishing to do him a good turn, and to encourage him, and having heard a deal about the great profits to be made by growing sugar-beet, very kindly told him he might take advantage of the excellent opportunities offered him during the remainder of his lease, and in a new lease clauses for the growing and selling of this kind of beet should be inserted. The answer was, "very much obliged for your kind intentions, but I have no desire to sell the mangold off my farm;" and, further, he said if he thought he should be compelled to carry out such a system in the management of his farm, he should decline to take another lease. It is true this is only the opinion of one man, but we should like to know how many practical men could be found in Norfolk to say he was wrong in the view he took of the matter. Mr. C. S. Read very dexterously and properly avoided being led into discussing a matter about which he confessed he had had no experience.—*The Norwich Mercury.*

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

MEETING AT OXFORD.

"If a foreigner had come to Oxford expecting to see the best show of breeding stock which England could produce, he would have been led to form a very inadequate idea of the merits of the different sorts of live stock bred in this country." So says the official Report on the first Meeting of the Royal Agricultural Society as held in the July of 1839. And what has occurred in the interim? If a foreigner should travel down to Oxford again expecting to see the best breeding stock which England can produce, we will undertake to say that he shall not be disappointed. In fact, foreigners themselves have made it a practice for many years past to attend these meetings, knowing very well as they do that they will be tolerably certain to see the best of everything. There is no other such an advertisement for the breeder, there is no other such an opportunity for the buyer. The Royal Agricultural Society of England, as proved by its celebrations in 1839 and 1870, will be found to have ably fulfilled its mission.

It may not, by the advent of another meeting, be altogether uninteresting or unprofitable to make some reference here to the proceedings at the first Oxford Show, the more especially as it so happened that we ourselves were present, and thus do not speak merely on hearsay. The great national breeds of stock had then, very much as they have now, a pre-eminence on the prize sheet; although many of the exhibitors, it was clear enough, required educating up to such a movement. As the Report said, "One of the advantages to be derived from an exhibition of this nature is to show farmers and breeders of live stock the perfections in shape and quality at which they ought to aim; and it should therefore be no disappointment to the Society to find that some of the exhibitors proved, by the animals which they brought to the show, that they were at present very deficient in this knowledge." But further, it was equally plain that some who possessed such knowledge, who had arrived at something like perfection in shape and quality, did not at the outset see the advantage of publicly displaying their attainments. There were in all twenty-six entries of Shorthorns, the majority of which were sent in from the immediate neighbourhood; while only one Yorkshire or North Country herd was represented, that of Mr. Bates, of Kirkleavington, as the other names that still live in Shorthorn annals were Mr. Baker, of Cottesmore, and his neighbour Lord Exeter, Mr. Beasley, of Chapel Brampton, and Mr. Langston, of Sarsden. Mr. Bates with his Duke and Duchesses took all the premiums but one for bull calves, and at the show of next week the Dukes and Duchesses will be one of the very few famous herds in England that the foreigner will seek for in vain. Those, however, who remember the Duchesses of those days would scarcely now be prepared to give them such unqualified precedence, so that their absence will not be so keenly felt. There has been a deal of good done with the Shorthorn since 1839.

The fifteen Devons were officially declared to have "excited great attention from the purity and beauty of the animals;" and yet they were but Somerset Devons, as there is not the name of a North Devon or Cornwall man to be traced in the catalogue. We have arrived at a somewhat higher opinion of the purity and beauty of the blood-red Devon since 1839. There were twenty-four

Herefords with the Reverend J. R. Smythies, one of the great champions of the White-faces, continually beaten, so that the competition must have been tolerably strong; but a nine-years-old Hereford cow from Lynch Court took the first prize in a mixed class as "best calculated for dairy purposes." Have the Herefords improved in this way since 1839? A Long-horn bull and a Sussex cow were in their respective classes the best of the other breeds, and Mr. Rowland sent five Herefords from the famous Creslow pastures that the judges declared would pay best for grazing; the next best being five Devons exhibited by Mr. Trinder, of Wantage. Where were the Shorthorn steers in 1839?

Amongst the sheep there were thirty-five entries of Southdowns, where a Mr. J. Webb, from Babraham, in Cambridgeshire, exhibited some animals that commanded no attention, and Mr. Stephen Grantham from Sussex, and Mr. T. Crisp from Suffolk took the chief honours. There were some thirty entries of Leicesters, with Mr. Sam Bennett, and Mr. Earl, of Earl's Barton, declared to be the crack ram breeders; and there was a mixed lot of Lincolns and Cotswolds, of seventeen entries between them, and with the Cotswolds in the ascendancy. Mr. Hewer, Mr. Slater, and Mr. Large were exhibitors in 1839, and will the Cotswolds offer a better front in 1870?

The following passage from the report, speaking to a part of the proceedings long since abandoned, has an air of primitive simplicity about it which comes in curious contrast to the organization of system now arrived at: "The prize intended to be given by the Society, in order to ascertain the best and most productive varieties of wheat, cannot be decided. The wheat exhibited was of excellent quality, and the judges selected, as was intended, two samples of white and two samples of red wheat, of great beauty and purity for trial; but the desire of the public to examine the different samples shown, and to compare them together, was so great, that not only a deal of the wheat from the selected parcels was thrown down and lost, but the wheat from all the parcels was mixed together, so that either as to quality or to purity the wheat sown might have been very different from that which was exhibited." How Mr. Branareth Gibbs and his stewards would stare at such arrangements as these; although it is almost to be regretted that the mixed sample was not tried, particularly as both parcels were of such beauty and purity. Some of our greatest discoveries have been the result of accident, and in the art of mixing or crossing a happy chance has often achieved more than the most laborious research. Scarron, the French comedian, as *The Spectator* tells us, being in sore need, stationed himself just outside the door of a tobaccoist in the most frequented part of Paris, where with a very engaging manner he begged a big pinch from the box of every customer as he came out. These pinches were all carefully preserved and sold back to the shopkeeper, who soon became famous for a new variety of snuff, which he called "Tabac de mille fleurs." The curiosity of the farmers at Oxford in 1839 might have led to some such similar invention in the way of seed corn—"Wheat from a thousand hands."

During the week there was a General Meeting of the Members, at which prize essays were read, and a dinner at which speeches were made. From all these the now

most noticeable contribution was a paper on the Comparative Advantages of Wheel and Swing Ploughs, by Mr. Handley, M.P., who went almost altogether for the wheel plough; while the Report says that "Messrs. Ransome exhibited a variety of ploughs of superior construction, amongst others a Bedfordshire plough with wheels, to which is adapted a lever for enabling a ploughman to regulate the depth of the land-wheel as the plough is in motion." Then, again, "Mr. Hart, of Wantage, exhibited some very clever swing and wheel ploughs; one also by Mr. Howard, of Bedford, of small size, with a mould-board of an excellent form, calculated to give the least resistance in turning over the furrow was much approved." How suggestive, how pregnant with matter, how something like the foreshadowings of the *Vates* of old do these reports of thirty years since now read! At the same time they serve to show that although started in something like "fear and trembling" the lines of the Royal Agricultural Society were laid straight enough, and that were her first commander Lord Spencer still amongst us, he might look back with some pride at her first voyage out.

THE IMPLEMENT DEPARTMENT.

"Trials of steam-engines, horse-gears, crushers, chaff-cutters, oilcake breakers, turnip cutters, steaming apparatus, dairy implements, from Monday, July 11, to Saturday, July 16." So says the official announcement; but thirty-one years since when the Royal Agricultural Society of England held its first meeting in Oxford there were no trials of fixed steam engines, simply because there were no steam engines to try. Beyond Trevithick's little engine down at Trewithin, that had been at the service of the Cornwall farmers for some thirty years or more, the use of steam power for the purposes of agriculture was unknown alike to manufacturers and farmers when the new Society went to Oxford in 1839. Many of the other implements, the turn of which comes round again here, were, however, "for the most part," as the Report has it, "familiar to one or other of those present." And we gather accordingly that "the judges especially invited attention to the chaff-cutting machines," as exhibited by Ransomes of Ipswich. "The one, No. XII. is the largest and most powerful of its kind hitherto constructed. It is remarkable for the equable slicing-out of the two knives, each three feet long, fixed on the fly-wheel, and for the method of advancing the straw. The first operation is effected by the peculiar form of the cutting edge of the knives, which pass through the straw at the same angle with it from point to heel; and are so adjusted as to act with nice precision against the polished metal surface of the straw-box. The straw, which is stationary and firmly compressed by the press-board during the cut, is advanced in the interval of one knife finishing and the other commencing its action. This operation is accomplished very exactly and simply, by means of an elliptic wheel, driven by an eccentric circular one, whose motion is derived from a latchet wheel on the same axis acted on by a crank, so that the straw is forced rapidly forward; the press-board in front being at the same time raised to take off the friction, and brought down again with a powerful grip upon the straw, whilst the knife passes through it. A contrivance is also adapted for varying the length of the chaff from 3-8ths to 1½ inch in length. With the ½ inch cut, it was stated to produce half a ton of chaff per hour, with the power of two horses, and so on in proportion to the length of cut. This machine is equally applicable to steam or water, as to horse power." Such was the model chaff-cutter of thirty years since, and on the prize list we find the Society's GOLD MEDAL duly awarded to Messrs. Ran-

somes of Ipswich, "for their excellent display of implements and especially their chaff-cutting machines and Biddell's scarifier." Again, we gather that "Gardner's excellent turnip-slicer, and a similar one of Edwards' were exhibited, as also one of Harts', the cutting part of which resembled that of Gardner; but it was placed on the side of a cast-iron disk, instead of being attached, as Gardner's, to the circumference of a cylinder." The exhibition of implements was not in other ways a very large one, the Garretts and Howards being almost the only firms of any present eminence that then entered the lists with the Ransomes. Nevertheless the judges did not close their brief report "without expressing their approbation of the exhibition of implements generally, and though many of them are well known to the practical agriculturist, yet there appears such a marked improvement in their manufacture and construction, that the Judges congratulate the Society on the progressive advance in the science of agricultural mechanics." The judges of implements were Mr. H. Handley, M.P., Mr. Parkes, and Mr. John Morton. To what further progressive advance their successors in 1870 will be able to speak the experience of this busy meeting will serve to show.

The seventy odd acres of ground are well occupied, and some £300 more has been paid by the manufacturers for "ground rents;" and the catalogue, was published in good time this year, is gradually becoming more bulky; on this occasion reaching 535 pages, and embracing 7,851 entries and 404 stands of implements. The number of articles shown is in excess of the last show by about 130, but this does not mark so rapid an increase as in the three previous shows, which each exceeded the preceding one by more than 1,000 entries.

Barford, of Banbury, has the large number of 180 entries, of which 5 are described as new implements.

Amies, Barford, and Co., of Peterborough, 100 entries, of which two are stated to be new, and 14 are set down for trial.

Perkins, Hitchin, 31 entries, among which are 3 new implements.

Asliby, Jeffery, and Lute, Stamford, 46 entries, 10 for trial and 6 new implements.

W. Crosskill and Sons, Beverley, 30 entries, 1 for trial.

T. Baker, Compton, Newbury, 55 entries, 4 for trial.

E. H. Bentall, Maldon, 50 entries, 14 for trial.

E. Cambridge and Co., 33 entries, 2 for trial.

Ransomes, Sims, and Head, 79 entries, 1 described as a new implement.

Reuben Hunt, Halstead, 24 entries, 14 for trial, and 3 new implements.

R. Hornsby and Sons, Grantham, 56 entries, 9 set down for trial.

R. Boby, Bury St. Edmunds, 30 entries.

Beverley Iron Works, 49 entries, of which 10 were for trial, 2 new implements.

Haslam and Clarke, Healey, 36 entries, 3 for trial.

Bristol Implement Company, 1 new for trial.

J. Alcock, Ratcliffe-on-Trent, 7 entries, 4 for trial, 1 new implement.

Coleman and Mortou, Chelmsford, 28 entries, 3 for trial, 1 new implement.

A. W. Gower and Son, Market Drayton, 25 entries, 1 new implement.

Burgess and Key, London, 9 entries, 2 of which new implements.

Hunt and Pickering, Leicester, 117 entries, 18 for trial, and 8 described as new.

John Barrowman and Co., Dunfermline, 4 new implements.

A. C. Bamlett, Thirsk, 17 entries,, one a new reaping machine.

W. Ball and Son, Rothwell, Kettering, 53 entries, among which are 6 described as new implements.

James Cornes and Co., Nantwich, 24 entries, 8 for trial.

John Fowler and Co., London, 36 entries.

Robert Maynard, Cambridge, 10 entries, 3 for trial.

Picksley, Sims, and Co., Leigh, 134 entries, 13 for trial, and 13 new.

Brown and Maude, Shrewsbury, 10 entries of which 9 are new, 1 for trial.

R. Winder, Dartford, 2 new implements, both for trial.

Fiskin and Co., Leeds, 4 entries, 1 new, and 2 for trial.

W. Tasker and Son, Andover, 29 entries.

W. S. Underhill, Newport, 30 entries, 1 for trial, 5 new implements.

Thomas Sheen, Aylesbury, 8 entries, all for trial.

Lewis and Hook, Shrewsbury, 88 entries, 27 described as new implements, 17 for trial.

Reading Iron Works, 27 entries, 8 for trial.

Woods, Cocksedge, and Warner, Stowmarket, 67 entries, 31 for trial.

Southwell and Co., Rugeley, 46 entries, 21 for trial, 35 described as new.

John Freer and Co., Loughborough, 2 new implements.

W. N. Nicholson, Newch, 60 entries, 10 for trial, 1 new implement.

Robert Tinkler, Penrith, 11 churns, all for trial, 4 described as new.

Edward Page and Co., Bedford, 62 entries, 9 for trial.

Wallis and Strevens, Basingstoke, 35 entries, 1 a new implement.

P. and W. Hobbs, Basingstoke, 17 entries, 7 for trial, 1 new implement.

E. R. and F. Turner, Ipswich, 38 entries, 17 for trial.

Richmond and Chandler, 36 entries, 3 for trial, 2 new implements.

William Woofe, Bedford, 5 entries, 1 new implement for trial.

Vickers, Snowden, and Morris, Doncaster, 11 entries, 2 new implements.

Thomas and Taylor, Manchester, 45 entries, 2 churns for trial.

Mellard's Trent Foundry, Rugeley, 60 entries, 23 for trial, 6 new implements.

J. and F. Howard, Bedford, 85 entries.

Walter A. Wood, London, 9 entries, 3 new implements.

G. W. Murray and Co., Banff, 8 entries, 5 of them new implements.

Richard Garrett and Sons, Saxmundham, 29 entries.

Joseph Gilbert, Evesham, 9 entries.

H. and G. Kearsley, Ripon, 9 entries, 5 for trial.

Joseph Warren, Maldon, 38 entries, 2 for trial.

John Gray and Co., Uddingston, 16 entries, 6 new implements, 5 for trial.

James Eastwood, Blackburn, 28 entries, 19 churns for trial.

Morton and Turner, Kenninghall, 6 entries, 1 a new implement.

James Davis and Son, Hemel Hempstead, 13 entries, 5 new, 3 for trial.

John Cooke and Co., Lincoln, 24 entries, 11 new implements.

Thomas Corbett, Shrewsbury, 29 entries, 13 new implements, 20 for trial.

C. Denny and Co., Chard, 12 entries, 6 for trial.

Aveling and Porter, Rochester, 5 entries, 1 new for trial.

John Tye, Lincoln, 15 entries, 4 for trial.

John Weighell, Pickering, 6 entries, 4 for trial.

Timothy Thomas, Cardigan, 4 entries, 3 new implements, 1 for trial.

Tuxford and Sons, Boston, 20 entries.

Alexander Aldworth, Abingdon, 5 entries, 1 for trial.

Whitmore and Benyon, 14 entries, 1 new implement for trial.

Marshall, Sons, and Co., Gainsborough, 15 entries, 2 engines and 1 mill for trial.

Wm. Foster and Co., Lincoln, 4 entries.

Davey, Paxman, and Davey, Colchester, 10 entries, 2 new implements, 1 for trial.

Robey and Co., Lincoln, 11 entries, 2 for trial.

Ruston, Proctor, and Co., Lincoln, 15 entries.

Riches and Watts, Norwich, 17 entries, 6 for trial.

A. B. Childs, London, 4 entries, 1 for trial.

Clayton and Shuttleworth, Lincoln, 19 entries, 2 for trial.

J. E. Hodgkin, West Derby, 8 entries, 5 for trial, 4 new implements.

W. Allchin and Co., Northampton, 4 entries, 1 for trial.

The following is a complete list of the stands:—

Arnold and Sons, London; Ashley Jeffery, and Luke, Stamford; Atmospheric Churn Co., London; Aveling and Porter, Rochester; Atkinson, London; Afflick, Swindon; Aylseford, London; Allway & Son, London; Alcock, Nottingham; Agricultural and Horticultural Association, London; Allechin and Son, Northampton; Amies, Barford and Co., Peterborough; Aldworth, Abingdon; Bentall, Maldon; Beard, Bury St. Edmunds; Bradford and Co., London and Manchester; Baker, Wisbeach; Burney and Co., London; Boby, Bury St. Edmunds; Baylis, Jones, and Baylis, Wolverhampton; Beach and Co., Dudley; Barford, Banbury; Barrows and Stewart, Banbury; Beverley Waggon Co.; Brown and Co., London; Baker, Compton, Newbury; Ball, Rugby; Barton, London; Barton and Sons, Carlisle; Bellamy, London; Boulton and Co., Norwich; Braggins, Banbury; Bristol Waggon Co.; Browning, Oxford; Bush, Histon, and Bush, Notts; Barrowman and Company, Dumfermline; Bell, London; Brown, Lyme Regis; Brice, London; Burgess and Key, London; Bristol Implement Company; Barford, St. Neots; Belcher, Gee, and Company, Gloucester; Brown and May, Devizes; Badger, Worcester; Bamlett, Thirsk; Barnard, Bishop, and Barnard, Norwich; Ball and Sons, Kettering; Binnie, Dayer, and Co., Chipping-Norton; Burrell, Hertford; Brown and Maude, Shrewsbury; Birmingham Boiler Co.; Barton, Boston; Burgess, Malvern Wells; Cottam and Co., London; Coultas, Grantham; Clayton and Shuttleworth, Lincoln; Clarke and Son, Brackley; Cranston, Hemel Hempstead; Childs, London; Carson and Toone, Warminster; Carson and Son, London; Carr, Bristol; Crosskill and Sons, Beverley; Clay, Wakefield; Corbett, Shrewsbury; Cambridge and Co., Bristol; Coleman and Morton, Chelmsford; Corbett and Son, Wellington, Salop; Corcoran, Wett, and Co., London; Central Cottage Improvement Society, London; Cousins, Oxford; Cooch, Northampton; Cooke and Co., Lincoln; Coulthurst, Symons, and Co., Bridgwater; Crowe, King's Lynn; Clemens, Abell, and Co., Worcester; Cheavin, Boston; Crowther and Co., Huddersfield; Cullingford, Stratford; Carter and Co., London; Cornes and Co., Nantwich; Clemensha and Co., Manchester; Cranston, Birmingham; Day, Son, and Hewitt, London; Davis, London; Driffield Linsced Cake Co., Driffield; Day and Sons, Crewe; Dodge, London; Dean, Oxford; Duffield, London; Davis and Co., London; Davy, Oxford; Davey, Faxman, and Davey, Colchester; Denny and Co., Chard; Dimsdale and Co., London; Denton, Wolverhampton; Davis and Son, Hemel Hempstead; Dowling, London; Duffield, sen., London; Davis and Co., London; Dickson and Sons, Chester; Derbyshire Cheese Factory Association, Derby; Dennis and Co., Chelmsford; Ellis, London; Eldridge, Bicester; Eagles, London; Early, Witney; Eddington, Chelmsford; Eastwood, Blackburn; Foster and Co., Lincoln; Fardon, Leighton Buzzard; Fenton, Great Grimby; Fiskin and Co., Leeds; Fox and Co., London; Friedlander, Breslau; Farmers' Supply Association, London; Follows and Bate, Manchester; Fowler and Co., London; Fell, Windermere; Freer and Co., Loughborough; Gros, Plymouth; Garrett and Sons, Leiston; Gibbs, Sewardstone; Gray, Sheffield; Grover and Baker, London; Gibbs, T., and Co., London; Garduer, Gloucester; Gibbs, J., and Co., London; Gower and Sons, Winchfield; Green and S O Leeds; Gilbert, Evesham; Gill and Co., Oxford; Griffin, Morris, and Griffin, Wolverhampton; Gibbons, Wantage; Gilbert, Abingdon; Gray and Co., Glasgow; Guggenheim, Oxford; Gwynne, London; Howard, Bedford; Hedges, Kendrick, Oxford; Hollis and Sons, Witney; Hodgkins, Liverpool; Haslam and Clarke, Henley-on-Thames; Hilton and Co., Liverpool; Hope, Wellingborough; Hardon, Manchester; Harrison and Sons, Leicester; Harlow, Macclesfield; Hill and Co., York; Heard, London; Headley and Sons, Cambridge; Haynes and Sons, London; Hollis, Stow-on-the-Wold; Hancock and Poden, Sandbach; Hare and Co., London; Hart and Co., London; Hancock, Dudley; Handley, Birmingham; Harris, Bermuda; Hobbs, Basingstoke; Hodgetts, Moreton-in-Marsh; Holmes and Son, Norwich; Hornby and Sons, Grantham; Hathaway, Chippingham; Hepburn and Sons, Southwark; Houghton and Thompson, Carlisle; Headley, Cambridge; Hilston and Co., Wandsworth; Harwood, Finsbury; Hunt, Earls Colne; Humphries, Pershore; Hunt and Pickering, Leicester; Hayward, Tyler, and Co., London; Hydes and Wigfull, Sheffield; Hunter, Maybole, N.B.; Hud-

speth, Haltwhistle; Hill and Smith, Brierley Hill; Hirst and Sons, Halifax; Howes and Son, Norwich; Halstead and Co., Newark; Howorth, Bolton; James, Cheltenham; Johnstone, London; Jones and Rowe, Worcester; Jones, Gloucester; Inman, Stretford; King, Coggeshall; Kerslake, Exeter; Kearley, Ripon; Kittmer, Louth; Ligon, Finsbury, London; Long, Bampton; Lewin, Poole; Lewis and Poole, Shrewsbury; Lampitt, Banbury; Larkworthy and Co., Worcester; Le Butt, Bury St. Edmunds; Lucy and Co., Oxford; Musgrave Bros., Belfast; Marshall Bros. and Co., Gainsborough; Matthews and Co., Driffield; Mattison, Bedale; Major and Co., Bridgewater; McKenzie and Sons, Cork; Massey, Openshaw; Maynard, Cambridge; Menuit de Lion and Co., Clerkenwell; McNaught and Smith, Worcester; Moule's Earth Closet Co., London; Merton and Turner, Harling; Main and Co., London; Merryweather and Sons, London; Mellard, Rugeley; Milford and Son, Cullompton; Murray and Co., Banff; Markall and Sons, London; Middleton, Southwark; Moore and Co., London; Myers and Co., London; Mulliner, Leamington; Messenger, Loughborough; Mapplebeck and Lowe, Birmingham; Marsden and Co., Leeds; Milford, Exeter; Milburn, Manchester; McNeil and Co., London; McFew and Co., of London; Moreton and Co., Liverpool; Native Guano Company, London; Nalder and Nalder, Wantage; Nye and Co., London; Norton, London; Nicholson, Newark; Nell, Harrison, and Co., London; Oliver and Co., London; Oldham and Booth, Kingston-upon-Hull; Owens and Co., London; Proskaner and Co., London; Penney and Co., Lincoln; Powis and Co., London; Pooley and Son, Liverpool; Powis, C. and Co., London; Parkes and Co., Birmingham; Perkins, Hitchin; Pierce, London; Pickering, Stockton-on-Tees; Pinfold, Rugby; Parham, Bath; Page and Co., Bedford; Picketsley, Sims, and Co., Leigh; Plenty and Son, Newbury; Proctor and Ryland, Birmingham; Priest and Woolnough, Kingston-on-Thames; Parsons and Son, Birmingham; Phillips and Co., Leeds; Pavy, France; Ransome, A. and Co., London; Ransomes, Sims, and Head, Ipswich; Richmond and Chandler, Salford; Richards, London; Reading Iron Works Co., Reading; Riches and Watts, Norwich; Reeves, Westbury; Robinson and Richardson, Kendal; Ransome, S. E. and Co., London; Robinson, Bridgewater; Robinson and Son, Rochdale; Rollins, London; Rainforth and Son, Lincoln; Richmond, Colne; Randall, Leighton Buzzard; Ruston, Procter, and Co., Lincoln; Robey and Co., Lincoln; Robinson and Co., Kettering; Ravenscroft, London; Rendle, London; Ransbottom and Co., Leeds; Roberts and Son, Bridgewater; Roberts, Stony Stratford; Samuelson and Co., Banbury; Spong and Co., London; Smith, London; Smith, Kettering; Sharman, Melton Mowbray; Smith and Grace, Thrapston; Sutton and Sons, Reading; St. Pancras Iron Company, London; Sawney, Beverley; Sales and Co., London; Singer Machine Co., London; Simpson and Co., London; Silvester, London; Shrewsbury, London; Shepherd, Abingdon; Stacey and Sons, Uxbridge; Startin and Co., Birmingham; Scott, Manchester; Stacey, Newbury; Salmon, Bermondsey; Sainty, Wisbeach; Salmon, Tomlin, and Co., Kettering; Sheen, Aylesbury; Siddeley and Co., Liverpool; Summerscales, Keighley; Slack and Brownlow, Manchester; Shand, Mason, and Co., London; Smith and Sons, Witham; Spear and Jackson, Sheffield; Schafer and Budenberg, Manchester; Staynes and Sons, Leicester; Sinclair, Manchester; Seary, Oxford; Smith, Lowthorpe; Shuttleworth, Sheffield; Southwell and Co., Rugeley; Topham, London; Tipper, Birmingham; Taylor, Rumsey; Thorn, Norwich; Tasker and Sons, Andover; Thomas, Stratford-on-Avon; Tangye, Bros., and Holman, London; Turner, Ipswich; Taylors' Sewing Machine Co., Driffield; Thomas and Taylor, Salford; Thomas, Cardigan; Tuxford and Sons, Boston; Tye, Lincoln; Tennent and Co., Leith; Thompson, Perth, N.B.; Tinkler, Penrith; Thompson, Edinburgh; Unite, Paddington; Underhill, Newport; Vulcan Iron Co., Ipswich; Vickers, Snowden, and Morris, Doncaster; Wendover, London; Weir, London; Webb and Son, Stowmarket; Whitehead, Preston; Watson, Andover; Wood, London; Williamson, Kendal; Worssam and Co., Chelsea; Webb and Co., Worcester; Warner and Sons, London; Worth, London; Willacy, Preston; Woods, Cocksedg, and Warner, Stowmarket; Wheeler and Son, Gloucester; Wilderspin, St. Ives; Waide, London; Walworth and Co., Bradford; Wilder, Wallingford;

Woolfe, Bedford; Warren, Maldon; Winder, Farningham, Dartford; Woolley, Allestree, Derby; Whitmore and Brinyon; Wickham Market; Weighell, Pickering; Wallis and Stevens, Basingstoke; Wilson and Co., London; Wright, Birmingham; Wheeler, Nottingham; Williamson, Reading; Yarrow and Headley, Isle of Dogs.

The first portion of the business of the thirty-second annual meeting commenced on Monday, July 11, and much credit is due to the bulk of the exhibitors, who were well forward in their preparations in conformity with the rules of the Council. Even the delay with those few who were late in the yard on Saturday arose more from pressure of traffic on the railways than from any dilatoriness on the part of the exhibitors. The general arrangements have been well carried out, with the exception of a little want of preliminary action in the engineering supervision, for great delay and difficulty arose from the bad working of the official registering dynamometers, which although supposed to be effective and expensive apparatus for counting the revolutions, were half the time in a state of rest and would not act at all! so that one would even have been content to have had the old treble-faced gas counters rather than no register at all when important implements were being tested, and which had in consequence to be tried over again, to the loss of time both to judges and exhibitors. So with the testing boilers, one or two harmless but startling explosions took place, owing to the bursting of the connecting india-rubber tubing, for which brass tubing would, we should have thought, have been better. Clayton and Shuttleworth had the trial of their engine stopped, owing to the excessive heat produced in running journals of the dynamometer, and separate sets of judges had to borrow the dynamometer to test their machines.

There was a want of announcement, too, to exhibitors as to the trial of horse gear; of which there were a great number entered, and at least fifty to be tested, but it was only on Friday that the exhibitors were made aware where they were to be tried, and then all the labour and expense which had been incurred in fixing had to be done over again.

One of Aveling and Porter's small traction engines, guided by a lad, did effective service all the week in fetching to and carrying from the trial-yard, heavy mills and bulky machines, like an elephant of vast power whipping its trunk round objects and moving them about in any direction with the greatest ease.

The width of the implement yard averages about 750 feet. There are 1,120 feet of shedding for implements in motion, 50 implement sheds, each 225 feet in length, and the shedding occupies the chief portion of the area erected across the yard in two rows of 25 feet with an avenue 70 feet in width running between the rows down to the trial-yard on the south side of the enclosure nearest the town; 850 feet more of machinery in motion is at work on the western boundary.

Monday, as usual, may be said to have been devoted entirely to preliminary arrangements and preparations, much of which might have been done on the previous Saturday, had due forethought, resulting from past experience, been exercised. The principal work achieved was commencing the trial of chaff-cutters and the testing of steam gauges. In 30 of the latter very great discrepancies were discovered. The standard by which they were tested was 50 and the highest gauge was found to be $7\frac{1}{2}$ above the standard and the lowest 60.

THE GRINDING MILLS.—In the mill trials on this occasion the competitors were timed to five minutes, to grind the largest quantity of meal equal or better to a sample produced by the miller employed. The mills selected for competition were:

1st. A portable corn grinding mill, invented and manufactured by Hancock and Foden, of Sandbach, Chester, price £50; fitted with one pair of 3 ft. 6 in. Mow Cop grey stone, on substantial metal frame with gearing complete.

2nd. A grinding mill with stone grinders 3 ft. 6 in. in diameter, invented and manufactured by John Weighell, of Pickering, Yorkshire, price £35: fitted with the best Derbyshire Peak stones, suitable for grinding or crushing all kinds of grain for farmers' use.

3rd. An independent iron-framed portable grinding mill, invented and manufactured by Whitmore and Benyon, of Wickham Market, price £55; with stones £2 10s. extra; with fast and loose pulley, fitted with 33 in. diameter French stones of superior quality.

4th. An improved grinding mill for steam or water power, manufactured by the Reading Iron Company, price £86; fitted with best burr bed stone and Peak runner 48 in. diameter, with crane for lifting the stone and pulley.

5th. The Royal Agricultural Society of England's Bury St. Edmund's first prize grinding mill, with French burr stones, manufactured by E. R. and F. Turner, Ipswich, price £55; mounted on an iron frame and constructed in the most substantial manner.

6th. Robey and Co., of Lincoln, a corn grinding mill, fitted with one pair of best Derbyshire Peak stones 3 ft. 6 in. diameter, price £50; the stones and machinery are fixed in a metal frame of excellent design, rendering the mill both strong and portable.

7th. Ashby, Jeffery, and Luke had a mill selected for trial with 42 in. stones, price £45, with crane £6 10s. extra; it was well and strongly-built, with oak frame, and stones of best quality Derbyshire Peak; gear-work strong, simple in management and noiseless; but did not compete.

8th. Marshall, Sons, and Co., of Gainsborough sent in a cylindrical iron frame grinding mill, price £54; fitted with 3 ft. 6 in. Derbyshire stones, complete with driving pulley.

9th. Woods, Cocksedge, and Warner, of Stowmarket, competed with a mill with 42 in. French burr stones, price £65; strongly constructed, with iron frame, and every improvement necessary for grinding any corn into flour or meal.

10th. John Tye, of Lincoln, sent in one of his portable grinding mills, fitted with 3 ft. 6 in. grey stones, price £56; on metal frame, with all necessary fittings; but some parts gave way in the trial and it had to be removed.

The comparative result of the trials, as far as regards quantity turned-out in the prescribed time, is shown by the following figures:

	Barley.		Wheat.	
	Lbs.	Oz.	Lbs.	Oz.
Hancock and Foden ...	61	2	...	—
J. Weighell ...	45	1	...	43 8
Whitmore and Benyon ...	Failed to get samples.			
Reading Iron Works ...	53	47	...	40 1½
E. R. and F. Turner ...	42	0	...	36 8
Robey and Co. ...	38	9	...	45 8
Ashby, Jeffrey, and Luke ...	—			
Marshall and Co. ...	37	12	...	82 4
Woods, Cocksedge, and Warner ...	37	1	...	21 9
John Tye ...	51	0	...	Broke down.
Riches and Watt ...	12	12	...	18 8

At Bury St. Edmund's it will be remembered Turner and Co. carried off the £9 prize for mills, John Tye the second prize of £6, while Ruston and Proctor were highly-commended.

THE CHAFF-CUTTER TRIALS.—The first entered by T. Sheen was not tried.

E. Page and Co., Bedford, a machine, 12-inch, fitted with three knives, reversing gear, cuts four lengths of chaff; cut 42lbs.

Thomas Alcock, of Ratcliffe-on-Trent, an improved chaff cutter, price £13, with three knives, for steam or water power, of immense strength, simple in construction, cutting two lengths without change of wheels, has a 13-inch mouth with reverse and stop motion and toothed rollers; cut 79½lbs. in three minutes.

Robert Maynard, of Cambridge, a patent portable steam power sifting chaff engine, price £45; if fitted with caving elevator, £4 extra; 89lbs.

Richmond and Chandler, of Salford, a machine identical in principle to that which obtained the first prize of the Royal Society at Bury St. Edmunds, price £16 16s.; with feeding web, £1 10s. extra. The diameter of pulley was 20½ inches. After a false start, owing to error in fixing dynamometer, the machine did excellent work, maintaining its previous reputation by cutting 154lbs. although rather an irregular sample.

The next tried was one manufactured by James Cornes and Co., of Nantwich, with three knives, a self-acting mouthpiece, and stop and reverse motions, which can be fitted to cut any length required. This machine has gained the first prize of the Society for 14 years in succession, while it turned out good chaff; it only cut 98lbs. Owing to the driving band slipping, it had to begin a second lot.

James Davis and Son, of Hemel-Hempstead, next entered the list with a 10-inch cutter, price £10 10s., mounted on wood frame, fitted with toothed roller, stop and reverse gear, with change wheels, but it only turned out 28lbs. of chaff in the prescribed time.

The next machine taken out for trial was one of Mel-lard's, Trent Foundry, Rugeley, price £10 10s.; stated by the manufacturers to be an excellent machine and of immense power and capability, specially constructed for being driven by steam, change wheel, rising mouth-piece from 2½ to 5½ inches and 12½ inches wide. The result of effective feeding by three men was 68 lbs. weight of chaff.

To this succeeded the star chaff-cutter of Lewis and Hoole of Shrewsbury, described as a new implement, which received the first prize at the Royal Cornwall Agricultural Society in May. It cuts two lengths of chaff without change of wheels and is fitted with forward, stop, and reverse motions, price £12 12s., pulleys £1 6s. extra. This machine might have done better but for bad feeding and help, as it got choked and the top layer did not pass through. The result was 70 lbs.

After this followed one by Hill and Smith (Corke's pattern), of Brierley Hill, Stafford. It was objected to by some as disqualified, not being entered in the catalogue, and when put to trial soon choked, and the sample produced was not considered of sufficient importance to be weighed.

One of Carson and Tooe's, of Warminster, with stop and reverse gear for steam power, was then put on the platform. It is of a similar principle to that which carried off the prize at Canterbury in 1860, price £13 13s. It made good work in the quality of chaff cut, and turned out 78½ lbs.

Messrs. P. and W. Hobbs, of Basingstoke, next entered the lists with an improved chaff-cutter, price £12 12s., fitted with three knives, cutting two lengths of chaff, rising rollers and mouth piece, width of cut 13 inches. It choked several times, and turned out at last 54 lbs.

H. and G. Kearsley, of Ripon, tried a chaff-machine, price £10 10s., with improved tooth-rollers and rising mouth-piece, and a new stop-motion for arresting the

rollers and steel mouth-piece. This turned out a good chaff, but choked once or twice in the feeding : the result was 59½lbs.

Hunt and Pickering, of Leicester, tested a chaff-cutter, price £11 11s., which appeared to be a strong machine for one or two horse-power with two knives, all safety appliances and a solid steel mouth-piece surface. It choked in feeding, and the result of the work was 50½lbs.

Picksley, Sims, and Co., of Leigh, then went in with a new implement, price £14, combining all the recent improvements, which cuts two lengths of chaff without change of wheels, is fitted with forward, stop, and reverse motion and patent clutch gear, and is a strong and substantial machine. It has a 24-inch pulley. It was well fed, produced good chaff, and turned out 133lbs. weight.

E. H. Bentall, of Maldon, was next in rotation, with a £14 14s. chaff-cutter, cutting three lengths without extra change wheels, has stopping and reversing motions, wrought-iron legs and braces, improved tooth rollers, and mouth-pieces. It was worked by a 21-inch pulley. After a good deal of choking from over-feeding, the result was 131½lbs.

Ashby, Jeffery, and Luke, of Stamford, tried a small chaff-cutter on wrought-iron frame. Price, to cut two lengths, £9 9s. It cut 61lbs.

Joseph Warren, of Maldon, tried a large machine, price £18 18s., with a mouth 18 inches by 4 inches rise, which produced 97lbs.; but a bad sample of chaff.

A few selected chaff-cutters were then put through a second trial, being first run through empty to test by the dynamometer the power they took. T. Alcock, of Ratcliffe-on-Trent, did in five minutes 148lb. chaff. Richmond and Chandler, with a pulley 21½ diam., 267 net. This ended the trials of chaff-cutters for Tuesday.

On Wednesday morning they were resumed with James Cornes and Co.'s machine; after some delays, owing to the strap slipping, they turned out 168lbs. of chaff in the given time.

To this followed Carson and Toone's machine, doing 154lbs. of work.

Next came Picksley, Sims, and Co.'s, which being well fed, turned out 217lbs.

E. H. Bentall followed, this machine being worked by a 20-in. pulley, cut 189lbs.

The trials of these cutters were concluded by the second test of R. Maynard's, which resulted in an amount of 223½lbs. The diameter of the mouth-piece of the principal chaff-cutters was in Bentall's 15½ in., and in Richmond and Chandler's, and Picksley and Sims's 14¼ in.

If we compare the trials of the chaff-cutters at the show at Bury St. Edmunds we find that the relative competitors stood as follows. The horse-power per minute, and the number of revolutions of the dynamometer, we cannot compare, as these are not yet made known by the judges at Oxford.

The time at Bury St. Edmunds for cutting 1 cwt. of straw stood as follows :

	Min.	Sec.
Richmond and Chandler	2	35
E. H. Bentall	2	21
Picksley, Sims, and Co.	3	18
Carson and Toone	4	17
E. Page and Co.	4	42
James Cornes and Co.	2	57

The first three named took the first, second, and third prizes in rotation, while the others were commended.

The comparative power and speed of these competitors on that occasion were as follows :

	Rev of Dynam.	H. P. per Min.	Average H. P.
Richmond and Chandler	5.23	2.948	1.142
E. H. Bentall	10.28	5.794	2.466
Picksley, Sims, and Co.	12.88	7.260	2.20
Carson and Toone	12.25	6.905	1.612
E. Page and Co.	14.57	8.213	1.747
James Cornes and Co.	10.8	6.087	2.063

CAKE-BREAKERS.—Soon after midday on Wednesday the judges commenced testing the oilcake breakers and crushers. The first tried was one invented by Holmes and Sons, of Norwich, price £15, fitted with large case-hardened or steeled cutters, very strong gearing, capable for adjustment for any sized pieces, or for sowing. We failed to get the time of this trial.

Next followed Amies, Barford, and Co., of Peterborough, with their improved Royal prize mill, price £6, which took the first prize at the last trials at Bury as the best mill for power. It is all made of iron, fitted with two pairs of adjustable rollers, and will break the hardest cake into twenty different sizes for lambs, sheep, and beasts. They finished their 3 cwt. of cake in 2 min. 20 seconds; but it was crushed rather too fine for feeding, although well suited for sowing. The second trial of the machine with thinner cake was also done in the same time.

Hunt and Pickering, of Leicester, next went in with an oilcake breaker, price £6, with double rollers, adapted to reduce oil, cotton or rapecake to very small sizes for feeding purposes, also fine enough for sowing as manure. The first trial with this cake was done in 2 min. 25 seconds; the second, with thin cake, in 2 min 35 seconds.

The Reading Iron Works put in an improved breaker, price, with pulley, £6 6s., fitted with two knob or teeth-rollers, and two additional grooved rollers, for reducing the broken cake to dust. The first trial was done in 2 min. 33 seconds; the second in 1 min. 31 seconds.

Messrs. Woods, Cocksedge, and Warner, of Stowmarket, entered a cake-breaker for fourteen different sizes, price £6. A strong machine, with double rollers for breaking any description of cake in sizes varying from dust to pieces for bullocks. The first trial was done in 2 min. 30 seconds; the second in 2 min. 55 seconds.

E. H. Bentall, of Maldon, sent in a good breaker, price £6 6s., and the first test was done in 2 minutes 15 secs., but on the second trial one of the teeth flew, and hence the machine was withdrawn.

To this succeeded W. N. Nicholson, of Newark, with a strong useful £10 machine, asserted to be capable of doing a large amount of work with little power. The first trial was done in 1 minute 53 secs.; on the second the machine got out of gear, but another trial gave 1 minute 27 secs.

E. R. and P. Turner of Ipswich then produced a breaker, price £10 10s., with two pairs of adjustable rollers, by means of which any desired sample could be broken. It had an 18-inch mouthpiece, rather shallow. The first trial gave the time 1 minute 7 secs., but the dynamometer did not register well. The second 1 minute 23 secs. The first trial, with thick cake, was repeated, and resulted in 1 minute 15 secs. This terminated the proceedings of these breakers on Wednesday.

On Thursday morning the trials were resumed with a double roller breaker, price £5, of R. Mellard and Co., of Rugeley, adapted for hand or power, both sets of rollers can be regulated to break the cake to any degree of fineness; it has a receiving box and screen. The time of the trials was 1 minute 48 secs. and 1 minute

20 secs.; but as the dynamometer did not register, the second trial was gone over again, the time being then taken at 1 minute 32 secs.

To this followed a cutter made by Coleman and Morton, of Chelmsford, price £4 14s., which gained the first prize at the Paris Exhibition in 1867; alleged to be very strong, and capable of getting through much work, but did not come up to promise, as it did not carry the stuff down, the cake jumped a good deal; the two trials gave 3 mins. 39 secs. and 4 minutes 6 secs. as the relative time, while the machine choked in the second trial.

This was followed by a double-action breaker, made by Robert Maynard, of Cambridge, price £10, suitable either for steam or hand-power, and for crushing any description of cake from 1 to 3½ inches thick. This ground a coarser sample, with little or no dust. Time, 1 minute 30 secs. and 1 minute 55 secs.

Holmes and Son, of Norwich, submitted a breaker, price £15, suited for steam or horse-power, fitted with case-hardened or steeled cutters, very strong gearing, adjustable to any sized pieces, or for sowing; sample coarse, with little dust. Time, 1 minute 30 seconds and 1 minute 10 secs.

S. Corbett and Sons, of Wellington, tried a breaker with one pair of rollers, price £12. The first sample was rather coarse, the second somewhat better. Time, 1 minute 15 secs. and 2 minutes 22 secs.

Those which were considered the most effective were then submitted to a second trial, which resulted as follows:

	Thick Cake.		Thin Cake.	
	mins.	secs.	mins.	secs.
E. R. and F. Turner	1	11	1	20
Amies, Barford and Co.,	2	5	2	10

Hunt and Pickering not tried.

TURNIP PULPERS, WITH POWER.—Each was given 3 cwt. of roots to cut, and the machines were timed.

R. Hornsby and Sons, of Grantham, a patent disc root pulper, price £6 15s., pulley for power extra, took the first prize at the Bury trials. Time, 1 minute 38 seconds.

Reuben Hunt, of Halstead, a disc root pulper, price £4 10s., with eight knives. Time, 3 min. 11 secs.

Woods and Cocksedge, Stowmarket, a root-pulper for steam power, invented by Phillips, of Brandon, price £7 7s. Described by the exhibitors as a very fast pulper. Will cut up 20 tons a day; teeth easily replaced at 1d. each. Turned out a good sample, and did the three cwt. in 3 minutes 11 seconds.

R. Mellard, of Rugeley, a treble action disc root-pulper, stripper, and slicer, price £7 10s.; pulley, 7s. 6d. extra. By turning the feed-plate, either operation can be done without altering the knives. Did not work well. The feeder had to hammer down the roots, to the danger of his fingers, which got caught by the slicer. The sample was rough. Time, 3 minutes 5 seconds.

E. H. Bentall, of Maldon, put in a patent root-pulper, price £7 7s., of a make which has been in use 14 years; it is expeditious and durable, and is alleged to be the only pulper that will pulp cabbages properly. The time taken was 1 minute 40 seconds. The Judges gave the machine a second trial, which resulted in 1 minute 53 seconds time.

The same exhibitor submitted another pulper, price £5 5s., on the disc principle, fitted with eight knives, which can be regulated to pulp finer or coarser. The time taken by this machine to cut a rather coarse sample, was 1 minute 44 seconds.

Thos. Corbett and Co., of Shrewsbury, tested an im-

proved pulper, price £6, which did its work in 1 minute 15 seconds.

Picksley, Sims, and Co., of Leigh, then placed on a very strong machine adapted for power only, price £6 5s., which had a very large cutting surface, and worked by a 24-inch pulley, turned out a good sample in 1 minute 8 seconds.

Messrs. S. Corbett and Son, of Wellington, next had tested a patent root-pulper, price £6 10s.; it was worked by a 15-inch pulley; it did the work required in 57 or 58 seconds.

Messrs. Edward Page and Co., of Bradford, next brought forward an improved disc root pulper, price £5, fitted with adjustable sliding knives and other appliances, which did not work well, and took the long time of 3 minutes 25 seconds.

The next brought on the platform was one by Hunt and Pickering, of Leicester, which was a disc root pulper, price £6; a strong compact machine, for horse or steam power, stated in the catalogue to be able to pulp 4 tons an hour. This did its work in 1 minute 45 seconds, but like some others of the same class, scattered the pulp widely through the holes of the disc cover, and made rather bad work.

R. Mellard, of Trent Foundry, Rugeley, tested a disc root pulper, price £5 5s., on strong wood frame, adapted for power, fitted with 12 steel knives. It was worked by a 12 inch pulley, and did the work in 1 minute 7 seconds.

This brought the trials to a close for Thursday.

On Friday morning, a few of the principal root pulpurs were again tested by the judges, without the limit of one person feeding with roots; the owners being allowed to put in the roots as they liked. The result of the trials as to time were:

	Min.	Secs.
Hornsby and Sons	1	34
T. Corbett	0	57
Picksley and Sims	0	50

Robert Willacy, of Preston, submitted a combined machine for trial, consisting of an oilcake breaker, turnip and root cutter, and patent cattle-feeder, price £25; a very pretty-looking affair in theory, but which broke down in practice, and would not touch the turnips thrown in.

Woods, Cocksedge, and Warner, of Stowmarket, then submitted a double-action turnip-cutter for bullocks and sheep, price £5 5s., but it was very slow in action, and not much approved of; it did its work in 4 min. 14 sec.

Hunt and Pickering, of Leicester, had a £5 5s. turnip-cutter tried, which did its work in 4 min. 30 sec.

R. Hornsby and Sons, of Grantham, were the next on the list with a patent disc turnip-cutter, price £4 10s., introduced in 1861 and improved in 1866. It cuts with great rapidity, and took the first prizes at the Bury trials of the Society. It did its work in 2 min. 59 sec.

On Saturday these trials were resumed, the first tested being a machine by E. H. Bentall, of Maldon, an improved Gardner's turnip-cutter, price £5 5s. A double-action cutter for sheep and cattle, the frame of iron and the grate of wrought iron, fitted with handle so that the turnips can be taken out at the side where the person turns the machine. Time occupied in cutting 5 min. 15 sec.

The following hand pulpurs were then tried with 2 cwt. each of turnips:

Reuben Hunt's (Gardner's) double-action turnip-cutter, price £5 5s., cuts for bullocks or sheep, made with cast-iron or wood top. Time occupied 3 min. 58 sec.

The results of others tried afterwards were:

	Min.	Sec.
Carson and Toones	5	0
Southwell and Co.	8	20
R. Hornsby and Sons' pulper	5	2
Woods and Cocksedge	5	28
E. H. Bentall	6	12
Ditto, another machine	6	45
Picksley, Sims, and Co.	4	1
Corbett & Sons, Wellington	3	0
Southwell and Co.	7	6
T. Corbett, Shrewsbury	6	0
Coleman and Moreton	5	0
E. Page and Co.	9	12
Woods and Cocksedge	6	30
Hunt and Pickering	9	50

HAND CHAFF CUTTERS.—The next brought on were chaff-cutters, worked by hand power. H. and E. Kearsley, Carson and Toone, Lewis and Hoole, Mellard, and Reuben Hunt had entered, but were withdrawn.

The first tested was one by E. H. Bentall, of Maldon, price £5 15s. 6d., fitted with wrought iron legs and braces, improved tooth rollers, the gearing in the frame covered, cuts three lengths, 9¼-inch mouthpiece, cut 12lbs.

Ashby, Jeffery, and Luke, a hand-power chaff-cutter, with wrought-iron frame and angle iron legs, to cut two lengths, £3 17s. 6d., 8¼-inch mouthpiece, cut 8lb.

P. and W. Hobbs, of Basingstoke, a chaff-cutter, price £5 5s., mounted on iron frame for cutting two lengths, with rising rollers, and mouthpiece 9 inches wide; to be worked by hand-power, or attached to a 1-horse gear. This machine cut 7lb.

J. Cornes and Co., of Nantwich, a chaff cutter, price £4 15s., has self-acting mouthpiece, and cuts two lengths; is stated to have gained four of the Society's prizes; cut 5lb.

Thos. Sheen, of Aylesbury, a chaff-cutter, mounted on cast-iron frame for hand-power, with registered rollers; rising mouthpiece 3½ inches wide, to rise from 2 to 3½ inches; adapted to cut two lengths of chaff without change of wheels; work done 4lbs. only.

Hunt and Pickering, of Leicester, a machine, price £5 5s., cuts two lengths; knives run within iron frame, double universal joints in top roller shaft, no change wheels, the mouthpiece fitted with solid steel surface; this machine cut 7lbs.

Southwell and Co., of Rugeley, a machine, price £3 12s. 6d., fitted with patent lever for varying the length of cut without changing the wheels or removing the cover: has a rising mouthpiece 8¼ by 3½ inches, and powerful fly-wheel; cut 7lbs.

Hill and Smith, of Brierly Hill, had one of Corne's pattern with two knives, but as there was no pulley sent with it and no one to attend to it, it was put aside.

Lewis and Hoole, of Shrewsbury, had entered one of their Star chaff cutters, price £2 5s., but would not bring it forward.

T. Alcock, of Ratcliffe-on-Trent, had an improved chaff cutter, price £5, with two knives; cuts two lengths without change of wheels; described by the maker as simple in construction and very easy to work. This cut 6lb. weight.

Joseph Warne, of Maldon, had a small £5 5s. chaff cutter, made to cut different lengths without change of wheels, which cut 6lbs.

Edward Page and Co., of Bedford, exhibited a 9-inch chaff cutter, price £7 10s., which cuts 3 lengths, and is sufficiently strong to be worked by horse power. This cut easily 8lbs.

Smith and Grace, of Thrapston, sent in a machine,

price £5 17s. 6d., fitted with brass bearings, case-hardened mouth-piece, toothed rollers, stop and reverse motions; cuts two lengths of chaff without change of wheels; has two handles, so that two men or boys can work it. Size of month 10in. by 4in. This cut 11lbs.

Picksley, Sims, and Co., of Leigh, a new chaff cutter for hand power, price £6; combines all the recent improvements, and will cut two lengths without change of wheels; 9¼in. month. The work done was 10lbs.

Alex. Aldworth, of Abingdon, an old-fashioned chaff machine; feed drawn by sacking; roller bottom; price £4. Length of box 6ft. 6in., size of cut 14in. by 7in. Length of cut can be varied without change of wheels. Worked by one man, with a knife cutter and treadle. Although much laughter and ridicule was created by the appearance of this coffin-looking machine, yet the man turned out an excellent sample of chaff, cutting 15lbs. in 3 minutes.

Richmond and Chandler, of Salford, finished in this class with a machine, price £7 7s., constructed with an entirely new form of mouth-piece. It is impossible to choke it. Adapted for cutting two lengths without change, and 4 lengths with 1 pair of change wheels. This cut 13lbs., the highest quantity registered.

We can only indicate the comparative merit of the several implements tried, in the absence of the power used, and the revolutions shown by the dynamometer, particulars which are not to be had from the judges; still, the several facts stated will enable the public to form a very fair average idea of the duty of the different machines submitted for trial.

A little difficulty arose on Friday, in consequence of the discretionary power exercised by the judges, in calling for and testing one or two crushing mills of Messrs. Ransome, Sims, and Head, who had entered nothing for trial, a step against which Mr. R. C. Ransome protested; but the judges persisted, and stated that exhibitors had no right to withhold anything for trial, and the judges had the power, on refusal, of ordering it out of the yard. After a little discussion, Mr. Ransome handsomely gave way to the judges.

On Saturday afternoon the council held a conference with the leading implement makers as to the general nature of premiums to be awarded at Wolverhampton in 1871, and a preliminary was submitted and discussed, which will come on again for further consideration.

The following is a summary of the competitors in the trial-yard in the several classes, and some of the results:

FIXED STEAM ENGINES WITH BOILER—SECTION 1—CLASS 1.

Clayton and Shuttleworth; Robey and Co.; Riches and Watts; Ashby and Jeffery; J. Eastwood; Brown and May; Hancock and Foden; Marshall, Sons, and Co.; E. R. and F. Turner; Reading Iron Works; T. D. Eagles; Davey, Paxman, and Davey; W. N. Nicholson.

ENGINE TRIALS.—The trials of the four-horse power fixed engines gave the following results:

Ten-horse-power Engines.	Price of Engine.	Real Time.	Mechanical Time.
	£	m. s.	m. s.
E. R. and F. Turner	142	2 14	2 17
Clayton and Shuttleworth ...	240	3 6	3 23
Marshall, Sons, and Co.	130	2 36	2 42
Reading Iron Works	202	3 13	3 19½
W. S. Underhill	150	2 21	

Four-horse-power Engines.	Price of Engine.	Real Time.	Mechanical Time.
	£	m. s.	m. s.
Clayton and Shuttleworth ...	145	3 25	3 45
Riches and Watts	105	2 1½	2 9
Robey and Co.	100	2 7½	2 17
Ashby, Jeffery, and Luke ...	102	2 13	2 25
Brown and May	125	3	3 9
Hancock and Foden (with boiler)	95	1 35	1 26

SECTION 1—CLASS 2—WITHOUT BOILERS.

G. H. Ellis; E. R. and F. Turner; Clayton and Shuttleworth; Marshall, Sons, and Co.; Reading Iron Works; W. S. Underhill.

SECTION 5—CLASS 1—MILLS WITH STONE GRINDERS, STEAM OR HAND POWER.

Hancock and Foden; J. Weighell; Whitmore and Benyon; Reading Iron Works; E. R. and F. Turner; J. D. Pinfold (Compound stone and steel); Robey and Co.; Allechin and Son; Mellard's Trent Foundry; Ashby, Jeffery, and Lute; J. Tye; Marshall, Sons, and Co.; Woods, Cocksedge, and Co.; T. Baker.

SECTION 3—CLASS 2—MILLS WITH METAL GRINDERS, STEAM OR HAND POWER.

Hunt and Pickering; E. Page and Co.; E. and H. Roberts; Beverley Waggon Co.; T. Corbett; T. Thomas; S. Corbett and Son; Riches and Watts, 12½ lbs. barley, 18½ beans; Amies, Barford, and Co.; Smith and Grace.

SECTION 3—CLASS 3—MILLS WITH METAL GRINDERS, HAND POWER.

P. and W. Hobbs; Smith and Grace; E. Page and Co.; Hunt and Pickering; T. Corbett; Riches and Watts; J. Davis and Son; S. Corbett and Son.

SECTION 4—CLASS 1—CRUSHERS, STEAM OR HORSE POWER.

Amies, Barford, and Co.; E. R. and F. Turner, 90½ lbs. oats, 15½ lbs. beans; Woods, Cocksedge, and Co., 13½ lbs. oats, 25½ lbs. beans; Picketsley, Sims, and Co., 67½ lbs. oats; E. H. Bentall, 116½ lbs. oats, 84½ lbs. beans; S. Corbett and Son, 59 lbs. 7ozs. oats, 103 lbs. beans; Ransomes.

SECTION 4—CLASS 2—CRUSHERS, HAND POWER.

P. and W. Hobbs; Picketsley, Sims, and Co.; T. Corbett; E. R. and F. Turner; E. H. Bentall, 15½ lbs. oats, 18½ lbs. beans; Woods, Cocksedge, and Co., 13½ lbs. oats, 21½ lbs. beans; S. Corbett and Son.

SECTION 4—CLASS 3—STEAM OR HAND.

E. H. Bentall, 15½ lbs. oats, 8½ lbs. beans; Woods, Cocksedge, and Co., 13½ lbs. oats, 6½ lbs. beans; Picketsley, Sims, and Co.; E. R. and F. Turner; Beverley Waggon Co.

SECTION 4—CLASS 4—HAND POWER.

Picketsley, Sims, and Co.; Richmond and Chandler; Woods, Cocksedge, and Warner; E. H. Bentall; E. R. and F. Turner; Ransomes, Sims, and Head, tried by judges, but not entered.

SECTION 5—CLASS 1—CHAFF CUTTERS—STEAM OR HAND POWER.

E. Page and Co.; T. Alcock; Lewis and Hoole; R. Maynard; Richmond and Chandler; J. Cornes and Co.; Davis and Son; Mellard's Trent Foundry; Hill and Smith; P. and W. Hobbs; H. and G. Kearsley; Hunt and Pickering; Picketsley, Sims and Co.; E. H. Bentall; Ashby, Jeffery, and Luke; J. Warren.

SECTION 5—CLASS 2—HAND POWER.

Quantity cut in 5 min.

E. H. Bentall, 12 lbs.; Ashby, Jeffery, and Co., 8 lbs.; P. and W. Hobbs, 7 lbs.; J. Cornes and Co., 5 lbs.; T. Sheen, 4 lbs.; Hunt and Pickering, 7 lbs.; Southwell and Co., 7 lbs.; Hill and Smith; T. Alcock, 6 lbs.; J. Warren, 6 lbs.; E. Page and Co., 8 lbs.; Smith and Grace, 11 lbs.; Picketsley, Sims and Co., 10 lbs.; A. Aldworth, 15 lbs.; Richmond and Chandler, 13 lbs.

SECTION 6—CLASS 1—OILCAKE BREAKERS—STEAM OR HAND POWER.

Holmes and Son, 1 m. 30 s. 1 m. 10 s.; Amies, Barford, and Co., 2, 2.20; Hunt and Pickering, 2.25, 2.35; Reading Iron Works, 2.33 1.31; W. N. Nicholson, 1.53 1.27; Woods, Cocksedge, and Warner, 2.30, 2.55; E. H. Bentall, broke

down; E. R. and F. Turner, 1.15, 1.23; Mellard's Trent Foundry, 1.43, 1.32; Picketsley, Sims, and Co.; Coleman and Morton, 3.39, 4.6; R. Maynard, 1.36, 1.55; S. Corbett and Son, 1.15, 2.22.

SECTION 6—CLASS 2—OILCAKE BREAKERS—HAND POWER.

Reading Iron Works; Coleman and Morton; E. Page and Co.; R. Willacy; Woods, Cocksedge and Warner; Hunt and Pickering; Ashby, Jeffery, and Co.; Lewis and Hoole; Southwell and Co.; S. Corbett and Son; P. and W. Hobbs; Picketsley, Sims, and Co.; T. Corbett; R. Hunt; Haslam and Clark; Mellard's Trent Foundry; W. N. Nicholson; E. R. and F. Turner; E. H. Bentall.

SECTION 7—CLASS 1—TURNIP AND ROOT CUTTERS.

R. Wallacy, broke down; Hunt and Pickering; Woods, Cocksedge, and Warner; Binnie, Dayer, and Co.; Hornsby and Sons; T. Corbett and Son; E. H. Bentall; Mellard's Trent Foundry; Lewis and Hoole; H. and G. Kearsley; R. Hunt; Carson and Toone; Southwell and Co.

SECTION 7—CLASS 2—ROOT PULPERS.

Lewis and Hoole; Southwell and Co.; Hornsby and Sons, 1.38 1.34; R. Hunt, 3.11; Woods, Cocksedge, and Warner, 3.11; Mellard's Trent Foundry, 3.15; E. H. Bentall, 1.40 and 1.53; T. Corbett, 1.15 and 57 sec.; Picketsley, Sims, and Co., 1.8 and 50 sec.; S. Corbett and Son, 59 sec.; E. Page and Co., 3.25; Hunt and Pickering, 1.50; R. Millard, 3.15.

SECTION 8—STEAMING APPARATUS.

W. N. Nicholson; Amies, Barford, and Co.; V. Barford.

Hunt and Pickering, of Leicester, had an improved breaker, price £3 10s., which had received a prize from the Society. It was adapted for breaking nine different sizes. It took 9½ min. time in breaking half-a-cwt. of cake.

Southwell and Co., of Rugeley, a breaker, price £3 3s., adjustable by a simple contrivance to break six different sizes, mouthpiece 1¼ by 2½ in., convertible into a hopper. Wheels entirely covered, to prevent accident. Time of working 7 min. 45 sec.

S. Corbett and Son, of Wellington, a breaker, price £3 10s. Made good work. Two trials gave respectively 4 min. 25 sec. and 4 min. 20 sec.

T. Corbett, of Shrewsbury, a similar machine, price £3 10s., adapted for breaking six different sizes. Time 5 min. 45 sec.

E. R. and F. Turner, of Ipswich, a double action breaker, price £4 15s., for cutting for beasts, sheep, and lambs. Time 6 min. 9 sec.

E. H. Bentall, Maldon, a breaker, price £3 3s., equally adapted for cutting several sizes of cake. Time 7 min. 50 sec.

Amies, Barford, and Co., an oilcake mill, £3 10s. Can be worked by a strong lad, and will break the hardest cake into eight sizes, for sheep and beasts. Time of two trials 4 min. 48 sec. and 4 min. 56 sec.

Mellard's Trent Foundry, Rugeley, an improved oilcake breaker, price £2 15s., fitted with eccentric motion to regulate the distance between the breakers. Time 4 min. 35 sec.

A few other breakers were subsequently put under trial. The following were the awards to oilcake breakers worked by hand-power: Amies, Barford, and Co., £6; Mellard's Trent Foundry, £4; Corbett and Son, commended.

Among the sets of horse gear tried were four sets by Reuben Hunt, of Halstead, ranging in price from a pony gear of £6 10s. up to £15.

Three from the Reading Iron Works, from £7 7s. to £11, the latter price being for a patent safety gear. The whole machinery being self-contained, no accident can happen to persons or machinery. The dust and wet being excluded, there is no waste of oil or grease.

Three made by Thomas Baker, of Compton, Newbury, price from £12 to £15 10s.

Two sets of gear work, with intermediate motion, by E. R. and F. Turner, Ipswich, £7 7s. to £11.

One by Robert Boby, of Bury St. Edmunds, price £12 12s.

One by Henry Denton, of Wolverhampton, £12.

Two by E. Cambridge and Co., of Bristol, £11 10s. to £12 10s.

Two by Coleman and Morton, of Chelmsford, £11 10s. and £15.

A one-horse power and a two-horse power gearing, by Hunt and Pickering, of Leicester, same price as last-named.

One one-horse and one two-horse gear, price £11 10s. and £16, by Richmond and Chandler, Salford.

A two-horse power gear, works of iron, by Brown and Maude, of Shrewsbury, price £12 10s.

A one-horse and a two-horse gear, by Holmes and Sons, of Norwich, price £9 and £13.

One, price £11, made by R. Hunt, of Earl's Colne, but exhibited by Haslam and Clark, of Henley.

Seven sets, by Woods, Cocksedge, and Warner, of Stowmarket, from £8 8s. up to £17 17s.

Two, by Ashby, Jeffery, and Luke, of Stamford, £11 11s.

An improved horse-power works, price £12, made by Mellard's Trent Foundry, Rugeley.

One-horse and two-horse power gear, by T. Corbett, Shrewsbury, price £13 10s. and £15 10s.

A two-horse gear, price £17, by Williamson Brothers, of Kendal.

A two-horse gear, price £10 10s., by John Weighill, of Pickering.

A two-horse gear, £14, and a three-horse gear, £24, by Davis and Son, of Hemel Hempstead.

We enumerate these principally to show the variable range of prices as put forth by different makers.

In the trials of the bone-crushing mills, the Beverley Iron and Waggon Company, with their Bury St. Edmund's first prize double roller mill, price £210, with a pressure of 25lb., crushed in 6 minutes 10 secs. 1 qr. 23lbs. to dust.

The single roller mill of the same firm, price £85, also a prize mill of the Society, turned out in 5 minutes, 3 qrs. 5lbs. of $\frac{1}{4}$ -inch, 3 qrs. 25 $\frac{1}{2}$ lb. of $\frac{1}{2}$ -inch, and 3 qrs. 6lbs. of rough.

W. Crosskill and Sons, of Beverley, tried their single roller mill, price £90, which delivered in 5 minutes, 1 qr. 18lb. dust, 1 cwt. and 26lb. of $\frac{1}{2}$ -inch, and 1 cwt. 1 qr. 15 $\frac{1}{2}$ lb. rough.

The Beverley Company received two prizes of £9 and £6 respectively, and the other Beverley house, £5.

FIXED STEAM-ENGINES OF 4-HORSE POWER.

£9 Clayton and Shuttleworth.

£6 Brown and May.

£5 Reading Iron Works Company.

Marshall and Co. highly commended.

Robey and Co., and Davey, Paxman, and Davey commended.

The correct running mechanical times were :

	Min.	Secs.
Clayton and Shuttleworth.....	3	45
Brown and May.....	3	9
Reading Iron Works Company.....	3	1
Marshall and Co.	2	26
Robey and Co.	2	22 $\frac{1}{2}$

FIXED ENGINES ABOVE 4-HORSE POWER AND NOT EXCEEDING 10-HORSE POWER.—Clayton and Shuttleworth and Reading Iron Works Co., equal £11 5s. each; Marshall, Sons, and Co., £7 10s. Time: Clayton, 3 min. 23 secs.; Reading Iron Works Co., 3 min. 19 $\frac{1}{2}$ secs.; Marshall and Co., 2 min. 24 secs.

The rule was that steam should be got up; and then, each stoker being provided with a certain amount of

Llangennech coal, was left to make the most he could of his engine, which was connected by a driving-strap to a force-register or friction-break, beneath the shed, some thirty feet distant. Each engine had been previously tested up to about double the pressure at which it was proposed to be driven, the working pressure of steam when on trial not exceeding 50lbs. per square inch. The judges, in adjudicating on the engine, in addition to the quantity of fuel used in maintaining the lifting powers, took into calculation the facility of access to the working parts, the simplicity of construction, probable durability, and prime cost. By this means, the most complete decision was arrived at in the interest of the purchasers of these expensive pieces of machinery.

For the class of mills with metal grinders, for grinding agricultural produce for feeding purposes by hand power, the £10 prize was withheld by the judges.

In the class of root-pulpers Pickley, Sims, and Co., of Leigh, were highly commended for their pulper worked by steam-power; and T. Corbett, of Shrewsbury, and S. Corbett and Sons, of Wellington, commended for their hand-power pulpers.

Steaming apparatus for preparing food for stock: Amies, Barford, and Co., £12 for their portable apparatus for farm use, price £26 10s., and £8 prize for a similar apparatus, but with smaller pans, price £23 10s.; it will steam inferior hay at 3d. per ton, and potatoes at 6d. per ton.

For churns worked by hand-power, £4, to Robert Tinkler, of Penrith, for a churn price £4 15s.—will make 1lb. to 30lbs. butter.

£3 10s. to George Hathaway, of Chippenham, for a barrel churn with newly invented stoppers and improved beaters; sold at £6.

£2 10s. to Thomas Bradford and Co., London, for a mid-feather churn; to make up to 25lbs.

The hexagon 8 gallons eccentric churn of Thomas and Taylor, of Salford, to make from 2lbs. to 24lbs. of butter, price £3 10s., was highly commended as handy for very small farms.

Churns worked by any other power: £4 10s. to Robt. Tinkler, for a churn for large dairies, price £6 5s., which will make from 6lbs. to 120lbs. of butter.

£3 to Robinson and Richardson, of Kendal, for a churn, price £6 15s., capable of making up to 30lbs. of butter.

£2 10s. to Thomas Bradford and Co., of London, for a churn, price £8 10s., fitted for steam, horse, or water-power, and to churn up to 1 cwt.

In the class of cheese tubs the judges withheld £7 of the amount offered.

In the class of guano-breakers the prize of £20 was withheld for want of merit.

Flax-breaking machines: John E. Hodgkin, West Derby, £6 for a flax-breaker, for steam or horse-power, and £4 for a machine for hand-power.

Draining tile machinery: £8 to J. D. Pinfold, of Rugby, for his improved power machine, which received the Society's prize at Leicester. It will make 10,000 bricks, or 15,000 draining pipes a day.

£7 to J. Whitehead, of Preston, for his hand machine.

Edward Page and Co., of Bedford, commended for their double end machine, suited for steam-power. One of the ten silver medals to be awarded was withheld by the judges.

The following are the judges' awards for the horse gear:

Class 1.—One-horse gear, Woods, Cocksedge, and Warner, Stowmarket, first prize, £5; Richmond and Chandler, Salford, second, £2 10s.; Reuben Hunt, Halstead, third, £2 10s. Hunt and Pickering, Leicester,

highly commended. Coleman and Morton, Chelmsford, Thomas Corbett, Shrewsbury, and the Reading Iron Works, commended.

Class 2.—Two-horse gear, Woods, Cocksedge, and Warner, first prize, £5; E. R. and F. Turner, Ipswich, second, £2 10s.; Richmond and Chandler, third, £2 10s. Reuben Hunt, Mellard's Trent Foundry, Rugeley, and Coleman and Morton, highly commended. Woods and Cocksedge, T. Corbett, and Williamson Brothers, Kendal, commended.

We now proceed to give some notice of the principal exhibitors in the implement yard, although this must necessarily be restricted, for space would fail us to give anything like even an enumeration of the number of stands. Every year adds to the magnitude of the show yard, and unfortunately the integrity and speciality of the purely agricultural element of the implement yard are more and more departed from, rendering it too much of a huge bazaar filled with heterogeneous miscellaneous articles which have little or no connection with the farming interest. This extension of the outside element tends to swamp the true agricultural implement makers, who devote enormous expense to a due representation at the Society's meeting, and whose objects are in one direction the main interest and support of the show.

Murray and Co., of Banff, exhibit some good double-furrow ploughs, which have been successful this year in competitive trials in Scotland: several of these embody new improvements, and one, a combined double-furrow plough and subsoiler, received high commendation from the judges. The front plough can be removed and a subsoil body attached, which stirs up the bottom of the previously cut furrow 5 to 8 inches deep, and the back plough following turns the next furrow on to it; thus all treading upon the newly-loosened subsoil is avoided, leaving the bottom free to drain off the surface water and to be operated upon by the frost and air. They also show a new land roller, jointed so as to follow the inequalities of the land.

Hornshy and Sons, of Grantham, have a varied collection of implements, including turnip cutters and root pulpers, thrashing machines, steam engines, ploughs, drills, mowers, and reapers. Their patent Governor self-raking reaper attracted much attention among practical men, by the simplicity and efficacy of the foot-board, by which the driver can throw the machine in and out of gear. The knife being held down by a slide-box prevents its being broken by the high speed at which it runs. The Progress reaper of this firm is the same in principle, but with a different raking apparatus. It is light and compact, with great strength, and took less draught than any machine tested at Manchester. Their Paragon mower, which took the first prize at Manchester, is different in arrangement to any existing machine. The joint of the finger bar being made to act direct upon the crank in travelling over inequalities of land, no friction takes place. It will work when turned-up for travelling, and crop at the side of a hedge. It gained the first prize in competition recently in France. The Manchester mower is lighter in construction than the Paragon. It is peculiarly adapted for cutting difficult crops on uneven as well as level land. The gearing being placed on the opposite side of the machine, gives greater facilities for throwing it in and out of gear. The Premier reaper, which gained the first prize at Manchester, is used either for one or two horses, with attachment for delivering side sheaf, side swathe, or back sheaf, and is very light in draught. It will be remembered that this firm has carried off the highest awards for turnip and root cutters and pulpers. Their cutter is different in the arrangement of the knives to any other made,

every knife being set in such a position that no wedging of the roots is possible, no two knives being set opposite to the other. The whole of the knives on one side may be removed bodily by taking out three bolts. As every knife can be readily got at, a new one can be put in if required by the most simple farm labourer. The number of teeth round the outside of the disc prevents the last piece from dropping through, and it is brought up again into the hopper where the other roots press it forward through the knives, as there is no other exit. In these root pulpers which carried off the first prize for steam power pulpers and the only prize for hand pulpers, each steel, diamond-pointed knife is fastened separately with an iron wedge, and the hopper holds the roots in position for being cut. The oscillating cleans the cutters and renders the machine simple and easy to work. Their adjustable corn screen, with efficient blower and improved dressing apparatus, was highly commended by the judges. It is somewhat similar to that which obtained the Society's prize at the Bury meeting. A fine riddle may be used for peas and such like. The screen is capable of opening and closing to suit various sizes of corn. The difficulty hitherto in making a combined blower and dressing machine has been that the hopper required the whole breadth of the machine to distribute the corn well in front of the blast, necessitating in many cases a change of hopper; here it is simply done by removing the plate and bringing it inside the riddle case. Corn and seed drills, ploughs, &c., and many other useful machines and implements are also shown on their stand.

On J. Fowler and Co's. stand we have 3, 4, 5, 6, and 8-furrow balance ploughs, subsoil cultivators, and turning cultivators, with 5, 9, or 11 tines, as may be required. The 12 and 14-horse engines, and the cultivators they draw, are coming into somewhat extensive use at home and abroad. Two of these, made for the Khedive of Egypt are shown, whilst there are two of 30 nominal horse-power, but capable of working up to a pressure of 100 or 120 pounds, which would give them a power of between 70 and 80 horses each. These monster engines have been made for Mr. R. Campbell, of Buscot Park, near Faringdon, who has had a similar pair in use for nearly twelve months. They are intended to prepare land to the depth of three feet for the growth of sugar-beet, of which Mr. Campbell has about 2,000 acres under culture. The cost of these engines, with a complete set of cultivators and apparatus, is nearly £2,500. We also noticed several of Pirie's double-furrow ploughs, besides a couple of 8-horse power traction engines. This double-furrow plough, which was considered a remarkable novelty at Leicester two years ago, has been outstripped since. It is carried on three wheels, which work in a diagonal position, and draw towards the soil to be cut and turned while at the headlands. The shares are raised clear of the ground by the application of a lever.

Thomson, of Edinburgh, shows a kind of omnibus road steam engine, which was highly commended by the judges. It is completely under the control of the driver, and, like Aveling and Porter's engines, will turn within a circle of a few feet in diameter. Its chief novelty, however, consists in the tire of each wheel having around it a band of indiarubber. This band varies from 4 to 6 or more inches in thickness, according to the weight of the engine, and it is shod with flat bars of iron an inch or so thick and about three inches in width. By this arrangement a large grip is obtained from the rubber yielding to the weight of the engine, and being formed into a flat surface of some length on the road, while the shoe protects the rubber from being cut by stones. The "shoe," in the form of these flat lengths of

iron bar, is held together by an endless chain being fastened to the ends of the bar on each side of the tire. An 8-horse power road steamer, weighing six tons, drawing a load of 18 tons, will consume 48lbs. of coal per mile on good level roads; on very hilly roads the consumption may rise to 96lbs. per mile.

Ransomes, Sims, and Head, of Ipswich, occupy a very large space with samples of all the varied implements and engines for which their firm is so well known. Among these is Jeffery's double-furrow plough, fitted with an apparatus for taking the plough out of work, and turning it easily at the headlands; the depth can be regulated as it proceeds. Then they have another double-furrow plough, which appears to be the only two-wheel plough that carries the weight in the centre of the implement. It is adapted to plough from 3 to 7 inches deep, and can be readily adjusted to take two furrows, each from 8½ to 10 inches wide. It can do deep work, angular work, or match work. There are also shown ploughs, fitted with Woofe's patent disc cutter for pulverising the soil, and patent presser for preventing the hollowness common to all rectangular furrows. This takes no more power than an ordinary plough. Then there are special ploughs, suited for use in Cheshire and Lancashire, and for the Eastern Counties; turn-wrest ploughs for hill-side ploughing or for level land; horse-rakes, harrows, haymakers, the latter double-speeded, fitted with a fast backward, instead of the usual overhead motion, for scattering, and a slow backward motion for turning the hay. These, with corn screens, thrashing-machines, and a host of lawn-mowers, for hand-use or for horse-power, ranging from 8 inches wide to three feet, constituted the principal articles. We must not omit to mention, however, that they also show a three-furrow plough, to supply the demand if such ponderous implements are likely to come into use.

Picksley, Sims, and Co. (Limited), of Leigh, a firm which has come out so successfully in all the competition trials for which its machines were entered, had on its stand a large and varied display of corn and lin-seed crushers, chaff-cutters, cake-breakers, turnip-slicers and pulpers, horse-rakes, combined mowers and reapers, and other useful articles. Their strong standard combined mower and reaper has a patent sliding double-gear arrangement, which allows of the finger-bar and knives being projected 6 inches outwards clear of the frame-work in reaping, without removing the pole. By the removal of a single bolt the speed is altered to fast for mowing and slow for reaping. In the manufacture of chaff-cutters they rank, perhaps, next to Bentall's in the quantity turned out, and are also well known for their root-pulpers, cutters, and mills, ranging from all prices.

J. and F. Howard, of Bedford, maintain their high reputation by the implements shown on this occasion. They exhibit their steam cultivation machinery. In one set the engine is fitted with a steam force-pump, available in case of fire or for irrigation. Steam harrows, subsoilers, and drills are also among their implements, besides innumerable ploughs, from the most cheap and simple to the most effective and complete forms. And there is also their three-furrow plough, which, it is said, can be worked by three horses on light land. A seat is provided for the ploughman, and a steering lever, which enables him readily to guide the implement. The self-acting horse-rake, which received a silver medal from the judges here, has been designed to meet the demand for a self-relieving rake, in order to reduce the manual labour required to raise the teeth, and relieve the rake of its load. The advantages of the Howard safety-boiler, of which there are about 8,000 already in use in England, are

stated to be the freedom of risk from explosion, economy of fuel, perfect circulation of the water, ready means of removing sediment, simplicity of parts, economy of space, and facility in transport and setting. It can work up to 140 or 150 lbs. pressure.

Tuxford and Sons, of Boston, have nine steam-engines on the ground, including horizontal, portable, steeple, and traction engines. The steeple engines are of great durability, and calculated to stand the roughest work, either in the yard or the field. They also show several combined thrashing machines, straw elevators, and specimens of Appold's centrifugal pumps, adapted to discharge from 150 to 1,400 gallons per minute.

The Reading Iron Works (Limited) have an extensive show, comprising a large amount of heavy machinery. Their four-horse and eight-horse fixed engines we have already spoken of in the competition trials. Horse-gear, thrashing machines, crushing mills, &c., are some of the specialities of this company. In the lock-lever horse-rake a great improvement has been made in the fastening of the teeth, which are adjusted to rise and fall according to the inequalities of the ground. In a cheap barley hummeler for hand power, which received the first prize at Worcester, the grain passes through a cylinder, with a wire screen at the bottom, in which revolves a spindle fitted with steel blades.

Woods, Coaksedge, and Warner, of Stowmarket, show a large variety of machines and implements. Their horse gear carried off the first prize in both classes for one and two-horse gear; some of those exhibited are adapted for working machines requiring either fast or slow speed; others for a pony to work a small chaff-cutter, mill, or for pumping, while some are mounted on travelling wheels to move about from farm to farm, and suitable for working elevators in harvest time. This firm also supplies mills, pulpers, root-cutters, carts, and other farm necessities.

Amies, Barford, and Co., of Peterborough, competed with a number of their corn-grinding mills, and took the first prize in the class of mills with metal grinders; also a first prize for their oilcake breakers; two for their steaming apparatus, two silver medals, and one high commendation in the miscellaneous articles. They had on their stand a large number of clod crushers, land pressers, garden rollers, and water-ballast rollers, up to three tons in weight when full. Some improved flour-dressing machines were also shown.

Ashby, Jefferys, and Luke, of Stamford, exhibited many varieties of haymakers, suitable for small occupations and for light or heavy crops; chaff cutters, sets of horse gear, cake breakers, horse rakes, and portable steam engines.

The Bristol Waggon Works Company (Limited) had on the ground a most extensive collection of agricultural carts and farm waggons, ranging from various prices. Among them was one fitted with Capt. Stephens' patent endless rails, for soft and marshy land, preventing the wheels sinking and making ruts. Drills, sheep racks, horse rakes, winnowers, and other useful articles completed their show.

E. H. Bentall, of Maldon: The reputation of this maker has been long maintained for the utility and effectiveness of his crushers, chaffcutters, cakebreakers, turnip cutters and pulpers, and his stand contained an extensive assortment of machines of his make.

The stand of E. Cambridge and Co., of Bristol, was principally noticeable for its rollers and clod-crushers, chain-harrows, some portable engines and horse-gear.

Reuben Hunt, of Halstead, had some useful horse gear, oilcake breakers, root-cutters, and pulpers, and we especially noticed an improved clover and trefoil seed draw-

ing machiuc, which will thrash and dress these with the same barrel in a very effective manner, removing the horny husk of trefoil, and the leathery pods of clover.

R. Roby, of Bury, excels principally in screens, although some haymakers and drills were shown. A small chaff screen, for use in a corn-merchant's office, attracted attention, by which may be readily ascertained what the samples will be when screened.

John Baker, of Wisbeach, exhibited a dozen varieties of his dressing and screening machines for cleaning and separating all kinds of grain and seeds for market.

The Beverley Iron and Wagon Company (Limited) had a very fine display of implements, among which were compound action grinding mills, bone mills, turnip cutters, prize carts and cart wheels, prize rollers and clod crushers, and portable farm and railway trucks. The one-horse reaping machine, with patent screw manual sheaf delivery, which was first shown at the Smithfield Show, received high commendation on this occasion from the implement judges. It has the advantage of a change wheel which the revolving machine has not. It is remarkably light and simple, and fitted with Norfolk's patent self-acting tipping platform to suit various crops, reduces labour, and ensures uniform sheaves.

HONORARY DIRECTOR OF THE SHOW AND GENERAL ARRANGEMENTS :

Mr. B. T. Brandreth Gibbs, Half-moon Street, Piccadilly, London.

STEWARDS OF IMPLEMENTS :

Sir A. K. Macdonald, Bart., Woolmer Lodge, Liphook, Hampshire.

Lieut.-Col. Wilson, Stowlangtoft Hall, Bury St. Edmunds.

Mr. Chandos Wren Hoskyns, M.P., Harewood, Ross.

Mr. W. J. Edmonds (Steward Elect), Southrop House, Lechlade.

JUDGES OF IMPLEMENTS.

Fixed Steam Engines, Horse Gears, and Steaming Apparatus :

F. J. Bramwell, C.E., 37, Great George-street, London.

E. A. Cowper, C.E., 6, Great George Street, London.

Mills, Crushers, and Coprolite Mills :

H. Caldwell, Monkton Farleigh, Bradford-on-Avon.

H. Stephenson, Throckley House, Newcastle-on-Tyne.

John Ogilvie, Mardon, Coldstream, N.B.

Chaff-cutters, Oilcake-breakers, Turnip-cutters, and Guano-breakers :

John Hemsley, Shelton, Newark.

Matthew Savidge, Sarsden Lodge Farm, Chipping Norton.

Henry Cantrell, Baylis Court, Slough.

Bone Mills, Flax-breaking Machines, Tile Machinery :

John Thompson, Badminton, Chippenham.

J. W. Kimber, Tubney Warren, Abingdon.

G. M. Hipwell, Elmore Lodge, Sutton, Surrey.

Dairy Implements :

J. K. Fowler, Prebendal Farm, Aylesbury.

George Jackson, Tattenhall Hall, Chester.

Gilbert Murray, Elveston, Derby.

Draining Tools and Miscellaneous Awards :

F. Sherborn, Bedford, Middlesex.

John Hicken, Dunchurch, Rugby.

John Wheatley, Neswick, Driffield.

PRIZES FOR IMPLEMENTS.

FIXED STEAM ENGINES.

Four-horse power, with boiler combined.—First prize, £9, Clayton and Shuttleworth; second, £6, Brown and May; third, £5, Reading Iron Works Company. Highly commended: Marshall, Sons, and Co. Commended: Robey and Co., and Davey, Paxman, and Davey.

Above four-horse power and not exceeding ten-horse power, to be worked by an independent boiler.—Clayton and Shuttleworth and Reading Iron Works Company (equal), prize of £11 5s. each; third, £7 10s., Marshall, Sons, and Co.

HORSE GEARS.

Gears for one horse.—First prize, £5, Woods, Cocksedge, and Warner, Stowmarket; second, £2 10s., Richmond and Chandler, Salford; third, £2 10s., Reuben Hunt, Halstead. Highly commended: Hunt and Pickering, Leicester. Commended: Coleman & Morton, Chelmsford; T. Corbett, Shrewsbury; and the Reading Iron Works.

Gears for two horses.—First prize, £5, Woods, Cocksedge, and Warner; second, £2 10s., E. R. and F. Turner, Ipswich; third, £2 10s., Richmond and Chandler. Highly commended: Reuben Hunt, Mellard's Trent Foundry, and Coleman and Morton. Commended: Woods and Cocksedge, T. Corbett, and Williamson Brothers, Kendal.

MILLS.

Mills, with stone grinders, for grinding agricultural produce into meal, by steam or horse power.—First prize, £8, J. Weighell, of Pickering; second, £7, E. R. and F. Turner, of Ipswich; third, £5, Marshall, Sons, and Co., of Gainsborough. Commended: Reading Iron Works Company, and Smith and Grace, of Thrapston.

Mills with metal grinders, for grinding agricultural produce for feeding purposes, by steam or horse power.—First prize, £8, to Amies, Barford, and Co., Peterborough; second, £7, T. Corbett, of Shrewsbury; third, £5, E. and H. Roberts, of Deanshanger.

Mills with metal grinders, for grinding agricultural produce for feeding purposes, by hand power.—The judges did not recommend any award in this class.

CRUSHERS.

Corn crushers by steam or horse power.—First prize, £6, Ransomes, Sims, and Head, of Ipswich; second, £5, E. H. Bentall, of Maldon; third, £4, Woods, Cocksedge, and Warner, of Stowmarket. Commended: E. R. and F. Turner, of Ipswich.

Corn crushers by hand power.—First prize, £6, E. H. Bentall, of Maldon; second, £4, Woods, Cocksedge, and Warner, of Stowmarket.

Linseed crushers by steam or horse power.—Prize of £5, E. R. and F. Turner, Ipswich.

Linseed crushers by hand power.—First prize, £6, E. R. and F. Turner, Ipswich; second, £4, Woods, Cocksedge, and Warner.

CHAFF-CUTTERS.

Chaff cutters to be worked by steam or horse power.—First prize, £10, Richmond and Chandler, Salford; £5, Picksley, Sims, and Co., Leigh; £5, E. H. Bentall, Maldon (bracketed equal). Highly commended: Carson and Toone, Warmminster. Commended: J. Cornes and Co., Nantwich; T. Allcock, Ratcliffe-on-Trent.

Chaff cutters to be worked by hand power.—First prize, £6, Richmond and Chandler, Salford; second, £4, Picksley, Sims, and Co., Leigh. Highly commended: Smith and Grace, Thrapston; E. H. Bentall, Maldon.

OILCAKE BREAKERS.

Oilcake breakers, for large and small cake, to be worked by steam or horse power.—First prize, £6, Amies, Barford and Co., Peterborough; second, £5, E. R. and F. Turner, Ipswich; third, £4, Hunt and Pickering, Leicester.

Oilcake breakers, for large and small cake, to be worked by hand power.—First prize, £6, Amies, Barford, and Co.; second, £4, Mellard's Trent Foundry. Commended: S. Corbett and Son.

TURNIP CUTTERS.

Turnip and root cutters.—First prize, £7, R. Hornsby and Sons; £4, Hunt and Pickering; £4, R. Hunt (bracketed equal).

Root pulpers.—First prize, £7, R. Hornsby and Sons (for steam or horse power); second, £4, Picksley, Sims, and Co. (for steam or horse power); third, £4, R. Hornsby and Sons (for hand power). Highly commended: Picksley, Sims, and Co. (for hand power). Commended: T. Corbett (for steam power); S. Corbett and Son (for hand power).

STEAMING APPARATUS.

Steaming apparatus for the preparation of food for stock.—First prize, £12, and second prize, £8, Amies, Barford and Co.

DAIRY IMPLEMENTS.

Churns worked by hand power.—First prize, £4, R. Tinkler; second, £3 10s., G. Hathaway; third, £2 10s., T. Bradford and Co. Highly commended: Thomas and Taylor. Commended: Richardson and Robertson, and W. Waide.

Churns worked by any other power.—First prize, £4 10s., R. Tinkler; second, £3, Robertson and Richardson; third, £2 10s., T. Bradford and Co.

Cheese tubs.—Prize, £3, Mellard's Trent Foundry. The judges withheld the balance of the amount offered for this class.

Cheese presses.—First prize, £4 10s., Southwell and Co., Rugeley; second, £3, Mellard's Trent Foundry, Rugeley; third, £2 10s., J. Cornes and Co., Nantwich.

Curd drainer, &c.—Prize, £2 10s., J. Cornes and Co.

Curd mills.—Prize, £2 10s., Southwell and Co., Cheese-turner and general collection of cheese-making apparatus.—Prize, £2 10s., Carson and Toone,

General collection of utensils for butter making.—Prize, £2 10s., Allway and Son.

BONE MILLS.

Bone mills to be worked by steam or other power.—First prize, £9, the Beverley Iron and Waggon Company; second, £6, the Beverley Iron and Waggon Company; third, £5, W. Crosskill and Sons.

GUANO BREAKERS.

Guano breakers, worked by hand power.—The prize was withheld for want of merit.

COPROLITE MILLS.

Prize of £10, E. R. and F. Turner, Ipswich.

FLAX BREAKING MACHINES.

First prize, £6, J. E. Hodgkin (for steam or horse power); second, £4, J. E. Hodgkin (for hand power).

TILE MACHINERY.

Machines for the manufacture of draining tiles.—First prize, £8, J. D. Pinfold (for steam or horse power); second, £7, J. Whitehead (for hand power). Commended: E. Page and Co. (for hand power).

DRAINING TOOLS.

First prize, £6, Hunt and Pickering, Leicester; second, £4, Clarke and Son, Brackley. Highly commended: F. Parkes and Co.

MISCELLANEOUS AWARDS.

SILVER MEDALS.

Amies, Barford, and Co., of Peterborough, for a portable metal corn grinding mill with dressing apparatus.

Amies, Barford, and Co., of Peterborough, for Campains' patent anchors for steam cultivation.

W. Barton, of Boston, for a cottagers' patent cooking stove, invented and made by Richards, of Wincanton.

J. and F. Howard, of Bedford, for patent self-acting appliance to horse rake.

Gilbert Murray, of Elvaston Castle, Derby, for model set of plant for cheese-making on the American factory system.

H. Pooley and Son, of Liverpool, for patent automatic grain scale, simplified from that exhibited at Manchester last year.

Robey and Co., of Lincoln, for patent self-feeding apparatus for thrashing machine, designed to prevent accidents and save manual labour.

J. and B. Sainty, of Wisbeach, for patent wood covering for temporary buildings, walls, &c.

James Sinclair, of Manchester, for chemical fire-engine called "l'Extincteur."

HIGHLY COMMENDED.

Amies, Barford, and Co., of Peterborough, for set of steam cooking apparatus.

T. Baker, Compton, Newbury, improved tumbler or tip-cart.

Wm. Ball and Son, of Rothwell, patent double-break on waggon.

Barrows and Stewart, of Banbury, improved 4-wheeled windlass for steam cultivation.

Beverley Iron and Waggon Company, Limited, double self-acting or reversible sheaf-delivery to reaping machine.

T. Corbett, of Shrewsbury, improvement in hand clover-seed barrow.

James Davey, of Eynsham, set of improved Scotch cart harness.

J. Fowler and Co., of London, 8-horse power traction engine on patent springs.

D. Hart and Co., of Wenlock Road, City Road, London, patent automatic self-acting and self-registering weighing machine for grain.

Holmes and Sons, of Norwich, improvements in corn, hay, or straw elevators.

R. Hornsby and Sons, of Grantham, combined corn-dressing and screening machine.

Thomas Hunter, of Maybole, Ayr, for Dickson's patent double drill turnip cleaner.

Thos. Mackenzie and Sons, of Dublin, for patent mower and reaper knife-grinder and rest.

G. W. Murray and Co., of Banff, for combined double-furrow plough and subsoiler.

Thos. Perkins, of Hitchin, patent folding shafts for reaping and mowing machine.

W. Rainforth and Son, Brayford Head, of Lincoln, for improved patent adjustable corn-screen.

Richmond and Chandler, of Salford, for an improved litter-cutter.

J. and B. Sainty, of Wisbeach, improved cattle crib, with iron posts and wood frames.

Southwell and Co., of Rugeley, improvement in ridging plough.

W. Smith, of Poston Lowthorpe, near Driffeld, for self-feeding sheep-rack with patent slides.

R. W. Thomason, of Edinburgh, for patent road steam engine, 8-horse power nominal.

COMMENDED.

J. P. Barford, of Banbury, for an improved carriage-lifting jack.

Henry Denton, of Wolverhampton, for improvement in a chain harrow carriage.

T. Mackenzie and Sons, of Dublin, for improvements in turnip and mangold drill.

H. J. and C. Major, of Bridgwater, for patent angularly corrugated roofing, and ridge or crest-tiles, for farm and other buildings.

J. and B. Sainty, of Wisbeach, for improvements in field and other gates; also for patent sheep fencing.

Richard Winder, of Farningham, Dartford, machine for tarring sheep-fold netting.

AGRICULTURAL SHOWS.

BY THE CROTCHETY FARMER.

I am crotchety enough to think that I have one or two crotchets upon a subject which some may and do think is quite beyond the regions of crotchets, while others, by-the-way, think it is precisely that in which crotchets abound. For example, is it a crotchet or is it not which nearly all—nay, I may as well say all, for that is simply the truth—our agricultural societies have, that what they interest themselves in and make the only features of their shows comprise all the points or subjects upon which farmers are generally interested? I am free to confess that this notion of our societies does seem to me a crotchet, and one which unfortunately exercises a very prejudicial influence upon the progress of agriculture. I think I could name half-a-dozen—probably a round dozen of subjects which are altogether ignored by our agricultural societies, never apparently dreamt of by their officials as coming within the range of useful subjects, but which nevertheless are of the greatest practical importance. I venture to say that there is not a practical man who thinks—an important concession no doubt in these days when thinking is itself deemed a crotchet, a man who ventures to think for himself being considered as equal to, if not exactly the crotchety man—I venture to say that there is not a practical man who thinks about what he is doing that has not in the course of a single season had several points brought up before him arising out of his daily practice which *he* is greatly, if not altogether ignorant of, and about which, just because he is so, he is desirous to have the authoritative expressions of other and wiser men than himself. It is in connection with our agricultural societies that such men are, and yet by reason of an unfortunate something they do not give the societies the benefit of their wisdom or experience, and this mainly because they are not asked to do so. Men are all apt to run for ever in the groove they have made for themselves, or which has been made for them, and this is especially true of corporations whether of science or of social life. Now, we think, that our great societies have been running too long in certain grooves, and the sooner they shunt off to others, the better for the societies, unquestionably the better for the farmers, and not the least benefit of going into any one new groove would be I take it that it would be seen that there would be other grooves branching out naturally from it which would lead along the lines of most interesting investigations, full of practical and suggestive truths. For example, I will walk along the alleys and round the broad beaten paths of the great yearly gathering at Oxford this year, and, unless I shall be greatly and I confess agreeably mistaken, while I find numerous examples of implements and machines and hosts of animals, I shall find nothing whatever to indicate what is the result of the working of these implements and machines, nor what are the substances upon which those countless herds and flocks are fed upon; in other words, I shall see machinery and stock, but not a vestige of the crops which these machines help to cultivate or upon which these stock are fed. Yet, why is this, that the very aim and object of a whole and ceaseless round of farming operations should have no place at all in the national gathering like that of the Royal Agricultural Society? And yet it is impossible to say that this branch of farming carries with it no points of practical importance to farmers—it on the contrary

carries many. If, indeed, this branch was taken up and prosecuted with the eagerness which other branches are prosecuted it would be found that many points are connected with it of surprising importance to the farming community. Supposing that prizes were offered for the best specimens of farm produce, the details of the mode of cultivating of which, the soils, the working of them, the mode and period of sowing, the quality of seed used—the manures and grain being also fully stated—I am crotchety enough to believe that a vast deal would be obtained of real service to farmers; and more than that, our agricultural *savans* would not fail to see that each detail of farm-work in connection with these would carry with it questions, many of which are now puzzling our best practical heads, but upon which our societies have given no authoritative utterance. Take any of the points in practice I have named above connected with the preparation of the soil—the sowing of the seed, its manuring—I will venture to put upon each and all of them a series of questions, not one of which has yet been properly, some not at all investigated by our societies, and all of which nevertheless are of the highest possible importance. We pet our stock at our shows, we make much of our implements and machines, but it apparently never enters the minds of the society authorities who do both to conceive of the possibility that taking up other branches would be the very means to show us how much there was connected with them that influenced the future both of stock and implements. Great as has been the improvement in the machinery of the farm during the last few decades, is there anyone who will venture to say that the improvement would not have been greater, much greater, had our machinists understood clearly what it was that our farmers wanted? Surely none. I have lived long enough to recollect what the agricultural machinery was at the date of the first Oxford Show, and what a difference between that show and the one now about to be held! and I have watched since then the long list of machines and implements which have been brought out, and the nearly as long list of those which have been condemned and consigned to oblivion, and yet many of which so consigned would never have been brought out at all had their inventors known what was wanted. And this knowledge might have been given to them had the societies entered upon and taken heartily up those lines of inquiry connected with the crops and cropping of the farm, which have lain for years—too long a course—and are now lying before them for investigation. Let this branch be taken up, and from it will flow a number of questions, the authoritative judgment upon which your societies will do a vast deal of good to the practice of farming.

A very interesting department of the coming show at Oxford will be what for some years has been a most interesting department—namely, the collection of seeds, manures, and feeding stuffs, and I should be surprised to find this year what I have never yet found, that these are within the pale of official recognition. With reference to the two first of these, what we have already said with reference to the crops and cropping of the farm applies more or less to them; and with reference to the feeding stuffs, I am crotchety enough to fail to see why, if the interests of the farmer are looked upon as worthy to be guarded as far as they can be guarded by official recogni-

tion of stock is concerned, they should not be guarded by the same being extended to the foods upon which they are fed. A man has some chance, and ought to have the skill, to guard himself from being taken in by the purchase of a bad beast, what chance has he of guarding himself against being taken in by the purchase of bad food? The question the reader will perceive is one of no small importance—by no means crotchety in its nature, although I know full well that it will be deemed as crotchety in having brought forward its claims to the consideration of the Society and of all societies which profess to be instituted for the benefit of and to do their work in the interests of farmers. Why are all these points overlooked? As the Yankees say, "I want to know; pray do tell;" but then who is tell me? those who should will not, and those who would like cannot. A rather crotchety dilemma, I confess, to be placed in. But the time will come when the question which should

be asked of the governing councils of our agricultural bodies will be asked of them, and will receive a reply other than we believe they would give now. The points have not as yet had their full weight with them—time shall yet be required to allow this weight to be exercised; meanwhile, it is some gratification for those interested to know that outside at least of those governing councils the subject we have only glanced at is receiving fair attention. What a journal such as this is can do in the helping on of such a movement it has for some years quietly done. So far as any advocacy of it is concerned, it may appear to some that a crotchety man can do nothing else than advocate crotchety subjects; still, in reply, I may say that you and I, good reader, have lived to see what was at one time called crotchets at another great and beneficial reforms. It may be so in the present case. That our societies have done much I heartily believe; that they can do more I no less believe.

THE THORNE AGRICULTURAL SOCIETY.

Thorne has recently held its annual carnival. There was a good show of horses for agricultural purposes, and for young draught horses the exhibition here has never been surpassed. Both carriage horses and roadsters were well represented, and in no previous year have better appeared amongst them; and though the hunters did not show in large numbers, still they were more numerous than last year. In the show of agricultural implements the number of exhibitors was in excess of former years. The entries for cattle have never at any time been large, and though there was an improvement this year there is yet plenty of scope for further advancement. Of the stock exhibited in this department the bulls preponderated. Of the sixteen shown, twelve of them were under two years old, the remaining four being aged. The judging of sheep was not at all satisfactory to the public. Not that the judges did not give perfectly honest decisions, but inasmuch as two of them were Lincolnshire men, they naturally preferred the prevailing character of their own county. Pigs, on the whole, were of first-rate quality. The only fault, if any, in this department, was the one also noticeable in the cattle and sheep—that they were not more numerously represented.

JUDGES.—Horses: G. C. Woolhouse, Wellingore, Lincoln; C. Wood, South Dalton, Beverley; W. Harper, Linley-hill, Beverley. Cattle: T. Cartwright, Dunstan Pillar, Lincoln; J. T. Havercroft, Wooton Dale, Barton; G. Smart, Aberford, York.

HORSES.

Agricultural mare and foal.—First prize, W. Bramley; second, E. Coulman.

Hunting mare and foal.—First prize, W. Pulsfordbrowne; second, T. Askren.

Carriage mare and foal.—First prize, J. Read; second, H. Cooke.

Roadster mare and foal.—First prize, W. Whaley; second, H. W. Godfrey.

Agricultural yearling or filly.—First prize, R. Fillingham; second, W. Bramley. Commended: J. Coulman.

Agricultural two-year-old gelding or filly.—First prize, H. Robinson; second, T. Duckitt. Highly commended: J. Brown. Commended: F. T. Turner and M. and A. Glew.

Agricultural three-year-old gelding or filly.—First prize, C. Lister; second, W. Banks.

Agricultural mare or gelding, any age.—First prize, W. Banks; second, J. Coulman. Commended: T. Black.

Pair of draught horses, exclusively for agriculture.—First prize, S. Thompson; second, M. Askren. Commended: M. Durlham.

Pair of draught horses, adapted for light soils.—First prize, J. Coulman; second, S. Barker. Highly commended: E. Coulman.

Hunting yearling colt or filly.—First prize, G. W. Morris; second, G. W. Morris. Commended: W. B. Houlden.

Hunting two-year-old gelding or filly.—First prize, G. Cross; second, F. J. Maw. Commended: J. S. Hill.

Hunting three-year-old gelding or filly.—First prize, H. Cooke; second, G. Cross.

Carriage yearling colt or filly.—First prize, J. Coulman; second, H. W. Godfrey.

Carriage two-year-old gelding or filly.—First prize, H. Robinson; second, M. Askren.

Carriage gelding or mare, any age.—First prize, S. Gurnell; second, J. Reader. Commended: G. Gurnell.

Roadster yearling colt or filly.—First prize, J. F. Watson; second, E. Ellis.

Roadster two-year-old gelding or filly.—First prize, J. Furniss; second, R. Maw. Commended: M. Askren.

Roadster three-year-old gelding or filly.—First prize, E. Ellis; second, T. Shearman. Highly commended: G. Wakefield.

Roadster gelding or mare, any age.—First prize, E. Winter; second, W. Stephenson.

Weight-carrying cob, any age or sex.—First prize, J. Askham; second, J. T. Blaydes.

Lady's hackney, any age or sex.—First prize, J. Cross; second, W. Duggleby, jun. Highly commended: J. Reader.

Pony, not exceeding 14 hands.—First prize, W. Axe; second, G. Gurnell. Highly commended: G. Harrison.

Pony, not exceeding 12 hands.—First prize, C. Dook; second, W. Johnson. Commended: W. Blaushard.

CATTLE.

Bull, under two years old.—First prize, J. Sunderland; second, G. Mann.

Bull, any age.—First prize, F. Frudd; second, T. J. Crowcroft. Highly commended: B. H. Brooksbank.

Bull, under two years old.—First prize, G. Hatfield; second, B. J. Whitaker. Highly commended: W. Burton.

Cow, in calf or milk.—First prize, J. Dickinson; second, T. J. Crowcroft. Highly commended: J. Dickinson.

Heifer, in calf or milk.—First prize, E. H. Marshall; second, M. Askren. Highly commended: J. H. Dean.

Pair of calves, under 18 mouths old.—First prize, W. Melhows; second, M. Askren.

SHEEP.

Long-woolled ram, any age.—First prize, R. Wright; second, J. T. Moorhouse.

Long-woolled ram, one shear.—First prize, R. Wright; second, R. Wright.

Pen of five long-woolled ewes.—First prize, J. Winder; second, W. Carr.

Pen of five long-woolled gimmers.—First prize, E. Lister; second, F. Frudd. Highly commended: J. Rishworth.

Pen of five long-woolled wedders.—First prize, W. B. Tate; second, T. Carr.

Pen of five long-woolled lambs.—First prize, T. Smith; second, G. T. Wood.

PIGS.

Boar, any breed.—First prize, W. Stephenson; second, W. Plumtree.

Sow, any breed.—First prize, G. Briggs; second, W. Maskill.

Open gilt, any age.—First prize, Z. Mande; second, G. Wagstaffe.

Three store pigs.—First prize, R. Sellars; second, T. Askren.

Cottager's pig.—First prize, G. Holgate; second, J. House; third, D. Hunter.

IMPLEMENTS.

Implements manufactured by exhibitors.—Prize, £2 2s., Messrs. Vickers, Snowden, and Morris.

Assortment of implements.—Prize, £5 5s. and the Society's medal, J. Glew, Howden.

THE IMPOVERISHMENT OF THE SOIL BY MAN.

BY CUTHBERT W. JOHNSON, F.R.S.

It is only within the last quarter of a century that the subject of this paper has attracted the public attention. This, indeed, has been induced in a great measure by the progress of sanitary efforts. When the inhabitants of crowded neighbourhoods began to awake and discern the ill-effects of living over cesspools, and allowing their noxious contents to filter into their wells, other modes of providing for the removal of sewage were adopted. Then came the time when sewers were constructed and house-drains connected with them. Then another difficulty arose, viz., the disposal of the large amount of sewage collected by the sewers. This was, as a matter of course, directed to the lowest portion of the district, and allowed to flow into an adjoining river. Then came complaints of the fouling of its waters, and legal proceedings. This rendered necessary the adoption of means for the purification and utilization of the sewage. This led to several erroneous estimates of the money value of town sewage, and these deceptive statements originated many schemes for its purification. As most of these have failed it will be useless to describe their manipulations; I propose, however to allude to two of these, which are founded on Nature's teachings, and her processes we are all aware rarely fail: I mean the dry earth, and the irrigation systems. Both these have recently been examined in a very valuable report, by her Majesty's Commissioners appointed to inquire into the pollution of rivers. And what they have so well described, I need hardly attempt to allude to in any other language.

The Commissioners (Major-General Denison, Mr. E. Frankland, and Mr. J. C. Morton), in commencing their inquiries, were impressed with the fact, that of all the live stock of our island, man was the worst as regards the manure he adds to the soil. They remark (*Report*, 1870, p. 71):

"Everyone is familiar with the idea that the fertility of a farm depends very much on the quantity of live stock kept upon it. It is, in fact, an established maxim in agriculture that, apart from the use of imported and manufactured fertilizers, the maintenance of fertility depends very much upon the live stock which the farmer keeps upon the land, and the quantity of manure which he can thus apply to it.

"The fertility of the 23,370,502 acres in the hands of English farmers is thus dependent on the 19,821,863 sheep, 3,706,641 cattle, and 1,629,550 pigs which, according to the statistical returns just issued by the Board of Trade, are kept on English farms; a number which, calculated wholly as sheep, that is, putting cattle of all ages as equal to six, pigs as equal to two, and horses equal to eight, sheep apiece, amounts in food-consuming and therefore manure-producing power to as nearly as possible two sheep per acre over the whole area of the enclosed land in England. Taking 1,141,996 agricultural horses into account, we may say that the whole farm-stock of this country is less than five sheep to every two acres in the hands of English farmers. These are the published returns for 1869. In 1868 there were in England

23,038,781 acres returned as occupied; there were 3,779,691 cattle, 20,930,779 sheep, and 1,981,606 pigs—numbers which calculated wholly as sheep amount to 47,572,137 sheep, corresponding to a very little more than two sheep per acre of the enclosed land in this country. No returns of the horses employed on farms were obtained in 1868. We give the returns of both years in illustration of the very considerable variations which take place from year to year in the farm livestock of the country, while mankind steadily increases in number every year.

"We have, however, omitted all reference to another resident animal of the greatest food-consuming power; for whose maintenance indeed all these acres and all this live stock are owned and cultivated. Nearly one-third of the live stock of this country is mankind! In 1869, there were in England 20,658,599 of 'man'; and he consumes not only the produce of all these acres, and of all these cattle, sheep, and pigs which are maintained upon them, but imported food as well, to the extent of two-fifths of the estimated quantity of our home-grown wheat, and probably one-twentieth or more in excess of our home-grown meat. A creature of such great powers of consumption ought according to all the analogies to be of corresponding agricultural value as a fertilizer. If, leaving out of consideration the products of respiration, excrement be just the food of an animal *minus* its growth, then on the ground of both these elements of the calculation, man ought to be the very best farm-stock we have. He is not only a much better fed animal than a sheep, but he takes much less out of his food. Bread and beef are better food than grass and turnips; and the growth taken out of these several rations is much less in the former case than in the latter. The population fed on bread and beef does not increase in number, and that is virtually in total weight, more than two per cent. per annum, whereas the 'population' fed on grass and turnips increases in weight at least 30 to 50 per cent. within the year. A sheep builds its whole weight of body out of the food of 18 months. The average age of man in England is rather more than 40 years, and the weight of his body at death is all that he has saved out of all the food he has consumed during the whole period of his life. On every ground, therefore, we ought to anticipate the superiority of man to sheep as a manure-producing animal for farm use.

"And it is worth while to compare the two species further. So far as England is concerned, although the sheep population varies considerably from year to year, they are upon the whole as nearly as possible alike in number; and in the month of June, when the agricultural returns are made up, and when lambs are not above half grown, they are probably also very nearly alike in weight. The average carcase weight of the sheep sold at Smithfield is barely 80lbs., which would correspond to a live weight of 140lbs.; and that may be considered also as the average weight of the adult man. Comparing then their respective rations, their relative wastefulness of food, their weight and number, we might reasonably

expect that Englishmen ought at the very least to be as efficient as English sheep in the maintenance of English fertility. But what is the fact? The sheep is the very best live stock known to English agriculture, and man is virtually good for nothing. What would the English farmer do without his flock? Over all the oolitic, chalk, and gravel soils—the light-land districts of the country—to be deprived of the assistance of the sheep would be the ruin of the agriculturist. Man, on the other hand, is, as live stock, we repeat it, virtually useless to him. The excrement of a sheep is worth, at least, five shillings a year to the farmer. In South Lancashire the excrement of man does not realize fivepence per annum individually. The following table shows, as regards the leading towns of which particulars have been given to us, (1) the population—deducting the estimated number using water-closets; (2) the tonnage of manure removed from privies, more than three-fourths of which must be ash and cinder waste; (3) the value annually received for it at the depôt from the farmer; and (4) the value thus received per head of the population annually:

QUANTITY AND VALUE OF TOWN MANURE.

Name of Town.	Population using Privies.	Tons of Manure annually.	Money received.	Value per Head.
Liverpool	350,000	138,777	£ 8,000	d. 5·5
Widnes	12,000	1,800	150	3·0
Salford	120,000	38,600	4,000	8·0
Manchester.....	300,000	73,594	6,740	5·4
Bolton	75,000	22,465	1,567	5·0½
Bury	29,000	7,000	100	0·8
Oldham	77,000	50,000	2,000	6·2
Ashton-under-Lyne...	37,000	6,637	95	3·2
Southport	15,000	9,000	740	8·8
Total	1,015,000	347,873	23,392	5·5

“The sum of £23,392, which is here quoted as representing the money value of all the house waste of about 1,000,000 people, is indeed all that is received from 1,236,000, that number being the whole population of the towns named, and that sum being all that is received for what the scavenger collects; so that the annual value individually of man as farm stock in Lancashire may be put down as less than 4½d.; and this supposes the ash and cinder waste with which the excrement is mixed to have no share in the valuation.”

It is when speaking of the remedies for the nuisance arising from common privies and ashpits that the Commissioners, in referring to the use of various common deodorisers, observe that “the so-called dry-earth closet is much the best of these plans; and it is undoubtedly capable of being made an admirable scavenging expedient, so far as privy refuse is concerned. Of this we convinced ourselves at the Broadmoor Criminal Lunatic Asylum, where a large number of earth closets have been introduced, and are worked to the satisfaction of Dr. Meyer, the resident medical officer. At Wakefield prison too, all the lower cells are provided with earth closets; and although the closeness of a confined and narrow room was perceptible (the prisoners having been kept in till a later hour than usual on our visit), there was no offensiveness recognizable of the special kind that might have been expected. Here, however, the plan has been found applicable only to the cells on the male side of the house, in which separate vessels for the urine are provided. The earth for the Wakefield prison is dried in a kiln and supplied weekly to the closets, and the pans are removed as soon as filled; their contents, taken to a shed, are turned and pulverized, and used in the prison garden with advantage. At Halton in Buckinghamshire a pretty country village of 50 or 60 cottages, the roadside chalky soil is used successfully in the dry-earth closet with which every cottage

is provided. For this purpose it is screened and dried upon a kiln floor about 9 feet square; 100 bushels of coke being used in this way per annum for the 50 closets in the village. When hot and dry the earth is carried to the hopper in the back wall of each privy, which holds about 60lbs.—enough for 40 uses of the seat. The floor beneath is cemented so as to hold the liquid as well as the solid excrement; and the seats are hinged and on springs, so that on rising from them a portion, about 1½lb., is discharged from the hopper, and thrown upon the mass below. We came, without notice, one evening into the village, and examined about a score of these cottages, and found everything as clean and sweet as possible. Seats and floors in front, hoppers and cesspool floors behind, were all clean; and there was nothing to be seen but white dry earth, and no smell was perceptible. Moreover we were told that the cesspool, cleaned out as required three or four times a year, furnishes a material, which, after lying in a heap for some months under a shed is put upon the kiln again and used a second time. Last year 70 tons of stuff were taken out of the privies of the 50 cottages; 30 tons however had been used twice, so that only 40 tons were available for use upon the land; and it had proved a capital fertilizer, producing an abundant crop of grass where the manure had been applied.

“In all these cases, however, the chamber slops are kept separate; and independently of that the success depends not upon the people using the privies, but upon an officer whose business it is to look after them and keep them clean. Even at Halton one man is set apart for this work who attends to the kiln, to the provision of dried earth, to the keeping the hoppers full, and to the removal of the manure. Elsewhere we have known earth closets introduced for the use of cottagers accustomed to the old privy seat and cesspool; and, requiring special service and attention which the average man or woman will not give, they soon became filthy and offensive. Add to these circumstances the enormous aggravation of all the difficulties of the plan when not fifty but fifty thousand householders have to be provided with the necessary appliances and induced to work them properly, and we can have no hesitation in pronouncing the dry-earth system, however suitable for institutions, villages, and camps, where personal or official regulations can be enforced, entirely unfitted to the circumstances of large towns.

“At Lancaster, indeed, an attempt has been made by a neighbouring landed proprietor, Mr. W. J. Garnett, of Quernmore Park, to get the house scavenging of the town done upon a modification of this plan, and to deal with the whole excrement of the household upon the dry-earth system. By constant and even daily collection in tubs and pans the whole excrement is collected from a large number of houses, and the payment of 1d. a week per house is said to secure the collection of the chamber slops as well as of the privy contents. Nearly one-tenth part of the town is thus dealt with. Earth is sent round daily, and thrown into the privy holes, and when the pit is full the whole is taken to a depôt where it is mixed with material derived partly from street sweepings and ash-pit refuse; and being thereafter piled beneath a shed built upon a farm near the town, the whole is soaked with the collected urine.

“A sample carefully taken being analyzed in our laboratory proved to contain—

Organic matter and ammonia containing .207 of total combined nitrogen	6·671
Mineral matter containing .326 of phosphoric acid	66·782
Water	26·547

100,000

N

"These figures indicate a practical value certainly much below that at which we had been led to estimate it by mere inspection; and it is manifest, from the very small amount of total combined nitrogen, that much of the urine escapes preservation. An inordinate quantity of earth appears also to have been added to the excrementitious matters, since more than 93 per cent. of the finished manure consisted of nearly worthless mineral matters and water."

Secondly, we will examine the deodorizing results of irrigation. This is of far greater importance than the large profit derived in this mode from sewage. The improvement of the public health, indeed, must ever be the primary object with Boards of Health. Now this great question has been carefully and laboriously examined by the Commissioners who have, in each month of the year, by their own analytical chemists, in a laboratory belonging to the public, examined the sewage as it flows on to the land, in various places, and the effluent water as it escapes from the irrigated land into an adjoining stream. I select from this invaluable report the cases of Croydon and Norwood, because here we have to consider the results obtained from two widely different soils—the first being a gravel soil, and the last a stiff variety of the London Basin Clay. Of these two most important operations, the Commissioners observe:

"The following table contains the results of our periodical analyses of the sewage and the effluent water from the sewage farm at Norwood:

RESULTS OF ANALYSES EXPRESSED IN PARTS PER 100,000.

Description and Date of Collection.	Total solid matters in Solution.	Organic Carbon.	Organic Nitrogen.	Ammonia.
Average composition of the sewage before irrigation.	94.9	3.971	1.586	6.032

" 29, "	93.6	1.889	.210	.135
" Aug. 12, "	93.8	2.095	.332	.130
" 26, "	74.3	1.605	.370	.673
" Sept. 9, "	89.2	2.085	.300	.300
" 24, "	87.0	2.034	.517	1.128

"These results, extending over an entire year, show that the effluent sewage was, except in a few instances, so far cleansed, even upon this heavy clay soil, as to be admissible into running water without nuisance. Two of these instances are instructive, since they occur consecutively during and immediately after seven nights' frost, viz., in the samples collected on January 25th and January

28th, 1869. The frost was by no means severe, yet the organic nitrogen rose from .098 to .419 per 100,000 parts of effluent water, showing that the removal of offensive nitrogenous organic matter was partially arrested, and indicating that during a severe winter the purification of sewage upon a non-absorptive clay soil may be seriously interfered with. It is fortunate, however, that the admission of putrescible organic matter into streams during frosty weather is far less objectionable than it is when the temperature is higher, since the organic matter does not render the water offensive so long as a low temperature is maintained.

"The following results of analyses illustrate the effect of irrigation when carried out upon the porous gravelly soil of the Beddington meadows. It will be seen that the sewage as it flows upon the land possesses scarcely half the strength of average London sewage. The effluent water, even in the month of December, was satisfactorily cleansed and contained but mere traces of suspended matters.

RESULTS OF ANALYSES EXPRESSED IN PARTS PER 100,000.

Description.	Suspended Matters.

Of the profit derived from sewage-irrigated land we have ample evidence. It was when speaking of the

Edinburgh meads that the Commissioners observed (*Report p. 75*):

"The grass of the Lochend meadows has averaged during nine of the spring sales, at which it is disposed of by auction, £27 12s. 2d. per statute acre. During the year 1869 the highest price attained was £11 17s. 6d. per acre, and from that down to £19 per acre has been realized. The Italian rye-grass on the same farm has varied in price from £32 an acre for the first year's cuttings to £25 an acre for the second year's cuttings."

Nearly similar sums per acre have been received from the sewage-irrigated meads of Norwood and Croydon. These laborious researches I earnestly commend to the careful study of the agriculturist, the landowner, and the sanitary commissioner.

After a lengthened experience, I feel well assured that by no known chemical process can sewage be so well and profitably utilized as by irrigation. It is a mode of purification which nature points out to us and which in all ages has been the means of removing the excreta of the animal world. Neither is it a novel application by mankind. The sewage waters of Milan, of Edinburgh, and of Mansfield have long and successfully been employed in the irrigation of the grasses. It is a process free for every one to adopt; but not being a patent process, it has no set of patentees to publicly defend its very superior claims, or to contend, as they might, that irrigation is the only process, and all others attempted on a large scale sources of deception and misery.

F A R M F E N C E S .

At the dinner of the Boroughbridge Agricultural Association, Sir G. O. Wombwell in the chair, Mr. BENNETT, of Heston, read the following paper:

The subject I have to introduce to your notice for discussion is one that perhaps may not be so interesting as many others relating to farming; but, nevertheless, I think it is one of great importance, for no farm, however well managed in other respects, can be considered complete and in a high state of cultivation unless the fences are neat and in good order. I think very often too little care and attention have been paid to this particular branch of the farm business. How often do we see large gaps and thin places in the hedges filled up with dead thorns (often thrown carelessly into them), making them larger every year by their smothering, and consequently killing any young shoots that may be near them. No doubt there has been a great improvement in the management of fences during the last few years. The old high hedge with the wide hedge-side growing all sorts of rubbish and producing a great crop of both insect and vegetable nuisance is fast giving way to a better state of things, and where now seen it is generally more the landlords' than the tenants' doing, on account of the preservation of game. I know of no farming operations upon which there is such a diversity of opinion as to the best method of managing hedges, some being in favour of what is called cutting and laying or plashing; some advocating scotching or cutting one side, and leaving the other side to cut in a year or two after; others again advocate cutting off close to the ground, and by that means getting a young fence from the old roots. The old-fashioned plan of plashing an old thin hedge, leaving for stakes the live wood, and where thin filling up with dead thorns, and then binding the top, I think a very bad one, and I have no doubt we can account for many of the wretched bad fences we see from this mode of proceeding. The description of fences vary a great deal in different localities. In some there are high sod banks with furze on the top, and others are made by planting the elm, holly, &c. Some are walls made with the loose stones so plentiful in their neighbourhood; but mostly they consist of the white thorn or quick, and this being the case in this particular district, it will be better perhaps to confine the discussion to the best mode of treating young and good hedges of this description; and also the best way to restore an old bad one. In making a new fence, I think the quicks should be planted early in the spring before the buds show, about nine to the yard, a trench being dug and the sod turned down upon the roots on the level land, if there is sufficient soil; if not, a bank may be formed by cutting a ditch on one or both sides, and planting on the top, but I do not like the plan of planting on a bank unless necessary. The quick should be allowed to grow for a year, and then be cut down, kept quite clean from weeds, and left to grow for two or three years, when it may be put into form, which should be very like the letter V inverted. I would not touch with the knife the lower lateral shoots at all, but leave them to spread wide on each side of the bottom, and by that means preserve the hedge from the depredations of sheep and cattle. I think many of the hedges we see are trimmed too narrow at the bottom, and by so doing letting the sheep get their heads into

the centre of the fence. It is indispensable in getting a young hedge up quickly to keep it clean and well defended by posts and rails or other means, and on no account should it ever be slashed by making the knife cut downwards, but always upwards, and I think the best time to do it is in the autumn. In the next place I come to a much more difficult part of the subject, viz., the best way to improve and restore an old bad hedge. No doubt it is the cheapest way in the long run to stub it up, and plant a new one at a short distance from where the old one stood, but under many circumstances this cannot be done. I think the best way is to combine the two systems of scotching and plashing—scotching where there is plenty of live wood, and laying and lapping a thorn from both sides of the gap, so that, if possible, they should meet in the centre, and be fastened down to the ground with some pegs that have hooks, and a nick or two cut in the layers to make them put out young shoots. All the roots and rubbish should be well forked out, and the hedge kept clean, or the tender shoots will not grow. When free from hedge-row trees, it would be perhaps the best plan to dig and manure the land in the gaps, and plant with young quick-wood, at least if the thorns should not be long enough to reach each other. I have seen some very old bad hedges make great improvements by this way of management, although it is very seldom anything will thrive where there are many trees growing, and I may remark that nothing hinders or spoils the cultivation of a farm so much as having a quantity of hedge-row trees, especially ash trees. Their roots being so near top, take all the goodness out of the soil, besides breaking the implements used. Another plan I have seen adopted is to lay the thorns on one side of the roots or stools, so that you have a guard fence during the time the young shoots are growing up. The objection to this way is that the guard fence is taking the greater part of the nourishment the old roots should give to the young shoots, and consequently they are not so strong and vigorous as they should be. With respect to the best and cheapest manner of forming dead fencing for thin places and gaps, I prefer turnip trays. Some years since I bought several dozen from the neighbourhood of Peterborough. The cost, including railway carriage, was 2s. 6d. each, but I am told they cannot now be had for the same price. They were made of riven oak heads, hooped. The rails were made of ash saplings, either whole or split down the middle. Trays made in this manner are far better and much more durable than those made of sawn wood. I had them in constant use for the purpose of putting down in gaps and at the side of thin places; the labour is very little, and they can be soon shifted from one place to another when required. I had them I think eleven or twelve years, and they were sold when I left my farm for within a trifle of what they cost when new. Perhaps the neatest and most durable wood fencing is what is called railway fencing, made of foreign timber. The expense I believe runs about 1s. per yard for sheep guarding, and 1s. 4d. per yard for cattle. The standards are driven down with a mallet, and the rails are fastened with clipped nails. Posts and rails are most

generally used, the cost depending much upon the locality, but I prefer the railway fencing. I believe the material is very much the same price as the railway fencing, but the labour in putting them down is much heavier and more expensive. I have to thank you for listening to these remarks, and I hope they will be the means of eliciting the opinions of those present on a subject which is too little thought about, and that we shall be able to learn something by mutually communicating our ideas to one another.

The CHAIRMAN was received with applause. He said he was very much obliged to the gentlemen present for having drunk his health so cordially, and it was a pleasure to him to attend the present gathering. As Mr. Smith had said, he purposed making a few remarks on the subject which was to be brought under discussion. He had to thank Mr. Bennett for his very instructive paper, and he would follow him in offering a few remarks on the same subject. He was very fond of jumping over farm fences at a certain season of the year, but he also took equal delight in rearing and training fences, as they should be upon every farm and estate, for in his humble opinion nothing improved the look of a farm so much as neat, well-kept, and well-shaped hedges, and he might also add good gates. He meant nicely painted gates, well hung, and capable of being opened, if required, without a person riding having to dismount his horse, or being obliged to strain his muscles in attempting to lift them—gates not fastened by an old halter or a broom handle. He was deviating from his subject, but whilst on the subject of gates let him add that, hunting as he did every day in the week, on every side of the country, he saw the most remarkable gates and fastenings; and he could assure them he often envied the owners the brains they must have in inventing such fastenings; and he often thought what a pity it was that they did not turn their powers of invention to better account. But, to return to our farm fences: Some twelve years ago it occurred to him that many acres of estate were wasted by growing wide, crooked old fences, full of hedge-row timber, and much of it of no value whatever. He therefore made up his mind to stub many of them up, and to throw small fields together, so as to have a few large enclosures instead of many small ones. He found it a slow and tedious process, and also an expensive operation; but, being fortunately blessed with a set of tenants all anxious for improvements, with their assistance he had succeeded, and he might say that his tenants and himself had stubbed and grubbed up miles of old hedge-rows. In this way they had thereby improved their farms and his estate. In this way, as many present well knew, the look of the country had been changed. With their permission, he would now tell them the system adopted with regard to planting quickwood and rearing it. In the first place, the planting of new quicks on the site of the old fence was carefully avoided. It was then trenched 18 inches deep by thirty wide. If planting on sward land, the sods were first pared and then chopped into small pieces and thrown back into the soil. The quickwood was next planted in a single row as soon after Christmas as possible, and left for one year. After allowing it one year's growth, it was cut off close to the ground, and it then put forth very many shoots, which grew strong and well. In the third spring, the tall shoots were cut down again, carefully leaving the lateral branches, which, of course, spread out, and make a good thick bottom. The fourth year and every subsequent year it was allowed to rise about a foot, and, by training it in this manner, and shaping it like the English capital letter A, it became a good sheep fence between ploughing fields in seven years, and a good fence between grass fields in ten years, and not requiring any guard fencing. He measured one on his farm on the previous day. It was nine years old, and was five and a-half feet high, whilst at the bottom it was exactly six feet in width. In rearing farm fences, the great secret he had found was to keep the quickwood well cut down the first four years, so as to grow thick at the bottom, and, above all, to keep it clean and well protected from sheep, especially lambs, which would injure it as much as hares or rabbits. He considered it a waste of time and money to attempt to get up young quickwood fences where there was much ground-game, it being impossible, as he had found out himself, to do so before he reduced the ground-game upon his estate. These

young fences, when seven years old, and trained in the way he had mentioned, were the best possible protection for winged game, as they were narrow at the top and wide at the bottom. A partridge could sit close to the quickwood, perfectly protected by the side or lateral branches, which covered her so that no dog could get near her. And let him tell them for their information, and for the information of landowners generally, that when he first commenced to grub up these old fences, so dear to all gamekeepers, that an old and excellent keeper of his informed him gravely that there would not be a place left for a bird to nest in, and that the new hedges would be useless. Last year, however, when out shooting, he came to a new hedge about eight years old on one of his farms, and this good keeper's retrievers could not extract a dead partridge from the bottom of the fence into which it had fallen in consequence of the width of it. The keeper turned round to him with the remark that "these ere hedges are the best for birds to nest in I ever saw." The man was converted, and he saw and was satisfied that he had done right in the course he had adopted. He said nothing to the keeper in reply to this remark. There were several present who knew the fences on his farm and estate, but should anyone whom he then addressed have not seen them, and would like to see for himself, he should be glad to have a visit from him, and he would point out to him hedges from two to ten years old which no other estate in the three ridings could beat.

Mr. CALDER said he had recently spent an hour or two in riding over and looking at the Newburgh estate, in company with Sir G. O. Wombwell, and he could say that he never saw better gates, and he had not once to get off his horse to open one. The estate, from what he saw, was one of the best managed he had witnessed since he came from Scotland to England. The hedges, too, upon the estate were very good. The best time to plant a new hedge was in November and December, or in February. In his opinion the best of all hedges was a stone fence, but the cost was great, and they could not be adopted except in a stone country.

Mr. T. SCOTT (the Secretary and the Vice-Chairman) quite agreed with Mr. Calder considering that one of the most prominent features of the proper management of an estate was good fences kept in proper order and duly cared for. He was of opinion that in the planting of quickwood four to the yard was sufficient, and that six to eight or nine was far more than necessary, and when planted the whole of them would not live. The quickwood could be well manured for three halfpence per yard, and this treatment was the means of getting up the fence as quickly as possible. In the cutting of a new fence it ought to be struck upwards, and never downwards, and the proper time for planting was to his mind in October. He deprecated the system of cutting down and laying old fences, as nothing was so detrimental to the thorn, which was in fact murdering the plant itself. Speaking of guard fencing he considered post and rails expensive, as they were rubbed against by cattle, but the American fencing was smooth and handsome. No estate of any magnitude ought to be without a saw mill, as by it a great amount of timber would be made available for fencing which otherwise could scarcely be sold at any price. It was to the interest of both landlord and tenant to have good fences on a farm, more particularly to the landlord. The keeping of the bottoms of hedges perfectly clean, and encouraging the lateral shoots to grow, was the proper means for securing good fences. He agreed with the hon. baronet as to the importance of good gates properly hung. Really good gates were scarce, those that would readily swing backwards and forwards and shut themselves. Many of them dragged upon the ground and soon became out of order and destroyed. They would not swing easily, and farmers who had such gates on their farms were rightly served if they found them left open.

Mr. JACOB SMITH spoke of railway fencing being good, but too expensive. As a guard fence there was nothing so good as oak posts with a single line of rails in front of an old hedge, by which cattle were kept from injuring it.

Mr. BENNETT, in acknowledging a vote of thanks, said that he did not approve of stone walls as fences. Loose stone fences were always getting out of repair, and they gave the country a cold and bleak appearance.

AGRICULTURAL CUSTOMS.

An adjourned meeting of the Midland Farmers' Club was held at the Royal Hotel, Temple Row, Birmingham, for the further consideration of the paper on Agricultural Customs, which was read by Mr. W. Fowler, jun., at the meeting in April; Mr. W. Brewster, President, in the chair.

The discussion was resumed by Mr. R. H. MASFEN, who had reduced his remarks upon the subject to writing. He was most anxious to know the views of Mr. Fowler and gentlemen of his profession upon the following points; First—Is the generality of land farmed well? Does it produce as much as it is capable of doing? What is the percentage of farms not directly handed down from one occupying member of a family to another, which are left in a good and desirable state of cultivation and condition? Next—What are the means of securing that desirable state alluded to? by whom must that expense be borne? And are, or are not, existing agreements tending to the encouragement of good husbandry, or to the depreciation of the land during the last few years of the occupation? It must be admitted that those who expend liberal sums in manure and feeding stuffs farm in a manner to make the land of greater value than when those appliances are withheld; and hence the cause of hearing so much on this subject. He would give a simple illustration on a farm of 400 acres—50 grass and 350 arable. He would contrast the grain crops in their respective value where farms are left in good condition with those which had been impoverished during the last years of occupation, and give proposed scales of compensation numerically. In the first case he should give the scale for artificial manures or purchased food, assuming that £200 per annum was expended for food, and £200 for manure. This proposed to give one-third of last year's manure bills, amounting on the £200 to £66 13s. 4d.; one quarter of the last year's but one purchased food, £50; and one-third the last year, £66 13s. 4d.; total, £183 6s. 8d. Now, if he grew one-half quarter per acre more wheat and barley, and sold the former at 40s. and the latter at 30s. per quarter; he was a gainer of £96 13s. 4d. in the first two years' crops, after paying the in-coming tenant the amount due to him on the scale referred to. The next scale proposed the same scale for foods as the last, but two-thirds instead of one-third for artificial manures:

One-quarter last year but one for food...	£50	0	0
One-third last year for ditto ...	66	13	4
Two-thirds of manure bill for roots ...	133	6	8
Total ...	£250	0	0

Now, if he grew six bushels of wheat and six bushels barley more under this scale than where no consideration to a quitting tenant was made, and the farm had been impoverished, he sold: wheat, £240; barley, £180; total, £420; amount received over in-coming payment, £170: a good return for his first outlay. The next was Mr. Cadle's prize agreement, and it gave on £200 for purchased foods:

One-quarter last year but one.....	£50	0	0
One-half last year	100	0	0
One-third last year but one for purchased manures	66	13	4
All the last year's, provided it is used for roots...	200	0	0
Total	£416	13	4

Now with this liberal allowance they would expect to have better crops than in the others; and one quarter per acre additional to the crop on an exhausted farm was a very moderate amount to put the increased crop at, which, at the same price as the other scales, would give

For 160 quarters wheat at 40s.	£320
For 160 quarters barley at 30s.	240
Total	£560

Hence they had a profit of £143 6s. 8d. They would see the

advantage was greater in the second illustration than in the third; and the only alteration he should suggest in the third was that the allowance for purchased manures should only extend to the last year, and he thought the returns would not be materially effected by the change. That would stand thus in the table:

One-quarter last year but one for cake	£50	0	0
One-half last year for cake	100	0	0
All the last year's manure	200	0	0
	£350	0	0
Thus for wheat	320	0	0
„ barley.....	240	0	0
	£560	0	0
Deduct	350	0	0

Total amount in first two years over amount paid on entry	210	0	0
---	-----	---	---

The amount of compensation should not be a matter of doubt or litigation. To those persons who doubted the desirability of such a practice being more generally accepted, he would reply by asking them to tell him how the landlord's interest was in any degree interfered with or encroached upon? The landlord was equally interested with themselves. He secured a class of tenants he never had before; the country at large was an immense gainer by the increased amount of native produce; and the additional amount of labour required to carry out the general requirements of good farming must tend to a beneficial result in all ways. He would ask how long a farm that was run out would be in regaining its natural producing powers under good management? He heard from some of the greatest land values that it will not much improve from the exhausted state for eight or ten years. Now the tabular statements which he had given had reference only to the improved crops of the first two years of the new occupancy, and showed a net gain to the income by paying for food and manures so as to retain the soil in an unimpoverished state, demonstrating beyond all power of contradiction the desirability of preventing exhaustion, which is so much encouraged by the present unsatisfactory covenants. Let the tenant be compensated for all improvements which have been effected by the landlord's consent (those of a permanent character must be paid by the landlord, as his land is worth a higher rent from the same) and the in-coming tenant should pay for acts of husbandry and unexhausted foods and manures. He believed such an arrangement would be fraught with unknown advantage, not only to the owner and occupier of the land, but to the community at large. Land must be well farmed and left clean, and those who did not so leave it ought to be made to forfeit a sum sufficient to repay the in-coming tenant for the additional outlay which he had to make. Under the old and general farm covenants he would impose no such thing, as nearly all of them tend to foster bad farming in every way during the last years of occupancy, both as to condition and cleanliness. In this he was aware the generality of the most thinking men and best landlords, agents, and farmers, agreed with him. The one great thing which was lost sight of was that when a farm was left the incomer was, in the majority of cases, called upon to expend large sums in cleaning and manuring the land before he got any return for his outlay. Would not this be more advantageously met by the farm being returned in a good state by paying the off-going tenant, and thus preventing the injury and spoliation that arose by a tenant having to take out of the land that which he had put in, because he receives no benefit from that which he leaves behind? Corn grown and consumed on the farm he would not allow for, neither for artificial manures used for the growth of grain crops. The proposed compensation would encourage men to farm so as to leave their occupations in good order, and would

attract capital to a branch of commercial enterprise which has occupied, and ever will occupy, an important and indispensable position in a nation's wealth, prosperity, and independence. Although we had imported annually during the last three years £37,000,000 in the shape of grain, and £5,000,000 worth of cattle, besides other articles of consumption, our teeming population required it all; and any protracted drought or continuous rain caused a marked difference in the value of agricultural produce. It was, therefore, imperative that no barrier should interfere with the best returns which a grateful soil is ever ready to yield.

Mr. BROWN regretted that the landlords had not manifested a greater interest in the discussions which had taken place upon the subject. It might be that they were apprehensive of losing something by any changes which might take place in the present system of customs and covenants; but he thought this was a very erroneous view. All the farmers asked was that they should be encouraged to cultivate their land so as to increase the amount of produce, and to employ more labour. One Warwickshire landlord, however—Lord Leigh—took a deep interest in the question; and he was sure that nobleman would not suffer, but rather benefit, by the graceful concessions he had made to his tenants. He was glad to find that, with a single reservation as to the last year of the tenancy, Mr. Fowler was not in favour of binding farmers to any fixed system of cropping; for such restrictions would never make a bad farmer into a good one, and he had seen land as thoroughly exhausted where a certain rotation was insisted upon as where the tenant exercised his own discretion. He was afraid Mr. Fowler was too much in favour of the six months' notice to quit, and he believed that a twelve months' notice would greatly tend to the improved cultivation of the soil—[Several voices: "Three years."] Buildings should be erected by the landlord; and if it was inconvenient to him to lay out his money, and the tenant was disposed to do so, the latter should be allowed to erect them on the understanding that he was repaid by the landlord at a fair valuation on expiration of tenancy. Draining, too, should be done by the landlord, and interest on the amount be charged as increased rent upon the tenant. In regard to compensation for unexhausted improvements, he thought it was desirable the Legislature should provide that all disputes should be decided by arbitration; and that a public umpire should be appointed to decide upon cases where the arbitrators appointed by the respective parties could not agree.

Mr. KING said it was a gross injustice that the law should allow a heir on succeeding to an estate to turn out the occupying tenants, almost at a moment's notice.

Mr. FOWLER said that the stringency of the law of which Mr. King complained was considerably modified some years ago.

Mr. HOUGHTON said that since the repeal of the Corn Laws every child born in this country had been fed by the produce of foreign countries; and that if landlords did not themselves make alterations, it was certain that alterations would be made for them, since it was dangerous for us to go on importing foreign food even faster than the increase of population.

Mr. MAY said there was great difficulty in stating the precise amount which ought to be awarded to a tenant for compensation, but all must agree that something ought to be done. He thought they were in a fair way for arriving at some decision, since the discussion of this topic was now general all over the country. If in the face of low prices for corn they were to go on spending their money, they must know under what guarantee they were doing so. He did not wholly agree with what had been said on that occasion as to the amount of compensation. The phases of the question were so various, and each ought to be considered so thoroughly, that he thought it would be hardly possible to lay down any particular rule. They all knew that the amount of corn or cake consumed very much altered the value of the manure. Mr. Lawes, and most gentlemen who had made it a matter of study, averred that beyond a certain amount a beast did not assimilate the whole of it. But if you gave a beast 4lbs. of cake, the probability was that it would assimilate more in proportion than if you gave it 8lbs.; and they all knew that our best feeders—those who fed for show purposes—gave an extreme quantity. Now it was said there would be great difficulty in knowing whether a man had consumed all for which he put in a demand. Some said you must bring vouchers, and here a great difficulty would

arise. Still they must have some arranged plan of compensation, which must be left to the decision of men capable of judging. If it had been achieved in other counties it could be achieved in this, and consequently in all other counties. He, himself, was a lease man, and preferred a lease on liberal terms to any other form of holding. He could not see why, under a lease, the land should not be left in as good a state as under any other kind of agreement. The six months' notice was a very dangerous thing when exercised in an arbitrary fashion.

Mr. T. B. WRIGHT said that he still thought the question before them should be discussed upon a wider and more extensive basis than it had hitherto been. So far as that Club was concerned, it had resolved itself into that of unexhausted improvements only; and it certainly was to be regretted that some general rules on this point had not long since been arrived at. But he must again express the opinion, that whatever scheme of compensation they might establish would prove an inadequate protection to tenant-farmers who held their farms subject to either a six or a twelve months' notice to quit. He thought either long leases or some arrangements of a similar character, would alone satisfy the requirements of the case. The state of agricultural affairs in Ireland had lately attracted public attention in an extraordinary degree; and in one province of that part of the United Kingdom, Ulster, a state of things existed which had been productive of the best results to both landlords and tenants. The Ulster custom was not founded upon any written law; but he believed the late Earl of Derby had said that he was as much bound by it as though it had the authority of an Act of Parliament. A recent writer, speaking of the extraordinary prosperity of Ulster, said: "Strangers see in the north of Ireland a province in no special way favoured by Heaven, with ruder air and less generous soil than that of the fertile and sunny south, and here in this 'black northern' county is centered all the prosperity of the land." He did not know whether the legislation which was found necessary with regard to Ireland would be applied to this country, but that some changes in the tenure of land were necessary there could not, he thought, be a doubt. At the same time, it would be unwise to rely upon any half measures, or to pretend to make changes when in reality the object was to keep matters very much in their present state. Every one must be satisfied that it was absolutely necessary for the welfare of the community that the land of England should be made as productive as possible, and should employ a fair share of the labour of the country, and it would, he thought, be unwise on the part of the landed interest to disregard the state of public opinion and especially in many of our large towns. But although he ventured to urge that compensation for unexhausted improvements was by no means all that was required, yet under any circumstances questions of this kind would from time to time arise, and he thought both the Club and the agricultural interest generally were indebted to Mr. Fowler and to Mr. Masfen for the clear and able manner in which they had treated the subject.

Mr. LOWE contended that the farmers had not hitherto sufficiently looked after their own interests. He should, no doubt, be told that farmers in this country were placed in a peculiar position, by reason of there being so great a demand for occupations; but since they were dealing with a limited commodity they should be the more careful as to the conditions on which they took it. By their eagerness to obtain possession of farms the farmers enabled the landlords to impose restrictions and exact conditions which were manifestly unfair to the tenant. What was wanted was a fair and equitable agreement between landlord and tenant; but if they waited for legislative interference he feared they would for a long time remain in suspense.

Mr. WINTERTON said that many tenants stood with open hands to invest their money in the land, if they had guarantees for compensation, which, he contended, they should demand, not as a favour but as their right. He himself had so invested his capital, because he felt he was doing what he ought to do as an occupier; for he held that the man who had a farm under his charge was bound, not only in justice to himself, but to the whole country, to make the best possible use of it. Still he must say that this investment of his capital had often been to him a subject of very anxious thought, and had caused him many sleepless hours, especially in regard to the family growing up around him. All farms ought to be taken under a fair agreement, and if this were the case, he believed the

produce of the land and the stock which it carried would be almost doubled.

Mr. FOWLER made only a brief reply, in which, with reference to the difficulty which it was supposed tenants would experience in making out claims for compensation, he suggested that they should enter in a separate book, or place upon a separate file, the accounts on which they based their claims. He agreed that where landlords were not prepared to drain, or to erect buildings, the tenants should be allowed to do it by an agreement which was equitable to both parties. As to the six months' notice to quit, he contended that much might be said on both sides; and that landlords did not turn out good tenants, for they were not over plentiful. He did not think any allowance should be made for manure used in the growth of corn crops. Speaking generally, with regard to purchased manures, he thought two-thirds of that used in the last year and one-third of that in the year before, would be about a fair allowance. Concerning corn and cake he should say one-third and one-sixth respectively for the last and previous year. In conclusion he said he would submit a resolution which was moderate in tone, and would, he thought, be agreed to by all present. His friend the Chairman had wished him to go a little further; but as probably this would give rise to discussion, for which the hour was too late, he had preferred to let it remain in the following form: "That in the opinion of this meeting it is highly desirable, both in the interests of the landlord and the tenant, that a fair and reasonable allowance should be made to an outgoing tenant for unexhausted purchased manures, and also for corn and cake consumed upon the farm within the last two years of the tenancy."

Mr. MASFEN seconded the motion, which was carried unanimously.

THE ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

The spring session closed with the usual distribution of diplomas, certificates, and prizes. About nine o'clock in the morning the visitors, professors, and students assembled in the College Chapel, and after a short service, adjourned to the theatre of the institution. Mr. Holland presided, and in giving away the prizes each professor made some remarks upon the work which had been done during the past session in his own department.

Professor WRIGHTSON expressed satisfaction with the attention which had been given to agriculture proper, and spoke of the growing interest in that very practical part of agricultural studies, manual work, which had become, he might say, a recognised institution at the College. A year ago the attempt was made to stimulate interest in this direction, and he felt confident that the large body of students he saw before him would bear him out when he said that the practical work on the farm now occupied an important part of their leisure time.

Professor CHURCH, after a few prefatory remarks regarding the progress of students in chemistry, gave a short epitome of the various subjects which had occupied his attention in the laboratory during the past session. He had devoted much time and care to the preparation of the new edition of the Laboratory Guide. The whole of the volume was in type, and would be published before the opening of next session. The Guide has been doubled in size, but, he hoped, increased in clearness as well as completeness. The first part, entirely new, consisted of 32 lessons of chemical manipulation, intended to teach practical chemistry in a way fitted for general adoption in colleges and schools. A series of experimental grass plots had been arranged in order to test the results of the continued application of certain manures to definite mixtures of grass and clover seeds: a series of sugar determinations in sugar beets, taken up at short intervals last autumn, had been completed. A new substance (cyclopia acid) had been discovered in the *Cyclopia Vogelii*, one of the plants used by the African Boers for tea; three new minerals, interesting from a scientific point of view, had been examined, and the usual work of water, manure, and other analyses had been carried on.

After some remarks from Professors McBride and McNab, the Principal spoke of the general good conduct of the students throughout the closing session. With regard to what Professor Wrightson had said upon practical work, he entirely concurred, but he would ever hold the opinion that, valuable as a know-

ledge of practical (manual) work must be to the farmer, the first object of the college was to encourage study and to communicate scientific knowledge. Without in the slightest degree deprecating the importance of practical work, he wished to remind them that it must ever hold a subordinate position with regard to more abstract study. While speaking upon the point, he must not forget to acknowledge the most kind and earnest interest Mr. Swanwick had taken in the encouragement, by prizes, of interest in farm work. Mr. Swanwick had allowed students every facility for acquiring practical skill in the sheepfold, the feeding sheds, and the fields, and he had given a large amount of his time in deciding who was the most eligible candidate for his prizes.

Mr. HOLLAND spoke at some length upon the objects of the promoters of the College and the success which up to the present time had been achieved. He also drew the attention of students to the means afforded by the College Club of continuing in after life friendships made while at college. The Club ought to become every year more important and more useful, and he hoped to see a large number of old students and old friends at the approaching Club meeting at Oxford.

Four candidates for the diploma then received their certificates of membership, namely: H. Willett, Lewes, Sussex; J. Edwards, Leamington; E. Jackson, Darlington; M. Granados, of Mexico. The certificates of honour and prizes having been distributed, the meeting separated.

SHEEP WORRYING.

At the Yeovil County-court, last month, a watchmaker and jeweller, of Yeovil, named Dobell, brought a claim against the son of a farmer, Mr. John Brooks, to recover the sum of £3, the value of a dog, which the defendant had shot. It would seem that some time in April last a Miss Cook, accompanied by the dog, was walking through a field of the defendant's, in which were a number of sheep, when the dog gave chase to a lamb, which he seized, and began to worry. Mr. Brooks, jun., at that moment came out of his house, and, shouting at the animal, caused it to leave its hold of the lamb, which at that time appeared to be dead. The dog had not, however, gone far before Mr. Brooks shot it dead. Under these circumstances, the action was brought to recover the amount above named.

On the part of the defendant it was not for a moment denied that he shot the dog, but it was contended that he had perfect right to do so. The dog, when first seen, had the lamb, which was only about six weeks old, on its back at the time, and was shaking it. It was impossible to have shot the dog before it left the lamb, or in all probability that would have been shot as well. The losses occasioned to Mr. Brooks by dogs worrying sheep were stated to be nearly £100 a year; and Mr. Watts, who appeared for him, argued that the conduct of the defendant had been perfectly justifiable in order to ensure the safety of the sheep; and he quoted an opinion from Oliphant, in support of his case, as follows: "To justify a person in shooting a dog for worrying his sheep, it is not necessary to prove that he was shot in the act, but it is sufficient if it appear that he has been accustomed to worry sheep and could not have otherwise been restrained from doing so."

On the other hand, Mr. Ellis, who represented the plaintiff, argued that the dog having left the lamb, defendant had no right to shoot it.

His Honour took a similar view of the case. If the dog had been in the act of worrying the sheep, or if he had been running after them, and they could not have escaped without the interference of the defendant, the law would probably have upheld him in his act. But here it seemed he had waited until the mischief had been done, and he killed the dog when it was not necessary for him to do so in order to prevent a recurrence of the attack, for the dog was going away; and that being so his remedy against the owner of the animal would have lain in an action for damages, and not in killing the dog.

Evidence was then given as to the value of the animal. By the plaintiff it was stated to have been a valuable retriever. The defendant said he should be sorry to be seen walking about with such a "mongrel" after him.

Ultimately the judge, Mr. Saunders, gave the plaintiff a verdict for 30s.

CALENDAR OF AGRICULTURE.

Drilled crops must be thoroughly cleansed, by scuffling and hand-hoeing, so that no weeds are seen to grow. The intervals of the drills are thoroughly followed by the horse-hoe repeatedly applied, and the ridglets broken and pulverized by the two-hand hoeings, which thin the turnip plant and destroy the weeds. Potatoes, beetroot, and cabbages are cleansed in the same way, and any tall weeds that may rise after the last scuffling and hoeing are pulled by hand. Before the haulm of potatoes has grown over the intervals of the drills, the ridglets are earthed up by two deep and heavy furrows of the double-mould-board plough, done in the interval of 10 to 14 days apart, the plough drawn by two horses, walking two drills apart, with a main draught-tree of 5 feet in length, the ridglets being 3 inches distant. The plough moving in the intervening hollow, a wide scope is afforded for throwing a deep furrow of soil over the sides of the ridglets, in which the tubers have room to protrude and swell. This finishing process of a deep and wide tillage forms a very chief point in the cultivation of the most valuable root that is enjoyed by man in the largest variety of purposes, from the table of the peer down to the feeding of the pig and the peasant, and in the various conditions of boiled or steamed, raw, washed or dirty, used alone or mixed with other substances. No other root permits so many applications.

Lay lime, dung, and composts on wheat fallows, the lime being previously laid in a longitudinal heap on the headland of the field, turned over and pulverized into a hot causticity by the application of water. In this condition the pulverulent body is spread over an extent of ground to the right and left of single-horse carts, by hand shovel in the allowed quantity, and harrowed into the ground by a double tinc. Another method places the cinders from the carts in small heaps on the ground, and covers with earth, and spreads the lime over the surface, when the rains and the moisture of the lengthening nights have dissolved the cinders. A recent method breaks the crude limestone into small pieces, which are burned into cinders, that are spread over the ground, covered by a furrow of ploughing, dissolved in the ground by the moisture of the soil, which is heated and the temperature raised by the warm and damp exhalations that are emitted by the process of dissolution. This way agrees well with the doctrine of lime conferring its benefit to the ground by the caloric of the incinerated body warming the ground and raising the temperature, which is very favourable to every vegetable life. The first-mentioned way of the lime being in the condition of quicksilver from a fresh dissolution of the cinders, and consequently running into the mo-t minute crevices in the land, spreads the warmth most evenly and intimately into the ground, and coincides more fully with the theory of the warming effects of lime, to which there is the strongest probability attached, and rises above the "*scientia media*," which is above conjecture, and below certainty. The warming effects of lime may be a fixed certainty, which are most generally lost or made very weak by reason of want of quantity, and from the land being a conductor over a fallow of caloric, depending mainly on the mixture with animal and vegetable remains. Hence arises the failures and the success of lime as a manure.

Farm-yard dung is laid on fallowed lands, cleaned of weeds, with all stones removed, and the soil pulverized. Small heaps of dung—from 12 to 15 two-horse cart

loads, and about 20 loads of single carts to an acre—are spread evenly over the surface, with lumps of dung, broken by hand and fork, and covered by a furrow of ploughing. A lad or woman may follow each plough, and gather into the furrow of the plough any piece of dung that lie on the surface, having escaped the covering furrow. The nicer ideas on the subject of evaporation lay the land into ridglets by one furrow of the common plough, the dung is spread along the hollows, and covered by splitting the ridglets with one furrow of the plough, which in going and returning opens a furrow and covers another. A cross harrowing will be required to level the ground for the seed furrowing of the land, or the ridging of the land may be done across the line of the seed furrows, and omit the harrowing. In the applications of farmyard dung, the advantage will appear of the straws being cut into short lengths by the steam-thrashing machinery. The covering in the land will be rendered more convenient, and the mixture will be more complete of straws, urine, and solid feces.

Supply to work-horses and cattle in the yards ample stores of vetches, which will be the green meat of the farm, and will constitute a good food from the pods of seed being formed. The second crop of clover will come into use, and the most necessary and constant (quite possible) supply of green meat being provided, the yards will be filled in summer, making dung as good as in winter, from horses, cows, cattle, and store pigs voiding much urine and mucilaginous feces. Ample littering must be afforded.

Keep the draft ewes on good pastures, and at the end of the month place them with the ram for early lambs. The lambs of the year must have a good maintenance.

Carry to the liquid manure tank all vegetable substances in a reduced bulk, with fine earths and scraping collections. Or the tank may contain liquids only, and the earthy bodies may form a dry compost heap, with caustic lime as a solvent of coarse substances, and mild lime as a mixture for minute substances. This heap will be most useful for receiving all reducible bodies into a compost.

Sow in the end of the month, on stubble ground of good quality, rye and tares for the early spring use, and sow on beds of well-prepared land the seeds of drum-head cabbages, kohl-rabi, savoy, and brocoli, for plants to be used next spring. The plants require to be transplanted into lines, to prevent shooting into seed too soon.

Cut all tall weeds on sides of roads, and on ditch banks, before the seeds are ripe, which, being light and feathery, are carried by the wind into places where they grow, and give much trouble. A special clause of agreement should stipulate the destruction of such pests.

This month constitutes the general season of the harvest of grain crops over two-thirds of the United Kingdom. In the earliest districts, the reaping is concluded by the end of the month, in next earliness the crops are reaped and finished by the first half of next month; while in the farthest northern parts, the whole business falls into September with a remnant into October. The earliest cuttings permit of the sowing of turnips on stubble lands, to be consumed on the ground as sheep feed in early winter, and also the scuffling of the ground, and the burning of the rubbish for winter sowing of suitable plants, and of pea and bean grattans, for wheat. The burning of the surface freshness makes a good manure.

Wheat is cut by hand sickle, tied into sheaves of a

moderate bulk, placed in shocks of twelve sheaves, two of which in the northern latitudes, are reversed, and serve as a hood for covering the shock. This precaution defends from rain, but retards from drying after the stack has been drenched by heavy rains. Still the practice is approved of by many. When fully dried, the crop is carried and built into ricks, or lodged in barns.

In early and dry climates, oats and barley are mown by the scythe, and dried as hay, and placed in ricks or in barns; on being turned and dried in the swathe for some days, the crop is tied into sheaves, carried and lodged. The binding suits better for the thrashing machinery. Peas are cut from the ground by hand sickle, laid into small heaps, which are turned over, and dried, and carried into ricks or barns. Beans are cut by sickle into small sheaves, and tied with straw ropes or tarred twine, which last may be preserved for several years. The cutting of the crops is done by day labour, by the acre or by the sheave, as may be most convenient. But in general day labour will be the most eligible, and when properly directed and carefully superintended will always produce the best execution of work; contract ever leads into deception and quarrels.

Reaping machines, which are known beyond description, are employed to cut grain, and have attained a very considerable employment. But a success in the exceptional cases of favourable circumstances is not by any means sufficient to establish a practice on a principle for general utility; a majority of similar results is most essential in all such cases of application and performed under the greatest possible variety of circumstances that can be ex-

pected to occur. The original cost of the machine is large, and consequently requires a large extent of farm ground on which to effect its reimbursements. Hence its ineligibility for small farms. All wheels require a level surface on which to run, and the operation requires a crop of rather strong stems, standing close rather than thin, of uniform height, and but little bent from an upright position. The application is awkward by the draught power being attached to the lateral end of the machine, and thus requiring an open cut at the side or in the middle of a field. The physical obstacles of uneven surfaces, hilly grounds, and swelling undulations, along with thin crops, and a frequent break down from heavy rains, with twisting and intertwining by winds and storms, may confine the use of the reaping machine to the benign climates of South Britain, and to the extreme parts of it, with a very partial use over the whole of Scotland, and North of England, owing to the physical and adventitious obstacles that have been mentioned; and as the value or utility of any discovery, invention, or calculation is not to be gained till time has sobered the enthusiasm of its advocates, a fair inference may be deduced that the cutting of grain crops may remain a manual operation notwithstanding all the ingenuity has been expended, that will appear in mostly all attempts of novelty. The toothed hand sickle continues to make the neatest work; the scythe sickle, though easier drawn, and with less power, cuts the stems before being caught by the hand, and in thin crops strews the ground with a dirty work; but in careful handsthe use is very eligible with strong crops.

CALENDAR OF GARDENING.

KITCHEN GARDEN.

Sow the main crop of turnips—the Early Store or Dutch—in drills, with an inch or two of good manure, and a pint of bone-dust to each barrow, three inches directly over the intended rows; and these drills should be struck in ridges, formed by taking a little of the earth from the spaces between them. Choose an open spot of land outside the garden; for turnips rarely prosper within it. Hoe and thin the plants as they grow, till, at last, they stand about nine inches apart, above two feet from row to row.

Sow in the first week the main crop of next year's early cabbage—in the most southern latitude, from the 6th to the 10th, in the northern parts, a week earlier, according to the coldness of the locality. Water the drills before sowing, if the weather be dry.

Sow winter prickly spinach twice, in the second and last week. Choose mellow soil, moderately rich, like to that after fresh dug early potatoes. Nitrate of soda has been proved a most fertilizing dress, particularly in binding gritty loams—half-a-pound scattered over a pole of 30½ square yards digged in, and the rows a yard apart, sown as the digging proceeds.

Sow endive in the second or third week.

Sow also a sprinkling of horn carrot, salads, radish, and lettuce, the hardier sorts, and onions for spring. Sow cauliflowers about the 20th, to be planted under glasses or in frames.

Transplant, at various times, according to their size, stout, well-formed plants of cabbages, brocoli, savoys, and Brussels' sprouts. Incorporate a quantity of good manure with the soil, to which has been added sulphate of ammonia, half-a-pound to a square pole. Coleworts, for greens, in the same manner, twelve inches apart. Celery, for the latest crop, by the third week. If the weather be dry,

apply water liberally. Never mutilate the plants by cutting the leaves. "Earth up" former plantings timely and carefully. The spade may be used when the plants are strong, and have already been twice earthed.

Propagate sweet herbs by slips and cuttings. Take up garlic, shallots, and onions that are ripe.

Destroy weeds, leave none to spread the evil by seeding, and the most sedulous attention is now required.

Cut vegetable marrows and cucumbers as they come on, leaving none to become ripe. Be particular to gather French beans and runners, for if pods ripen, the bearing of edible pods is checked at once. "Gather beans and have beans," says the old rule.

FRUIT DEPARTMENT.

Raspberries.—Attend first to cut out the brown canes that have borne fruit; then take away slender supernumerary young shoots—air and sun will thus act upon those six or seven good canes which are left to ripen. Burn the dry canes that are pruned out, and scatter the ashes over the raspberry beds. Some condemn this burning, but the earth may beneficially receive back, as soon as possible, the inorganic salts thus developed by fire.

Spur bearing trees on espaliers should be regulated very early by cutting back or snapping the wandering breast or spur wood one-third of their length. By snapping the sap is checked and diverted to the lower buds, while its course is not so fully and suddenly arrested as it is by amputation. The trees are for a time rendered unsightly, but as all must be cut lower back in a few weeks, this is a mere trifle, if the benefit alluded to be taken as a "set off."

Vines may not be shortened, but let the bearing and succession wood be trained in open regular order. Cut off to the lowest bud all weak laterals, stop the leaders,

and thus divert all the power of the main shoots and leaves to the perfecting of the clusters. A few plants of vines may grow on the garden-wall or on a railing.

Make fresh plantations of strawberries, if the season be not dry and parched. The land must be richly prepared with dung, and if possible with a mixture of fresh soil from a vegetable earth, rotted for a time before application. The sets must be healthy and strong, in a dark-green colour, with roots fibrous and spreading, placed six inches apart, in rows that are one foot distant. If dry weather continues, apply water very liberally till the sets

are seen to have struck root. The beds may be six feet wide, and the rows drawn across or lengthwise.

FLOWER GARDEN.

Attend to the routine directions that have been so often given, especially to the gathering of manure, from large weeds cut and chopped into the tank; carths and droppings in the compost-heap, with earthy matters of all kinds. Now re-pot and dress any auricula plants, and pot off seedlings. At the end of the month transplant or introduce evergreens, particularly if the weather be moist.

AGRICULTURAL REPORTS.

GENERAL AGRICULTURAL REPORT FOR JULY.

The weather during the past month has been all that could be desired for the growing crops, and all cereals have made rapid progress. Wheat has improved much in the ear, and has come rapidly to maturity. As we write the harvest is general, and the results, on the whole, are considered satisfactory. No doubt there is a decided deficiency on light and ill-cultivated soils, but the falling off will be made good by the return from well-farmed and heavy lands, on which the wheat plant is remarkably good. The present year has afforded another proof, if one were wanting, that a dry, hot season is the best suited to the development of the wheat plant in this country. We have this year experienced something more nearly approaching to drought than has been the case within recollection. The dryness of 1868 was rather owing to the great degree of heat than to any long-continued absence of rain, but this year less than half the average rainfall occurred during the first six months. While, however, wheat has flourished under this state of things, the spring corn crops have been very differently circumstanced. Barley and oats at one time presented a very poor appearance, but improved considerably under the influence of rain. It is surprising that roots and the corn crops have not suffered more than they have done, but this may be partially explained by the fact that the spring was cold and ungenial, and that the moisture was retained in consequence, and not dissipated by radiation.

When we last wrote there was every appearance of dull markets and declining rates ruling for some time, but since then an element of the greatest uncertainty has been imported into the case. The declaration of war and the threatening aspect of continental politics generally have had the effect of causing a state of excitement in the grain trade which has been rarely equalled. On the news of the declaration of war by France against Prussia becoming known, a panic set in at Mark-lane, and the most extravagant prices were demanded. The prospect of the partial suspension of the import trade and of the total cessation of shipments of fine wheats from the Baltic induced factors to hold very firmly, and millers were at length compelled to pay 5s. to 6s. per qr. more money for English wheat. A similar rise took place in the value of foreign wheat, though in the case of American red wheat the improvement was as much as 8s. per qr. A reaction naturally followed the state of panic, and prices receded towards the close of the month 3s. per qr., leaving wheat about 2s. per qr. dearer than at the opening of July. It was only natural that the favourable harvest prospects and the early date at which the harvest has commenced should influence the quotations in a downward direction.

Although the hay crop in the South of England has proved very unsatisfactory, in the North and in Scotland the yield has been good, while the prospect of a second cut is everywhere encouraging. In Ireland all crops have prospered under the influence of fine weather.

It is believed that feeding stuffs of all kinds will rule firm in value for some time to come. Large quantities have been purchased on French account, and these transactions will no doubt be carried on so long as they are found practicable. One of the most unfortunate features of the war is the fact that the crops in North Germany are outstanding; and it is believed that, owing to the depletion of the labour market, a great portion of them is doomed to destruction.

The accounts from the hop districts were never better, and the yield is looked forward to as an unprecedentedly large one. The bine has seldom been freer from blight, and towards the close of the season the weather forced on its growth rapidly. Consequently the hop trade has been in a state of total suspension, and values have remained quite nominal.

The wool markets suffered much by the withdrawal of French and German buyers from the market and by the check that the yarn trade has suffered from the outbreak of war. Prices are consequently lower, colonial wool having given way 1d. to 2d. per lb.

REVIEW OF THE CATTLE TRADE DURING THE PAST MONTH.

There has been an absence of any important feature in the cattle trade during the past month. The commencement of hostilities between France and Prussia, and the prospect of a curtailment of our foreign receipts at one time tended to impart strength to the market, and to promote a higher range of values. However, the increased liberality of the arrivals from our own grazing districts caused a reaction to set in, and the advance was lost. Although some really fine stock has been received from Lincolnshire, the bulk of the arrivals have come to hand in but indifferent condition. Certainly, during the past week a tendency to improvement has been apparent; but there is still a comparative scarcity of choice stock. In Scotland, on the other hand, owing to the plentiful supply of grass, cattle have fared well, and the few beasts which have been sent to market have been well-conditioned animals. As regards trade, really prime beasts have been in request, and have at one time made 5s. 6d. per 8 lbs. At the present moment the extreme quotation does not exceed 5s. 4d.; whilst many good serviceable animals are being disposed of at 4s. 10d. to 5s. per 8 lbs.

The show of sheep has been equal to the average so far as numbers have been concerned; but the quality has been but middling. During the earlier part of the month the trade was weak, and there was a tendency to lower rates. Subsequently, there was a reactionary movement, and the value of the best Downs and half-breeds recovered to 5s. 4d. to 5s. 6d. per 8 lbs. But, at the same time, transactions have been effected in good breeds at 5s. per 8 lbs.

Lambs have been quiet and without change in value.

For calves, the supply of which has been good, there has been very little inquiry, and the business doing in pigs has been unimportant.

The hay crop in the southern counties has proved sadly deficient; but farther north the yield has been much better. The recent rains give promise of a second crop, but in no case will it be heavy. The root crop promises to turn out well. On the whole, so far as can be discerned from present prospects, fodder will be scarce during the winter months.

The total supplies of stock exhibited and disposed of at the Metropolitan Cattle Market have been as follows:

Beasts	24,843	Head.
Sheep and Lambs...	211,610	
Calves	5,350	
Pigs	1,155	

COMPARISON OF SUPPLIES.

July	Beasts.	Sheep and Lambs.	Calves.	Pigs.
1869	20,340	176,880	4,185	1,129
1868	21,312	195,250	3,938	1,360
1867	18,590	136,480	3,117	1,755
1866	21,710	158,990	3,778	2,120
1865	26,010	149,900	5,757	2,480
1864	27,394	147,890	4,658	3,140
1863	21,070	169,870	3,822	2,682
1862	22,392	151,060	2,339	2,632
1861	19,740	156,140	3,532	3,240
1860	19,870	153,600	3,133	2,428
1859	19,600	166,632	3,609	2,430
1858	20,468	154,922	4,262	3,290

The arrivals of bullocks from our own grazing districts, as well as from Scotland and Ireland, thus compare with the three previous years:

From—	July, 1867.	July, 1868.	July, 1869.	July, 1870.
Norfolk, Suffolk, &c.....	2,500	1,800	300	1,100
Lincolnshire, Leicestershire, &c.,	2,860	6,600	5,300	4,800
Other parts of England.....	3,370	3,700	2,020	2,800
Scotland	324	96	47	97
Ireland	80	170	450	120

The total imports of foreign stock into London have been as under:

	1863.	1869.	1870.
Beasts	6,037	8,784	6,806
Sheep and Lambs.....	24,905	30,772	37,991
Calves	2,282	4,669	4,340
Pigs	2,316	3,349	3,230

Beasts have sold at from 3s. 2d. to 5s. 6d., sheep 3s. 4d. to 5s. 6d., lambs 6s. 4d. to 7s., calves 3s. 10d. to 5s. 6d., and pigs 4s. 6d. to 5s. 8d. per 8lbs. to sink the offal.

COMPARISON OF PRICES.

	July, 1868.		July, 1869.	
	s. d.	s. d.	s. d.	s. d.
Beef from	3 0	5 0	3 0	5 8
Mutton	3 0	5 0	3 0	5 8
Lamb	5 0	6 0	5 6	6 0
Veal	3 6	5 0	4 6	5 8
Pork	3 2	4 4	3 10	5 2

The dead meat markets have been moderately supplied with meat. The trade, generally, has been quiet. Beef has sold at from 3s. 6d. to 5s., mutton 3s. 6d. to 5s. 2d., lambs 5s. to 5s. 10d., veal 4s. 8d. to 5s., and pork 4s. to 5s. 4d. per 8lbs. by the carcase.

AGRICULTURAL INTELLIGENCE,
FAIRS, &c.

BANBURY FAIR.—There were a good many sheep, but business seemed sluggish, the best bringing about 5s. per stone. The supply of cattle was not large, neither was the business great.

PRIZES AT BASINGSSTOKE FAIR.—For the largest number of sheep and lambs as a breeder, the same having been in the possession of the exhibitor prior to the 1st of March last, a piece of plate, value 20 gs., to T. Moore, Viables Farm, near Basingstoke; to the breeder who shall pen the second largest number, a cup, value 5 gs., J. Portsmouth, Basingstoke. For the best pen of 100 Hampshire Down wether lambs, bred and fed by the exhibitor (the breeding flock to consist of not less than one-fourth two-tooth ewes), 10 gs. to A. Budd, Overton; second, 5 gs., J. Wigg, Basingstoke. For the best pen of not less than 40 wether lambs of any breed, bred and fed by the exhibitor from a flock of ewes not exceeding 410, such pen to be taken in proportion of 10 to every 50 ewes, 5 gs. to G. Twitchee, Wortling Wood Farm; second, 3 gs., J. Palmer, Cliddesden. For the best pen of ewes, the whole of which shall have been fed by the exhibitor from the 31st of October, 1869, such pen to consist of not less than 50 nor more than 100, taken in proportion of 10 to every 50 ewes kept by the exhibitor, 10 gs. to F. Budd, Hatch-warren. For the best pen of 100 two-tooth ewes of any breed, having been in the possession of the exhibitor from the 1st of January last, 10 gs. to J. Lunn, Preston Candover. For the best pen of 100 wether sheep of any breed, which shall have been in the possession of the exhibitor prior to the 1st of

March last, 5 gs. to J. Wigg, of Skyer's farm; second, 3 gs., A. F. Bradby, Preston Candover. For the best Hampshire Down ram of any age, 5 gs. to J. Moore, Littlecot, Pewsey, Wilts. For the best pen of not less than five Hampshire Down ram lambs, taken in proportion of 2 to every 100 ewes kept by the exhibitor, 5 gs. to F. Budd. For the best ram of any age not being of the Hampshire Down breed, 5 gs. to Mrs. E. Cliff, Sherborne St. John; second, £2 10s., J. Wheeler, Long Compton, Shipston-on-Stour, Oxfordshire.

BOSTON FAT SHEEP MARKET.—A fair supply, which met a tolerably brisk demand, at from 7d. to 8d. per lb. There were several buyers from the North present again.

BRISTOL COLT FAIR.—A fair trade was done, 30 guineas being the highest price realized. There were some capital Irish nags, and they realized high prices, from 40 to 50 guineas being given for first-rate ones. The cart-horses and mares were poor, and trade was dull owing to the shortness of keep.

BROMYARD FAIR.—The supply of store stock was very small; but small as it was it was fully equal to the demand, there being no purchasers, and the greater part being driven home unsold. Cows and calves were more plentiful, but for want of keep only a few changed hands. No fat beef. Sheep were plentiful; fresh ewes brought 7d. and wethers and lambs 8d. per lb. There was a large supply of pigs, which sold upon easier terms. The fair was altogether a very dull one, very little business being done.

PORT-WILLIAM SHEEP MARKET.—Gleninnan and Glenaladale blackfaced wethers 31s., Beach blackfaced lambs £11 15s. per clad score, Lettermore blackfaced wethers £27, Acharn blackfaced ewes £24, slack ewes £14, wethers 27s., shot lambs £6, Beneveicht blackfaced wethers 33s. 6d., Achyhair Duror wethers £23, ewes £12, Achuaone wether lambs 10s., mid ewe lambs 8s. (shotts deferred), Auchintee wethers 31s., Appin wether lambs 9s. 9d., Lundavra slack ewes £17, Inchree do. £15, Auchindal wether lambs £12, Kenlochmoidart three-year-old wethers 30s., Dalness do. 29s., Keil Ardour wethers £29, Corunan ewes £17, Crigan two-year-old wethers £21, Frinisgaig ewes £12, Mr. Anderson's Oak Bank Mull Cheviot top wether lambs £13, South Corrie Kenloch Gairloch two-year-old wethers £19 10s., shot lambs £4, Kinloch Arasaig wethers £25, Glenmore Ardnamurchan shott lambs £6, Strathmashe and Shirra Beg ewes £18, Moy Lochaber Cheviot wether lambs £13, Cruben Beg slack blackfaced ewes £17, do. three-year old wethers £30, Glennevis ewes £17 10s., wethers £31 10s., Guishean three-year-old wethers £26 10s., Bar Blaroch Morrar top wether lambs £9 10s., Gorstenferm Ardnamurchan three-year-old blackfaced wethers £25, Bohintin yeld ewes £26, Glenmage Ardnamurchan top wether lambs £10 5s., east ewes £4 10s., shott lambs £6, Kenloch three-year-old wethers £33.

GRANTHAM FAT STOCK MARKET.—A very good show of stock; business dull. Beef 8s. to 8s. 6d. per stone, mutton 7d. to 7½d. per lb.

HORSHAM FAIR.—There were about 10,000 sheep and lambs penned. The highest price made for lambs was 36s. for a pen of 150, belonging to the Messrs. E. and R. Emery, of Hurston-place, Storrington. This was 1s. per head higher than any other sheep in the fair.

LINCOLN FAT STOCK MARKET.—A good supply and brisk trade, beef making 8s. to 9s. per stone, and mutton 7½d. per lb.

OVERTON FAIR.—On ordinary occasions 60,000 to 70,000 sheep and lambs are penned, but on this it was from 10,000 to 15,000 short. There was a brisk sale at the commencement of the day, and some thousands were speedily disposed of; but later the sale declined, and became somewhat dull, though a good clearance was effected. Average lambs fetched from 2 1s. to 36s., choice from 30s. to 40s., Mr. R. Awbery penned some which realised 37s. each. Mr. F. Budd's 100 ewes fetched 66s. Ewes averaged from 30s. to 45s., and wethers from 38s. to 48s.

PRIZES AT THE OVERTON (HANTS) FAIR.—The judges were E. Olding of Woodford, T. Gerish of Upton, and T. Moore of Viables Farm, Basingstoke. Best pen of 100 wether lambs, Mr. A. Budd; best pen of wether lambs, Mr. J. Wigg; second, Mr. G. Twitchee; best pen of ewes, Mr. T. Budd; second, Mr. A. Budd; best ram, Mr. J. Moore; best pen of ram lambs, Mr. F. Budd.

ST. BOSWELLS FAIR.—As compared with the prices

current at last year's fair, those obtained to-day were considerably up. The best class of lambs may be quoted at from 29s. to 36s., and the second lots at from 23s. to 28s. 6d. Last year the highest price was 31s.; so that on the top there is an increase of 5s. The general advance would range from 3s. to 5s., though in some instances a greater rise was reported; but then when this occurred the lots were considered to be of better quality than the lots from the same herself were last year. This market was not a very profitable one for dealers, and it was only from farmers that information as to prices could be obtained.

SALISBURY SHEEP FAIR was the largest ever held there, about 10,000 sheep being penned, which was about 1,000 more than last year's fair, and probably 2,000 in excess of the average number. Trade, however, was dull, and in the course of the day lower prices had to be submitted to in several cases before sales could be effected. Good useful lambs were sold at from 18s. to 25s., superior ones realizing as high as 49s., ewes 25s. to 35s., and wethers 35s. to 45s., a few lots fetching even higher prices. Mr. James Rawlence, of Balbridge, sold a pen of 100 splendid ewes to Mr. Bishop, a dealer of Southall, for 55s. a head, the lot having carried off Dr. Lush's prize, as the best pen in the class in which they were exhibited. Mr. Carpenter, of Lake, obtained 42s. for the pen with which he took the second prize in the same class, and Mr. Walter Young sold a lot which did not take a prize for 43s. Mr. Reed, of New Court, obtained 35s. 6d. for a very good lot of ewes. Mr. F. Tabor sold some lambs for 32s. Mr. James Rawlence sold his fourth lot of 100 cull lambs at 30s.

PRIZES AT THE SALISBURY SHEEP FAIR.—The judges were J. Marsh (Stratford), Mr. Compton (Fisherton Delamere), and Mr. Attwater (Britford). A piece of plate, value £5, for the best pen of improved Hampshire Down ram lambs in the proportion of two to every 100 ewes, kept and

put to tup the previous year, not less than four, nor more than ten lambs from one flock: First prize, Mr. Moore, Lielteott; second of £3, Mr. Dibben, Bishopstone. A piece of plate, value £5, for the best pen of 80 wether lambs, bred by the exhibitor, from any flock, not exceeding 400 breeding ewes, or of 100 lambs from any flock exceeding that number: First prize, J. Fleetwood, Coombe; second, Mr. Higgins, Great Wishford. A piece of plate, value £5, for the best pen of 80 wether sheep, having been at least for three months in the possession of the exhibitor, from any flock not exceeding 400 wether sheep, or 100 from any flock exceeding that number: Prize, J. Harding, Speckington. A piece of plate, value £5, for the best pen of 80 breeding ewes, good on tooth, and having been at least for six months in the possession of the exhibitor, from any flock not exceeding 400 breeding ewes, or of 100 from any flock exceeding that number: First prize, Mr. Rawlence, Balbridge; second, Mr. Carpenter, Lake. A piece of plate, value £5, for the best Hampshire Down ram of any age: J. Moore. A piece of plate, value £5, to the largest penner: J. Thatcher, Stoford. A piece of plate, value £5, to the largest purchaser: Mr. Meaking, of Cambridgeshire.

SHERBORNE FAIR.—The threatened rain held off, and there was consequently no inducement to do business in the few lots of sheep offered (about half the usual average). Beasts were also scarce and business feeble.

SLEAFORD FAT STOCK MARKET.—A very large and first-class show of fat beasts, which were sold at a shade less than the extreme rates of last week. Good show of sheep, which met with a brisk trade. Best beef realised from 9s. to 9s. 3d., second quality from 8s. 3d. to 8s. 9d. per stone; mutton from 7½d. to 8d. per lb., lambs from 25s. to 35s. each.

SPLISBY FAIR.—There was only a small number of fat beasts, which sold readily at 9s. per stone; well-fed sheep made 8d. per lb. Store beasts, of which there were several of good quality, were a drug, and could not be converted into cash.

REVIEW OF THE CORN TRADE DURING THE PAST MONTH.

The month commenced with refreshing showers which soon left their mark upon the meadows, though not heavy or of long continuance, but after the first week hot dry weather returned, and cut off the hopes of a second crop of grass, though greatly facilitating the maturity of the corn. Some quantity of oats has already been gathered, also of peas, barley, and also Talevera wheat, and we are brought to the eve of our general gatherings. These prospects at the outset of the month began to curtail the late advance occasioned by foreign exports, but suddenly a war cloud has burst upon us from the nation needing our supplies, exciting a panic on the Stock Exchange and producing on our corn markets a scene of wildness that reminds us of former times. On the third Monday the entire aspect of prices was changed for every description of corn. Wheat then rose 6s. to 7s., and nearly all spring corn 2s. to 3s. The latter has sustained its then value, but the wheat trade only one week after the sudden and heavy advance, showed symptoms of a reaction, and English became so difficult to sell that prices could not be considered more than nominal, holders of foreign consenting to a reduction of 2s. to 3s. per qr., with but little doing at that. Very large sales of floating cargoes were made at the advance, and as things now look these purchases have a prospect of leaving a loss, but the chapter of accidents now that war has commenced and harvest is coming on may set matters right. Rumours have now become so much the order of the day that prices have been quite unsettled, but after all the nominal rates are not extravagant, and may yet be surpassed. The Government reports of the crop in America represent the wheat harvest as being about six million quarters less than in 1869,

and from California less is to be expected than previously received. So our range of prices, independently of any political calculations, does not seem likely to be a low one, more especially as spring corn will be deficient and dear, and hay still more so. They are in full harvest in France, but scarcely an average is expected, nor is it in many parts of Germany where the long and trying winter did much damage. War may greatly add to this, and so none can divine for the future, while we would sincerely hope that our own country will keep clear of the tremendous conflict expected. The prices lately quoted abroad were as follows: White wheat at Paris 64s., red 60s.; white at Bordeaux 52s. 6d.; wheat at Courtrai (Belgium) 54s., at Liege 60s., Antwerp and Brussels 62s., mixed Polish at Amsterdam 56s., white Zealand at Rotterdam 53s., marks at Hambro' 47s., Wahren 50s. 6d., at Romanshorn 57s. 6d., at Porrentruy 56s., at Stettin 45s. to 50s., at Pesth fine red to 46s., at Cologne 51s. free on board, fine new at Danzig 60s. cost freight and insurance, fine old to 65s. c. f. and i.; soft at Algiers 53s., hard 46s.; No. 2 Milwaukee at New York 48s. cost freight and insurance per 480lbs.

The first Monday in Mark Lane commenced on small supplies of English wheat, with only moderate arrivals of foreign. The show of fresh samples from Essex and Kent was very scanty, but with favourable weather trade was dull, at a decline of 1s. to 2s. per qr. The sale of foreign was also very limited, and all descriptions were reduced in value to the same extent. Though few cargoes were on the coast they were more than sufficient for the demand, with prices pointing downwards. A decline for a fortnight past having been submitted to in the country, far-

mers in some places resisted any further reduction, but still there were sellers at 1s. less at Sleaford, Wakefield, Market Rasen, Stockton, and Gloucester; and other towns followed the London reduction, as Birmingham, Leeds, Ipswich, Rotherham, Wolverhampton, and Bristol; Liverpool only gave way 1d. to 2d. per cental for the week. Wheat, both at Glasgow and Edinburgh, gave way 1s. per qr. Native wheat at Dublin was not lower but dull, foreign was 6d. to 1s. per barrel cheaper.

On the second Monday the English supply was small, but the foreign was considerable. The show of fresh samples from the near counties was very limited. The circumstance of rumours of war on the Continent prevailing saved the market from a further fall, which seemed imminent on Friday, though millers were not eager buyers. The foreign trade hardened from the threatening state of politics, though business was but on a moderate scale, at the previous Monday's rates. With an increase of cargoes off the coast holders were asking higher rates, which prevented extensive business. With more warlike appearances as the week wore on, partly checked by the near approach of harvest and very fine weather, there was but little difference noted in the country wheat trade. Though some places where war was supposed probable demanded higher rates, others who did not credit it were willing to make some concession. Liverpool, always excitable, rose 2d. on Tuesday per cental, and a like advance was realized on Friday; and on that day in London there were few sellers unless at an advance of 2s. or 3s. per quarter. Glasgow was again up 1s. per qr. for wheat, and Edinburgh was about 6d. per qr. dearer. Wheat at Dublin was decidedly 6d. per barrel dearer.

On the third Monday the English supplies were rather better, and the foreign less, though good. Few fresh samples were exhibited on the Essex and Kentish stands. The news of a declaration of war by France against Prussia made a very wild market. Holders of English scarcely knew what to ask; many demanded 10s. more, some 7s., and as much as the last was really paid, though the average rise for home-grown qualities could scarcely be stated as over 5s. to 6s. With greater variety in foreign, and a possible entrenchment of supplies, as much as 8s. more was in some instances paid, while some were offering at 5s. advance, and of course did not exceed it. Business was in fact nearly paralysed, and prices very irregular. For cargoes afloat 5s. per qr. increase was demanded. The country markets this week were in some instances wilder than London. At Bury St. Edmunds, Bristol, and Brigg 10s. more was reported to have been paid for fine qualities; 5s. to 8s. was commonly insisted on, and the more moderate places, as Hull and Thirsk, were 4s. to 5s. dearer. Liverpool, after a rise of 1s. 6d. per cental on Tuesday, gave way on Friday 3d. per cental, and London then evinced symptoms of reaction, as France, the country actually at war, did not quote such an advance as England. Glasgow was 3s. 6d. to 4s. per boll dearer, and Edinburgh nearly as much. Dublin noted a rise of 3s. to 4s. per brl. on native and foreign samples.

On the fourth Monday the English arrivals were moderate; those from abroad plentiful. The show of fresh samples from Kent and Essex was limited; among the latter appeared a very dry sample of new Talavera, held at 63s. The entire trade was unhinged, a reaction having set in since the previous Monday, as even the French markets had not advanced so heavily as our own. Though Monday's rates were asked, there were no buyers; and so prices were nominal. As regards foreign, some holders—who in the previous week were more moderate in their views than others—were able to sell in retail at about previous rates; but they were generally 2s. to 3s. per qr. lower.

The imports for four weeks into London were 18,197 qrs. English wheat, 112,214 qrs. foreign; against 14,916 qrs. English, 116,324 qrs. foreign for the same period last year. The London exports in four weeks were 23,650 qrs. wheat, 6,498 cwts. flour. The imports into the kingdom for four weeks ending July 16, were 1,945,632 cwts. wheat, 309,682 cwts. flour. The general averages commenced at 50s. 5d., and closed at 49s. 8d. Those of London commenced at 52s. 9d., and ended at 55s. 6d. per qr.—showing that all these sales had been made before the declaration of war.

The flour trade, which had previously worn a dull aspect, had a sudden start on the third Monday, when the French declaration of war was known. Country, as well as foreign sacks then instantly rose 4s. per sack, and even barrels as much; while town millers put up the price of town qualities from 47s. to 51s. On the last Monday, however, there was a great calm, and holders of country and foreign sorts were ready to concede fully 1s. per sack and barrel, or even more. The imports into London for four weeks were 53,405 sacks country made, 5,149 sacks 39,253 barrels foreign, against 66,647 sacks English, 21,716 sacks, 38,908 barrels foreign in 1869.

The supplies of maize have only been moderate throughout the month, and fine qualities have risen 3s. to 4s. per qr., making extra yellow worth about 36s. and extra white 37s. The imports into London for four weeks were 22,141 qrs., against 48,374 qrs. in 1869.

The receipts of barley of our own growth have been exceedingly small, the crop being pretty well exhausted; but there has been an increase in foreign descriptions, chiefly for grinding purposes. This trade has been animated by the poor accounts in some places of the crops and the lively French demand which has taken off 9,570 qrs. during the month. Nothing can now be had under 28s. per qr. for grinding, and good sorts are worth 30s.; but malting descriptions were only of nominal value. The imports into London for four weeks were 564 British, 47,118 qrs. foreign, against 1,267 qrs. British, 14,811 qrs. foreign in 1869.

The malt trade, on the whole, has been steady, and after losing a shilling in value at the commencement of the month, recovered it on the rise in barley.

As regards the oat trade the first Monday commenced with a decline, which was recovered on the second; then came the declaration of war, causing a rise of 2s. to 3s. per qr.; and the Monday following brought a further increase of value of 6d. to 1s. per qr., from the effects of the drought and the large exports to France, which in the month, from London alone, reached to 70,205 qrs. Coarse Russians, weighing 38lbs., have become worth 26s. 6d. per qr., and fine Petersburg 29s. Swedes of great weight 30s. and over. The imports into London for four weeks were 2,177 qrs. English, 1,060 qrs. Irish, 213,081 qrs. foreign, against 2,090 qrs. English, 3,503 qrs. Irish, 179,081 qrs. foreign last year.

Beans throughout the month have been in moderate supply, and advanced on the third Monday 1s. to 2s. per qr.; but the time of year being against the sale, and maize being relatively cheaper, the demand has not been extensive. The poor appearance of the growing crop serve, however, to keep up values, as well as the small imports. The London receipts during four weeks were 1,338 qrs. English, 1,896 qrs. foreign, against 636 qrs. English, 1,520 qrs. foreign for the same time in 1869.

Though of English peas the supply was only half that of beans, the foreign arrivals have lately considerably increased, chiefly in white sorts of medium quality only fit for feeding, from the Baltic and Montreal. Such have only increased in value about 1s. per qr., fair sorts being worth 38s. to 39s., fine boilers to 42s. The imports into London for four weeks were 629 qrs. English, 16,739 qrs.

foreign, against 125 qrs. English, 10,263 qrs. foreign in 1869.

The arrivals of Linseed have been quite on a small scale, and seem likely to be limited. Prices therefore have advanced 2s. per qr., and cake from the drought has increased in value 5s. to 10s. per ton.

All sorts of agricultural seeds have been held at high rates, though the dry weather in France has so prevented the sowing of trifolium incarnatum that, notwithstanding a very short crop, it has become cheaper.

GLASGOW, (Wednesday last).—A large supply of cheese, which caused sellers in some cases to make slight concessions in order to effect sales. A good many left over unsold. Cheddars (old) 65s. to 70s. per cwt., ditto (new) 50s. to 55s.; Dunlops (old) 63s. to 69s., ditto (new) 48s. to 52s.; skim-milk 18s. to 22s.

CORDEROY & CO'S CHEESE CIRCULAR, Thursday July 21.—Since our last circular was issued, the chief topic of conversation in commercial and other circles has been the disastrous news of impending war on the continent of Europe. The immediate effect of the tidings upon the provision market here has been to raise the value of bacon and pork, in anticipation of shorter supplies from abroad, and to lower the price of Dutch cheese, of which large quantities are being hurried forward to this market. What further results will follow we cannot venture to predict.

POULTRY, &c., MARKETS.—Goslings, 5s. to 6s.; Ducks, 1s. 6d. to 2s.; Irish, 1s. to 1s. 6d.; Ducklings, 2s. to 3s.; Surrey Fowls, 4s. to 7s.; Sussex ditto, 2s. 9d. to 3s. 6d.; Boston and Essex, 1s. 9d. to 3s.; Irish, 1s. to 1s. 9d.; Rabbits, tame 1s. to 1s. 6d., ditto wild 6d. to 9d.; Pigeons, 6d. to 9d. Eggs, best 8s. 6d., seconds 7s. per 120.

Just Published, price 5s., uniform with "SILK AND SCARLET," &c.,

SADDLE AND SIRLOIN;
OR
ENGLISH FARM AND SPORTING WORTHIES
(NORTH),
BY THE DRUID.

LONDON: ROGERSON & TUXFORD, 265, STRAND.

POPULAR MEDICAL WORKS,
PUBLISHED BY MANN, 39, CORNHILL, LONDON.

Post Free, 12 Stamps; Sealed Ends, 16 Stamps.

DR. CURTIS'S MEDICAL GUIDE TO MARRIAGE: A PRACTICAL TREATISE ON ITS PHYSICAL AND PERSONAL OBLIGATIONS. With instructions to the Married and Unmarried of both Sexes, for removing the special disqualifications and impediments which destroy the happiness of wedded life, founded on the result of a successful practice of 30 years.—By DR. J. L. CURTIS, M.D., 15, ALBEMARLE STREET, PICCADILLY, LONDON, W.

And, by the same Author, for 12 stamps; sealed ends, 20.

MANHOOD: A MEDICAL ESSAY on the Causes and Cure of PREMATURE DECLINE IN MAN; the Treatment of Nervous Debility, Spermatorrhœa, Impotence, and those peculiar infirmities which result from youthful abuses, adult excesses, tropical climates, and other causes; with Instructions for the Cure of Infection without Mercury, and its Prevention by the Author's Prescription (his infallible Lotion).

REVIEWS OF THE WORK.

"Manhood.—This is truly a valuable work, and should be in the hands of young and old."—*Sunday Times*, 23rd March, 1858.

"The book under review is one calculated to warn and instruct the erring, without imparting one idea that can vitiate the mind not already tutored by the vices of which it treats."—*Naval and Military Gazette*, 1st February, 1856.

"We feel no hesitation in saying that there is no member of society by whom the book will not be found useful, whether such person hold the relation of a PARENT, PRECEPTOR, or CLERGYMAN."—*Sun, Evening Paper*.

Manhood.—"Dr. Curtis has conferred a great boon by publishing this little work, in which is described the source of those diseases which produce decline in youth, or more frequently premature old age."—*Daily Telegraph*, March 27, 1856.

Consultations daily, from 10 to 3 and 6 to 8. 15, ALBEMARLE STREET, PICCADILLY, LONDON, W.

HARDING'S FLEXIBLE ROOFING.

REDUCED TO ONE PENNY PER SQUARE FOOT.

The BEST and CHEAPEST COVERING for HOUSES, SHEDS, FARM and other BUILDINGS, &c.

Suitable for all Climates, and adopted by the English and Foreign Governments, Railway Companies, Metropolitan Board of Works, &c. Awarded the Silver Medal, Amsterdam Exhibition, 1869, for its Cheapness and Superiority to Felt, although the price was then 50 per cent. higher than at present, and is proved to be a much more Durable, Efficient, and Weather-tight Roofing than Corrugated Iron, at One-third the cost, and can be most easily fixed by any unpractised person. Please send for samples of present make.

PRICE ONE PENNY per Square Foot, or 23s. per Roll of 25 yards by 44 inches wide.

DRESSING, 2s. 6d. per gal.; ZINC NAILS, 5d. per lb.

SAMPLES AND TRADE TERMS FREE.

HARDING'S COMPOUND GLYCERINE DIP.

CONTAINS NO POISON, AND IS DESTRUCTIVE TO INSECT LIFE ONLY.

It is a certain cure for Scab in Sheep, who thrive and increase in weight after the use of this Dip. It also preserves the health of all animals belonging to the homestead.

It increases the growth of the wool, and cleanses it of all offensive accumulations which always cause functional derangement, it being a well known fact that acrid and corrupt humours allowed to remain on the surface are the cause of a great many diseases which afflict animal life.

This preparation is most easily applied, perfectly harmless in use, and most deadly to Ticks, Lice, Maggots, and a sure cure for Foot Rot. It also prevents the Fly striking; avoiding the Animal being troubled with Maggots, and heals all Sores, &c.

Sold in Tins of 5lbs. and 10lbs., at 6d. per lb.; and in Drums of 25lbs., 50lbs. and upwards, at 5d. per lb.; by all Chemists, Seedsmen, Ironmongers, and others throughout the Kingdom.

A 5lb. TIN IS SUFFICIENT FOR TWENTY-FIVE SHEEP.

No Dipping Apparatus necessary, common Tubs being all required. (See the simple Directions for Use on each Tin.)

J. HARDING,

Sole Manufacturer, 20, Nicholas Lane, Cannon Street, London, E.C.

ASSISTANT MANAGER.—William Howard, Esq.

At the Half-yearly General Meeting of the Proprietors, held on Thursday, the 4th August, 1870, at the City Terminus Hotel, Cannon-street Station,

The following Report for the half-year ending the 30th June, 1870, was read by the Secretary.

WILLIAM CHAMPION JONES, Esq., in the Chair.

The Directors, in presenting to the Proprietors the Balance-Sheet of the Bank for the Half-year ending the 30th June last, have the satisfaction to report that, after paying interest to customers and all charges, allowing for rebate, and making provision for bad and doubtful debts, the net profits amount to £83,285 6s. 11d. This sum, added to £8,895 17s. 5d. brought forward from the last account, produces a total of £92,181 4s. 4d.

They have declared the usual dividend of 6 per cent., with a bonus of 2½ per cent. for the half-year, free of income-tax (being at the rate of 17 per cent. per annum), which will absorb £85,000, and leave £7,181 4s. 4d. to be carried forward to profit and loss new account.

Mr. John William Burmester, after 15 years' service, has requested, on account of his advanced age, to be relieved from office as one of the Trustees of the Bank, and Mr. Frederick Harrison, a Director, has been elected in his stead.

The dividend and bonus (together £1 14s. per share) will be payable at the Head Office, or at any of the Branches, on and after Monday, the 15th instant.

BALANCE-SHEET of the LONDON and COUNTY BANKING COMPANY, 30th June, 1870.

Dr.	
To capital paid up	£1,000,000 0 0

We, the undersigned, have examined the foregoing balance-sheet, and have found the same to be correct.

(Signed) WM. JARDINE,
WILLIAM NORMAN,
R. H. SWAINE, } Auditors.

London and County Bank, July 28, 1870.

The foregoing Report having been read by the Secretary, the following resolutions were proposed, and unanimously adopted:

1. That the report be received and adopted, and printed for the use of the Shareholders.

2. That the remuneration of the Auditors be increased from £100 per annum to £150 per annum, to take effect from the 1st of January last.

3. That the thanks of this Meeting be given to the Board of Directors for the able manner in which they have conducted the affairs of the Company.

(Signed) W. CHAMPION JONES, Chairman.
The Chairman having quitted the chair, it was resolved, and carried unanimously,

4. That the cordial thanks of this Meeting be presented to William Champion Jones, Esq., for his able and courteous conduct in the Chair.

(Signed) P. P. BLYTH, Deputy Chairman.

Extracted from the Minutes.

(Signed) F. CLAPPISON, Secretary.

LONDON and COUNTY BANKING COMPANY.

NOTICE IS HEREBY GIVEN, that a DIVIDEND on the Capital of the Company, at the rate of 6 per cent. for the half-year ending 30th June, 1870, with a BONUS of 2½ per cent., will be PAID to the Proprietors, either at the Head Office, 21, Lombard-street, or at any of the Company's Branch Banks, on and after MONDAY, the 15th instant.

By order of the Board,
W. McKEWAN, General Manager.

21, Lombard-street, August 5th, 1870.

THE
MARK LANE EXPRESS,
AND
AGRICULTURAL JOURNAL,

IS THE
LARGEST AND THE LEADING FARMER'S AND GRAZIER'S NEWSPAPER,
PUBLISHED EVERY MONDAY EVENING, IN TIME FOR POST.

Office of Publication and for Advertisements, 265, Strand, London. May be had of all Booksellers and
Newsmen throughout the Kingdom, price Sevenpence, or £1 10s. 4d. per annum.

CHEAP SUNDAY AND WEEK-DAY READING FOR THE PEOPLE.

Now Publishing,

The Church of England Magazine,
A VERY CHEAP RELIGIOUS PERIODICAL.

Containing original contributions by several of the Bishops and many other distinguished Divines; Narratives; Sketches of Natural History; Biography, Missionary Proceedings, Juvenile Reading, Poetry, &c., with a Register of Ecclesiastical Intelligence; the whole combining amusement with instruction, in a style suited for all classes of readers.

A series of Parish Churches, with Illustrations of a superior kind is in course of publication. This series, which will be of a very extended character, will be found of particular interest.

Intending subscribers are requested to send their orders without delay, as the back volumes and parts are now becoming VERY SCARCE.

As the Magazine enjoys a circulation far exceeding that of any other church periodical, and is read by all classes of society, it will be found a very eligible medium for Advertisements, which are conspicuously printed, and inserted at the most reasonable rate.

Vol. LXVI., Imperial 8vo., Embossed Cloth, 480 pages, with highly-finished Illustrations of Parish Churches, price 6s. 6d. London: Published in weekly numbers, price 1½d., and in monthly parts, price 9d., by S. EWINS & SON, 9, Ave Maria Lane; ROGERSON & TUXFORD, 265, Strand, W.C.; and sold by all Booksellers.

POPULAR MEDICAL WORKS,
PUBLISHED BY MANN, 39, CORNHILL, LONDON.
Post Free, 12 Stamps; Sealed Ends, 16 Stamps.

DR. CURTIS'S MEDICAL GUIDE TO MARRIAGE: A PRACTICAL TREATISE ON ITS PHYSICAL AND PERSONAL OBLIGATIONS. With instructions to the Married and Unmarried of both Sexes, for removing the special disqualifications and impediments which destroy the happiness of wedded life, founded on the result of a successful practice of 30 years.—By DR. J. L. CURTIS, M.D., 15, ALBEMARLE STREET, PICCADILLY, LONDON, W.

And, by the same Author, for 12 stamps; sealed ends, 20.

MANHOOD: A MEDICAL ESSAY on the Causes and Cure of **PREMATURE DECLINE** IN MAN; the Treatment of Nervous Debility, Spermatorrhœa, Impotence, and those peculiar infirmities which result from youthful abuses, adult excesses, tropical climates, and other causes; with Instructions for the Cure of Infection without Mercury, and its Prevention by the Author's Prescription (his infallible Lotion).

REVIEWS OF THE WORK.

"Manhood.—This is truly a valuable work, and should be in the hands of young and old."—*Sunday Times*, 23rd March, 1858.

"The book under review is one calculated to warn and instruct the erring, without imparting one idea that can vitiate the mind not already tutored by the vices of which it treats."—*Naval and Military Gazette*, 1st February, 1856.

"We feel no hesitation in saying that there is no member of society by whom the book will not be found useful, whether such person hold the relation of a PARENT, PRECEPTOR, or CLERGYMAN."—*Sun*, Evening Paper.

Manhood.—"Dr. Curtis has conferred a great boon by publishing this little work, in which is described the source of those diseases which produce decline in youth, or more frequently premature old age."—*Daily Telegraph*, March 27, 1856.

Consultations daily, from 10 to 3 and 6 to 8. 15, ALBEMARLE STREET, PICCADILLY, LONDON, W.

Duchess.

Exposition

THE FARMER'S MAGAZINE.

SEPTEMBER, 1870.

PLATE I.

DUCHESS; A PRIZE POLLED COW.

THE PROPERTY OF MR. B. BROWN, OF THURSFORD, THETFORD.

Duchess, a red polled cow, bred by Mr. Benjamin Brown in the summer of 1866, and consequently now four years old, is by Tenant Farmer out of Hansom. At the recent meeting of the Suffolk Agricultural Society, at Sudbury, Duchess took the first prize of £10 as the best cow in her class, and the Silver Cup as the best of all the polled cows and heifers; while, as our report of the meeting ran, "there were several very beautiful specimens of the polled Suffolk, both male and female, and the judges honoured the lengthy well-made Cherry Duke with the Cup for the best bull of any age in preference to the Skorthorn, Monk, who did not look in high form. As they did this with the Suffolk bull, surely they might have given the beautiful Duchess the Cup, if form or quality have anything to do with it." At the Norfolk Show, at Harleston, the whole class of polled cows was commended; and at the Royal Meeting, at Oxford, Duchess could get no nearer than a high commendation,

as there is no doubt the red Polls are coming to be more and more appreciated.

There is in reality no difference in the breed of a Norfolk and a Suffolk Poll, though none are considered to be pure bred but the whole coloured reds. They were, however, originally of a dun or Norwegian pony colour; but, from in-and-in breeding, and dark bulls being preferred, they have gradually reached to a deep red—the now fashionable tint. The Polls have a high character as a milk producing breed, while they feed well, and for quality of beef are said not to be surpassed even by the Highland Scots.

Mr. G. D. Badham, of Bulmer, was one of the first to give any great attention to the merits of the Eastern Counties Polls, and his bull, Red Jacket, used in turn by Lord Sondes in Norfolk, and Colonel Tomline in Suffolk, was almost as famous in the show ring as Chester Emperor, or that distinguished service veteran, the white headed Major.

PLATE II.

EXPECTATION; A PRIZE HUNTER.

THE PROPERTY OF SIR WATKIN W. WYNN, BART, M.P.

Expectation comes from the Emerald Isle, and was bought by Sir Watkin or Lord Combermere, of Mr. Mc Garne, the well-known Dublin dealer. He has carried Sir Watkin four seasons, and was awarded the first prize of £80 at Islington this year for the best weight-carrying hunter up to not less than fifteen stone with hounds, with the Gold Medal as the best horse in any of the hunting classes, beating, among others, Iris, the Wetherby prize-horse; Harkaway and Tyrcannel, seconds at Islington; Brian Boru, a well-known prize-taker; Heroine, the first of the light weights at Islington; Comrade, the selected

four-year-old; and Coxcomb, a prize hunter and ladies' horse; as well as Loiterer, who played third to The Heroine in the light weights, and was not placed in the weight-carriers up to fifteen stone, but afterwards was proclaimed the winner of the Badsworth Hunt Cup at Wakefield.

Expectation is a rich chesnut, standing over sixteen hands high, and is a grand square-looking horse, with a deal of quality. Like all good-made ones, he looks smaller than he is, and when going collects himself together, so that he almost gives one the idea of a short

caution (*Jour. Roy. Ag. Soc.*, vol. vi., N. S., p. 156). The following he found to be the

Composition of Beet-root Pulp from Lavenham.

Moisture	70.11
*Albuminous compounds (flesh-forming matters)...	2.25
Sugar	3.39
Mucilage and pectinous compounds	1.93
Digestible cellular fibre	15.13
Woody fibre (cellulose)	5.32
Mineral matter (ash)	1.87
	<hr/>
	100.00
*Containing nitrogen.....	.361

We learn, continues the Professor from the preceding analytical results :

1. That this pulp contains, in round numbers, 30 per cent. of dry feeding matter.

2. That an appreciable amount of sugar is retained in the pulp.

More sugar probably was left in this residue than is usual, owing to the circumstance that the roots were rather flabby when they were worked up for sugar, and in that condition could not be grated so thoroughly as fresher beets, and the juice in consequence could not be squeezed out so completely as from more perfectly rasped beets.

3. That a large proportion of the fibre is readily digestible ; and

4. That beet-root pulp contains a considerable proportion of albuminous or flesh-forming matters.

The next analysis was made from a specimen of French pulp, which yielded the following results :

Composition of a Specimen of Beet-root Pulp produced in France.

Moisture	70.88
*Albuminous compounds (flesh-forming matters)...	2.38
Mucilage, pectinous compounds, and a little sugar	6.59
Crude cellular fibre.....	16.43
Mineral matter (ash)	3.72
	<hr/>
	100.00
*Containing nitrogen.....	.383

It will be seen that the French pulp resembled closely in composition the English specimen. Both contained about the same percentages of water and of flesh-forming compounds, and both may be regarded as equally useful for feeding purposes.

In a second specimen of French pulp, which evidently had been kept for a considerable length of time in an unsheltered place, I found a good deal more water, as will be seen by the subjoined analysis :

Composition of Second Sample of French Beet-root Pulp.

Moisture	77.10
*Albuminous compounds (flesh-forming matters)...	1.93
Mucilage, pectinous compounds, and a little sugar	1.19
Lactic acid	1.12
Crude cellular fibre.....	16.07
Mineral matter (ash)	2.59
	<hr/>
	100.00
*Containing nitrogen.....	.39

This refuse pulp thus contained nearly 7 per cent. more water than the preceding one. Its taste was strongly acid, and on examination I found that the sour taste was due to lactic acid, of which the pulp contained fully 1 per cent.

When beet-root pulp is kept for any length of time it turns decidedly acid, and in that state is quite as much relished by cattle and sheep as when fresh. Practical feeders, with whom I came in contact maintain that old pulp is superior to new for fattening purposes. Be this as it may, the lactic acid which is generated during the time of keeping, certainly has the effect of preserving

the feeding qualities of the pulp and of rendering it more digestible.

Except in its more acid taste old pulp differs but slightly in its appearance and general characters from new. The plan of preserving beet-root pulp in a good condition for feeding purposes is extremely simple. All that is necessary is to dig a trench in the earth, to place in it the pulp, and to pile it up in the same way as a heap of mangolds or swedes, and to cover the heaps with the earth from the trench. In this way the residue may be kept for years in a good condition.

On the occasion of our journey to Belgium I brought home with me a sample of old pitted pulp which had been kept for about one year, and submitted it to a general analysis. When it was analysed it yielded 61.74 per cent. of water ; but as it no doubt lost some water on the road, it will be more appropriate to represent its composition in the same state of moisture as the specimen of English pulp, which, in round numbers, contained 70 per cent. of water.

This specimen of the old Belgium pulp accordingly had the following composition :

Composition of Belgium Beet-root Pulp one year old.

Moisture	70.00
*Albuminous compounds (flesh-forming matters)...	2.43
Digestible fibre, pectinous compounds, &c.	18.67
Woody fibre (cellulose)	6.48
Mineral matter (ash)	2.42
	<hr/>
	100.00
*Containing nitrogen.....	.39

Allowing only little for the superiority of sugar as a fattening element of roots, the case is far from overstated if 1 ton of English sugar-beets is considered as equivalent in nutritive properties to at least 1½ ton of common mangolds. In the next place, let us compare the preceding analyses with the average comparison of the refuse pulp from beet-root sugar manufactories. In round numbers this may be stated with sufficient accuracy as follows :

Average Composition of Beet-root Pulp (Refuse Pulp of Sugar Manufactories).

Water	70.0
Sugar.....	1.5
*Albuminous compounds (flesh-forming matters) ...	2.5
Crude fibres and a little lactic acid	24.0
Mineral matter (ash)	2.0
	<hr/>
	100.0
*Containing nitrogen.....	.40

In 100 parts of pulp it will be seen there are 30 per cent. of dry matter, whereas 100 of sugar-beet from which it is obtained contain only 15½ parts of dry substance, and common mangolds but 11 parts.

A ton of beet-root pulp accordingly contains 672lbs. of dry matter, or 325lbs more than a corresponding weight of the roots, and 425½lb. more dry matter than 1 ton of common mangolds. In other words, 1 ton of pulp contains not quite, but nearly, the same amount of solid substances as 2 tons of Silesian sugar-beets, or 3 tons of common mangolds.

Nobody probably will dispute the fact that the dry substance of a sugar-beet or a mangold is more valuable for feeding and fattening purposes than the dry substance of the pulp. The question, however, which requires to be settled is, not whether the perfectly dry pulp is less valuable than perfectly dry roots from which it is made, but whether the 672lbs. of solid matter contained in a ton of pulp are worth more or less than the 347lbs. of solid matter present in a ton of sugar-beets, or 246½lbs. of the solid matter of which common mangolds consists.

Before we proceed farther let us refer to the analysis of the common mangolds grown in this country and compare it with that of the Silesian or sugar-beet. Here again we are indebted to Professor Voelcker, who thus warns us (*Jour. Roy. Ag. Soc.*, N. S., vol vi., p. 160) :

In all comparisons of that kind care should be taken to avoid extremes, and fairly to represent the average composition of the materials under discussion. It may not always be easy to do so, and I experienced the difficulty in endeavouring to draw up figures which may be regarded as fairly representing the average quality of common mangolds and Silesian sugar-beets, both grown in this country. The following tabular statement, however, I believe represents correctly, and in round numbers, the composition of English common mangolds and sugar-beets of fair average quality :

Composition of Common Mangold and Silesian Sugar-beets of fair average quality grown in England.

	Common Mangold.	Silesian Sugar-beets.
Water	89.0	84.5
Sugar	5.5	9.5
*Albuminous compounds (flesh-forming matters)	1.5	1.5
Crude fibre	3.0	3.5
Mineral matter (ash)	1.0	1.0
	<hr/>	<hr/>
	100.0	100.0
†Containing nitrogen..	.24	.24

Speaking generally, the Silesian sugar-beets grown in this country contain the same amount of nitrogenous compounds and mineral matters as ordinary mangolds, and from 4½ to 5 per cent. less water, and nearly double the amount of sugar which is found in common mangolds. The average percentage of dry matter in sugar-beets is 15.5, and in common mangolds 11. A ton of the former therefore contains 347lbs. of dry feeding substance, in round numbers, and a ton of the latter only 246½lbs.

The influence of soil and of climate upon the composition of sugar-beet are questions of very considerable importance. Some years since this inquiry engaged the attention of Sir Robert Kane, who ascertained the composition of the sugar-beet grown on various soils of the Sister Island :

The following table gives the proportion of sugar found by him in various specimens of Irish grown sugar-beet. In this column I, gives the nature of the soil ; II, the maximum and minimum solid matter per cent. in the beet grown on it ; III, that of the sugar :

	I.	II.	III.
Tenacious clay	12.7	11.6	8.5
Heavy clay	15.0	10.9	9.4
Loam	15.5	13.6	8.2
Rich loam	22.0	19.3	14.5
Slightly sandy loam.....	20.1	15.8	13.5
Rich loamy clay	16.0	14.8	11.1
Rich clay	14.7	12.2	8.5
Clay loam	15.5	12.7	10.8
Tenacious clay loam.....	15.4	11.2	9.8
Rather clayey loam.....	18.6	12.3	12.8
Stiff clay, full of inert organic matter.....	11.5	6.2	5.7
Good clayey loam.....	16.5	9.2	11.4
Tenacious clay.....	15.3	11.4	9.3
Rich clay loam.....	19.4	9.2	12.5

This eminent chemist found that to obtain the maximum produce of sugar, the roots should not exceed 4lbs. or 5lbs. at the utmost, as large roots are too spongy, and contain but very little sugar ; they should have a solid hard flesh ; the crown and heart be as small as possible ; they should grow as little as possible out of the earth, and should not exhibit a green segment about the crown,

as those portions of the beet which grow out of the soil contain scarcely any sugar ; the roots should not be suffered to remain too long in the ground, or exhibit the slightest tendency to throw out flower stalks ; the soil best suited for the sugar-beet is a deep rich loam, rather inclining to clayey than to sandy, but not peaty ; the application of rich nitrogenous manures should be avoided ; that Irish grown beet contains as much sugar as the continental grown, under similar circumstances.

The average amount of sugar in the beet grown in the moist climate of Ireland, would seem to be rather less than that of the roots grown in England. But it is probable that by improved culture and selection of seeds the average amount of sugar in this root may be materially increased.

There does not appear to be any great difference in the amount of crystallizable sugar in the beets grown in this country and on the continent. Professor Voelcker has given the result of many of his examinations (*ibid*, vol. v., N. S., p. 358). He found :

	Per cent.
In a specimen of Silesian sugar-beet grown in Holland	10.56
In another specimen.....	7.42
In Silesian beets grown in 1868, near Lavenham, of crystallizable sugar	10.51
In another specimen	10.94
In another specimen	9.31
In another specimen.....	10.04
In a specimen manured at Barking with London sewage	13.19
In another specimen	6.53
In a specimen grown in Scotland.....	8.65
In another.....	12.18
In a specimen grown in Norfolk.....	9.42
In another.....	7.46
In a specimen grown in Berkshire	8.86
In another.....	6.67
In a specimen grown in Devon	5.46
In another.....	3.62

Upon the whole we have reason to conclude that the amount of sugar in English-grown beet is sufficient to remunerate the manufacturer. The sugar-cane of the West Indies, I believe, only contains on an average 18 per cent. of sugar. The amount of cane-sugar produced per acre also varies considerably, as in the sugar-beet the soil and climate influence very largely the composition of the cane. The largest produce, it appears, from a given extent of land being in the Island of Mauritius.

CART HORSES OR DRAY HORSES ?

TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR,—In your report on the Yorkshire Show, when speaking of the agricultural classes, you describe Lincolnshire a great prize-taker in Yorkshire, that beat Honest Tom last year at Beverley, as being quite lost, and appearing as a pony among the agricultural stallions. You add, "But certainly it struck us that these horses, though active, were more dray horses than farm horses." Now, Sir, this has struck a good many of us for a number of years past. The dray horse is being improved off the streets of our towns ; where our farming men used to walk they now ride. A groom of one of these monsters told me at Manchester that his horse's weight was 22 cwt. ! Now, if like *begets like*, what would you set a horse of this sort to do on a farm ? Suffle turnips ? hor-e rake ? harrow ? There is just as much diversity of type between dray and farm horses as between any other of the horse classes. If the Scotchmen would get rid of the superfluous hair on their legs, the Clydesdale seems to me the model sort.—Yours obediently,
"Cymro."

Llan, Carmarthen, Aug. 9, 1870.

THE PRESENT PROSPECTS OF THE SEWAGE QUESTION IN RELATION TO THE PUBLIC HEALTH.

The following paper was read by Dr. LETHBY before the Metropolitan Association of Medical Officers of Health: Hasty and inconsiderate legislation, promoted by those who, as the sequel will show, had no real knowledge of either the principles or practice of the subject with which they officiously meddled, together with the most mischievous charlatanism, has brought the whole question of the disposal of sewage into such a frightful mess, that the public are not only loud in their complaints of the injury inflicted on them, but are equally emphatic in their demands for a remedy. A review of the parliamentary history of this subject would be instructive, and it would also be amusing, but for its serious results and its solemn prolixity; for it would show how Blue-book upon Blue-book, and report upon report, from the same officious hands, and in the same wearisome tone and bewilderment of facts and figures, had so perplexed the Legislature, that they were glad to dispose of the subject by hasty legislation, or by handing it over to some Royal Commission, not always discreetly chosen. But, bad as are the consequences of this, the prospects of the future are worse; for there is a well-grounded fear that the same incompetent school of sanitarians who have been concerned with our present difficulties will also be concerned with the future, and that Parliament will again have to correct the errors of inconsiderate legislation. If this can be prevented, it will be of vast importance to the public; and none are better able to assist in the matter than the health officers of this metropolis. It is with this object I draw your attention to it, and ask you to give it your serious consideration. In the first place, let us inquire what is the nature of the thing we have to deal with. Sewage is at all times a very complex material, for it is composed not only of the solid and liquid excreta of the population, but also of the fluid refuse of every branch of industry, as the filth of kitchens, laundries, and dye-houses, the drainings from stables, slaughter-houses, and the public markets, the various liquid impurities of trades and manufactures, and the washings of streets and alleys. These, with the ejecta of the inhabitants, and a large volume of water, compose the sewage of towns. But each of these constituents has its specific influence on the composition of the general mass, and on the putrefaction to which it is subject. Every town or city, therefore—in fact, every part of a city—has its own peculiar quality of sewage, varying with the density of the population, the habits of the people, as to their diet, cleanliness, and trade pursuits, with the season of the year, the state of the weather, the day of the week, and even the hour of the day. This makes it difficult to obtain precise information of the nature and composition of sewage. Nevertheless, there are two ways by which the subject may be approached, as by ascertaining the average amounts of solid and liquid matters contributed by each individual, and by the various branches of industry; and secondly, by making careful analysis of the sewage collected throughout the day at various seasons of the year. Messrs. Lawes and Way in this country, and M.M. Wolf and Lehmann on the Continent, have determined, with very nearly the same results, the average proportion of solid and liquid matters discharged daily from the human body. It varies, of course, with age and sex, but broadly it may be said that, taking a thousand individuals at all ages, as they are found in a population, they contribute about 2,640 lbs. of liquid and moist excreta. In the dry state it would amount to about 141 lbs. This is at the daily rate of 42.25 oz. of moist, or 2.25 oz. of dry matter per head of the population. The washings of streets have been carefully examined by Professor Way, who finds that the liquid discharged into the gullies, after a heavy shower of rain, contains, in the case of granite roads, about 813.3 grains of solid matter per gallon, and of this 276.2 grains are dissolved, and 537.1 grains suspended. In that of wood pavements it contains only about 39 grains per gallon, of which 34 grains are dissolved and 5 grains suspended. The general average of the washings of several streets differently paved, and with various amounts of traffic, gave

262.6 grains of solid matter per gallon, of which 113.3 grains were dissolved, and 149.3 grains suspended. The refuse of factories, &c., cannot be easily determined, and therefore we are obliged to rely for our results on the second method of investigation—namely, the analysis of the sewage at different times and places. In this metropolis the sewage discharged by day contains about 94 grains of solid matter per gallon, of which 38 grains are suspended, and 56 grains dissolved: of the suspended matters, 17 grains are organic, and 21 grains mineral; and of the dissolved, 15 grains are organic, and 41 grains mineral. The night sewage is not so rich in solid elements, for it contains only about 79 grains of solid matter per gallon, of which 14 grains are suspended and 64 grains dissolved; and of these, 15 grains are organic, and 64 mineral—the organic being distributed very evenly between the soluble and insoluble constituents. Branch sewers, and those which are nearly stagnant, are generally very foul, for the sewage of them contains from 150 grains to 500 grains of solid matter per gallon, of which from 90 grains to 250 grains are suspended. The organic matter ranges from 20 grains to 120 grains in the soluble part, and from 20 grains to 176 grains in the insoluble. Taking the average of all the results obtained in the examination of the metropolitan sewage by Dr. Hofmann, Mr. Witt, Professor Way, and myself, it may be said that it contains about 90.4 grains of solid matter per gallon, of which about 29.8 grains are suspended, and 60.6 grains dissolved, there being about 15 grains of organic matter in each of these constituents. A storm of rain does not diminish the proportion of solid matter, for although it has a tendency to dilute the sewage, yet it washes away so large a quantity of filth from the streets, and disturbs so much of the sediment in the stagnant sewers, that the sewage after a storm generally contains more than the average proportion of solid impurity. Taking 90 grains per gallon as the usual amount, it will be increased after a storm to 125 grains per gallon, of which 64 grains are suspended, and 61 grains dissolved. The physical properties of sewage are peculiar, for when examined under the microscope the clear liquor is found to contain a large quantity of amorphous organic matter, with filaments of various fungi, and it swarms with the lower forms of animal life, as beaded spirulina, vibrios, and monads; but soon after exposure to the air higher forms of infusoria appear, as paramoecium, vorticella, rotifera, &c. The sedimentary matter consists of the remains of undigested food, as muscular fibre, husk and hair of wheat, the cells and starch of potato, and the tissues of vegetables, as cotton, cabbage, &c., and fibres of wool. It also contains the products of some of the secretions, as yellow biliary matter, intestinal mucus, and crystals of uric acid and triple phosphate; besides the *débris* of the streets, as particles of granite, flint, and carbonate of lime, with a large quantity of black amorphous matter. When sewage has a very offensive odour, and is evolving marsh gas and sulphuretted hydrogen, it rarely exhibits much sign of animal life; but when it is diluted with water, and exposed freely to the air, the bad odour quickly disappears, and the higher forms of infusoria are rapidly developed. This is proof of the salutary influence of air and water in promoting the less hurtful kinds of decay. I have often noticed that where the sedimentary matters of sewage accumulate and putrefy, without free access of air, foul gases are evolved, and little or no organic life, except of the very lowest kind, appears. This was formerly the case with the mud upon the banks of the Thames, where the only living things were *monads*, *vibrios*, and *fungi*; but in the middle of the stream, where there was abundance of air and water, the highest forms of infusoria abounded. This may be noticed in every river of the kingdom which receives the sewage of a large town. At first, the sedimentary matters deposit and putrefy; but the supernatant water, containing all the soluble constituents of the sewage, passes on, and rapidly becomes clearer and clearer, until its organic matter is appropriated by living beings, or destroyed by oxidation. This process is not only

indicated by the marked improvement in the appearance and odour of the water, but it is actually demonstrated by the character of the vegetation, which passes successively from the simplest and lowest forms of fungi, to *conferva*, *calothrix nireca*, *vaucheria*, &c., until at last *anacharis*, *nasturtium*, *veronica*, &c., abound; and when these are clean and healthy we may be assured that the sewage, in its noxious condition, is no longer in existence, and that the most refined skill of the chemist will fail to discover it. I have, on a former occasion, fully discussed this important question, and I should not again refer to it if it had not been made a special subject of comment, and apparently of experimental inquiry, by the Rivers Pollution Commission; for at page 18 of their recent report they say: "It has often been stated, but so far as we know without proof, that the organic matter contained in sewage and other similar polluting materials is rapidly oxidized during the flow of a river into which such materials are discharged. Thus, it has been asserted (Report of Royal Commission on Water Supply, p. 79) that if sewage be mixed with twenty times its volume of river water, the organic matter which it contains will be oxidized, and completely disappear whilst the river is flowing 'a dozen miles or so.'" Now, I think it is right to state that the quotation is not fairly made, and that the sense and substance of my evidence herein alluded to are not fully expressed; for on referring to the page from which the Rivers Pollution Commissioners have quoted, it will be found that I spoke of oxidation as only one of the agencies concerned in the destruction of organic matter in a running stream. My words are these: "Considering the powerfully oxidizing influence of water upon sewage, the many agencies which are at work destroying it, the power of precipitation, the using of it up by vegetable and aquatic plants, and by fish, and above all by the power of oxidation, I think none of the sewage discharged into the Thames can, at the present time, be discovered at Hampton." And when I am asked how far it would have to flow before it would be broken up into other chemical compounds, I answer thus: "I have made a great number of chemical experiments to determine that. I have examined most of the rivers in England, and this is the conclusion that has been come to, not only in my mind, but in the minds of all the engineers who have devoted their attention to the subject—that if ordinary sewage, containing, we will say, nearly 100 grains of solid matter per gallon, such as London sewage, out of which probably something like 14 grains or 15 grains are organic, be mixed with twenty times its bulk of the ordinary river water, and flows a dozen miles or so, there is not a particle of that sewage to be discovered by any chemical process. I ought perhaps to have said by any *reliable* chemical process; for I will not answer for the results of such processes as are used by Dr. Frankland for the determination of "organic carbon" and "organic nitrogen," processes that I have already criticised, and which others have declared to be so faulty, that the range of error embraced by them is greater than the range of possible truth. It is curious, however, that even with these processes the Thames at Hampton, according to Dr. Frankland, is purer than the Thames at its source, notwithstanding that it has received the drainage from all the towns on its banks. But to return to the subject, the Pollution Commissioners say, "We thought it very undesirable that a subject of such vital importance to our inquiry should any longer rest upon mere opinion, and we have therefore determined to submit it to careful experimental investigation." Their investigations were of two kinds—namely, an examination of the Mersey, the Irwell, and the Darwin, at different parts of their course, choosing the winter time, when most of the agencies to which I have referred were dormant; and, secondly, by examining air and sewage contained in a bottle. Both of these investigations were of the most unsatisfactory kind; for from what I know of the rivers in question, there is no part of their course so free from the access of impurities as to furnish even remotely the sort of evidence upon which we can rely. The evidence, however, which they do furnish is that, notwithstanding a continued access of impurity, there is a continued improvement of their condition; and as for the experiments with sewage in a bottle, they are so absurdly ridiculous, as a means of testing so important a question, that I am ashamed to refer to them. The proper way in which such an inquiry should be conducted is an appeal to the large facts of nature; for everywhere the rivers of England are

receiving the sewage of towns, and yet they are everywhere undergoing a rapid self-purification. If this were not so, their condition would be frightful, and we should expect a universal pestilence. In this metropolis, for example, the water which we drink is taken from the Thames after it has received the sewage of thousands of people, and yet, to use the words of Dr. Frankland, "it is purer and better adapted for domestic purposes at Hampton," where it is taken, "than at any other part of its course." And how has this been effected but by oxidation, and by the operations of animal and vegetable life? When Dr. Miller was asked by the Royal Commissioners on Water Supply, whether he had made any experiments on the power of water, in a given course, to oxidize organic matter, he said, "I ascertained a remarkable result in 1859 upon the river: I took specimens of the water at Kingston, at Hammersmith, at Somerset House, at Greenwich, at Woolwich, and at Erith on the same day, and examined the quantity of oxygen which the water contained at all these different points. I found that the quantity of oxygen at Kingston was the ordinary or normal proportion; at Somerset House it was much diminished; at Greenwich the whole of the oxygen had disappeared; at Woolwich it was in much the same condition; and at Erith the water was very much improved—showing that this diminution of oxygen had been produced by its action upon the water contaminated with the sewage of the London district, and that, as it passed lower down, the oxygen was again absorbed from the air, and again it became diluted with a large volume of water from below, from other sources—the Lea, the Ravensbourne, and other tributaries—and in this manner the water had again become oxidized. I look," he says, "upon this as a *direct proof of the effect of oxygen in destroying those organic contaminations which are thrown into the river.*" Dr. Odling, also, in reply to a question from the Royal Commissioners, as to the self-purifying power of water, said: "You see in many rivers, even sluggish rivers, having sewage discharged into them, that for a mile or two the appearance of the river is affected by the sewage, but beyond a certain distance there is no recognizable effect at all—the weeds are perfectly clean and perfectly healthy," and he instances the river Soar, at Leicester, which is black and very foul from the refuse of the town—but "three miles from the town, its appearance is such that you could not tell it had been contaminated; for it was running clear, with fish swimming in it, and the weeds were clean." That, he said, was simply from a process of self-purification. Again, Dr. Taylor, of Guy's Hospital, in his examination before a Committee of the House of Commons on the Metropolis Water Supply Bill, states, when speaking of the effect of water on sewage matter, that "all such substances are very rapidly decomposed and destroyed; the nitrogen is converted into nitric acid, and the sulphur into sulphuric acid—so that those foetid and putrid substances which go into the Thames from London, when rolled about by the action of the water, containing an enormous amount of air, are all oxidized and destroyed; within a certain limit they may be found, but still, after a very short passage, they are very soon indeed destroyed." I believe," he says, "it is the opinion of every chemist who has considered the subject, that sewage-matter does not remain as sewage-matter in well-aerated water, but all phosphorus, sulphur, and nitrogen are speedily destroyed by the oxygen of the water. Every 1,000 gallons of water contain 46 gallons of oxygen, and that oxygen destroys all such putrescent effluvia. With water not exposed to the air, and not containing air, it is most offensive and unwholesome; but with water containing air, like the Thames, and exposing an enormous surface to the air, in its daily motion, the effect is completely to obliterate every trace (of sewage matter) that a chemist can detect. In the Thames, and other water, the air is in a state of solution, the matter in a state of diffusion, and thus the air and this foetid matter are in the very condition to combine together and form an innocuous compound; it requires time and motion, but still it does take place with very extraordinary rapidity." And he concludes his remarks by saying: "The supposition that the drainage of London, which goes into the river about the bridges, remains the drainage of London all up the river, is contrary to all chemical experience; it is contrary to every chemical fact, and every chemical analysis." In a former communication to you, I spoke of the investigations of Dr. Angus Smith on the polluted water of the Clyde, which were

to the same effect. Engineers also, who have been largely concerned in such inquiries, have always spoken of the remarkable self-purifying power of water. Mr. Hawksley, whose experience of this matter renders him a very high authority on the subject, said, in answer to a question from the Rivers Commission, as to the quantity of water, compared with the volume of sewage discharged into it, as necessary for the purpose of breaking up the sewage into inoffensive compounds, that generally 20 to 1 was sufficient; but if the water flows rapidly, and is very much disturbed, so as to be continually receiving fresh oxygen, a smaller quantity—even 12 to 1—will effect the process; and if it proceeds very tardily it may take a little more, but 20 to 1 is abundant. "I could," he adds, "give you very remarkable instances of it. Take Sheffield. Nothing can be fouler probably than the state of the water at Sheffield; whereas if you go down to Doncaster (about twenty miles below Sheffield), the water is supplied by the waterworks, and is actually drunk in the town." Again says Mr. Hawksley, "Take the river Irwell (the very river which Dr. Frankland has been examining). After leaving Manchester it receives the Irk, the Matlock, and all the refuse of the manufacturing population for a great many miles. When it travels down only eight or nine miles to Warrington it is perfectly changed; it ceases, or nearly ceases, in that short distance to be an offensive river." "At Leicester, likewise," to use his words, "the water was as black as ink—nothing could live in it, and the smell was abominable; but by the time it had got to Loughborough (which is about twelve miles below Leicester) it was entirely restored to its pristine condition. You could stand on the bridge there and see the fish swimming amongst the beautiful reedy and other plants growing in the water, just as in the purest stream. You could see every pebble at the bottom; that is an instance of oxidation." You may remember the instance which I gave you last year of the river Trent, which receives the sewage and manufacturing refuse of some of the largest, busiest, and dirtiest towns in the kingdom, with an aggregate population of more than a million and a-half of persons, and yet when it arrives at Nottingham it is not only clear, pellucid, and inoffensive, with abundance of fish and aquatic plants, but is actually used for the domestic supply of the town. But why need I multiply such instances, or dwell upon such self-evident empirical facts, when they are within the common knowledge and experience of everybody? for even Dr. Frankland is ready to admit, in the case of the London water supply, that "by gradual oxidation, partly in the pores of the soil, partly in the Thames and its tributaries, and partly in the reservoirs, filters, and conduits of the company, this sewage contamination had been converted into comparatively innocuous organic compounds before its delivery to consumers." "I believe," said Dr. Frankland, in his evidence before the Royal Commission on Water Supply, "that the noxious part in sewage is that which is held in mechanical suspension, not that in solution;" and no doubt the sedimentary matters of sewage are capable of producing an offensive condition of the rivers, for when they are discharged into a sluggish stream they quickly subside, and form accumulations of persistently putrefying mud. This is the chief cause of complaint wherever sewage enters a river. At the time of the inquiry into the state of the Thames in 1858, it was admitted on all hands that the filthy mud-banks of the river were the great source of annoyance; and Dr. Hofmann and Mr. Witt, in their report of the matter to the Government referees, declared emphatically that the formation of this mud-deposit in the bed of the river appeared to them to be by far the most serious evil which results from the discharge of London sewage into the river, and they strongly urged this point upon public attention. Dr. Odling, in his report to me on this subject, for the information of the referees appointed by the Metropolitan Board of Works, said that "any means which would prevent the deposition of organic mud in the bed, but more particularly on the exposed banks of the river, would effect an amply sufficient purification of it." The same was my own opinion, for in reporting to the referees I stated that the mischief produced by the discharge of sewage into the river "was not occasioned, as I once supposed, by the soluble matters of the sewage, but by the mud or insoluble constituents which settle and putrefy upon the banks of the river." These constituents being in a solid form, and not easily accessible to atmospheric oxygen, continue to putrefy for a considerable

time. In my laboratory operations I have found that they will keep up a persistent decomposition, with a constant evolution of offensive gases, for many months, the air being excluded from them. I am therefore of opinion that the chief point to be aimed at in the purification of sewage is the rapid and effectual separation of its suspended matters, leaving the soluble matter to mix freely with proper proportions of running water, in which it will be quickly appropriated by infusorial life, or be destroyed by atmospheric oxidation; and this leads me to consider the means whereby this may be effected. One method of accomplishing it is to keep the solid matters out of the sewage, as is practised, with more or less success, in Manchester, Salford, and other towns of Lancashire. In Salford, according to the report of the medical officer of health, Dr. Syson, the most satisfactory results have been obtained with a modification of M. Goux's plan, whereby the soil is received at once into tubs lined with some refuse absorbent; and the advantages of the plan, according to Dr. Syson, are that the manure becomes of great commercial value; that the excrement of the whole town can be readily removed at least once a week; and that in case of fever or contagious diseases the whole of the excrements can be readily and economically disinfected; besides which the plan is simple and economical. Earth-closets are not so manageable, as they require about $3\frac{1}{2}$ times their weight of earth to the excreta, and the difficulties of carrying the material to and from the closets are not manageable on a large scale, although I have seen them in satisfactory operation in factories, as they may be in military camps, where the organization of labour is easy. Instead of earth, Mr. Stanford recommends charred seaweed, which is not only an excellent deodorizer, but does the work of three times its weight of earth. In Edinburgh, in olden times, there were no closets in the poorer houses, but there were numerous public privies, which still exist. These are provided with from eight to forty compartment, beneath which there is placed by the scavengers, every morning, a tin can, like the modern milk-can on the railway, and the can of the previous day, with its contents, taken away. The soil is mixed with ashes and road-sweepings, and sells for about £7,000 a-year, which is half the entire charge of the scavenging of the older part of Edinburgh. Nearly everywhere on the Continent some such method is adopted for the collection of the refuse and excreta, and they are profitably utilized. How far an improvement of this condition of things, instead of the present water-closet system, may have met the requirements of hygiene and the demands of agriculture, is an important question. The Pollution Commissioners, however, condemn this plan *in toto*; and so far are their views disturbed by the medium of their prejudices, that they cannot perceive any difference in the quality of the sewage of a place retaining its solid matters and of another which lets them flow into the public sewers. Liverpool, for example, which collects and disposes annually of about 130,000 tons of privy soil; Manchester, 74,000 tons, Salford 46,000 tons, Oldham 50,000, Preston 30,000 tons, and Bolton 22,500 tons—furnish in each case as much sewage, and of the same composition, as the towns which discharge everything into the sewers. The inconsistency of the thing is so striking that it creates most serious doubts of the accuracy of the analyses, and of the reliability of the determination of organic carbon and organic nitrogen. And now let us turn to the pet scheme of the Pollution Commissioners—the disposal of sewage in all places and under all circumstances by irrigation. Fortunately for us, the thing has been tried, and is now being done in many places, so that we can test it by its practical results, and examine it by the light of something more than that of abstract speculative chemistry. To begin with its absolutely required conditions. You must have a soil that is sufficiently porous to allow the sewage to filter through it, and this soil must be well drained to carry off the subsoil water. The situation of the farm must be convenient as regards the flow of sewage to it by gravitation, and the discharge of water from it by drainage. It must not be within reach of danger from atmospheric miasms, or the pollution of wells by the subsoil drainage. It must have a ready market for the disposal of its only merchantable produce green Italian ryegrass; and lastly, there must be an area of not less than two acres for every 100 people, one of these acres being in use while the other is resting to recover itself. These conditions cannot always be secured, but even if they could, let us see if the objections to the process, on sanitary

grounds, are not conclusively against it. 1. In the first place, the land irrigated with sewage is always a fetid, swampy, morass of the most offensive description. Nowhere, of all the places which I have visited, is there an exception to this condition of things. At the Craigintry meadows, near Edinburgh, which I have often seen, the stink from them is hardly endurable; to use the words of Dr. Ligertwood, who was stationed at the neighbouring barracks, "the stench is sometimes quite sickening." At Norwood and at Beddington it is a subject of serious complaint by those who reside in the neighbourhood of the farms. I have myself experienced it on several occasions, and have been surprised at the statements of Dr. Carpenter, of Croydon, whose pet thing it is, that nobody complains of it. Mr. Creasy, the surgeon at the Female Orphan Asylum, at Beddington, tells a different story, for he says it so damages the value of the neighbouring property that villas near the farm do not let so well as others, nor at so high a rent. At Aldershot, which is frequently referred to as a well and successfully managed sewage farm, I ascertained, on a recent visit with Mr. Hawksley, Mr. Eggar, and Professor Ansted, from the occupants of the few cottages which skirt the farm, that the stench is frequently unbearable and most sickening. At Banbury there is but one house upon the estate; it is a public-house called the Bowling Green, and the landlady described to us, in very graphic terms, the nuisance she was obliged to submit to. 2. But these miasms are not alone offensive, they are also dangerous to the public health; in fact, the early proceedings of those who have brought about this condition of things were devoted almost entirely to the proof of their morbid action, and it was this apparently clear proof which was made the lever of their Parliamentary movements, and was the main cause of our present difficulties. Now, however, they will tell you that the emanations from acres of land soddened with putrefying sewage are neither offensive to the senses nor injurious to the health. I put it to you, gentlemen, as a simple matter of common medical experience, whether you are of such an opinion; for, if so, where is the necessity for all our elaborate and expensive machinery for getting rid of these matters from our houses, and for preventing the escape of such offensive emanations? Why feel, in fact, the least concern for an untrapped drain or an overflowing cesspool? One of the highest medical authorities on the subject of fevers, Dr. Murchison, has traced a particular fever to this particular source, and has devoted a large portion of his classical work to the proof of sewer gases being the primary cause of what he has termed *pythogenic* or enteric fever. It is true that he has some doubts, like Dr. Christison, of the effects of the diluted gases; but time will prove whether these doubts are well founded. Already enough has been seen to show that they are not so harmless as many suppose. Mr. Creasy, to whom I have before alluded as practising at Beddington, said very recently, before a committee of the House of Commons: "I know the sewage farm belonging to the Croydon Board of Works, at Beddington, and have had experience in my professional capacity of what condition of health is around those flats, for I have known the district ever since it was a sewage farm. The first case of typhoid fever occurred in the place in 1867, and from that time to this there has been typhoid fever in every cottage on the estate; and I find around it that almost every disease assumes a particular type, accompanied with what we call a sewage tongue." In the spring of last year I was inquiring into the condition of a stream called the Hebble Brook, which receives the sewage of Halifax, and I was informed that at a place near the outfall of the brook into the Calder, some of the sewage was distributed upon the land, and that it caused such a serious outbreak of typhoid fever in a neighbouring model village, belonging to Mr. Ackroyd, that it was found absolutely necessary to discontinue it. Again, in the autumn of 1862, I had an opportunity of witnessing, on a very large scale, the morbid effects of sewer gases in the town of Shaftesbury, and the adjacent village of Enmore Green. The town had been recently drained by a gentleman of no great practical acquaintance with the subject, and he carried the sewage into the ponds and ditches around the town. It was an experiment of a very instructive kind, for soon the people were attacked with enteric fever, and in less than a year one-eighth of the whole population was down with the disease; for out of about 3,500 persons, 448 were attacked. I am afraid, therefore, that these miasms, even when diluted with air, are capable of producing serious mischief, and that such facts are more conclu-

sive than the statistics of Dr. Carpenter, which seem to show that the people of Beddington and Norwood have actually been better in health since the sewage was brought to them than before. 3. I would remind you that the efficacy of sewage irrigation is entirely dependent on the percolation of sewage matter, and the distribution of it through the subsoil water. It cannot but be, therefore, that this water is polluted to such an extent as to endanger the neighbouring wells. Many instances of this have already come under my notice; and it would seem, from the remarks of Dr. Carpenter, that Dr. Frankland had himself stated that the chalk well at Croydon, from which the public supply is obtained, is actually polluted with the soakage of foul matters from the irrigated grounds at Beddington. The morbid effects of such water are but too frequently observed, as the annual reports of the medical officer of the Privy Council abundantly testify; and then again, if the doctrines of Professor Von Pettenkofer, of Munich, be correct, as they certainly seem to be, that fluctuation in the level of ground water-charged with sewage is the most active agent of fever and cholera, the consequences of irrigation may be most serious. 4. There is another very important objection to sewage irrigation—the danger of propagating parasitic diseases. Sewage contains myriads of ova of intestinal entozoa—every segment of a tape-worm discharged from the human body is crowded with them, and if distributed with sewage upon the land will become attached to the grass and other green fodder which is produced thereon. This is eaten by cattle, whose bodies quickly become infected with the parasite in its larval condition, and thus the measly meat becomes the agent of disease in our own bodies. At present, the distribution of these ova, and their access to the bodies of herbivorous animals, is entirely a matter of accident; but make it a matter of certainty, as most assuredly you will by distributing sewage upon the fodder-producing land, and the consequences must be serious. Dr. Cobbold, who is our highest authority on this subject, has published an essay to warn the public against the danger of this method of disposing of town sewage; and he has hinted at the probable introduction into this country of a terrible helminthic malady (*Bilharzia*) which is now common in Egypt, in Africa, and the Mauritius, and would assuredly be propagated throughout the land by this dangerous scheme of irrigation. "Have the kindness," he says, "to observe that every colonist returning from the Cape is liable to bring this parasitic treasure with him as a 'guest' indeed, dwelling in his blood, and feeding on his life stream. In the advanced stages of the malady, the afflicted individual must frequently evacuate the eggs and their contained embryonic larvae, which are thus conveyed into the ordinary receptacles of such voidings. There let them remain, or convey them into a cesspool, and no harm follows. If deemed preferable, you may transport them, along with myriads of other human parasite eggs and larvae, into a common sewer, and thence into the sea; still, entozoologically speaking, no harm follows. Here, however, let me invite you to pause; for if, without due consideration, you adopt any one of the gigantic schemes now in vogue, you will scatter these eggs far and wide; you will spread them over thousands of acres of ground; you will place the larvae in those conditions which are known to be eminently favourable for the development of their next stage of growth; you will bring the latter in contact with land and water snails, into whose bodies they will speedily penetrate; and, in short, you will place them in situations where their yet higher gradations of non-sexual growth and propagation will be arrived at. After all these changes, there is every reason to believe that they will experience no greater difficulty in gaining access to our bodies here in England than obtains in the case of those same parasites attacking our fellow-creatures whose residence is found in Egypt, in Natal, in the Mauritius, or at the Cape. In a natural history point of view, it would not be an altogether singular result, if, twenty years hence, this parasitic malady should be as prevalent in this country as it is now known to be in particular sections of the African continent. Foreseeing the possibility, not to say probability, of this contingency, am I not right," he says, "after years of long study, to raise my voice in the hope of preventing such a disaster?" Nor is it unlikely that the *Trichina* may be distributed in the same manner, for it swarms in the intestines of those who have just become infected with it, and may be discharged into sewage and scattered upon the land and eaten by creatures whose flesh will give it back to us again. No one, indeed,

but the helminthologist can say what particular parasite may not be distributed and propagated by this dangerous agricultural process. "May we not, indeed," as Dr. Cobbold observes, "but too reasonably conjecture that the wholesale distribution of tape-worm eggs by the utilization of sewage on a stupendous scale, will tend to spread abroad a class of diseases, some of which are severely formidable? So convinced am I," he says, "of the truth embodied in an affirmative reply to this latter query—so certain am I that parasites are propagated in this particular way—so surely do I foresee unpleasant results if no steps be taken to counteract the evil, that I feel myself bound to speak out boldly, and to produce no uncertain sound in the matter which most closely concerns humanity." The whole question, in fact, is of vast hygienic importance. But, fitly, let us see if the system, in a sanitary point of view, is so successful as to render the sewage innocuous, before its admission into a running stream. Go to a sewage farm after you have given due notice of your intended visit, and you will be taken to places where the subsoil water is running from the land apparently pure and drinkable; and no doubt with proper management, under proper conditions of thorough and effective filtration, such a result may be achieved; but the real question is how far this is really and practically accomplished, for it involves such a nice adjustment of all the appliances, such a continuous distribution of the sewage over successive areas of land, and such constant supervision, that it is rarely effected. To judge of the results, therefore, you must visit these places, as I have done, without previous notice, and you must examine the whole district, for it is not uncommon to find byways for the disposal of the sewage which the land will not take. Not long ago, as I have said, I visited Aldershot, with Mr. Hawksley, Mr. Eggar, and Professor Ansted. This you know is a pet place with the advocates of the system, but at the time of our visit we found that nearly all the sewage was passing along the carriers to the outfalls, and going bodily into the river. I took samples of the sewage as it entered the farm from the two camps, and as it flowed from the farm to the river. The original sewage contained 54 grs. of soluble matter per gallon, and 44 grs. of insoluble, each of which contained about 30 grs. of organic matter. As it left the filter-tank it contained the same amount of soluble matter, and 35 grs. of suspended, of which about 26 grs. were organic. As it ran along the carriers to the lower part of the farm, it retained its black offensive character, and this was very marked upon that portion of the land where a little of it was distributed. At one of the outfalls into the Blackwater river it contained 52 grs. of soluble matter per gallon, of which 28 grs. were organic, and 2·84 grs. of suspended matter. At three other outfall from the farm the soluble matters amounted respectively to 52 grs., 58 grs., and 54 grs. per gallon, of which 24 grs., 20 grs., and 22 grs. were organic; the suspended matters being 26 grs., 6 grs., and 5 grs. per gallon respectively, of which 12 grs., 2 grs., and 3 grs. were organic. At the several points of discharge into the river the sewage was black and fetid, and there were large accumulations of sewage mud in a high state of decomposition. I took a sample of the river water before it received the outfall sewage, and after; the former contained 19 grs. of soluble matter per gallon, and the latter 24 grs., of which the organic amounted to 3½ grs. and 5 grs., the ammonia in the two cases being 0·264 of a grain, and 1·545 gr., showing an enormous pollution of the river by the so-called defecated sewage. Everywhere upon the land where the sewage had been distributed there were masses of fecal matter, waiting for the first heavy shower of rain to wash them away into the nearest outfall; the neighbouring ditches were in a most offensive condition, and we were told by the occupants of the houses adjoining the farm, that in times of flood the whole roadway was covered with sewage matters. Considering the praise which has been bestowed on the alleged success of this farm, I was not prepared to witness such a frightful condition of things. At the Craigintinny meadows, near Edinburgh, it is notorious that the outfall water from the farm is shockingly offensive, but as it runs into the sea it is not complained of as a nuisance. A like condition of things, but not so such an extent, I have seen at Norwood, at Rugby, at Warwick, and at Banbury; in fact, at the last-named place the ditches around the farm were full of sewage, and the water was running from the outfall in a very offensive state, showing that the system, although susceptible of good results, is rarely so in

practice, unless it receives an amount of attention that makes it a serious business. Besides which, there are times when no attention will prevent the discharge of foul sewage from the land, as when the soil is heavy, and a flood of rain sweeps over it, and when vegetation is dormant. In winter time it will freeze upon the land and kill the grass, and, as it thaws, run off to the nearest stream. At Warwick we saw acres of ground thus despoiled, where the defecation of sewage was entirely a matter of surface filtration. All authorities, indeed, agree that the success of this system is dependent upon a combination of circumstances which are not always attainable, and upon the strictest care and supervision. Even then, according to Dr. Frankland, although it may purify sewage to a great extent, it does not sufficiently purify it to render it admissible into potable water without danger; "the risk arising not only from the considerable amount of animal organic matters which the effluent water still retains in solution, but also from the absence of any guarantee for the removal of the germs or other noxious suspended matters which are frequently present in sewage." The other means of dealing with sewage, so as to separate the suspended matters, and to remove a certain portion of those which are dissolved, is to submit it to chemical treatment. Already there are sufficient facts to enable us to review this part of the subject. At Leicester, at Hertford, and formerly at Tottenham, the sewage was defecated with lime, the lime being used to the extent of from 5 to 20 grs. per gallon of sewage. The treatment is effected by adding the lime to the sewage, and then briskly agitating it; after which it flows into subsiding-tanks, where the sedimentary matters deposit, and the clear supernatant water runs off by a weir placed a little below the surface. At Hertford the supernatant water is filtered before it is discharged into the outfall, and in summer time a little chloride of lime, amounting to about half a grain per gallon of sewage, is also employed, as it is found to deodorize the sewage, to check secondary putrefaction, and to prevent the growth of the sewer fungus in the outfall channel. In the year 1858, when I first examined this process at Leicester and Tottenham, for Messrs. Bidder, Hawksley, and Bazalgette, the referees appointed by the Metropolitan Board of Works to consider the question of the main drainage of the metropolis, I found that with 12 grs. of lime per gallon of sewage the whole, or nearly the whole, of the suspended matters were removed, and that the soluble organic matter fell from 13½ grs. per gallon to 10½ grs. When 20 grs. of lime were used, the soluble organic matter fell to about 9 grs. On the occasion of a more recent visit to Leicester, with Dr. Frankland and Dr. Odling, at the instance of the Thames Conservancy Board, we found that the soluble matters of the sewage were reduced from 63 grs. per gallon to 48 grs.—the organic matter falling from 15 grs. to 5 grs. At Hertford, where the original sewage is remarkably weak on account of subsoil water, I have ascertained from many experiments that the organic matter in solution is reduced from about 3 grs. per gallon to 1·6 gr. All these results accord well with laboratory experiments, and they show, as I stated in my original report to the referees alluded to, that, "judging from the experiments which I have made, and the observations of practice on a large scale, it is ascertained that about 12 grs. of lime to a gallon of sewage will effect the speedy separation of all the suspended matters, and also about one-fourth of the dissolved organic matter, leaving a clear liquor which has lost a great part of its offensive odour; and when the clear liquor is mixed with from five to seven times its bulk of water, and is exposed to the air, it is no longer offensive." At Leicester, where the lime method has been adopted, the river Soar, into which the sewage flows, has undergone a remarkable improvement. Before the works were established the river was most offensive, the fish were killed, the vegetation of the river was destroyed, and those who inhaled the effluvia from it were constantly ill. At the Belgrave Mill, which is just below the point where the sewage enters the river, the foulness of the stream was such that in summer-time the water of the mill-dam appeared to boil with putrefaction; the stench from it was intolerable, and so large was the quantity of sulphuretted hydrogen evolved, that the silver in the men's pockets turned black in a few hours. At that time the men were constantly afflicted with diarrhoea, they lost their strength, and their appetites always failed them; one man only out of thirty men in eighteen years had been able to stand it, and he it was who gave me an account of the matter. Now, however, and for

the last three years, since the lime process has been adopted, the river presents an entirely different appearance—aquatic plants have begun to flourish, the fish have ventured to return, the black mud has ceased to accumulate, and the mill-dam is no longer offensive. All along the stream the people speak of the change with satisfaction, and it would appear that the process fulfils the requirement of the local Act, which demands that the water discharged from the works shall not occasion a nuisance, or be injurious to the health of those who live or are employed on the banks of the stream. Crude sulphate of alumina is another precipitating agent. It is employed at Stroud, in Gloucestershire, in what is known as Bird's method. The crude sulphate is made by adding about 20 lbs. of sulphuric acid to 1 cwt. of powdered clay, and allowing it to stand for some time. This material is mixed with sewage in the proportion of 1 cwt. to from 20,000 to 30,000 gallons of sewage, and the sedimentary matters are collected in a properly-constructed tank. Sulphate of alumina is decomposed by the ammonia of the sewage, and the alumina flocculates and precipitates the suspended matters, leaving a clear supernatant liquid, from which a good deal of dissolved organic matter has been removed. To ensure the precipitation of the alumina, Dr. Anderson, of Coventry, recommends the addition of lime. He uses about one pound of crude sulphate to every 100 gallons of sewage. This mixture is well agitated, and then a quarter of a pound of lime in a creamy condition is added. Again it is agitated, and the flocculent alumina, together with the suspended matters, rapidly falls. The sediment is collected in subsiding-tanks, which are worked alternately, and the clear liquor is run off from it. As in the last case, the suspended matters are entirely removed, with a considerable amount of the dissolved organic matter. Chloride of iron, with lime, is also a powerful defecator. It was formerly used at Northampton, and is still, to some extent with lime—the lime being first added to the sewage in the proportion of about a bushel to 8,500 gallons of sewage, and the chloride of lime to the extent of about half a gallon! The chloride is made at the works, and contains about 9,500 grains of the mixed chlorides of iron per gallon. In this case also the precipitation of the sewage is very complete. At present, however, the local authorities are using sulphate of iron and alumina instead of the chloride. The compound is made by mixing 3 cwt. of crude sulphuric acid with 2 tons of a ferruginous earth obtained in the neighbourhood. After standing for a few days the mixture is ready for use, and it is added to the sewage in the above proportion to a million gallons of sewage. At Leamington, where there is an injunction against the discharge of unpurified sewage into the river Leam, the authorities have resorted to the use of the "A.B.C." process of Mr. Sillar, which is worked by the Native Guano Company at its own cost. The sewage flows to the works by gravitation, and there it is mixed with the A.B.C. material (consisting of alum, clay, sulphate of magnesia, bone ashes, wood charcoal, and a little blood diffused through water). The material is added to the sewage in the proportion of one gallon to 200 gallons of sewage, and the whole of it well agitated. It then flows through subsiding-tanks, where the precipitated matter subsides, and the clear water flows off from a weir into an outfall channel with a filter. The tanks are worked continuously for about a week, when the precipitated matter is removed to a centrifugal machine, and drained to the consistence of putty. This is further dried by exposure to the air, and its ammonia is fixed by means of a little sulphuric acid, which also breaks up the organic matter. In this state it is riddled, and sold freely at a good profit for manure. Samples of the Leamington sewage were taken for examination by the Royal Pollution Commissioners on the 11th of December last, and duplicates of them were furnished to me on the following day for analysis. I ascertained that the original sewage contained 66 grs. of solid matter in solution per gallon, of which 14.43 grs. were organic, while the effluent water before filtration contained 67 grs. of soluble matter per gallon, of which 11.27 grs. were organic, and the filtered water contained 61 grs. per gallon, of which 7.58 grs. were organic. Again, the suspended matters in the original sewage amounted to 113.6 grs. per gallon, while in the effluent sewage before filtration it was 7.64 grs., and in the filtered sewage 3.12 grs. The Royal Commissioners, in describing their results, do not mention the filtered water, but in

other respects their results accord pretty closely with mine. Lastly, there is a method of the late Mr. Blyth, which is very deserving of attention. Mr. Blyth was the chemist of the old Board of Health, and he had great opportunities of studying this matter. His plan is first to add a soluble phosphate of lime and sulphate of magnesia to the sewage. After agitation, the mixture is neutralized by means of a little slaked lime, and the precipitated magnesian phosphate carries down with it the whole of the sedimentary matter and a portion of the soluble ammonia. A million tons of sewage require about 1 ton 3 cwt. of Blyth's compound, and 4 cwt. of lime for neutralizing. The resulting dry precipitate weighs about 3 tons 8 cwt., and contains about 58 per cent. of organic matter (yielding 4.5 ammonia) and 8.66 of phosphate of lime. All these methods are manifestly capable of separating from sewage all the sedimentary matter, and also of removing considerable portions of dissolved organic matter; but to be effective there should not only be good agitation of the sewage after the addition of the precipitating agent, but there should also be sufficient tank-room for the deposition of the sewage for not less than four hours; and there should also be a means of filtering the defecated sewage before it is discharged into the river or other watercourse. After witnessing the action of lime as a defecator at Leicester and Hertford, Dr. Odling, Dr. Frankland, and myself reported to the Thames Conservancy that the following were the conditions necessary to its success: 1. The proportion of lime should not be less than one ton to a million gallons of sewage, and there should also be used 56 lbs. of chloride of lime. 2. That the mixture of the sewage with the lime and chloride of lime should be very complete, and that the mixture should be agitated, so as to aggregate the suspended matters, and thus assist in the subsequent precipitation of suspended matter. 3. That the sewage when thus treated with lime should flow along two subsiding-tanks in series; the first should be capable of holding at least one hour's flow, and the second of holding not less than four hours' flow. The tanks should be four feet in depth, and the overflow of the defecated sewage should be by a weir only half an inch below the surface. 4. That there should be a double set of tanks for alternate working. 5. That the defecated water should flow through a shallow open conduit of not less than a quarter of a mile in length before being received into a stream of freely running water, of not less than eight or ten times the volume of the defecated sewage. In this way, or by any similar method of defecation, the sewage of towns may be easily and safely dealt with, so as, on the one hand, to ensure its purification before it is discharged into a running stream, and, on the other, to avoid the many dangers of irrigation. I refrain from entering on the subject of the pecuniary aspects of this question, for they are nowhere encouraging, notwithstanding that the most sanguine opinions have been expressed of the commercial and agricultural value of sewage. Irrigation, like precipitation, except in the case of the Leamington method, is everywhere unprofitable, when it is conducted in such a manner as to prevent the pollution of the neighbouring streams; and I warn you against the glowing accounts which are given of the profitable returns of certain sewage farms, for, if the cost of outlay is considered and balanced with the average returns, it will always be found to be a losing affair. The most sanguine enthusiasts have generally abandoned the system after a trial of its merits. Little or nothing, in fact, can be profitably grown upon the sodden land but Italian rye-grass, and when this is abundant it must be cut, or it will rot upon the ground, and it must be sold for what it will fetch. In the summer of 1866, when I was in Edinburgh, I saw acres upon acres of rye-grass rotting upon the far-famed Craiginnty meadows; and when I asked the cause of it I was told by the manager that the cattle-plague had ruined his customers, and there was nobody to buy it and nothing to eat it, and there it must rot. Besides which, there are considerable doubts as to the value of it as fodder. Mr. Campbell, of Rugby, who ought to be a high authority on the subject—for it was a pet of his—honestly declares that his experience does not show a profit in the use of such fodder, and he gives a good example of it. Twelve Ayrshire cows, which calved about the same time in May, 1869, yielded at the end of twelve weeks an average quantity of $9\frac{1}{2}$ quarts of milk per day per cow. Their daily consumption of rye-grass was $1\frac{1}{2}$ cwt. per cow. If they had been milked for nine months, the average daily yield of milk would have been only from five to six quarts per cow. The

cost of the grass, at 10s. per ton, was 9d. per cow per day, and the other expenses of the dairy raised it to 1s. 3d. per cow. The milk, at 8d. per gallon, was worth only 1s. 7d., and when the cost of sending it to market was taken into account, together with the wear and tear of utensils, he vainly asked for profit. But all this is, as I have said, no part of my present inquiry, for my business is solely with the sanitary part of the question; and I would ask you whether, having regard for the public health, there are not serious dangers in the rash recommendations of the Royal Pollution Commissioners to scatter the sewage of every city and town in the kingdom broadcast upon the land? Medical authorities of some sanitary experience are alone able to engage in such important pathological considerations, and it must strike every one who is interested in the subject, that a Royal Commission, without any pretence of medical knowledge, is singularly incompetent to deal with such a matter. What importance the public or Parliament may attach to their recommendations I am unable to learn, except from former experience, but it is clearly our duty, as public health officers, to examine the subject from a medical point of view, and I doubt not what will be the conclusion.

Dr. COBBOLD said that individually he regarded the sewage question as one which was three parts out of four a chemical question. On this account he thought the chemists should have the advantage of speaking first upon it. Dr. Letheby had referred specially to the remarks made by him in his *brochure*. Now, though the observations he made there were written in a warm, perhaps too warm a strain, he believed there was no statement which he was not still prepared to substantiate. And he thought since he had gained more experience in experimental researches that he could now write a pamphlet much more cogent than that to which Dr. Letheby had alluded. With reference to parasitic diseases, he would only say that he knew of two patients in this country who were suffering from that frightful malady which was so destructive in Egypt. These patients at every urinary discharge must pass a number of the eggs of this parasite, and if the number of persons so afflicted was increased fivefold the chances of the extension of this disease must likewise increase. But happily there were so many contingencies which the parasites had to encounter before they arrived at the human body that the community were yet spared; still he held by the statements contained in his pamphlet. Then take the case of ordinary tape-worm disorders, respecting which he had had much experience. There were about 3,000 persons in London suffering from this cause, who each passed from four to twelve joints a day, each joint containing 30,000 mature eggs, which would give at least a daily return of 450 millions, but he believed 1,000 million eggs was nearer the mark. A certain number of grains of organic matter per gallon were found by chemists in sewage, of which organic matter these eggs must be part and parcel. A handful of large entozoa parasites had been taken from the Craiginfinny meadows. If this sewage was distributed far and wide, it was certain that a considerable portion of these millions of eggs must gain access to the herbivora. It was known, from experimental researches, that measles were developed productively in beef. It was a popular notion that pork only developed measles, but he would assert that in underdone beef persons ran a greater risk. The proportion of tape-worm disease derived from mealy beef was as seven or eight to one in the case of pork. It was, therefore, to incur an enormous risk to distribute sewage which contained these germs over the land. It was possible to decimate the population of any town within a certain number of months by the distribution of tape-worm germs, there being one tape-worm in particular which produced a disease of the human body at present causing the death of 400 persons annually in this country. If that parasitic disease should increase in the same proportion as other parasitic diseases, such as the ordinary tape-worm, a result would follow such as still obtained in Iceland, where one-sixth of the population died annually from this cause. Having these facts to deal with, and knowing the developmental process through which these parasites passed, he thought they were called upon to ask people to pause before adopting a scheme so gigantic as that now proposed, inasmuch as it was with consequences so serious as those which he believed were involved in it.

Mr. HOLLAND said he did not believe any portion of Dr.

Letheby's paper, and he thought the writer was inconsistent with himself. In the first place he alleged that twenty times its volume of water would purify the sewage poured into it, and afterwards he asserted that even a small quantity of water from irrigation meadows was poison. Was Dr. Letheby prepared to recommend that the soil should be burnt; if not, what did he propose to do with it? Unless he was prepared to recommend that all human manure should be burnt to avoid the supposed risk, his argument went for nothing. He (Mr. Holland) believed that the danger of spreading disease by the irrigation system was purely imaginary. Where was the evidence of disease having been produced where the system was adopted? He had made inquiries on the subject and could find none. At Carlisle he asked whether the sheep had the rot, and was answered that they had not. At Edinburgh cows had been fed with grass from the irrigated meadows for sixty or seventy years, but there was no evidence of the prevalence of disease among them. It was true that they were not very healthy, but this arose from their mode of life. Everything was done to stimulate the production of milk from them, and they suffered from want of exercise and fresh air. Sewage was nothing but manure suspended in water, and the error was not in putting it on the land at all, but in putting it on in excess. At Carlisle he had been told that the residents in the neighbourhood of the irrigated fields were unhealthy, but on inquiry it turned out that there were no inhabitants in close proximity, and of those who were anywhere near, there were abundant causes of unhealthiness in the condition of their houses.

Dr. CARPENTER considered that the arguments of Dr. Letheby were based upon a false foundation, and that either he had little practical acquaintance with the facts from which he had drawn his inferences, or had taken only such portions of them as were calculated to sustain his view of the case. Dr. Letheby had alluded to some statements made by him, and had specially referred to the sanitary state of the fields at Beddington. The people of Croydon were among the earliest to adopt any sanitary arrangements at all. They were compelled to adopt some plan, because of the terrors of the law—no less than five or six injunctions having been obtained against them, and the Local Board were threatened with committal to prison unless they ceased to do certain acts. That was in 1858, and in 1859 and 1860 they obtained powers to do what they had since continued to do. In 1860 the irrigation meadows were laid down, and they had been in active operation to the present time. Until this year no complaint, either officially or otherwise, had been made of injury arising from these meadows. Previous to 1860, the town had been put to thousands of pounds expense for damage occasioned by the sewage, but from that year till within the last nine months they had been free from such liability. In 1860 they laid down 276 acres of land for the purpose of irrigation, and to remove the mischief which 19,000 people produced by their sewage. Since then the population of the town had increased to 50,000, and he was free to confess that the quantity of sewage was too much for the land. The result had been that occasionally of late the water was not so effectually purified as it should have been. Until 1867 no cases of fever occurred there. The water of the effluent stream passed through the grounds of a gentleman residing in the neighbourhood, and even at the present time trout might be seen swimming about in it. That being the case, was it not evident the plan adopted for dealing with the sewage was the correct plan? Indeed, Dr. Letheby said so himself and it had been shown in that room that, if sewage were made to pass through five feet of earth, it would be rendered perfectly innocuous, and would be perfectly oxidized. Surely, then, the passage of sewage over land where it was exposed to the air, and came in contact with growing vegetable matter, would remove from it all those elements which were injurious to health, and the water would go off perfectly pure. Dr. Letheby was in the position of an engineer, who, some years ago, wrote a pamphlet to prove that it was totally impossible for a steambot to cross the Atlantic, because she could not carry sufficient coals, the pamphlet being issued at the very moment that a steamer was actually accomplishing the feat. The town of Croydon was a standing proof that sewage could be successfully disposed of in the way Dr. Letheby asserted to be impossible. With regard to the question of health, he might state that, since the beginning of the

year, there had not been a single case of fever reported to the Board of Guardians from Beddington, and he might add, as the medical attendant of most of the wealthy families there, that he had not had a single case of fever, either typhus or typhoid, among them since the irrigation meadows commenced. With reference to the effect upon the inhabitants of Croydon proper, surely, if the emanations from the farms were so dangerous as represented, the inhabitants of the densely populated low-lying parts, which were within 500 yards of the outfall of those farms, would have suffered from typhoid. But for a long period there had not been a single case in that low district, and with the exception of a few cases of scarlet fever there had been no fever there at all. The irrigation system went on during the winter as well as the summer, and in the former period of the year the water had gone off pretty nearly free from those elements which were injurious. This was the result of experience of the system forced upon the parish of Croydon, and which they had not taken up of their own will. Having observed the system, and seen its effects, he was positively convinced that the air which passed over the fields, instead of being injurious, was a benefit to the people living around. It was a positive fact, with regard to Norwood, that the moment the irrigation fields were established the mortality fell from 18 to 15, and had remained so. Dr. Lethby said he had evidence of water coming off the fields in an impure state. He (Dr. Carpenter) knew that there had been such instances, arising from the fact that persons had gone to the fields, broken down the carriers, and pulled at the sluices, letting the water out. Dr. Lethby knew very well that the argument to be drawn from the chemical analysis of the water was valueless, unless he was aware of all the circumstances of the case.

Professor ANSTED, being referred to by the chairman, as having had experience of these matters in connection with the city of Milan, said he hardly felt qualified to take part in the discussion, although, perhaps, so far as a certain amount of familiarity with works of this kind went, he might be able to afford some little information. The general subject appeared to him as far more belonging to the medical man than the geological engineer, if he might so denominate himself. Having had the opportunity, now and then, of noticing the results obtained during the irrigation of considerable tracts of land on a large scale, with material more or less mixed up with sewage, he thought he was justified in saying that in most cases, if not in all, those results had been certainly unfavourable to the general health of the neighbourhood. The chairman alluded to his experience at Milan. He knew the town well, and the way in which the sewage was conducted over the fields in the lower part of the town, and he believed, on the evidence of medical men—some of whom had been examined by parliamentary committees in this country, and whose evidence might be found in blue-books—that the result of the system pursued there was eminently unsatisfactory with regard to the health of the people living near where the works were carried on; and it was not astonishing, for no one could go into the lower parts of the town near the stream and the works without being conscious of their being eminently disagreeable, and probably unhealthy. The Italians were not particular on the subject of smells, but it was confessed that these were very objectionable. The sewage was carried over the fields, and took its course. Sometimes it was used, and in all probability, when that was the case, it passed off the ground without doing any damage to the water of the stream; but during a great part of the year such was not the fact, and the consequence was that the stream in its course was much polluted. And this was a result which he had also observed in other parts of the world. A few days previous he had the opportunity of visiting the irrigation works at Aldershot, and there it was perfectly clear to him that the firm which took the camp sewage and was working it, was utterly inadequate for the quantity put upon it, and that, from the nature of the irrigation, the sewage water carried over the fields could only be used upon a very small scale, while the greater part of it necessarily ran away into the river. He could not help thinking that in most cases this must be the result. It was not for him to say what was the right method of getting over the extraordinary difficulty which the public were called upon to face, but that some method must be adopted was evident. The question before the meeting was whether that particular method of carrying on the work suggested by the Royal Commission on the Pollution of Rivers was likely to be practically useful. As far as his own experience and know-

ledge were concerned, it seemed to him that the method of carrying away the sewage and utilizing it by irrigation might be successful upon a small scale, where the population was limited and the acreage was large; but he could not see much probability of its being successful upon a large scale, for what upon a small scale would practically do no harm—say, in the case of 200 or 300 acres—would be attended with very serious result in the case of a large city or town. It might be very well in the case of Croydon, where the population was small, but the limits of the adaptability of the system were soon reached, and could not be advantageously extended.

Mr. LITTLE remarked that in dealing with the subject they had two enthusiasts to encounter—Dr. Lethby and Dr. Frankland—whose papers were always read with attention, and probably between the two some useful information might be gathered. He was disappointed in the paper just read, because it contained very little which was of practical benefit to the meeting as a body of sanitary officers. It raised objections to the existing modes of operations, but it gave them no hint as to what could be done with the sewage, how to utilize it without creating a nuisance, and exposing the community to those fatal consequences which Dr. Cobbold had described.

Mr. CREAMY thought it was necessary to explain in some degree the sort of conflict of evidence which had taken place. When Beddington was mentioned, it should be known that it was a large district, and that a portion of it had little to do with the sewage question. The sewage fields of Croydon had been well chosen with reference to population, but certainly in every cottage on the estate there had been typhoid fever through the whole course of the time—not a cottage had escaped. And as to the outfall at Beddington Corner, every well was contaminated, and not a house was free from fever. At Carshalton he had had cases of enteric attack. At Beddington Corner, near the outfall, four children had been taken out of one house in a day stieken down with scarlet fever.

Dr. CARPENTER interposed the remark that the local nuisances in connection with those cottages were quite sufficient to produce all the fever complained of, without seeking a cause in the outfall sewer a quarter of a mile off.

Mr. CREAMY said that might be, but the watershed went in that direction. In every one of those houses an examination of the tongues of the inhabitants would show that there was enteric irritation. The same indications which were caused by the Croydon sewage on one spot arose from the existence of cesspools on another.

Mr. HAWKESLEY said he could fully justify the statements made by Mr. Creamy, for few persons were better acquainted than himself with the results of the irrigation works at Beddington Corner. He had been professionally called down to look at those works at intervals for many years, and also in consequence of complaints having arisen, although Dr. Carpenter stated there had been no such complaints since 1860. When on other occasions he had been in the neighbourhood on totally different business, he had taken samples of the water as it fell into the Wandle, and had them analysed. He had also been up the stream, and looked at the confluence of the two waters, which ran over the meadows in different directions. On one recent occasion he found one of those waters exceedingly clear, and the other about as foul as it could be. These two waters met, and passed down by the side of the cottages just mentioned, and thence to the Wandle. In the month of February last he was down there; the sewage was then frozen over the whole surface of the land for acres and acres, and was not in the state which Dr. Carpenter had described. But, besides that, he had been there in the summer, and in the summer it depended very much upon the state of the water whether the sewage, when passed upon the land, stank or not. In warm weather it often stank frightfully, especially on "muggy" evenings. The sewage then gave off a very sickening, though not necessarily a very powerful odour. The same sort of thing occurred everywhere when sewage was applied to land—at the Barking farm, at Edinburgh, at Aldershot, and every place he had visited. It had been stated, to his great surprise, in the course of this discussion, that at Carlisle the sewage did not stink. Most assuredly it did in hot weather, although the entire quantity of sewage put upon the enormous acreage of land there was only from 200,000 gallons a day as a minimum, to something under 400,000 gallons as a maximum, which was only one-sixth of the sewage of Carlisle. And it was there of so little value that the other five-sixths were

allowed to run away into the river, though the acreage of land for its reception was sufficient to utilize the whole. As to the commercial economy of the system, he had made a great many inquiries, and he had been told very frequently of crops being sold at £18, £20, and even £25 an acre, and that everyone was delighted with the effects. But when he came to ask what was the net result of the year's working, he was answered, "Ah, that is another thing." "Well, but what is it?" "Well, we lost so many hundred pounds last year," and in some cases so many thousands. There was not one single place he had heard of where the application of sewage for the purpose of sanitary disinfection was proved to be a commercial success. It was a commercial success at Edinburgh. Why? Because it was not applied for sanitary purposes. They used as much as they required for irrigation purposes, and the remainder ran into the sea or river nearly as foul as when it entered upon the land. But this was not the question now before the meeting. The question before them was one which almost every one could answer for himself. Take the case of plain irrigation by water only—pure water—water issuing, as in the majority of irrigation schemes in this country, from chalk springs. They all knew that when water was put upon land in certain seasons of the year in that state it did fertilize the land, and good grass crops ensued. But what was the result in a sanitary point of view? Fever and ague were produced. Go to Italy. He had been over all the irrigation works there, extending for 200 miles in one way, by 60 or 70 in the other, and what was the result? The people were in a state of actual decrepitude, not simply affected with fever, but with rheumatic complaints, and there was a great deal of cretinism. The same thing existed in the south of France, where irrigation by water only was adopted. Superadd to this foul organic matter, and what must be the result? He believed there was really nothing to be learned upon the subject. His own opinion was that of all unsanitary applications the most unsanitary was that of the application of sewage to land by way of irrigation.

Mr. CREASY said the Beddington grass was irrigated as long as it could stand up, and then it was sent away to market with the sewage some inches up the stem. So that if Dr. Cobbold was right, there was an opportunity for the development of entozoa there.

Dr. LETHBY, in bringing the discussion to a close, said he thought Mr. Holland had not quite apprehended the statements he had made. He had said all along that sewage going into a running stream where there was abundance of vegetation, fish, and a large quantity of oxygenated water, even in the condition of sedimentary sewage, was by a natural process quickly disposed of. But what he also said was that the main cause of all those nuisances which arose from the discharge of sewage into running streams was the sedimentary matter it

contained, and that the distribution of sewage upon the land at the present time did not provide a remedy, and was accompanied by a large number of disadvantages. He said, further, that there was another means whereby these sedimentary matters could be separated; that by a process of chemical precipitation, as by lime, sulphate of alumina, or the agents employed by the A. B. C. Company, or that recommended by Mr. Blyth, they had the power to do certainly, and without danger, what they were not doing certainly when the sewage was put on the land, and with a great deal of danger. By this system of precipitation they could separate those solid elements, and could superadd agents which were not particularly injurious to the highest forms of animal life, but were deadly to those creatures referred to. There was, indeed, a mode within their reach, of dealing with those sedimentary matters which were the real cause of nuisance by accumulating in the rivers, and of rendering the water in such a condition that it might safely be admitted into a stream of eight or ten times its volume. It was a fact that in every one of the places visited, where the irrigation system was adopted, they found—whether by accident or design—abundant evidence of those evil results which it was most desirable they should seek to avoid. The system of precipitation, by chemical processes, could, however, be carried on without the slightest danger to the public, but this could not be said any system of irrigation; for it was indisputable, from the investigations of Dr. Murchison, that sewer gases would produce sewer fever; and as these gases are abundantly evolved from irrigated land, no doubt it was a question open to a great deal of discussion how far they must be diluted before they would cease to produce dangerous consequences. He had told them what he found in his own experience at a model place—the Hebble Brook—where the inhabitants were so decimated by fever that the system was obliged to be stopped. He was asked whether the sewage then was to be wholly lost, and not utilized upon the land. He hoped he had sufficiently answered those questions by showing that the proposed mode of dealing with it was open to the objections that it was dangerous and uncertain, and that there were other and better means of dealing with it. He did not mean to say that by irrigation sewage could not be defeated, but he contended that the system required great attention, and that the result could not be realised in practice; whereas, by the adoption of chemical processes, there was a safe and certain mode of accomplishing the object, and, so far as he knew, these processes were more economical, for there was not a single instance in the country in which the utilization of sewage by irrigation had proved profitable.

On the motion of Mr. LITTLE, a vote of thanks were given to Dr. Lethby, for his paper, and the proceedings terminated.

HORSE SHOERING: THE NEW METHOD.

On the Thursday in the Dumfries Show week a meeting was called under the auspices of the Highland Society, Major Gilson, of Wallhouse, Chairman of the Veterinary Committee of the Society in the chair.

In introducing the lecturer the Chairman said he first made the acquaintance of Mons. Charlier in Paris, in the month of January last, when he went there for the express purpose of thoroughly sifting this new system of shoeing of which they had heard so much, and the great success of which had reached this country. Mons. Charlier had not come here as a speculator, but had come to Scotland and to this very place at his (the chairman's) invitation, to introduce his system of horse shoeing into the country. Professor Williams had had the kindness to agree to read the lecture for Mons. Charlier.

Mons. CHARLIER having said a few words in French,

Principal WILLIAMS then read the paper as follows: I come from France, sent by my father, a veterinary surgeon at Paris, a knight of the legion of honour, to exhibit to you a new method of horse-shoeing which he has invented. This shoeing has been practised in our country for the last five years on a great number of horses employed in different services, and

obtained, on account of its advantages, the most honoured rewards, given by the International Committee of the Exhibition, 1867, and by the Imperial Agricultural Society. Encouraged by the success and the hope given by the noble visitors who saw and persuaded us to this undertaking, I will try to import a thing of public utility into this hospitable land that kindly receives all new ideas indicating any progress in science or art. With your sanction, in spite of the opposition which always attacks anything destined to change a habit, the new shoeing will obtain victory and extend to all the countries where the preservation of the horse is an honour. For a long time a good system of shoeing has been sought for; many would even no longer shoe the horse, to avoid the numberless defects of the usual mode. But the shoe is, to this day, the only way of preventing the wear of the foot; we must, therefore, try to reduce the size of the shoe as much as possible in reforming it. Our shoeing answers to this universal want, being more natural or rather less artificial than any other, being more simple and rational. Seen in its ensemble it is quite different from all other shoes known hitherto, on account of—1st. The whole strength left to the

bare foot; its whole form and whole function in never paring the crust, never touching the frog, nor the sole, nor the bars. 2nd. The new method of preparing the hoof with new instruments to receive the shoe. 3rd. The new fittings of the shoe round the hoof, this alone allowing the pressure of the frog on the ground. 4th. No bevelling. 5th. Its elasticity. 6th. Its narrowness. 7th. Its lightness. 8th. The new manner of forging the shoe; stamping and nailing it. 9th. No longer any calking nor hooks of the shoe to prevent slipping. 1. Frog, sole, and bars preserve all their uses on the ground. The foot is left full, strong, and free. In fact, the frog, when large and strong, supple and elastic, in assisting to support, fills a most useful office. It is the principal organ of elasticity of the foot, which weakens the shock on the tendons and the articulations, and by its pressure on the ground acquires a sufficient consistency to give play to the flexible branches of the crust. Moreover, by its structure it forms in the hinder part of the foot a kind of natural calking or wedge, which strengthens the bearing on the ground, and prevents the horse from slipping. It should be then wrong to suppress the functions of the frog in cutting it away, and in removing it from the ground by the high heels of a thick shoe. The sole, when thick, forms a strong cover that protects all the inner parts from contusions of stones, nails, spricks, or stumps; also fills the office of an arch by its solidity maintaining the crust, and by its yielding under the weight of the body, giving it play. Thus, if we cut the sole, we render it more sensible, dryer, and more contracted. The bars also serve for the support and the expansion of the crust. Never rasp the crust. The crust, when thick, as supple as it is strong, resists shocks, and is elastic. In rasping if you render it thin and dry, being susceptible of being broken or split and contracted. 2. In the natural state the crust is the basis of the foot; when it is solid and resists wear the whole foot remains entire. On our artificial roads, and with severe work, it breaks, and the foot is ere long worn away. It is necessary to protect the crust while preserving it, as it preserves the whole foot. In our system we don't shoe, we merely place a ferrule or ring round the natural foot to prevent the breaking of the precious wall, as a ferrule is placed round the bottom of a stick to prevent the splintering of the wood. Then let us take away only the lower edge of the crust and replace it by an artificial border, harder, more resisting, but the same as to form, thickness, and length, flexibility and elasticity; its durability being such that, thanks to a regular wear, by the continual growth of horn, the hoof remains ever in its normal length. The support is as in a natural state. On the lower edge of the crust a groove is formed by a burr with a guide, taking care not to cut so deep as the thickness of the sole, nor so broad as the width of the crust, sloping on the white line that marks the separation of these two portions, just within the track of the old nails. This groove is to receive a shoe which is not placed under the sole of the foot, but rather under the wall, as its continuation, being sometimes even with the sole and the frog in the normal foot. The shoe being only supported by the crust, does not want bevelling. It cannot injure the sole nor heels, and never forms corns, when it is well fitted. The new shoe is as elastic as the crust itself, which it follows in all its movements of expansion. Thanks to its elasticity, the contracted foot is enlarged, and regains its suppleness and health by regaining the circulation in its interior and its normal functions. The shoe owes this power to its new shape, being curved as a spring,

and to its fitting round the base of the foot, put in the place of the crust itself. The new shoe is very light; it weighs about a third, and often even a half less than the ordinary shoe. The horse is freer in gait. The new shoe is of necessity narrow, since it merely rests on the width of the crust, and not quite even on that. But on the lower surface it can be made broad, in order to increase its durability; the external surface follows the natural bend of the hoof. It is higher than wider, without increasing the length of the foot, being buried in a groove. This shoe has over the narrow shoes the important advantage of allowing the support of the frog. The hind shoe is, however, stronger than the fore shoe. 8. The manner of forging this shoe is very simple. A square, or nearly square, little bar of iron is turned cold in a very short time, or hot; a man can alone stamp it with two rounded punches. The shape and direction of the nail-holes are particular, necessitated by the unusual thickness and narrowness of the shoe. The exterior opening of the hole is rounded oval; the hole is funnel-shaped; the upper orifice is square. The nail has exactly the same shape—a head of a lengthened cone shape, a neck strong and solid, a square blade. The nail thus stops up the hole hermetically. Thanks to these conditions, the new shoe, of a good quality of iron, is very solid on the foot—an important advantage, especially for hunters. Six, seven, or eight holes have different directions, according to the inclination of the hoof; they are nearly straight towards the heels, more inclined towards the toe. A shoe with well-stamped holes can be nailed without danger of injuring the living parts, the hole being a guide to the nail. 9. No longer calkins, nor hooks, or toe-plees. There is no need of calkins; the frog is a natural calkin on the slippery ground, sustaining the tendons instead of straining them. In case of frost, only two moveable nail-calkins are fixed towards the heels of the shoe; the toe forms a kind of hook by its narrowness, and the inner angle of the shoe. These nail-calkins can be fixed by anyone, not being into the horn, and, owing to the thickness of the shoe, are solid. They are taken off as soon as they become useless, becoming even hurtful on hard and level ground. In fine, the new shoe is not difficult to use, and no more liable to accidents than the ordinary shoe; it takes less time to be forged, a single man making 80 to 100 shoes per day—no longer time to fit it on the foot; it can be fitted cold as well as warm; it lasts a sufficient time; it is then no more expensive than the common shoe, being made with a small piece of iron, requiring less coal to be heated; it is suitable for all shapes of feet; it is an orthopedic and pathological shoe, sufficient frequently alone to cure corns and contracted feet and other diseases, being susceptible of all modifications, according to the worst feet; and when the instruction of farriers is extended, it will be known and practised easily everywhere. Till that time comes, in case of lost shoe, the foot is left stronger than after the ordinary destructive shoeing, and resists wear much longer on the roads or pavement. Before changing the old shoe, it is necessary to allow the foot sufficient time to grow. To resume with our shoeing, the foot, being sufficiently preserved from wear, acts quite as in the natural state; it is as an unshod foot of a colt. The greatest enemies of it are routine and ignorance; but we, friends of progress, ought to unite and destroy this ignorance for the preservation of such a precious servant as the horse.

On the motion of Mr. ANSTRUTHER THOMPSON, a vote of thanks was awarded to Mons. Charlier for his lecture.

AGRICULTURE IN NORMANDY.

"Were I asked to name the most favoured portion of France, without doubt I should point to Normandy," thus says M. de Lavergne in his work upon rural economy. The highly-finished appearance of the country, the mansions scattered about, the neatness of the villages, the well-trimmed fences and carefully-dug ditches that line the roads, the freshness of the verdure in the meadows, the healthy and vigorous race of cattle—all these remind the traveller more especially of England. From times long past agriculture has flourished, either from the nature of the soil, the humidity of the climate, or the careful attention of the farmer, or more probably from

its proximity and easy access of transit to the capital. Paris has been a great devourer of the fisheries furnished by the coast, of the fat oxen, butter, fowls, cider, the principal market for horses, and all that could be gathered from the soil. Since the alteration in our treaty relations, and the opening of our ports, there has of late years arisen another outlet scarcely less important. Any one who needs to be confirmed in these facts can visit the markets in different localities—such as Cnen for corn, Charenton and Isigny for butter, Pont l'Évêque for butter and cheese, Le Mans, La Hecke, and Alençon, with many others; or if he takes his station at the windows of the

Hotel Cheval Blanc at Honfleur, or stand upon the quays, he can watch the lading of the steamers of the Brighton and South-Western Companies, and their arrival and departure at the flow of the tide. At first the line of steamers of the Brighton Company plied weekly between Honfleur and Littlehampton, but now there is a daily service of these and the opposition vessels of the South-Western Company. During the month of May in 1868—by no means the most prolific month of the year—there were shipped altogether at this port 12,000 cases of eggs, weighing 800 tons; 15,000 packages of butter, weighing 450 tons; besides fruits, as cherries, strawberries, and early plums, weighing 360 tons. In the autumn the exports are much larger, the shipments of poultry, pears, walnuts, and seed being very considerable.

The province itself includes the départements of Eure, Orne, La Manche, of the Seine Inferieure, which corresponds to what was called Upper, and the Calvados to Lower Normandy. The Seine traverses a portion, and, with the thriving ports of Havre and Honfleur, exercises an important influence upon the description of the products. The Calvados may be taken as a fair sample of the other portions, and therefore we have selected this for our purpose from the reports accompanying the proceeding of the *enquête agricole*. From this source we learn that the Calvados consists of six districts, the names of which are well known in English history, and here the Commission held their sittings—Caen, Bayeux, Falaise, Lisieux, Pont l'Évêque, and Vire; these again are sub-divided into 37 cantons, in all 765 communes. It appears the soil is affected by three distinct geological actions, one part resulting in the greater abundance of the cereals, another in pasturage, and a portion, although small, in woods and copses. The rivers are numerous and abundantly sufficient to supply the needful amount of moisture. The ports are seven in number, and are all situated on the coast with the exception of Caen, which is connected with the sea by a canal traversed in about an hour by steamers which ply daily with passengers and goods backwards and forwards to Havre. It is the capital town of the département, and is remarkable also for the quaint architecture of its streets, and the number and beauty of its churches, one of which has been appropriated for the purposes of a corn market. The town is the resort of the farmers, who are generally an exceedingly well-to-do class, of which there is every sign in the appearance of the country around.

Since the beginning of this century, agriculture, as stated in the report, has made immense progress, and that we can readily believe. Up to that time the property was in the hands of the church and of a few "grand seigneurs," the roads were desperately bad, and there was no easy outlet for the produce; but at the Revolution the change seems to have been marvellous, the law compelled the sale of many estates, the subdivision of all, the communications were improved, education penetrated the dense ignorance of the people in the villages, and the husbandmen and farmers have caught the infection and give fresh skill and intelligence to their occupation. The population continued to increase until within the last thirty years, and since then it has somewhat declined, owing it is said to the superior attractions offered by the large cities for the labouring classes. From this and other causes wages too have risen considerably, in the proportion of 1*l.* to 1*l.* 50*c.*, and those of farm servants have doubled.

The whole superficies of the département covers 552,072 hectares, or 1,380,180 acres; of this arable lands occupy more than one-half. The farms are not generally large, those above 50 hectares requiring a capital of 10,000 francs being rare; and it is seldom they exceed more than half that number, the *petits cultures* do not exceed 20 hectares. Owing to the construction of the railways, the better management of the roads, and the consequent openings for produce, rents have risen one-tenth; the large occupations let for 100 francs per hectare, the moderate for 110, and the small for 130. The *métayage* system, common in other parts of France, is here unknown. The cultivation of the cereals constitutes the chief wealth of the plains; that of colza, attempted at the beginning of this century, has taken a great development, and has led to the adoption of a system of alternate courses. The fallows have been replaced by artificial grasses, which prepare the soil for wheat; the tillage, executed formerly by oxen, is now universally managed by horses, and the farmers of the plains around Caen rear a goodly number of colts for the markets in Paris and elsewhere.

At one time rye was extensively cultivated, but now it has diminished greatly; whereas barley has increased, especially in the lighter soils around Caen and Falaise; flax and hemp have also diminished, and sainfoin, lucerne, and trefoil have increased. The rotation of crops are—for the first year, colza; second, corn; third, sainfoin and other grasses, rye and oats, and in some spots beetroot and potatoes are cultivated. The custom of reaping and leaving a length of straw for the cattle has disappeared, and the harvest is now reaped with the scythe. The only machinery in common use are the thrashing machines; their effect upon wages has not been perceptible, and they necessitate the employment of an additional number of persons. The different kinds of manure used are the natural refuse of the stables and farmyards, oilcake from the colza, guano, the wrac and star fish found on the sea coast.

The breeding and rearing of horses furnishes the chief occupation of the farmers in the district of Caen, and the sheep-farming is most general in the neighbourhood of Falaise; there a farm of 100 hectares generally possesses a flock of 100 to 150 sheep. By the present system of cultivation certain changes have taken place. The colza, which in 1852 occupied 29,985 hectares, has been extended over 40,000 to 50,000 hectares, which bring in not less than 30 to 40 millions of francs. The fallows have completely disappeared. In 1852 it was ascertained that 121,113 hectares were in grass or natural meadow, 317,294 in arable land, and 115,175 devoted to forest, heath, &c. There are now probably 150,000 hectares in grass, since meat, butter, and cheese being articles in great request, all the soil that could be turned to that purpose has been converted into natural meadows. Throughout the département milk, butter, and cheese constitute a considerable agricultural industry. The making of the butter, which is now perfectly understood, and of which the Bessin is the principal centre, does not bring in less than 20 millions of francs to the Calvados; that of cheese produces from 2 to 3 millions. In the district of Pont l'Évêque, and more especially of Lisieux, there is made an excellent cheese called Camembert, which owes its name to a village in the district of Vimoutiers, where it was first produced. The cheeses of Pont l'Évêque, of Livarot, and Mignot have long been celebrated in Paris and all the markets of France. In some cantons the rearing of poultry, and more especially the commerce in eggs, forms an important source of occupation. The *gélinoles* of Caumont in the district of Bayeux, the *chapon* and *poulard* of Crèvecœur in the district of Lisieux, merit an especial mention. The ports along the coast furnish a valuable assistance to the development of this trade; we find it stated that during seven years and a half there were exported in all 340,006,402 kilograms, giving an annual average of 4,534,187 kilograms. Since a kilogram is the weight of 16 ordinary-sized eggs, it follows that there were exported annually by the ports of Calvados 72,546,992 eggs, or more than 6 million dozen. The farms of Calvados do not however alone supply this quantity, since the départements of the Orne and the Mayenne bring their contingent. On the other hand, from Carentan in La Manche the exports are said to be still more considerable, and towards this the districts of Bayeux and Vire contribute their share.

Attention to horticulture has become general, and the growth and sale of fruits of all sorts, fresh and preserved, furnishes a considerable revenue to the inhabitants, particularly around Honfleur. The cultivation of the cider-apple has increased much in all the districts, except Caen, where it is quite unimportant. It is reckoned that in average years the whole of the Calvados produces in cider 2 million hectolitres, and in years of abundance upwards of 4 millions. In valuing the hectolitre at 3 francs, this would give the produce of the soil at from 6 to 12 million francs. It is not unusual in some of the cantons for the farmer to pay the whole of his rent from the crop of apples in his orchard. The produce exported from Havre is generally sent to England, and often even to Russia; but Paris, London, and the United States are the chief consumers of the abundant supplies of animals, butter, eggs, poultry, &c.; and this commerce has been greatly facilitated by the line of railway from Paris to Cherbourg, with branches to Honfleur, Trouville, Le Mans, and Saint Lo. Well may M. de Lavergne—an excellent authority upon all that concerns the agriculture of France—speak in terms of exultation of Normandy as the most favoured portion of his native country! When occasion requires and opportunity arises we shall gladly revisit it.

THE AGRICULTURAL LABOURER.

The following paper was read by Canon GIRDLESTONE at a meeting of the Devon Central Chamber of Agriculture, at Newton Abbot; but the subsequent discussion stood over to an adjourned meeting at Newton:

When, at the beginning of this year, I was for the first time in my life at Newton Abbot, it was as your invited guest. You did me the honour of asking me to be present at the annual dinner of your Chamber, made me most heartily welcome, and gave me, in short, such a warm and cordial reception as I can never forget. Under such circumstances it was, of course, my duty in addressing you to avoid carefully every subject which was likely to lead to difference of opinion. There is no surer mark of bad manners than to risk ruffling, even in the least, what always ought to be the unbroken harmony of a convivial meeting. To-day, however, I appear before you under entirely different circumstances; for we are met together, not for conviviality, but for business, discussion and mutual improvement. You are not now my host, nor am I your guest; but we are one and all members of the same chamber of agriculture, and I am about to address you by your own request on a particular subject, regarding which it is supposed that I am in possession of a certain amount of information and experience. When I thus refer to the honour which you have done me in allowing me to become a member of your chamber, and inviting me to read a paper on the subject of the agricultural labourer, do not, I pray of you, for one moment suppose that I make this reference as a preliminary to throwing amongst you an apple of discord. Nothing can be further from either my wishes or my thoughts. It seldom, however, happens that any two persons can wholly agree upon any subject. It is the most unlikely thing in the world that in such a meeting as this we should all agree on such a subject as that on which my paper is written. But the very object of these meetings is discussion, and there can scarcely be discussion without difference of opinion. The very object of discussion, in short, is to elicit difference of opinion, and so to endeavour to arrive approximately at the truth. When engaged in discussion we cannot too strictly and carefully observe the rules of good temper and mutual forbearance. And, for one, I never could understand why, if such discussions should, as is often the case, be accompanied by very wide divergence of opinion, and even more warmth than is always agreeable, those who have fought valiantly as long as the battle lasted, when it is over should not shake hands over a glass of grog. Thus members of both sides of the House of Commons are found chatting and sipping their tea together immediately after, or even in the midst of a most exciting debate. Thus, also barristers, who, as long as they had their wigs on and were in court, were tearing each other to pieces like a pack of wolves, afterwards dined together as quietly and happily as a flock of lambs. I stoutly protest against allowing differences of opinion on public matters to interfere with the kindness and courtesies of private life. Thus, in this matter of the agricultural labourer, I am quite sure we all wish the same result, though we may differ as to the means of attaining it. We wish to do the best we can for the labourer, though, perhaps, we are not all quite agreed what is the best; and many differ still more widely as to the ways which lead to it. I, then, having my own opinions on this subject, propose to give you a short description of the agricultural labourer as I think he ought to be, leaving you, in the discussion which will follow, to decide whether my picture is correctly drawn, and how far it is realised here and elsewhere. If we differ, let us agree to differ, and be good friends over the agreement. First, as regards the home of the labourer. We have most of us more or less some good horses of our own, and we are no doubt anxious that they should do a good day's work, and do it well and cheerfully. In order to do this one of the first things we do is to secure a good stable. A cold drafty stable, or a stable low, small, badly ventilated, and badly drained, or one in which, without any separation of stalls, all our horses would be huddled together, is there any one of us but, putting all views of humanity out of the question, and merely with

reference to our own advantage, would at once say, "With such a stable my horses are more likely to be in the hands of the farrier than of the ploughman, with such a state of things I shall get no work done?" It is exactly the same with the human animal. Laying aside both Christian and moral considerations, a healthy and comfortable home is essential to the efficiency of the working man, and is consequently of as much importance to the employer as to the employed. The following is my idea of the sort of home a labourer ought to have, if he is to be able to do a really good day's work. A house well roofed, drained, and ventilated, and floored, with a fireplace in every room, and every window made to open, with down stairs a good family room, with handy grate, oven, and boiler, and a scullery at the back, with door to the garden, with upstairs never less than three, and if possible four bedrooms, with a good garden round it, a pigstye, and other conveniences so constructed and screened as to be decent in appearance as well as in reality. The labourer's home should be on the farm if possible, or at any rate as near as can be to his work. A long walk to and from his work is most exhausting to the labourer, and very unnecessarily so, and of course at the same time most damaging to the farmer, who wants the whole strength of those who work for him, and to whom it is of great importance that they should be fresh when they come upon the farm. A moderately sized potato ground, in addition to the garden, is a great advantage to the labourer; whereas if too large it is apt to embarrass and over-fatigue him. If to some one or two cottages on each farm there were also added a cowshed, with facility of pasturage for a cow, and these cottages were reserved as prizes for the most skilled, industrious, and thrifty labourers, the employer would reap as much advantage as the labourer himself from the improved character of both workmen and work, to which such sort of emulation, wherever scope has been given for it, has always led, and is sure to lead. This, then, is my idea of an agricultural labourer's home. As far as providing such a home is concerned it is of course almost entirely a landlord's question. But I have no hesitation in saying, nevertheless, that if I were a farmer, laying aside all regard for the labourer and with a view to my own advantage alone, I should no more think of taking a farm without stipulating for proper and healthy labourers' homes upon it, than I should of being content with stables and cowhouses of such a sort as would be sure to make my horses and cattle unhealthy and unprofitable. The farmers have only to be awakened to a sense of this matter in its true light, and to act upon their knowledge, and the landlords must yield. The result will be for the labourers, decent, healthy, comfortable home; for the farmers, staunch, more skilled, industrious, thrifty, and contented labourers. I pass on from the home of the labourer to his work. This ought, as far as is possible, to consist of piece work. I say as far as possible, because I am well aware of the difficulty there is in bringing many agricultural operations under the denomination of piece-work. Nevertheless, many of those difficulties may by perseverance and good management be overcome, and for his own sake, as well as in the interest of those who work for him, it is well worth the farmer's while to overcome them. For until human nature is very much changed from what it is now, labourers will be found, even without reference to age, to differ very widely from each other. Physical strength and power of endurance, skill, industry, a desire to do an honest day's work, and many other particulars, are points in which there is sure to be an immense amount of difference. Yet, unless the amount of a man's earnings depend upon the amount of work done, it is difficult to see how to avoid paying all these various characters of labourers exactly the same amount of wages, and so inflicting on the farmer both a present and a prospective loss by getting now a less amount of work than he ought for his money, and discouraging improvement in the class for the time to come. It is very important also for all parties, that in every case in which a system of day work is adopted, the number of hours constituting a day's work should be definitely settled and un-

derstood, and that an account of all after-time employment should be accurately kept, and paid for, not by beer or cider or other refreshment, except perhaps in time of harvest, but in money, and in the proportion it bears to a day's work. Now that thrashing is almost entirely done by machinery, it is very difficult to provide wet-weather work for agricultural labourers. Yet when the immense loss of income, which in the changeable climate of Great Britain, and specially in these western counties, accrues to the labourer from bad weather, unless paid by the week, with no deduction for wet days, and the difficulty in which the loss involves him, are considered, it will be obvious that a farmer, who wished his labourers to have well nourished powerful bodies and minds, free from anxiety, will do his best to secure them against the possibility of many day's forced idleness in the course of a year—involving, of course, short commous for themselves and families, or harassing debts at the village shops. Next to work comes wages. In the North of England wages are paid almost entirely in kind, and the result is pronounced by the Women and Children Employment Commissioners to be very good. But then this system is in that locality connected with hiring by the year, the keep of a cow, involving abundance of milk, and many other substantial advantages, which there is no time to mention now, but a full report of which will be found in the report of the commissioners. Unless the whole system were adopted in full, the same results could not be expected to follow. And in general, considering the many abuses to which a system of payment in kind is open, I am still of opinion, as I always have been, that the safest and best way for all parties concerned is to pay wages wholly and solely in the coin of the realm. The worst of all ways is to pay wages in cider or beer. This is nothing more or less than to whet the appetite for a further supply at the public-house. Liquor does not strengthen, it only stimulates. If taken in excess, it debilitates and destroys. Not cider or beer, but beef, is the best manufacturer of muscle. A Devon potato and cider-fed man, with six months' Yorkshire beef in his belly, has been found able to do what he never in his native county could do—as good a day's work as a Yorkshireman born and bred. To the use of cider in the place of a solid nutritious food in the West of England, may be attributed in great measure the rheumatic attacks which cripple up so many of our labourers in the prime of life. The weekly allowance of cider to a Devonshire labourer is valued at from 1s. 6d. to 2s. Now it is clear that out of wages of nine, ten, or even twelve shillings a-week, this is far too much for a married man with a family to spend in drink for himself alone. If given in money instead of in liquor, it would in nine cases out of ten be spent on beef for himself and family, and be vastly more beneficial to all parties, including the farmer, whose object is of course to have able-bodied labourers, with minds free from the anxieties caused by sick wives and children. It may be objected that the labourers are many of them opposed to such a change. So many of them are opposed to the introduction of machinery or any other rational improvement. Our duty is to teach them better, to do at any rate what we know is our duty to them, and they will soon find out that we are consulting their real interest at the same time. I know one large employer of labour in South Devon, whose men as they go to work all leave an empty can at the house, in size proportioned to the number of their families, and on their return in the evening take it away filled with milk as an addition to their wages. Milk is a most wholesome and nutritious diet for any one, but especially for children, and makes the use of rice, another cheap and nutritious article of diet, possible, because palatable. In the midst of plenty of milk, however, there is in most cases no article of diet more scarce or difficult of attainment to the labourer. In my own neighbourhood, generally speaking, he cannot get it at any price. The farmer who follows the example above described, or if he cannot afford to give the milk to his labourers, at least lets them buy as much as they want at cost price, will not only much benefit those who work for him, but will find his own account in a stronger race of men. Wages ought to be paid never less frequently than once a week, and at a stated hour: at an early hour if paid on Saturday, though Friday, as giving the wife a better opportunity of spending the money thriftily, is a much better day for payment. Wages, for obvious reasons, should never be paid at a public house. Though I am afraid it will be difficult to persuade many of my hearers to that effect, yet I feel sure that if, as in the case of domestic servants,

no deduction for bad weather or sickness were made from the wages of agricultural labourer except perhaps to the amount received during sickness from a benefit society, the farmer would save as much in poor rate as he would lose in wages. He would also gain as much as almost the labourer would gain, by the comparative immunity from debt and long-continued sickness, from want of proper nourishment, in which large and repeated deductions from wages almost always involve the labourer. As above stated, I advocate a system of piece work whenever it is possible. But where this is impossible, which must often be the case, why should not there be paid, to some more and to others less, wages according to their ability and skill, as is the case in almost every other trade and profession? The paying all—good or bad, skilled and unskilled, industrious and idle—alike, is a plan which must surely have been invented on purpose to keep all agricultural labourers on the same dull dead level, and to deprive them of all encouragement to improve themselves. Almost all of us, no matter what our employment is, need a stimulus, or else we are apt to sink into the way of going on as we have always done, and as others do. Now it is not to be expected, of course, that farmers should pay their labourers more than the market price. But if the market prices were raised by an improvement in the character of the labourer, the farmer, though he should pay higher wages, would find a more than corresponding advantage in more work done, by fewer hands. The character and habits of the labourer must next be considered. And that these should be of the right sort is fully as important for the farmer as for the labourer himself. If labourers are idle, drunken, unthrifty, always on the verge of the Union and often in it, in debt and difficulty, with bodies debilitated by intemperance and the substitution of stimulating drink for wholesome nutritious food, and minds never free from the anxiety which is the sure accompaniment of an unhappy home and a neglected family—except the poor victims themselves, who suffer more than those who employ them—who, on the other hand, is a greater gainer than the farmer, if having in his employ a lot of labourers the very reverse of those above described? It is clearly to the interest of the farmer, even at a little sacrifice, to do all he can to encourage habits of thrift and industry amongst his labourers. Pronounce decidedly against all sitting at the public house. Never let an act of drunkenness or dishonesty be overlooked. Make it a rule, if possible, that labourers should belong to some friendly society, established on sound principles, in which old-age pay as well as sick pay and funeral expenses are provided for. Make known the rules and advantages of the Post-office Savings Bank, and give every possible encouragement to make use of it. Let farmers' wives and daughters, in conjunction with the clergy and their families, take a personal active interest in clothing and blanket clubs and mothers' meetings, as being all of them more or less instrumentalities which tend to the formation of those thrifty habits, which, when acquired by labourers, are so valuable to their employers. One way in which labourers incur much unnecessary loss is connected with small village shops. It not unfrequently happens—owing, perhaps, not to the shopkeepers, but to those who supply them—that the goods sold in these are very much adulterated as well as dear, and that when long credit is given the accounts are not kept as accurately as could be wished, yet the labourer, being in debt, even though he is fully aware of the disadvantage at which he is laying out his small amount of wages, has no alternative but to continue his custom. There is no better antidote to this than a good co-operative store in every village. These in London and all our large provincial towns are found to be of the greatest advantage, not only to the working classes, but even to the middle classes and gentry. Wherever the same system has been tried in small towns and villages, it has been successful. Not only by this means are unadulterated articles at low price secured, but ready money being an essential part of the system, habits of debt are discountenanced, and the labourers, as many of them as take shares in the stores, find the advantage of such investment so great, as to disincline them to waste their money in other ways. A co-operative store, in which all the inhabitants of a parish should join together for the purchase of the necessaries of life, would be equally beneficial to all classes; would enable farmers, as well as labourers, to lay out their money to the best advantage, as well as encourage thrifty habits in all. After all, however, there is nothing which so much tends to degrade and pauperize the labourer as the habit which to such an alarming ex-

tent prevails almost everywhere, of dependence on the Poor Law. Had there never been a Poor Law in this country there would have been no paupers. The really poor and sick and afflicted, the deserving poor—if I may use the term in contradistinction to the word pauper—those whose condition is owing to no fault of their own but to causes over which they had no control—and the number of such persons is comparatively small, would have been much more amply and cheerfully provided for than now by voluntary benevolence, the genial flow of which would not then, as now, have been checked by the indiscriminate and compulsory maintenance of the undeserving, many in number, as well as the deserving few. The time, it may be hoped, is not far distant, when the growing feeling of the country will be realised by the abolition of the Poor Law. This, which, to an extent which cannot be contemplated without alarm, demoralizes the working classes, presses hard upon the employers, and even to a certain extent tends to demoralize them, for it tempts them, often through mistaken kindness, to the expedient—which is fatal alike to the independence and well being of all parties concerned—of keeping wages low, with the relieving officer as the resort in sickness and old age; whereas a better scale of remuneration for work done would be more than repaid to the employer by the absence of all call for poor rates, and the labourer would be roused by the certainty that if he did not out of his increased resources lay by for a time of need, he could have no legal claim, as now, for a reward for his improvidence. Who is bold enough to deny that a class of labourers, such as I have above described, would be a gain both to themselves and to their employers? Nothing would render greater assistance to the formation of such a class of labourers than education. I am no advocate for over-education. But to be able to make out and cast up a bill, to write a well expressed, correctly spelt, and legible letter, and above all to read with fluency, ease and pleasure, so as to be disposed and able to acquire all such information as is necessary for the formation of the character and habits above described, as well as becoming a skilled workman, is in the advanced and continually advancing condition of agriculture quite indispensable. Whereas some fifty years ago, or even less, land was cultivated on nearly the same system as had prevailed for centuries before, and which required from the labourer neither skill nor knowledge, at the present time agriculture has become a science, and a labourer who has some knowledge of the principles on which the science is based, and skill in the handling of the intricate machinery by which human nature is now so largely supplemented, is much more valuable to his employer. Mr. Edwin Chadwick in his address on the opening of the last session of the National Association for the Promotion of Social Science, goes so far as to say (p. 21): "There are probably more sound mechanical inventions and labour saving, processes unused, than there are used in agriculture, and the barrier to their use is the ignorance of the working classes." The farmer has as much interest in the education of the labourer's children, as the labourer himself has. I say to the farmer, then, determine, even at a small present sacrifice, though I hardly think any sacrifice at all will be involved in doing so, to employ no children except they can bring a certificate from a competent authority that they can at least read fluently, write a good hand, and know enough of arithmetic to make out and cast up a bill. Never tempt them by offers of work to leave school till they have had time to acquire at least the above amount of education. Rather make a condition with those labourers whom you employ, that they must from the earliest age send their children to school. Do not tempt the mothers away to work in the fields, to run on errands, and so force them to keep their children at home to mind the house and the baby. Home is the place for wives and mothers, school for children. Field-work after a given age, and when they can read, write, and keep accounts, is the sphere for boys, domestic service for girls. Not only after such previous teaching will they be more skilled in their several spheres, but, which tends even more perhaps to their value as servants, they will be more likely to be sober, industrious, and trustworthy. This holds still more good as regards religious instruction. Put no obstacle, such for instance as work not absolutely necessary, in the way of a labourer and his family keeping the Sabbath and attending his place of worship. Rather give him any encouragement to do this, and to send his children to Sunday school. Where a certain amount of Sunday work, as for instance tending of cattle and sheep, must be done, the farmer,

who is alive to the value of having a religious man in his employ, will arrange, as far as possible, that each of his labourers should take his turn, and so none entirely miss the blessing of the Sabbath. In those parishes, which in different parts of the country are not few in number, in which the farmers, their wives, and daughters take a personal interest and part in these matters, teaching in the Sunday school, visiting the day school, noticing the needlework and knitting, and in always, by precept and example and personal interest, by encouraging, with little presents and acts a kindness, the parents and children who are doing their duty in these respects, and so setting a mark upon those who neglect it, it is wonderful what a rapid and steady improvement there is in the character of the agricultural labourer, and, consequently, in the cultivation of the land and the prosperity of the farm. There is nothing better for maintaining and carrying forward the amount of education required at school than good loan libraries of interesting and instructive books. None should be allowed to take the books out except members, and the rate of subscription for membership should, of course, be less for labourers than for citizens, shopkeepers, and farmers. Of such paramount importance is it to the farmer—now that agriculture is so much more of a science, business and profession than it was, and that the machinery employed, and which, to a much greater extent than now, must be employed by any farmer who, in the midst of a host of competitors, wishes to hold his own, requiring such skilful and trustworthy management that the labourer should be much better educated than now—that it will be well worth the time and attention of this chamber and other chambers of agriculture in England, to watch carefully the progress through Parliament of the Government Education Bill, with the view of improving it in any respects in which it does not sufficiently meet the wants of the agricultural districts. I have now as far as time permits, though necessarily very shortly and imperfectly, sketched out to you what, as regards his home, his work, his wages, his moral character, his religious and secular training and education—the six features which appear most prominent in his position—the agricultural labourer ought, in my opinion, to be. We are all agreed, I am sure, as I have hinted before, on the value of a well stabled, fed, groomed, and trained horse, or on the shortsightedness of the policy of those who in any way neglect their horses or other stock. A labourer, such as I have above described, is equally, or even more valuable, both as a more effective servant, as a saving of that which, of all burdens, is the most oppressive to the farmer—the poor rate, and as facilitating the use of machinery, and so making a higher class of cultivation possible with fewer hands, and, consequently, less cost. Moreover, unless the condition of the agricultural labourer be brought up to, and maintained more or less at the mark above described, with the present facilities for emigration, and the earnest desires of the colonies—as more than once expressed to me by those eminent ex-colonial governors, Sir William Denison and Sir George Grey—to possess themselves of our best agricultural labourers, the back bone of the country is sure to leave it, and nothing remain but what is nearly worn out. Is it likely that a young, healthy, intelligent labourer, who on landing in Australia would be eagerly sought for at three times the wages he gets here, with an active wife who would nearly double his own earnings, will forego all these immediate advantages, with the certainty, moreover, after a few years' service, of a farm of his own, and cling to a few shillings a week wages, a tumble-down cottage, and the Union for his home as soon as he is crippled up with rheumatism or premature age by over-toil and unwholesome food—is it likely that he will sit still simply because a not after all very unpleasant voyage of a few weeks separates him from a land which, when he reaches it, he will find as rich in soil and better in climate than that which he leaves, while constant communication with the old country may be maintained by post and telegraph? Is it wise in landowners and farmers to sit still, instead of doing all in their power to stay this exodus, as long at least as there is room in old England? Would it not be far wiser to endeavour to attach these most valuable servants to home by making home something more like what it would be if they emigrated to Australia? I do not offer any opinion as to how far the labourers in this district come up to the mark sketched by me. This is a matter of which you, my hearers, are the best judges. All I say is, that, as a mere matter of pounds, shillings and

pence, it would pay well everywhere to bring them up to this mark. In his address already quoted, Mr. Chadwick, p. 17, says: "Mr. Brassey, who has made railways in France, in Italy, in Germany, in Russia, and in India, tells me that, with the exception of about 10 per cent. in one part of Germany, and about 40 per cent. in earthwork in India, he found the higher priced labour of England as cheap as any in the world. And other engineers have told me the like. Now what is the economical result of two having the efficiency of three? It is that you save the food, the clothing, and the house room of the third—in fact, that you save a third capital, or create a fund which may be divided as extra wages between the other two, as in point of fact it is to a great extent, leaving some extra profit to the capitalist." And again, at page 22: "Mr. Paget, the late member for Nottingham, came forward at the recent meeting of the Educational League at Birmingham, and stated that he had for more than 17 years maintained a half-time school, chiefly for the children of the agricultural labourers working on his farm. He avowed that he did this as a matter of business, and it answered him commercially, in the production of more intellectual and better labourers; and his bailif, too, was of opinion that it answered as a matter of business." There are many reforms needed for the benefit of farmers. Game, for instance, is very destructive, and ought to be dealt with, as I think, in a way which would protect the farmer much more thoroughly than is contemplated in the Bill now before Parliament. The incidence of taxation also is a very important subject connected with farming. If, as is supposed, the local taxes fall heavier upon land than upon other kinds of property, the balance ought to be fairly adjusted. It might be well also, as was suggested by Mr. Dashwood in a paper read last year before the Farmers' Club, at the Salisbury Hotel, in London, if the owner were made to pay half the amount of local taxes, instead of all being paid by the occupier, and that all compounding for rates should be abolished. Landowners and labourers would thus acquire such an amount of personal practical knowledge about the rates, and interest in them, as would greatly tend to control extravagance and mismanagement. Leases for a fair term of years, Tenant Right on a fair scale of remuneration for improvements made during his tenure by the occupier, and legislation providing against the very large accumulation of property in single hands, are all subjects which might be dealt with more beneficially to the farmer. Such matters, however, are in the hands of Parliament. I hope a better adjustment of these things may not be too long delayed. Except, however, by ventilating such sort of subjects in these chambers of agriculture, and pressing your views upon your representatives in Parliament, and so upon Parliament itself, you can do little or nothing towards accelerating the always somewhat slow action of legislative bodies. You must patiently bide the time when you will lawfully reap the benefit which you hope reconsideration of these matters will secure to you. On the other hand, the many unquestionable and really solid advantages which I have shown you would accrue to the farmer by improving the condition of the labourer as above described, you can yourself, with your own hands, and without waiting for the legislature to help you, secure for yourselves. If you will really set about the work, over and above conferring an inestimable benefit on the labouring classes and on the country at large, you can yourselves make a large and immediate profit, and no one can hinder you. I have thus far argued this matter solely in a commercial spirit, with a regard simply to profit and loss, to pounds, shillings, and pence. But, though addressing you specifically as one amongst yourselves, a member of a chamber of agriculture, I must not, I cannot forget, that I am a Christian minister speaking to Christian men. I hope the remembrance that such is the case may have saved me throughout from uttering a single word which can justly give offence to any one. I am sure that every one present will strongly sympathize with me when I conclude by reminding you that though, as I have already at length shown you, the labourer, like the horse or any other animal, pays better the better he is housed and fed and generally treated, yet to the labourer we are charged by that Gospel which we profess to believe with a duty of a far higher character. In dealing with those who, unlike the brute creation, are bone of our bone and flesh of our flesh, who are members of the same family as ourselves, of which Christ is the head, who are heirs of immortality, it is pleasant to find that our own personal interest and profit

here are identical with their temporal and eternal welfare, and our duty to them as brothers in Christ. But we must not forget that, even if the reverse were the case, we should, as Christian men, be bound to do our utmost to improve their condition, and could not, at least in God's sight, evade the responsibility, asking "Am I my brother's keeper?"

At the adjourned meeting, Mr. WADE, the chairman, said the principles they were advocating were very important. Some people appeared to argue as though everything had to be done for the working man, and not by the working man. That was a mistake. What was wanted to be done for him was to raise him in the social scale, to make him a more truly independent man, a better labourer, more frugal, a less frequenter to the cider shop, and more constantly home after his day's labour, with his wife and family. He entirely agreed with Canon Girdlestone, that something should be done for the labourer, with the view of providing him with a better house, and he sincerely wished that every working man had at least two good bedrooms. Just now they were hearing a great deal about education, and he asked if they considered a child's education was finished when he left school at thirteen; what prospect was there of a boy learning farming practically, or of becoming a good labourer, or of learning other duties he would be called upon to perform in after life? The fact was, there was no system at present laid down. A farmer at the present moment was less independent of manual labour than ever he was, because he no sooner would correct a boy of 14 or 15 years of age than the lad would say, "I will leave you on Saturday night," and perhaps would go into the town. Legislation was required to deal with this and other difficulties, arising out of the conduct of boys between the ages of 15 and 18. He suggested the boys working on farms should live with and be under the control of their parents, and that they should be paid a graduated scale for their services, similar to that adopted under the Workshops and Factories Act. It was high time some change was effected with regard to the agricultural labourer, for now not more than one labourer in a parish could be found to make faggots, whilst if a farmer wanted a rick to be thatched he had to hire a professional man to do it. This afforded ample proof of the great necessity for adopting some kind of system to ensure the raising of the abilities of the labourer to a higher point than at present.

Mr. WATSON thought that some were disposed to think the tenant-farmer a great deal more independent than he really was. The tenant-farmer, as a rule, was seldom in the habit of acting of his own accord; he had, in fact, a kind of wholesome dread of his betters, and hence it was he seldom took any decisive action of his own. He had carefully considered the subject before the meeting, and he could come to no other conclusion than that the best way to improve the agricultural labourer would be by improving his wages. He would give the labourer the option of having the cider or not. The withdrawal of cider from the men was an attempt, he thought, to make them teetotalers. Teetotalism might be very good in its way, but he had a great objection to its being compulsory.

Mr. KNOWLES thought the great obstacle to the increase of manual labour resulted from the fact of so many thousand acres remaining uncultivated. Many of the large landowners cultivated their land in the outset, but finding it did not pay, let it off. He would ask what was the reason it did not pay? Because it was so overrun with rabbits and hares. He maintained that the owners of coppices and preserves ought to pay much heavier taxes than they did at present. The worthy Canon had commenced firing at little birds, with a view, he supposed, of frightening the big ones, but he trusted that for the future he would direct his attention to higher game.

The Rev. J. M. HAWKER said the light in which cider ought to be given, was not in consideration of any portion of men's wages, but rather with a view of sweetening their labours, for in his opinion cider was one of the most wholesome beverages they could have.

Mr. NORRICOKE did not believe that the labourer either stood in need of cider, or that it did him any good. His experience had taught him this. In fact he (the speaker) was a much better man since he had abstained from drinking cider.

Mr. SOWTON considered that agricultural labourers had much deteriorated since the abolition of parish apprenticeships, and suggested that the legislature should adopt some means to remedy existing evils.

Mr. STOOKE moved: "That this Chamber desires to ex-

press its approval of the generous efforts of the Rev. Canon Girdlestone to improve the condition of the agricultural labourer; but, at the same time, considers that, whilst wages is properly an employer's question, the condition of the home-stead or dwelling of the labourer, as stated by the Rev. Canon, is mainly an owner's question; and this Chamber is also of opinion that the Rev. Canon might, with equal propriety and effect, extend the area of his observations to labourers in general." He did not approve of too much attention being paid to the comforts of the labourer, to the entire exclusion of those of the tenant-farmer. However, if something was not done, it was evident the labourer would emigrate.

Mr. FORD seconded the resolution. He contended that the comforts of the agricultural labourer were equal, if not superior, to those of the towns. He referred the worthy Canon to the deplorable condition of labourers, as regards house accommodation, in the fashionable places of Torquay and Newton and other towns.

The Rev. Canon GIRDLESTONE said they had differed on matters of detail rather than on principle. They were all agreed that the condition of the agricultural labourer required

improvement. He agreed with the Chairman's remarks, with the supplementary remarks as to the carrying out of the practical education of the labourer after leaving school. As to the cider question, he did not object to labourers having cider, but he did object to its being kept back out of their wages. He did not believe in helping the labourer so much as teaching him the way to help himself. When he was last here he attended the Newton Board of Guardians, and he was extremely interested in the manner in which the business was transacted, and it was evident from what he saw that the poor-law was administered with remarkable skill and judgment. This led him, when he returned home, to examine the statistics, comparing those of the Newton Union with those of the Tiverton, and he must say that the comparison was considerably in favour of the former. This arose from the fact that at Tiverton the guardians were pretty well of one calling, whilst at Newton they were various, and, as a result, a greater amount of experience was brought to bear on the administration generally. It would also be seen that indoor relief was more rigidly enforced at Newton, and which he regarded as one of the greatest tests for keeping down pauperism.

The motion was then agreed to.

THE EGG OVENS OF EGYPT.

My guide stops before a low door, which I am informed is the entrance to the egg ovens. The door is slowly opened by a swarthy individual, whose entire clothing consists of a loose kind of shirt and a turban, disclosing to my view a chamber or divan, round which are seated four or five old men smoking vigorously. In the centre of this group are eggs heaped in small pyramids, crates filled with eggs, baskets of eggs, earthen bowls containing eggs, while outside are several donkeys tethered to the walls, each bearing its freight of eggs. One old man, the head, I presume, at first sternly objects to my viewing the process by which, with artificial heat, chickens are produced, asserting his belief that I am only come to spy out their secrets. This I know is only a scheme to extort a large "baksheesh"; but an offer to pay liberally removes every scruple, and I am conducted to the egg ovens. Very much after the fashion of the burrowing mole, I contrive to wriggle through a long dark kind of tunnel, to reach at last a large vaulted chamber, built of sun-dried bricks. The air is hot and oppressive, and I wish I could have left my nose outside.

All round this chamber are small circular openings, which, without actually measuring, are, I should say, about three feet in diameter; each orifice or mouth leads by a short arched passage into an oven about twelve feet in diameter. These ovens are not quite circular, but nearly so; the roofs are domed, and contrived with a kind of fire-chamber over them; the apertures leading to the fire-chambers are the same size as the openings to the ovens, and only large enough to admit a boy to pass through. From each fire-chamber there is likewise a communication with the oven to which it belongs. In the domed roofs of the ovens, and in the roof of the room there are holes that can be opened or closed at pleasure; these serve the twofold purpose of letting out the smoke and letting in air and a dim hazy light.

Egg-hatching, I am informed, is only carried on during three months of the year—April, May, and June. The hatching establishment is called a *maawal*, and the proprietors can set twenty ovens working at the same time, each oven containing about five hundred eggs. Supposing the ovens in full work, there will be about ten thousand eggs hatching at the same time. The eggs are supplied by the peasantry, and there are two systems of purchase. Under one system, the hatcher pays down an agreed sum to the peasant for eggs; under the other, the owner of the eggs leaves them with the hatcher at his own risk, the latter covenanting to return one chicken for every two eggs. The material employed for heating the ovens is called *yelch*, a fuel composed of the offal of animals, worked with straw and water into cakes by women and children in Cairo. This is kept smouldering slowly in the fire-chambers

above the eggs, as well as in troughs made of mud bricks encircling the eggs.

The first oven I was shown contained about 500 eggs, which had only been in three days; these were arranged in circles round a central egg; underneath the eggs was a coarse description of rush-matting. The temperature was 96 degrees Fahrenheit; and here I may remark, that these egg-hatchers know by experience the proper temperature at which the ovens should be kept, even to a degree or two, being guided entirely by their external senses, for they employ no heat-gauge whatever. In oven No. 2 the temperature was rather over 100 degrees Fahrenheit, and the eggs—about the same in number and arrangement as in No. 1—had been in 14 days.

Arriving at No. 3 I could distinctly hear, even before the interior was unclosed, feeble squeaking sounds, as though a large choir of young birds were practising part-singing. In this case, before the oven was opened "the birds began to sing." On putting my head through the aperture, when opened, before me was one of the most interesting sights I ever beheld; for, running and scrambling over the circles of eggs, and gathered together in groups against the walls were woolly little chickens of every shade and colour, while some about half-way out of the egg-shell, and others with only the head protruding, piping their mellow cries. Whether they were cries of joy, complaints of a mother's neglect, or caused by anxiety to escape from their hot prison, must be left to the decision of those more learned in the bird-language of the East than myself. These eggs, I was informed, had been in the oven 21 days, which is about the period of natural incubation, and the temperature, when I saw the chickens, was exactly 130 degs. Fahrenheit. The chickens are taken from the oven during the day; the strong and vigorous are to be sold, the weakly ones being placed in a chamber constructed for the purpose, there to be fed and nursed.

Very few, if any, eggs of domestic poultry (by poultry I must be understood to mean fowls only) are incubated naturally. The chicken-ovens are employed throughout Upper and Lower Egypt. The amount of work accomplished by these primitive, but most effective, contrivances may be gathered from a statement published by order of the government in an Egyptian newspaper, in which the number of establishments for the hatching of fowls' eggs in Lower Egypt is given as 105, and in Upper Egypt as 99. The number of eggs hatched in Lower Egypt is 13,069,733, and the number spoiled 6,255,867. In Upper Egypt the number hatched is 4,349,240, while the number spoiled is 2,529,660.—*Travels in Egypt.*

THE LINCOLNSHIRE AGRICULTURAL SOCIETY.

MEETING AT SLEAFORD.

With its resources and a purse like unto that of Cæsus, if we may judge by the way everything is done, this Society ought to be one of the best and most perfect gatherings in the kingdom; as it will be, if the management will pay a little more attention to trifles. They are, indeed, going a-head in the right direction, as the conduct of the yard was a wonderful improvement to that of last year, when chaos reigned at Lincoln. The conduct of the horse ring was worthy of much praise, for the classes came in orderly and without loss of time, were nicely numbered, and the winners' figures duly hoisted on some capital telegram boards. Then no intruders of any kind were allowed within during the day, and there was no interruption to business caused by any jumping. But if the horses came in without delay they did not go out again in a hurry, for never were judges more dallying. This, though, was according to order, as it was thought that if the award could be spun out for a couple of days it would attract more people. A greater mistake was never made, as there was nothing worth naming left for the next day, whereas if the judges had been allowed to commence at eight instead of ten, and had gone to work like men, they might have got through the classes in ample time for a general parade, and so sent the visitors away pleased and entertained instead of wearied out. The laying out of the yard and shedding, as at Lincoln, was capital, with plenty of room behind the horses for a stroll through, and a famous horse-ring encircled by the strongest of rails, while a grand-staud was in the course of erection, with its patch of scarlet in the centre, like the squire's family pew in some village church. It would be just as easy we think to be ready a day before the fair as a day after, as there is nothing so unsightly and slovenly in a show-ground as to see the mallet and saw in full swing after the visitors are admitted. Again, the public ought not to be kept an hour without a catalogue; and another thing that some one should attend to would be the superintendence of the first-rate boxes where the stallions stood, and impress on the men in possession, who were furnished with locks, keys, and shutters, that they brought their horses to Sleaford not only for a chance of a prize, but for the public to see. As it was, many of the horses, boxed up and locked up as they were, might just as well have been on their way home by express. Further, the prize cards should have been distributed immediately, and posted in the sheddings of cattle, sheep, and pigs, as well as the horses, as they only had the colours put by the side of their numbers, or stuck to the animals' heads, under the ear, on the back or the tail, according to the fancy of those in charge. Then the number of the class on the prize cards, over the horses' heads, was much too small. All this should be rectified, so that the public may gain some little information from a well-got-up shilling catalogue, on which was advertised "Public Dinner Tickets, *in addition to wine*, for four shillings," while the purveyors on the ground were allowed to charge the public three and sixpence for cold meat, a sum for which any one may dine like a gentleman at the Grantham "George."

There was a grand collection of animals, the Shorthorns and horses contending for precedence, the one headed by Bolivar and the other by the Hermit. The latter three years ago we saw with his coat staring, being dragged as it were along by a lad in the dip under the plantation at

the Durdans end of the paddock at Epsom, almost unnoticed, and in an hour afterwards standing on the brow, stripped, with head erect, eye dilated, nostrils distended, and his coat glistening with sweat, covered with a net-work of veins that his heated blood played through—the hero of the day when the betting mania was at its zenith! For this horse, now going for the twenty as the best thorough-bred hunting-stallion, is no other than the Derby winner of '67, that did so much for the Squire of Blankney and the Cathedral of Lincoln.

Doubt and mistrust is thrown on Heaven,
And all its power to chance is given.

With how much more pleasure do we scan his beautiful frame in the ring at Sleaford, a sight alone worth double the charge of admission to gaze on! And we think we are not saying too much when we do say that he has grown into one of the neatest, handsomest, best-proportioned, good-limbed, muscular, short-jointed horses, entirely free from lumber, that we ever saw. The second best is Rapid Rhone, that a first-flight Yorkshireman by the side of the ring tells us was always a favourite of his; and that poor Bullock declared, in tears, he must have won the Derby on had not Lord Glasgow deprived him of the asphalt a friend handed him after being stripped of his whip and spurs. We do not always go hand and heart with our Yorkshire friend in his opinion of a horse, more especially hunters; but we do agree with him about Rapid Rhone, of whom, when shown at Lincoln last year, we thus wrote: "Rapid Rhone by Young Melbourne, dam by Lanercost, was one of the late Lord Glasgow's roans; but is now standing at Blankney, and we recollect seeing him run third for the Derby when Lord Clifden or Macaroni won. He is the colour of a Norfolk trotter, and has a good head, strong neck, and well-laid shoulders, with a nice rise in the withers, a good back and loin and deep rib, strong muscular quarters, arms, and thighs, with knees and hocks near the ground—adding to this plenty of length, he is anything but a bad horse; in fact, the roan has always been a favourite of ours, though his colour is against him." Then, there was Ratacatcher, a well-known prize horse in this county, shown last year at Lincoln, and third at Bury St. Edmunds, where we then described him as "a model of power, barely fifteen two, with legs of iron and great substance below the knee, but taking somewhat after his sire in thickness of shoulder;" while with less flesh he looked better than last year. Odd Trick was also at Lincoln, when we described him in full; if anything there is less of him now. The Lancer we recollect seeing at Leicester; he has a good forehead but is light below the knee, and he falls off behind, with his legs too far away from him. Rallywood, by Newminster, was bred by Lord Falmouth, and has been hunted by Mr. Welby; as he is only four there is every probability of his thickening into something useful; while Broomielaw, that harum-searum restless animal, is as leggy as a fowl, and his middle continually reminds us of the apothecary in Hamlet, who had more physic than fodder. Strathern was in the roll, but did not enter the lists. In a good class of hunting brood mares, with some rubbish in the ruck, the judges again went for blood in awarding an old racing brood mare, Juanita Perez, by

Melbourne, in her nineteenth year, first honours—a lengthy lathy nicely-made mare, too; while the third at Oxford, Heliotrope, who we then said had too much of the coacher, was second. Putting the third in her place, a powerful Irish chesnut mare of breed, would have pleased us better, with Mr. Grove's brown game-looking mare full of hunting character third. Mr. Byron exhibited a mare of nice character, but very deficient below the knee; then Old Marigold, in her twenty-fifth year, looked as well as ever, but, as might be expected, there was not much go in her. She is a grand old mare barring the shoulders; nevertheless, Mr. John Booth says he was never carried better for six seasons; while her foal by The General beat the lot. Mr. Smith's useful old mare by Loutherboung and Mr. Marfleet's bay by Brilliant were, among some others, worthy of note. Mr. Booth was again to the fore with Brian Born, who is now almost as well known in the ring as himself, followed by Mr. Paddison's bay gelding by Gobbo, who last year was noticed as "going very oily and like a hunter, and in another year will take some beating." He now turned the tables on Mr. Clarke's (Sleaford) bay Motley horse that he played second to last year—a lengthy powerful evenly-got-up horse, that does not bring his hind legs well under him in his gallop. It was a great pity, we thought, that, with so grand a ring, the judges or some of the officials did not remove a few of the hurdles that separated the two sets, while the hunters were ridden before them, as they could have seen them extended so much better. Mr. Maxwell's bay mare Adelaide was the reserve number; and Mr. Goodson's thick-set Robin Rough, Mr. Coate's Hero with something taking about him, and Sir H. Bacon's brown, were of hunting form, and could move. In the four-year-olds Mr. Paddison won with a very nice horse by Epicurian, beating the first and second at Islington, Comrade by The Swell, and Borderer by Clausman, both now the property of Mr. T. H. Bayley. Comrade we did not consider a hunter at Islington, but more of a charger or match horse, and we were backed in our opinion by one who, we should say, has given and received higher prices for hunters, taking numbers into consideration, than any man in the kingdom. Mr. Bingham's The Admiral, who came out at Beverley last year, is a horse of breed, but looks more like steeple-chasing or hurdle-racing than hunting, and, like Broomielaw, wants a dose of cod-liver oil, as his corn evidently does not agree with him. Mr. Clarke, of Howden, came in for a commendation for Cracksman, a flash-looking, gentlemanly horse, with four white heels, somewhat of the Sprig-of-Nobility stamp on a smaller scale; while he was highly commended for Chieftain, by Carbineer, who, we think, would have fared better at Beverley, where they were both shown as three-year-olds, had he not gone a little tender. Lord Kesteven's bay mare by Richmond was compact and well put together, but did not succeed in the light-weights, where she was beaten by Upstart, a bay horse of fair form, that could move. Mr. Cross's and Mr. Wyle's were worthy of notice; and Mr. Welfitt's Caller could go, but he is rather coarse. Loiterer, a third at Islington, and a useful horse for general purposes that we should fancy was as slow as a man in his gallop, got the prize here, beating a big brown horse, Grindstone, by Cornerstone, of Mr. Dudding's, that, we think, would be more in his place bearing an officer to and from Knightsbridge and the Horse Guards. Among the others were Mr. Goodson's Robin Rough, Mr. Nell's Shylock, mentioned in a previous class, for the same horses were shown on several occasions. Lothair, the best three-year-old, by a thorough-bred horse, was of a gaudy colour, and light of bone but a sweet oily goer; and Speculation was a very showy one. Mr. Brewster's

filly Patch by The Earl of Surrey was of good form, with peculiar formed pasterns, but a loose easy goer. The two-year-olds, yearlings, and foals were well represented with many promising things amongst them. The hackneys were not in such great force as the hunters. Fireaway, a very showy rich chesnut from Downham Market, and who has often shown himself in a ring before, wore the prize-ribbon for roadster stallions, and Young Quicksilver, a horse who beat Mr. Pearl's Ambition at Lincoln last year, was second in a class of ten, including a very fashionable flourishing grand parade sort of three-year-old of Mr. Milward's, while Thugarton was first in the ponies not exceeding fourteen, beating a rather clever black four-year-old cob, and a very clever bay with a long mane of Mr. Vincent's, called Welby. There were a few roadster mares, Peg being of the right stamp, and the well-built Sally of Sleaford knew how to use her legs, as a fading old dowager of form and character of Mr. Powers, came in for a high commendation. The beautifully made old grey mare Beda was first for both cobs and hackneys, not having anything very grand to oppose her. In the ponies under thirteen hands the winner turned up in a nice one by Croton Oil, beating a dun of Colonel Astley's that we fancy we have seen his owner driving round the ring at Islington, and a handsome little white one of Mr. Seels, with several others.

The agricultural classes were not strong, but the horse of the day, Honest Tom, was first in the stallions, while the second, a grey with middling feet, some thought ought not to have beaten Mr. Mannings's gaudy coloured Young Champion, the second prize at Oxford. There were eleven in the class, but most of them under lock and key. There were some very useful draught brood mares with foals of power and substance, and Royal Duchess, the first at Manchester as a two-year-old, and first at Oxford this year, had only one to beat here, Mr. Wyles' Flower, a niceish roan filly. Royal Duchess was got by Mr. Kirkby's Champion, who went for honours in the stallion class. There were three pairs of fair draught horses, but not equally matched, which is very often the case, while there was a capital team of roans under excellent command, who walked over for a red waggon, there being no opposition. Five two-year-old fillies, with a good one or two among them; two neatish yearling fillies; four or five colt foals of fair promise, and a nice cart filly, with half-a-dozen ordinary animals in the extra stock made up the agricultural horses.

The show of Shorthorns was grand and a credit to any yard, comprising many animals of note; amongst these the Manchester and Oxford bull Bolivar, who won the champion prize, though the Marquis of Exeter's Telemachus, quite a beauty in mould, substance, and quality, was the reserve number, Heydon Duke third, and Bythis fourth—was how the judges placed them in a class of seventeen. Robin, bred by the late Mr. Foljambe, has great style and character, Baron Torr being very much off his legs, while Charlie was wonderfully got up, and is, we believe, an own or half-brother to Bolivar. Telemachus, of whom we can scarcely say too much, as there was a prize for everything, came in for the two-year-old premium with only two to oppose him, and the judges also awarded him an additional prize as the best bull in the three classes; while Heydon Dukewas the champion yearling, Bythis being disqualified as a Royal winner. Travelling, however, does not seem to agree with the Duke, or his trainer has not the knack of keeping him in condition like Bythis. The Duke of Morton is a lengthy animal, bought at Mr. Hodgkinson's sale; Mr. Lynn's bull calf is a famous one that would hold his own anywhere, while Mr. Betts' is a nice one, Lord Aberdeen a promising young nobleman with good hair, and the Stan-

ard Bearer is a very useful animal. The Queen of Rosalea, with her grand form, has winning ways; for she fixed the eye of the judges in spite of Lady Anne's sweet head and kind eye, her wonderful barrel and blooming looks—the reserve in a capital class, and a prize-taker as a three-year-old heifer, having had a calf in a very good lot. Amongst a moderate lot, Magnolia, a first-prize cow at Peterborough and a perfect specimen of a Shorthorn, was first here a long way. Mr. How was again to the fore with his gem the beautiful Windsor Butterfly, Mr. Searson's second having a good frame and quality, while the judges took some time to decide between Lord Braybrooke's Memory and Lady Pigot's La Belle. The Countess of Yarborough, who was second at Oxford, was the best yearling heifer, and the blood red Vesper Queen, with her taking form and pretty loin, came in for a second instead of a third as at Oxford. Then it was a near thing between Lady Pigot's Dame Swift and Mr. Poljambe's Consort, both excellent animals. The heifer calves under one were a very pretty lot, Fleurdelis being better in her frame than quality, while the second was a very nice one, but sharp in her hair, and Prize Rose, a first at Peterborough, a trifle flat in her sides but with grand quarters. There was a very smart red ox, but the judges did not advise his being sent on to Smithfield.

In a good show of sheep Mr. Borton led off by playing first and second in the shearings, and two shear rams or older, though the Oxford shearing only came in for a high commendation, being, as they said, lame, but as we said quite out of his place at the Royal Show; while the awards in the ewes were the same as at Oxford. The Lincoln shearing rams were useful sheep, but the two-shear were better, the first and second being very even. The three-shear were an average class, the first and second being both very good. Still the Lincolns were strongest in the ewes, which were capital, and the shearing gimmers extraordinarily good; while the shearing wethers were uneven, and the ewe lambs indifferent, but in the extra stock there was a five-shear ewe that had kept her wool and mutton together wonderfully well. For the challenge cup and fifteen guineas the two sets of judges (Lincoln and Leicester) stuck to their sheep like Britishers to their guns, and there being three on each side, the old game of pull devil pull baker was tried; but as neither party proved the stronger, they departed without giving a decision; though Mr. Borton wished to appoint an umpire, or have the guineas divided; but Mr. Torr did not see it. The show of pigs was strong in the white breeds, with about half-a-dozen Berkshires scattered through the entry.

JUDGES.

SHORTHORNS.—W. Sanday, Holme Pierrepont, Nottingham; C. Howard, Biddenham, Bedford; G. Drewry, Holker Grange, Lancashire.

LEICESTER SHEEP AND PIGS.—G. Mann, Scawsby, Doncaster; R. Woods, Osberton Grange, Worksop; J. Spencer, Snaresdon Lodge, Ashby-de-la-Zouch.

LONGWOOL SHEEP.—W. Chatterton, Tathwell Cottage, Louth; J. O. Daintree, The Grange, Lotworth, Huntingdon; J. L. Needham, Huttoft Grange, Alford.

HORSES.—**Hunters:** J. E. Bennett, Husband's Bosworth Grange, Rugby; T. Elerby, Whitwell, York; H. Thurnall, Royston. **Hunters and Roadsters:** C. Wood, South Dalton, Beverley; H. Beevor, Blythe, Worksop; S. Robson, Louth. **Agricultural horses:** J. B. Watts, Melcombe Horsey, Dorchester; J. Rowland, Eastville, Boston; S. Smeeton, Kirton, Boston.

WOOL.—G. E. Townend, Bradford.

POULTRY.—W. B. Tegetmeier, London.

CATTLE.

SHORTHORNS.

Best bull,—Champion prize of £30, C. W. Brierley,

Rhodes House, Middleton, Manchester. Highly commended: The Marquis of Exeter, Burghley Park, Stamford.

Bull, three years old or upwards.—First prize, £15, Messrs. Dudding, Panton, Wragby; second of £5, T. Statter, jun., Stand Hall, Whitefield, Manchester.

Two-year-old bull.—First prize, £15, the Marquis of Exeter; second of £7, Earl Brownlow, Belton Park.

Yearling bull.—First prize, £15, Lord Braybrooke, Saffron Walden; second of £7, W. W. Slye, Beaumont Grange, Lancaster; third of £3, P. Brown, Glentworth Hall, Lincoln. Commended: Messrs. Dudding.

Best bull.—Additional prize of £15, the Marquis of Exeter.

Bull calf under a year old.—First prize, £10, J. Lynn, Stroxtun; second of £7, W. Bett, Benniworth, Wragby; third of £3, R. Wood, Clapton.

Bull, above one and not exceeding four years old, which has served cows during the present year, or the owner of which will undertake that he shall serve cows in Lincolnshire during the next year at a charge of not exceeding £1 ls. each.—First prize, £20, P. Brown, Glentworth Hall, Lincoln; second of £10, Earl Brownlow; third of £5, Messrs. Dudding.

Bull of any age.—The challenge cup, value 20 guineas, W. C. Brierley.

Cow or heifer, in milk or in calf.—The champion prize of £25, Lady Pigot, Branches Park.

Cow, more than four years old, having produced a calf within nine months of the time of showing.—First prize, £20, R. Searson, Crammore Lodge, Market Deeping; second of £10, Messrs. Dudding.

Owner and breeder of the Shorthorn cow, not exceeding four years old, which shall exhibit the greatest dairy properties, with aptitude to fatten.—Silver cup, value £10, J. Lynn.

Three-year-old heifer, having produced a calf.—First prize, £10, J. How, Broughton, Huntingdon; second of £5, R. Searson. Highly commended: R. Searson. Commended: J. Lynn.

Two-year-old heifer.—First prize, £10, J. How; second of £7, R. Searson; third of £3, Lady Pigot. Highly commended: Lord Braybrooke, Saffron Walden. Commended: W. Bradburn, Wednesfield, Wolverhampton.

One-year-old heifer.—First prize, £10, Messrs. Dudding; second of £7, J. How; third of £3, F. J. S. Poljambe, Osberton Hall, Worksop. Highly commended: Lady Pigot.

She calf, under one year old.—First prize, £7, F. J. S. Poljambe; second of £4, E. Paddison, Ingleby, Lincoln; third of £2, J. Lynn. Commended: Lady Pigot and Messrs. Dudding.

Pair of bullocks.—A piece of plate or £10, Colonel Reeve, Leadenham, Grantham. Second prize not awarded.

Milch cow, having produced a calf, the property of a cottager.—First prize, £5, J. Nix, Ropsley, Grantham; second of £2, G. Watkin, Lenton.

Heifer, under two years old, bred by and the property of the exhibitor, as in previous class.—Prize, £5, G. Brunby, Hems-well, Kirton Lindsey.

SHEEP.

LEICESTERS.

Shearing ram.—First prize, £10, to J. Borton, of Barton House, Malton; second of £5, J. Borton. Commended, J. Borton.

Two-shear or older ram.—First prize, £10, J. Borton; second of £5, J. Borton. Highly commended, G. Turner, jun., Alexton Hall, Uppingham.

Pen of five ewes or gimmers.—First prize, £10, T. H. Hutchinson, Manor House, Catterick; second of £5, J. Borton.

OTHER LONG-WOOLS.

Shearing ram.—First prize, £15, R. Wright, Nocton Heath, Sleaford; second of £10, R. Wright; third of £5, J. H. Casswell, Langiton, Falkingham. Highly commended, R. Wright; commended, R. Wright and F. Sardeson, Cranwell, Sleaford.

Two-shear ram.—First prize, £10, Messrs. Dudding; second of £5, Messrs. Dudding. Highly commended, J. Byron, Kirkby Green, Sleaford.

Three-shear or older ram.—First prize, £10, Messrs. Dudding; second of £5, T. Cartwright, Dunstan Pillar, Lincoln. Highly commended, R. Wright.

Pen of 5 ewes.—First prize, £10, C. Clarke, Ashby-de-la-Launde, Sleaford; second of £5, C. Clarke.

Pen of 5 ewes, the property of an occupier of not more than 200 acres.—First prize, £7, R. Toynebe, Bracebridge, Lincoln; second of 3, W. Roe, North Searle, Newark.

Pen of 5 shearing gimmers.—First prize, £10, T. Cartwright; second of £5, J. Byron.

Pen of 5 shearing gimmers, the property of an occupier of not more than 200 acres.—Prize of £7, R. Toynebe.

Pen of 5 shearing wethers.—First prize, £10, J. Byron; second of 5 gs., C. Lister, Coleby.

For the best pen of ten she lambs.—First prize, £5, C. Clarke; second of £2, R. N. Morley, Leadenham, Grantham.

Extra Stock.—Prize of £1, J. Byron (Two-shear wether); prize of £1, - Sardeson (Pen of 3 ewes).

HORSES.

Thoroughbred stallion for hunters.—First prize, £20, H. Chaplin, M.P., Blankney Hall, Lincoln (Hermit); second of £10, Lord Glasgow's executors (Rapid Rhone).

Best mare for breeding hunters, with foal at foot or having been served in the season of 1870.—First prize, £15, G. H. Sanday, Holme Pierrepont, Nottingham; second of £7, W. Tindall, Ashfield House, Lincoln; third of £3, H. Chaplin, M.P. Commended: R. Graves, jun., Liawood.

Hunting gelding or mare of five, six, or seven years old.—First prize, £20, J. B. Booth, Killerby, Catterick; second of £10, E. Paddison.

Hunting gelding or mare five years old, pedigree taken into consideration.—First prize, £10, J. Benrose, Caythorpe, Grantham.

Gelding or mare, four years old, calculated to make a hunter.—First prize, £15, E. Paddison; second of £10, T. H. D. Bayly, Biggleswade. Highly commended: W. H. Clark, Hook. Commended: T. H. D. Bayly, T. Crots, jun., Melton Mowbray; and S. M. Wellitt.

Hunter, four years old or upwards, up to 14 stone.—Prize £10, S. J. Wellitt.

Hunter, four years old or upwards, up to carrying 12 but not up to 14 stone.—First prize, £10, W. Godson, Normanby-by-Stow. Commended: Lord Kesteven, Casewick.

Hunting gelding or filly, three years old, by a thoroughbred horse.—First prize, a whip value £5 and £20, R. G. F. Howard, Temple Bruer, Lincoln; second of £10, M. Wilson. Commended: Captain W. Singleton.

Hunting colt, two years old.—Prize, £5, F. Frudd, Dorrington. The class highly commended.

Hunting colt, two years old.—First prize, 10gs., F. Frudd, second of £5, R. Johnson, Westborough. The class highly commended.

Hunting colt, one year old.—First prize, £10, C. Clark, Ashby-de-la-Launde; second of £5, F. W. Alix, Willoughby Hall, Grantham. Commended: J. P. Oliver, Walcott, and G. Coates, Great Coates.

Hunting filly, two years old.—First prize, £10, J. T. Pawlett, Rippingale; second of £5, G. Hill, Edenham.

Hunting foal by a thoroughbred horse.—First prize, £20, W. H. Clark, Howden; second of £5, T. Wheatley, Ashfield House, Lincoln. Commended: G. Willows, Swallow, Caistor.

Foal by Nottingham.—A cup value £20, G. Willows.

Gelding or mare, the cleverest jumper.—First prize, £10, J. Greenham, Blankney; second of £5, F. Frudd.

Stallion for roadsters.—First prize, £10, B. Mitchell, Crowle Hall, Downham Market (Fireway); second of £5, T. Upton, West Walton, Wisbeck (Young Quicksilver). Highly commended: B. Balderston, Mount Pleasant, Boston (Norfolk Hero), and Rd. Milward, Thurgarton Priory, Southwell (Don Carlos).

Mare for breeding roadsters, with foal at foot, or having been served in the season of 1870.—First prize, £7, S. Gibson, Barton-on-Umber; second of £3, J. M. Phillips, Rowston.

The horse whose action in harness is best, special consideration being given to pace.—First prize, £10, Rev. W. S. White, Potterhanworth; second of £5, P. Hornsby, Grantham.

Weight-carrying cob, not exceeding eight years old, and not under 14½ hands nor above 15 hands in height.—First prize, £10, J. Hornsby, Grantham; second of £5, Wm. E. Chapman, Horbling, Fakingham.

Hackney not under 14 hands nor above 15.1 in height.—Prize, £5, J. Hornsby, Grantham.

Pony above 13 and not exceeding 14 hands in height.—First prize, 10gs., R. Milward; second of £5, J. Martin, Wainfleet, Boston.

Pony under 13 hands in height.—Prize, £5, J. Eaton, Farnfield, Southwell.

Stallion for draught horses.—First prize, £20, Wm. Welcher, Mouse Hall, Tofts, Brandon (Honest Tom); second of £10, I. Wilson, Saxilly, Lincoln (Young Champion). Commended: B. Balderston, Mount Pleasant, Sibsey, Boston (Wiltshire Champion).

Stallion for draught horses two years old.—Prize, £10, C. Sharpley, Kelstern, Louth (Le Bon).

Mare for breeding draught horses, with foal at foot, &c.—First prize, £10, R. Allett, Little Hale Fen, Sleaford; second of £5, A. Jackson, Bicker Bar, Spalding; third of £3, F. and W. Kingrose, Langford Moor, Newark. Commended: R. Allett.

Cart filly, three years old.—Prize, £5, C. Lister, Coleby Lodge, Lincoln. Commended: Robt. Wyles, Little Ponton, Grantham.

Cart filly, two years old.—Prize, £5, R. Hopper, North Bank, Whittlesey. Commended: J. Hubbard, Ewerby, Sleaford.

Cart filly, one year old.—Prize, £5, C. M. Ward, Washingborough, Lincoln.

Cart colt foal.—Prize, £3, — Birkitt, of West Ashby, Horncastle.

Cart filly foal.—Prize, £3, J. Chatterton, Hagworthingham, Spilsby.

Pair of draught horses, geldings or mares, under 8 years old.—Prize, 10gs., G. Woolhouse, Nocton Grange, Lincoln.

Team of either three or four horses suitable for agricultural purposes.—Prize, £15, Wm. Pilkington, Brauncwell, Sleaford; £3 to driver.

PIGS.

Boar of the large breed, not less than 12 months old.—First prize, £10, Str T. Whichcote, Bart., Aswarby Park, Sleaford; second of £5, Messrs. Duckering, Northorpe.

Boar of large breed, not exceeding 12 months old.—First prize, £5, Messrs. Duckering; second of £2, Messrs. Duckering.

Boar of the small breed, not less than 12 months old.—First prize, £10, G. P. Watson, Londonthorpe, Grantham; second of £5, Wm. Hatton, Addingham, Leeds.

Boar of the small breed, not exceeding 12 months old.—First prize, £5, W. Hatton; second of £2, J. Lynn, Stroton. Berkshire boar.—Prize, £5, Messrs. Duckering.

Sow of the large breed.—First prize, £5, to Messrs. Duckering; second of £3, W. Hatton.

Sow of the small breed.—First prize, £5, W. Hatton; second of £3, W. Hatton.

Berkshire sow.—Prize, £5, W. Richardson, Ashby Puerornm, Horncastle.

Three breeding pigs of the same litter, large breed, not exceeding 6 months old.—Prize, £5, Wm. Goose, Frampton, Boston.

Three pigs of the small breed.—Prize, £5, to G. P. Watson.

WOOL, SEEDS, AND ROOTS.

Three fleeces of hogg wool.—First prize, £3, R. Wright, Nocton Heath; second of £2, R. Wright.

Three fleeces of ewe or wether wool.—No entry.

Collection of seeds and roots.—Prize, £15, to James Carter and Co., Holborn, London.

IMPLEMENTS.

JUDGES.—J. Hicken, Dunchurch.

J. Coleman, Escrick.

Major Grantham, Spilsby.

The best stand of agricultural implements exhibited by a maker.—First prize, £10, Hornsby and Son, Grantham; second of £5, Ransomes, Sims, and Head, Ipswich.

The best stand of agricultural implements exhibited by an agent.—First prize, £10, Amies, Barford, and Co., Peterborough; second of £5, S. Williams, Sleaford.

R. Mason and Sons, Alford, £1 for sack lifting and weighing machine combined.

Hayes and Son, Stamford and Peterborough, £2 for carts.

George Cheavin, Boston, £1 for water filter.

Penney and Co., Lincoln, £1 for patent corn screen.

Vickers, Snowden, and Morris, £2 for double furrow plough, horsehoe, and drill.

William Barton, Bcston, £1 for cooking stove.

J. Williams, Sleaford, £1 10s. for milk preserving vessel and a churn.

J. Barlow, Kirkby Laythorpe, £1 for wood plough with bean mill.

Amies, Barford, and Co., Peterborough, £1 for horse rake, £2 for elevator, £2 for grinding mill and dressing machine, and 10s. for iron lamb hurdle.

T. Watson, Scopwick, £1 for gearing for four horses.

R. S. Baker, Lym, 10s. for horse rake.

J. Lingard, Caythorpe, 10s. for cart and waggon.

J. Cooke and Co., Lincoln, £2 for ploughs and waggon.

Isaac Spright, Brigg, £1 for horse hoe.

J. Conitas, Spittlegate, Grantham, £2 for drills and horse hoe.

William Ashton, Horncastle, £2 for drags, cultivators, and jacks.

Ashby, Jeffery, and Luke, Stamford, £1 for horse rake and chaff cutter.

R. Medley, North Raucedby, £1 for a cart.

W. and F. Walker, Lithby, near Bingham, Notts, £1 for two drills.

T. Allcock, Ratcliffe, Notts, £1 for chaff cutter.

William Watkinson, Louth, £1 for liquid manure drill, and £1 for brick and tile making machine.

W. R. Harris, Sleaford, £1 for waggons, and £1 for hay-maker.

T. Ashley, Louth, prize for steam cultivating tackle.

Hornsby and Sons, Grantham, £2 for turnip cutters, £2 for root pulpers, £2 for drills and ploughs, and £1 for knife grinding machine.

E. Tong, Lincoln, £2 for drills.

George Robinson, Sutterton, Fen, £1 for waggon.

William Ball, Rothwell, Kettering, £2 for waggon, £2 for cart, and £1 for ploughs.

THE DINNER

took place on the Thursday, Mr. W. E. Welby, M.P., in the chair.

The Hon. A. L. MELVILLE said: When at a *table d'hôte* in Paris, where one sits down next to the last comer, it happened that he got next to American, and as he always took the opportunity of talking to any one he sat near, whether at a dinner table or in a railway carriage, he fell into conversation with his neighbour, who told him he came from the United States, and after having gone through England and other countries, had at last got to Paris. He had seen a great deal, but he had not seen the thing he came to see, something he had been told of but could not believe, "that one man had put his money in another man's land." He (Mr. Melville) replied that the English tenant-farmers did that to their great interest, and he invited him to come and see his farm at Lincoln, when he would soon show him that such really was the case. His new friend came in about three weeks "to see one man put his money in another man's land." He took him to Mr. Doughty's, who was well-known, and who showed him his books and bills for £500, £800, or £1,200 paid by tenant-farmers. He was still not satisfied, however, and in going past Canwick they saw a man drilling on land occupied by a tenant-

farmer, Mr. Tong. It was Colonel Sibthorp's land, and the stranger was convinced, but was surprised to see Mr. Tong putting seed into Colonel Sibthorp's land. In America, he said, they put it into their own land; if they had got no land they bought some; and if they had no money to buy land they put their horses in the carts and went West, where they could get land at half-a-crown an acre, but they never put money in other men's land.

Lord KESTEVEN said he was at the Oxford show the whole of the week, but there he did not see anything like the display in one department. They had not half so good horses as they had here, and they did not ride them half so well. Thus Lincolnshire was proud both of its horses and riders. In another field also they had a competition as to who should be first in hunting. At the Oxford meeting a prize was given for the best cultivated farm; there were 21 competitors, and the prize was won by a lady, a native of Lincolnshire.

The CHAIRMAN said those who have managed this show have kept one object in view, namely, the promotion of the science of agriculture and the welfare of all classes connected with it. With that view we, almost alone of all such societies, allot funds to honest and intelligent labour, and also devote a portion of our income to giving to masters the benefit of chemical analysis, the same as is done at the Royal and other similar societies. With the same object in view, we not only attempt to make the show as attractive as we can, but as far as possible to carry its operations into every corner of the county. I would add that we must bear in mind that we have not to-day—as we had last year—met in a large centre of the county like the city of Lincoln. I believe, as far as the excellence of the show is concerned, we can challenge comparison with last year; but I confess my misgivings, notwithstanding the manner in which this tent is filled and the company present to-day, as to whether, in a financial point of view, the funds of the Society will not be severely trencned on. I say this because I wish it to be understood that the Society cannot be kept up without the cordial support of the whole county. Next year the meeting will be held at Brigg—I have reason to hope it will be as successful as this year; the year after it remains to be decided where the meeting shall be held.

Mr. CHARLES BRAMLEY said Mr. Melville had remarked that the tenant farmers put their money in the land, but why did they do it? because they were encouraged by the landlord. If that was not the case, he did not believe there was a tenant farmer in Lincolnshire who would put his hand so readily in his pocket.

Mr. TORR said labour was the true source of wealth, as without good labourers the efforts of the farmer were nullified, and that without good labourers and a good landlord he would advise no one to be a farmer. Believing as he did that all present appreciated the value of good labourers, he felt sure that with good landlords and good labourers no leases were required. At this meeting there had been seen one of the finest exhibitions of steam engines ever brought together. These were economizers of labour; they were intended to husband, not to supplant labour, and he believed that no Lincolnshire labourers would think of injuring reaping or mowing machinery. He believed the summer management of sheep in a large portion of Oxfordshire was far superior to that of Lincolnshire.

HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND.

MEETING AT DUMFRIES.

The judges of stock commenced their duties on Tuesday. The entries are Galloways, 64; Polled Angus, 46; Shorthorns, 61; Ayrshire, 154; Highland, 20; fat stock, &c., 29—in all, 374. Horses for agricultural purposes, 120; extra sections, 51—in all, 171. Sheep: Cheviots, 91; blackfaced, 59; Border Leicester, 69; Leicester, 17; Long-wooled, 19; Southdowns, 12; Short-wooled, 40; extra, 15—in all, 322. Pigs, 39; poultry, 134; dairy produce, 130; implements, 1,875.

The total number of entries is the third highest ever witnessed under the auspices of the Society—the two highest being in Edinburgh last year, and Glasgow in 1859.

The exhibition of Galloways, as it invariably is in the south of Scotland, was large and good. After long deliberation on the part of the judges, Squire Dacre, shown from Knells, Carlisle, and bred by Mr. Graham, Parcelstown, was set aside to head the list. To be only

three years old this is really a rare bull. He carried off, besides numerous local premiums, the first at Aberdeen Highland Society's show in 1868, and the second at Edinburgh last year. He has splendid long quarters, with good back and rib, and shows great weight for his age. The second, bred by the late Mr. Graham, Braidlee, is only three years old, but he had little chance with the one placed before him. While the Galloway bulls were decidedly a good show, the cows and heifers were even more numerous, and, if possible, of finer quality. Besides three champion cows of previous shows entered for gold medals, there were fifteen cows staled, the majority of them good animals. This class occupied the judges a long time. The place of honour was latterly given to a three-year-old cow shown by Mr. Cunningham, and also bred by Mr. Graham, Parcelstown. She was second as a two-year-old heifer at Edinburgh last year, and has reached the top of the tree, so to speak, very early. In addition to having even quarters, so characteristic of the breed, Theresa II presents a sweetness and feminine appearance generally which the judges could not get over. The second is seven years old, and was bred at Brandledys, Dumfries. She is, of course, fully heavier than the young cow by which she was beaten, but is not so fine.

The entries of Polled Angus have been more numerous at former exhibitions of the Society; but notwithstanding the entire absence of Tillyfour cattle, the quality has never been surpassed, if indeed it ever has been equalled. To award the premiums in the aged-bull class took the judges nearly three-quarters of an hour, so close and keen was the competition. The choice of the judges ultimately fell on Palmerston, four years old, shown and bred by Mr. Walker, Portlethen, Aberdeen. He is very evenly fleshed, large, and well fed, with good points—beautiful head, shoulder, and neck. He took the third prize as a two-year-old at the Highland Society's show at Aberdeen, as also the first and silver medal at Stonehaven last year. The famous three-year-old bull March, from Westertown, Fochabers, Morayshire, bred by Mr. Brown, ran so close for the palm that many people looking on thought he would have once more come in the victor. When this fine bull first came before the public at Aberdeen in 1868, he obtained the highest honours the Highland Society could then bestow, and golden opinions were early formed as to his future career. Previous anticipations were fully realized when he beat all comers at Manchester last year. From some mysterious cause, however, though he came direct to Edinburgh last year, under the highest honours obtainable from the Royal Society of England show, the Highland Society judges of 1869 left him out in the cold. This year March was in the eyes of the judges and many others within a hair's breadth of shutting the door in his face for future competition at the National Society's exhibitions, by taking the chief prize from the aged bulls, of which he is one of the youngest. Sir George Macpherson Grant has the honour of breeding the two foremost bulls among the two-year-olds.

As was to have been expected from the locality, the show of Shorthorns was somewhat under what it is at the Society's exhibitions held where this popular breed predominates to a greater extent than it does in Dumfries and neighbouring counties. These remarks, however, apply more to numbers than to the quality of the animals entered. The judging of the six classes of this breed occupied about four hours—a fact which speaks loudly for the quality and equality of the various lots. The oldest bull in the yard was assigned the first prize among the aged bulls. He is over seven years, and is well known in the principal showyards in England, his more recent honours in which were the second prize at Oxford

last week, and a similar place at Manchester in 1869. This is Edgar. It was early evident that the three-year-old bull Baronet, from Burnside, Fochabers, bred by the Duke of Buccleuch, after Royal Errant, was to come close on the old bull. Many people did not hesitate to give it as their decided opinion that Baronet should have been first, and thus repeat his success of last year at Edinburgh, Aberdeen, Banff, Huntly, and Elgin. A good deal of surprise was occasioned by the defeat of the three-year-old white bull from Litch Haddo, Aberdeenshire, with which Dr. William Cochran carried the challenge cup at Aberdeen last week, and that was expected by many good judges to go far up in the list at Dumfries. Coming to the two-year-olds, we meet the observed of all observers in the now renowned bull Scotsman, from Newton of Struthers, Morayshire, which attracted so much notice at Oxford. Yearling bulls are not good as a class, though there are a few good beasts. The first prize animal is from the herd of Mr. Torr, Lincolnshire. He has in every sense of the term an ugly head, and he is not so broad and full behind as could be desired in a first prize beast. Good blood, however, is evident in his veins, while he is beautifully skinned and true round the heart, rib, back, and shoulder. The second bull is more massive, and was by not a few thought the more deserving animal of the two. He was bred by Mr. Lamb, Cumberland, and had for grandsire the first prize bull Edgar. Last year there were only four cows of the Shorthorn breed exhibited, and this year there are four times as many. The first prize cow is four years old, and was bred by Mr. Torr, Lincolnshire. She carried the first prize as a two-year-old at Lincoln, and has a good level back and loin, but is rather inclined to patchiness at the rump. The second was bred by Mr. Lawson, Darlington, and handles quite as well as the first. The third was third last year at the Highland Society's show. The first prize two-year-old heifer was bred by the exhibitor, Mr. Scott, Manben, Elgin, and carried the first prize as a calf at the Aberdeen show of this Society in 1868, and the third as a yearling last year. She shows her points to fine advantage, as does also the second, which was bred at Keavil, and got second honours last year, beating then the first of to-day. Both are light roans, and handle almost alike indifferently; otherwise they are good; but their skins are very thick, especially that of the second. The third was bred and shown by the Duke of Buccleuch.

Seldom has there been seen a finer show of Ayrshire stock, and the judges had great difficulty in arriving at conclusions in almost every one of the classes. Indeed, it was confessed by all the judges that they had never seen such a remarkably good lot of young Ayrshires. Of the forty who were brought out into the ring, that shown by Mr. James Brown, Cartleburn, Kilwinning, was judged most worthy of the first prize. Topsy was first at Ayr in her class, and received the premium as the largest and best quey in the yard. She has a wide forehead, mellow eye, fashionable horn, good rib, and is broad across the torr bones. A brown heifer shown by Mr. J. Carruthers, Lockerbie, was placed second. She is a magnificent animal all over the fore-end, but rather deficient behind. The yearling heifers were also very good as a class, and the first prize one, belonging to Mr. A. M'Dowall, Stranraer, is a beautiful specimen, with a nice pile of hair.

The shaggy Highland breed is not so largely represented as if the exhibition had been farther to the north-west. The display of cattle under the head of crosses and extra stock is rarely of much merit at the Highland Society, and this year proves no exception. In fact, there is little inducement to show in these classes, only a few medals being offered for prizes.

The horses for agricultural purposes are undoubtedly a very fine show; and in the distribution of the awards there was more than one surprise. Principal Williams, Edinburgh, accompanied the judges, and made a careful examination of all the competing horses, in order to decide whether they were sound or not before the awards were given.

There has seldom been a more magnificent display of Cheviots. Among more than forty entries we find Mr. Brydon, Moffat, once more at the top of the list for aged tups. He got three of the four tickets in this class, and deservedly, for animals bred by himself. As Mr. Brydon among Cheviots, so Mr. Archibald, Overshiel, Stow, among Blackfaced, is invincible. Mr. Archibald has for several years carried everything before him for blackfaced sheep at these shows, and this year he has repeated his former victories with animals of a high order of his own breeding. They are well woolled, bare-faced and bare-legged, with beautifully turned horns, and square bodies—all well-known characteristics of this hardy breed. Border Leicesters are a fair show, especially the shearing tups, which were mostly bred by the exhibitors. Leicesters are not nearly such a good show as they sometimes are under the auspices of the Highland Society. The first prize shearing tup was bred by Mr. Anslie, Costerton, and Mr. Lyal's sheep were reared by himself from stock he has had for some time. Mr. Gibson's long wools, bred by himself, are heavy, and much admired. Southdowns are not very numerous. The Altyre ones were home-bred, and Mr. Gordon's were also bred by the exhibitor. These gained several prizes at Aberdeen last week. Mr. Scot Skirving won with good ewes of his own breeding. The other classes of sheep were about an average show.

If there was overfeeding in the showyard, it was, as it often is, visible among pigs. Messrs. Ducker- ing's were most successful, and the large boar was a winner at Oxford.

JUDGES.

CATTLE.—Galloway: James Grierson, Brandelleys, Crockettford; Allan C. Pagan, Innergeldie, Comrie. Polled Angus: Robert Hector, Montrose; Alex. Paterson, Mulben, Keith. Shorthorn: L. C. Crisp, Hawkhill, Alwihk; Robert Hardie, Harrietfield, Kelso; John Unthank, Netherseales, Penrith. Ayrshire: Robert Guthrie, Crossburn, Troon; John Macadam, Blairover, Drymen; J. Waugh, St. John's Kirk, Biggar. Highland: Donald McIntyre, Tighnablair, Comrie; John Macfarlane, Faslane, Hlensburgh; Peter Robertson, Achilty, Dingwall. Fat stock: Alex. Young, Keir Mains, Dunblane; Mr. Hugh Muirhead, butcher, Dumfries.

HORSES.—Draught horses: James Cumbrough, Blairtunnock, Campsie; Robert Jack, North Gyle, Corstorphine; Alex. Wyllie, Bolton, Haddington. Veterinary inspector: Professor Williams, Edinburgh. Extra horses: John Curror, Comiston, Edinburgh; John Anstruther Thomson, of Charlton, Colinsburgh. Veterinary inspector: Robert Paterson, V.S., Dumfries.

SHEEP.—Cheviots: William Aitchison, Linhope, Hawick; Robert Paterson, Bighouse, Tyndrum; William Thompson, Belvalle, Coldstream. Blackfaced: David Foyer, Knowhead, Campsie; Donald McIntyre, Tighnablair, Comrie; Donald Stewart, Achalader, Tyndrum. Leicesters and Long-Woolled: Joseph Bell, Scalehill, Lazonybury, Penrith; Thomas Ferguson, Kinnochtry, Coupar-Angus; John Wilson, Edington Mains, Chrinside. Southdown and Short-Woolled: William Borthwick, Whitehaven Castle, Whitehaven; John H. Buckley, The Cottage, Loughborough.

SWINE.—Thomas D. Findlay, Easterhill, Glasgow; John McLaren, Millhill, Inchture.

POULTRY.—Thomas Raines, Bridgehaugh, Stirling; David Stratton, Edinburgh.

DAIRY PRODUCE.—R. A. Dickson, Dumfries; James Fulton, 47, Argyle-street, Glasgow; T. Gibson, Princes-street, Edinburgh.

IMPLEMENTS.—Professor Macquorn Rankine, honorary consulting engineer to the Society; John Gibson, Woolmet, chairman of the Society's Machinery Committee; Alex. Slight, Edinburgh, practical engineer to the Society; Professor Wilson, Edinburgh; Thomas Mlyn, Niddrie Mains, Liberton; John Munro, Fairnington, Kelso; Adam Curror, The Lec, Edinburgh; Robert Binnie, Seton Mains, Longniddry; William Ford, Hardengreen, Dalkeith; John Ord, of Muirhouseclaw, Nisbet, Kelso.

PRIZE LIST.

CATTLE.

GALLOWAYS.

Bulls calved before 1st January, 1868.—First prize, J. Fisher, Knells, Carlisle; second, Sir F. Ulric Graham, Bart., Longtown; third, J. Graham, Parcelstown, Westlinton, Carlisle; commended, J. Cunningham, Tarbreoch, Dalbeattie.

Bulls calved after 1st January, 1868.—First prize, J. Thomson, Blaikett, Crockettford, Dumfries; second, P. Morton, Laws Hall, Longtown; third, R. Jardine, Balgray, Lockerbie.

Bulls calved after 1st January, 1869.—First prize, T. Biggar, Chapelton, Dalbeattie; second and third, W. Kair, of Whitehaugh, New Castleton; commended, J. Cunningham, Tarbreoch, Dalbeattie.

Cows of any age.—First prize, J. Cunningham, Tarbreoch, Dalbeattie; second, W. and J. Shennan, Balg, Kirkcubright; third, J. Gifford, Torhousekie, Newton-Stewart; commended, T. Biggar, Chapelton, Dalbeattie.

Heifers calved after 1st January, 1868.—First, second, and third prizes, the Duke of Buccleuch and Queensberry, K.G., Tibbers, Thornhill.

Heifers calved after 1st January, 1869.—First prize, T. Biggar, Chapelton, Dalbeattie; second, J. Cunningham, Tarbreoch, Dalbeattie; third, R. Wallace, Langbarns, Kirkcubright.

POLLED ANGUS OR ABERDEEN.

Bulls calved before 1st January, 1869.—First prize, R. Walker, Portlithen, Aberdeen; second, G. Brown, Westerton, Fochabers; third, W. J. Tayler, Rothiemay House Huntly; commended, J. Scott, East Tulloch, Stonehaven.

Bulls calved after 1st January, 1868.—First prize, Sir G. Macpherson Grant of Ballindalloch, Bart., Ballindalloch; second, Colonel C. Fraser, of Castle Fraser, Aberdeen; third, W. D. Fordyce of Brucklay, M.P., Aberdeen; commended, J. Scott, East Tulloch, Stonehaven.

Bulls calved after 1st January, 1869.—First prize, G. Brown, Westerton, Fochabers; second, Col. C. Fraser of Castle Fraser; third, J. Scott, East Tulloch, Stonehaven; commended, T. Ferguson, Kinnochtry, Coupar-Angus.

Cows of any age.—First prize, Colonel C. Fraser of Castle Fraser, Aberdeen; second, Sir G. Macpherson Grant of Ballindalloch, Bart., Ballindalloch; third, J. Skinner, Drummin, Ballindalloch; commended, W. M'Combie of Easter Skene, Skene, Aberdeen.

Heifers calved after 1st January, 1868.—First prize, Sir G. Macpherson Grant of Ballindalloch, Bart., Ballindalloch; second and third, Colonel C. Fraser of Castle Fraser, Aberdeen; commended, Sir G. Macpherson Grant of Ballindalloch, Bart.

Heifers calved after 1st January, 1869.—First and third prizes, J. Skinner, Drummin, Ballindalloch; second, G. Brown, Westerton, Fochabers; commended, the Earl of Dunmore, Dunmore, Stirling.

SHORTHORNS.

Bulls calved before 1st January, 1868.—First prize, C. R. Saunders, Nunwick Hall, Penrith; second, J. Bruce, Burnside, Fochabers; third, Sir T. Buchan Hepburn of Smeaton, Bart., Prestonkirk; commended, T. Marshall, Howes, Annan.

Bulls calved after 1st January, 1868.—First prize, R. Bruce, Newton of Struthers, Forres; second, R. Binnie, Seton Mains, Longniddry; third, J. Beattie, Newbie House, Annan.

Bulls calved after 1st January, 1869.—First prize, J. Beattie, Newbie House, Annan; second, J. Bell, Fans, Earlston; third, Sir David Baird of Newbyth, Bart., Prestoukirk; commended, J. Johnstone, Halleaths, Lochmaben.

Cows of any age.—First prize, J. Beattie, Newbie House, Annan; second, J. Currie, Halkerston, Gorebridge; third, W. Lambert, Elvington Hall, Haydon Bridge; commended, S. Campbell, Kineller, Blackburn, Aberdeen.

Heifers calved after 1st January, 1868.—First prize, R. Scott, Maubeen, Elgin; second, J. Beattie, Newbie House, Annan; third, the Duke of Buccleuch and Queensberry, K.G., Dalkeith Park, Dalkeith.

Heifers calved after 1st January, 1869.—First prize, Lord Kinnaird, Rossie Priory, Inchture; second, J. Wilson, Woodhorn Manor, Morpeth; third and commended, J. Beattie, Newbie House, Annan.

AYRSHIRE.

Bulls calved before 1st January, 1868.—First prize, R. Wilson, Forehouse, Kilbarhan; second, W. Macadam, Kerpulloch, Balfron; third, J. Meikle, Seafield, Bathgate.

Bulls calved after 1st January, 1868.—First prize, T. Ballantyne, Netherton, East Kilbride; second, J. Fleming, Meadowbank Cottage, Strathaven; third, J. Parker, Broomlands, Irvine; commended, J. Hewetson, Achenbainzie, Thornhill.

Bulls calved after 1st January, 1869.—First prize, J. Meikle, Seafield, Bathgate; second, J. Parker, Broomlands, Irvine; third, D. C. Willison, Whitecleugh, Douglas; commended, G. Dunlop, Castle Farm, Stewarton.

Cows in-milk, calved before 1st January, 1867.—First prize, R. Wilson, Forehouse, Kilbarhan; second, J. Moffat, sen. and jun., Gateside, Kirkconnel; third and commended, J. Fleming, Meadowbank Cottage, Strathaven.

Cows in-milk, calved after 1st January, 1867.—First prize, J. Fleming, Meadowbank Cottage, Strathaven; second, R. Wilson, Forehouse, Kilbarhan; third, J. Mitchell, Lochingarroch, New Cunnock; commended, J. Meikle, Seafield, Bathgate.

Cows in-calf, of any age.—First prize, J. Fleming, Meadowbank Cottage, Strathaven; second, G. Dunlop, Castle Farm, Stewarton; third, R. Wilson, Forehouse, Kilbarhan; commended, R. M'Kean, Lumloch, Bishopbriggs.

Heifers calved after 1st January, 1868.—First prize, J. Brown, Cartleburn, Kilwinning; second, J. Carruthers, Heithal, Lockerbie; third, J. Fleming, Meadowbank Cottage, Strathaven; commended, A. Kerr, Castle Hill, Durrisdeer.

Heifers calved after 1st January, 1869.—First prize, A. M'Dowall, Auchtrahue, Stranraer; second, J. Meikle, Seafield, Bathgate; third, G. Dunlop, Castle Farm, Stewarton; commended, J. Fleming, Meadowbank Cottage, Strathaven.

HIGHLAND.

Bulls calved before 1st January, 1868.—D. M'Laren, Corrychrone, Callander; second, J. Stewart, Duntulm, Portree; third, J. M'Kechnie, jun., Glenmore, Oban; commended, J. Stewart, Duntulm, Portree.

Cows of any age.—First prize, the Earl of Seafield, Castle Grant, Grantown.

Heifers calved after 1st January, 1867.—First prize, J. Malcolm, Poltalloch, Callton Mor, Lochgilphead; second and third, J. Stewart, Duntulm, Portree; commended, J. Malcolm, of Poltalloch, Callton Mor, Lochgilphead.

Heifers calved after 1st January, 1868.—First and second prizes, J. Malcolm; third, the Earl Seafield, Castle Grant, Grantown; commended, J. Malcolm.

FAT STOCK.

Galloway oxen, calved after 1st January, 1867.—First prize, R. Jardine, of Castlemilk, M.P., Lockerbie; second, J. Routledge, Old Mill, Portwilliam, Wigtownshire; third, R. Jardine; commended, J. Millar, of Priestlands, Troqueer, Dumfries.

Galloway oxen, calved after 1st January, 1868.—First, second, third, and commended, T. Biggar, Chapelton, Dalbeattie.

Highland oxen calved after 1st January, 1866.—First and second prizes, J. Dalgleish, of Ardnamurchan, West Grange, Culross; third, G. Henderson, Garroch, Dumfries; commended, G. Henderson.

Highland oxen calved after 1st January, 1867.—First and second prizes, J. and W. Martin, Newmarket, Aberdeen.

Oxen of any other pure or cross breed calved after 1st January, 1867.—First prize, the Earl of Dunmore, Stirling; second, the Duke of Buccleuch and Queensberry, K.G., Tibbers, Thornhill.

Oxen of any other pure or cross breed calved after the 1st January, 1868.—First prize, R. Bruce, Newton of Struthers, Forres; second and third, J. Birkett, Broom Rigg, Ainstable, Penrith.

Galloway heifers calved after 1st January, 1867.—Prize, The Duke of Buccleuch and Queensberry, K.G., Tibbers, Thornhill.

Heifers of any other pure or cross breed calved after 1st January, 1867.—Prize, J. Brown, Cassielauds, Dumfries.

EXTRA CATTLE.

Galloway.—Commended, P. Dudgeon, Cargen, Dumfries. Alderney.—Commended, W. Ritchie, of Middleton, Gorebridge; Miss Hope Johnstone, of Annandale, Marchbank Wood, Moffat.

HORSES.

FOR AGRICULTURAL PURPOSES.

Stallions foaled before 1st January 1867.—First prize, Peter Crawford, Dumgoyack, Strathblane; second, David Riddell, Kilbowie, Dumtocher; third, William Moffat, Shirva, Kirkin-tulloch; commended, John Macdonald, Porterfield, Renfrew.

Entire colts foaled after 1st January, 1867.—First prize, Peter M'Robie, Sunnyside, Aberdeen; second, Sir William G. Gordon Cumming, of Alyre, Bart., Forres; third, Robert Brewster, Barnbeth, Bridge of Weir; commended, Samuel Clark, Manswrae, Kilbarhan.

Entire colts foaled after 1st January, 1868.—First prize, Robert M'Kean, Lumloch, Bishopbriggs; second, Archibald Yuill, 33, Cathedral Street, Glasgow; third, Samuel Clark, Manswrae, Kilbarhan; commended, Lawrence Drew, Merryton, Hamilton.

Entire colts foaled after 1st January, 1869.—First prize, David Riddell, Kilbowie, Dumtocher; second, John Robertson, West Mitchellton, Lochwinnoch; third, Robert Frederick, Drumflower, Glenluce; commended, James Nicol Fleming, of Knockdon, Maybole.

Mares (with foal at foot) foaled before 1st January, 1867.—First prize, Adam Smith, Stevenson Mains, Haddington; second, Thomas Marshall, Howes, Annan; commended, John Mitchell, Poundland, Dunscore.

Mares in foal, foaled before 1st January, 1867.—First prize, Sir William Stirling-Maxwell, of Keir, Bart., Dumblane; second, John Graham, Rosebank, Mid-Calder; third, Abram Kerr, Castlehill, Durrisdeer; commended, James Young, Niddrie, Winchburgh.

Fillies foaled after 1st January, 1867.—First prize, Robert M'Kean, Lumloch, Bishopbriggs; second, A. Buchanan, Garscadden Mains, New Kilpatrick; third, J. N. Fleming, of Knockdon, Maybole; commended, Lawrence Drew, Merryton, Hamilton.

Mares or geldings foaled before 1st January, 1865, suitable for field.—Prize, Michael Teenan, Lochside, Dumfries.

Mares or geldings foaled between 1st January, 1865, and 1st January, 1866, suitable for field.—First prize, James Gillespie, Craigie, Cramond; second, John J. M. Borthwick, Georgefield, Langholm; third, William Dickie, Balgerran Castle-Douglas.

Mares or geldings foaled before 1st January, 1866, suitable for carriage.—Prize, John Rithet, Pennersanghs, Ecclefechan.

Mares or geldings between 12 and 14 hands high.—First prize, Robert Scot Skirving, Camptoun, Drem; second, James Hewetson, Auchenbainzie, Thornhill; third, William Davidson, Sibbaldie Mills, Lockesbie; commended, John Smith, Bonshawsie, Ecclefechan.

Mares or geldings, 12 hands and under.—First prize, Patrick Dudgeon, of Cargen, Dumfries; second, Thomas Coultts Trotter, Champleurie, Linlithgow; third, Miss Scot Skirving, Camptoun; commended, William Ritchie, of Middleton, Gorebridge.

EXTRA HORSES.

Carriage or saddle.—Commended, William Francis Hunter Arundell, of Barjarg Tower, Dumfries; Major Fletcher, Keltoun House, Dumfries; John Richardson, Dryfesdale Gate, Lockerbie; Robert Wallace, Langbarns, Kirkcudbright.

Clydesdale.—Commended, David Kennedy, Newlands, Dumfries.

Fillies foaled after 1st January, 1868.—First prize, J. N. Fleming, of Knockdon, Maybole; second, Lawrence Drew, Merryton, Hamilton; third, Abram Kerr, Castlehill, Durrisdeer; commended, Robert C. M'Culloch, Kirkland of Longcastle, Kirkiner.

Fillies foaled after 1st January, 1869.—First prize, J. N. Fleming, of Knockdon, Maybole; second, Alexander H. M'Clean, Auchnel, Stranraer; third and commended, William and James Sheenan, Balig, Kirkcudbright.

EXTRA SECTIONS.

Draught geldings foaled before 1st January, 1866.—First prize, Archibald Johnston, Lochburn, Maryhill; second and third, the Duke of Buccleuch and Queensberry, K.G., Tibbers, Thornhill; commended, Thomas Gibbons, Burnfoot-on-Esk, Longtown.

Draught geldings foaled between 1st January, 1866, and 1st January, 1867.—Prize, The Duke of Buccleuch and Queensberry, K.G., Holestane, Thornhill.

Mares or geldings foaled before 1st January, 1865, suitable for field.—Prize, Michael Teenan, Lochside, Dumfries.

S H E E P.

CHEVIOT.

Tups above one shear.—First and second prizes, J. Brydon, Kinnelhead, Moffat; third, T. Elliot, Hindhope, Jedburgh; commended, J. Brydon, jun., Holm of Dalquhairn, New Galway.

Dimont or shearing tups.—First prize, J. Brydon, Kinnelhead, Moffat; second and third, T. Elliot, Hindhope, Jedburgh; commended, G. McCall, Burance, Lockerbie.

Ewes above one shear, with lambs.—First prize, J. Brydon, Kinnelhead, Moffat; second, T. Welsh, Ericstane, Moffat; third, T. Elliot, Hindhope, Jedburgh; commended, J. Archibald, Glengelt, Lauder.

Best lambs.—First prize, J. Archibald; second, J. Brydon. Shearing ewes or gimmers.—First prize, T. Elliot, Hindhope, Jedburgh; second, J. Brydon, Kinnelhead, Moffat; third, Sir G. G. Montgomery, Bart., M.P., Stobo Castle, Stobo; commended, T. C. Borthwick, Hoprig, Langholm.

BLACKFACED.

Tups above one shear.—First and second prizes, J. Archibald, Overshiels, Stow; third and commended, C. Howatson of Dornel, Daldorch House, Mauchline.

Dimont or shearing tups.—First and second prizes, J. Archibald, Overshiels, Stow; third, J. Moffat, senior and junior, Gateside, Kirkconnel, Saquhar; commended, C. Howatson of Dornel, Daldorch House, Mauchline.

Ewes above one shear, with lambs.—First prize, J. Archibald, Overshiels, Stow; second, J. Moffat, senior and junior, Gateside, Kirkconnel, Saquhar; third, J. Malcolm, Poltalloch, Callton Mor, Lochgiphead; commended, C. Howatson of Dornel, Daldorch House, Mauchline.

Lambs.—First prize, J. Archibald; second, J. Moffat.

BORDER LEICESTER.

Tups above one shear.—First prize, J. Lees, Marvingston, Haddington; second, J. Nisbet, Lambden, Greenlaw; third, W. Lambert, Elvington Hall, Haydon Bridge; commended, the Representatives of the late T. Watson, Esperston, Gorebridge.

Dimont or shearing tups.—First prize, G. Torrance, Sisterpath, Dunse; second, T. Simson, Blainsie, Lauder; third, J. Lees, Marvingston, Haddington; commended, J. Nisbet, Lambden, Greenlaw, Dunse.

Ewes above one shear.—First prize, G. Simson, Courthill, Kelso; second, J. and G. Laing, Wark, Coldstream; third, A. Smith, Castlemains, Gifford; commended, L. Drew, Merryton, Hamilton.

Shearing ewes or gimmers.—First prize, G. Torrance, Sisterpath, Dunse; second, G. Simson, Courthill, Kelso; third, J. Lees, Marvingston, Haddington; commended, The Marquis of Tweeddale, K.T., Yester, Haddington.

LEICESTER.

Tups above one shear.—First prize, T. Wilkin, Tinwald Downs, Dumfries; second, J. Mackenzie, Barnhill, Dumfries; third, C. Lyall, Old Montrose, Montrose; commended, J. Mackenzie, Barnhill, Dumfries.

Dimont or shearing tups.—First prize, A. Smith, Castlemains, Gifford; second, R. Jefferson, Preston Hows, Whitehaven; third, the Representatives of the late T. Watson, Esperston, Gorebridge; commended, R. Jefferson, Preston Hows, Whitehaven.

Ewes above one shear.—R. Jefferson, Preston Hows, Whitehaven.

Shearing ewes or gimmers.—First prize, R. Jefferson, Preston Hows, Whitehaven; second, C. Lyall, Old Montrose, Montrose.

LONG WOOLLED OTHER THAN LEICESTER.

Tups of any age.—First prize, T. Wilkin, Tinwald Downs,

Dumfries; second and third, J. Gibson, Woolmet, Dalkeith; commended, J. Gibson, Woolmet, Dalkeith.

Ewes of any age, or gimmers.—First prize, J. Gibson, Woolmet, Dalkeith; second, W. Normau, Hall Bank, Aspatia; third, J. B. Irving, Whitehill, Lockerbie.

SOUTHDOWN.

Tups of any age.—First and second prizes, Sir W. G. Gordon Cumming of Altyre, Bart., Forres; third and commended, J. Gordon, Parkhill, Aberdeen.

Ewes of any age, or gimmers.—First prize and commended, J. Gordon, Parkhill, Aberdeen; second and third, R. S. Skirving, Camptoun, Drem.

SHORT-WOOLLED OTHER THAN SOUTHDOWN.

Tups of any age.—First and second prizes, J. Gibson, Woolmet, Dalkeith; third and commended, The Earl of Strathmoore, Glamis Castle, Glamis.

Ewes of any age, or gimmers.—First and second prizes, The Earl of Strathmoore, Glamis Castle, Glamis; third and commended, J. Gibson, Woolmet, Dalkeith.

EXTRA SECTIONS.

Cheviot shearing wethers.—First prize, R. Jardine of Castlemilk, M.P., Lockerbie; second, T. Biggar, Chapelton, Dalbeattie; third, R. D. Barre Cuninghame of Hensol, Castle Douglas; commended, J. McGill, Rotchell, Dumfries.

Blackfaced wethers of any age.—First prize, The Earl of Strathmoore, Glamis Castle, Glamis; second, Sir W. Forbes, Bart., Craigeivar, Fintray House, Aberdeen; commended, G. Hewetson, Auchinleck, Newton-Stewart.

Half-bred hogs.—First prize, T. Biggar, Chapelton, Dalbeattie; second and third, R. Jardine of Castlemilk, M.P., Lockerbie.

EXTRA SHEEP.

Cheviot.—Commended, R. D. Barre Cuninghame of Hensol, Castle Douglas.

Blackfaced.—Commended, Miss Hope Johnstone of Annandale, Marchbank Wood, Moffat.

Cotswold.—Commended, J. Gibson, Woolmet, Dalkeith.

Shropshire.—Commended, The Earl of Strathmoore, Glamis Castle, Glamis.

Lincoln.—Commended, J. B. Irving of Whitehill, Lockerbie.

Cross-bred hogs.—First and third prizes, R. Jardine of Castlemilk, M.P., Lockerbie; second, J. McGill, Rotchell, Dumfries; commended, T. Biggar, Chapelton, Dalbeattie.

PIGS.

Boars, large breed.—First prize, R. E. Duckering and Sons, Northorpe, Kirton Lindsey; second, G. Mangles, Great Givendale, Ripon.

Boars, small breed.—First prize, G. Mangles; second, Sir W. Forbes of Craigeivar, Bart., Fintray House, Aberdeen; third, G. Mangles; commended, R. E. Duckering and Sons.

Sows, large breed.—Prize, R. E. Duckering and Sons.

Sows, small breed.—First prize, R. E. Duckering and Sons; second, G. Mangles; third, T. Wilkin, Tiwald Downs, Dumfries; commended, R. Philp, Royal Hotel, Bridge of Allan.

Pens of three pigs not exceeding eight months old, large breed.—First prize, R. E. Duckering and Sons; second, G. Mangles; third, N. Milne, Dryhope, Selkirk; commended, N. Milne.

Pens of three pigs not exceeding eight months old, small breed.—First prize, R. E. Duckering and Sons; second, G. Mangles; third, J. B. Story, jun., Milnhead, Dumfries; commended, R. Philp.

Extra pigs.—Commended, R. E. Duckering and Sons.

DAIRY PRODUCE.

Cured butter.—First prize, D. McFarlane, Balmuldy, Bishopbriggs; second, D. McLaren, Middleton, Strathblane, Milngavie; third, A. Lithgow, Drumtall, East Kilbride; commended, J. Wilson, Cntlins, Lockerbie.

Powdered Butter.—First prize, A. Lithgow; second, D. McLaren; third, D. McFarlane; commended, J. Wilson.

Fresh butter.—First prize, D. McLaren; second, J. Wilson; third, A. Lithgow; commended, the Duke of Buccleuch and Queensberry, K.G., Holestane, Thornhill.

Sweet milk cheese, Cheddar variety.—First prize, D. Frederick, High Ardwell, Dumbreldon, Stranraer; second, J. Cowper, Mid-Kelton, Castle Douglas; third, J. McClue, Enoch, Dinvin, Portpatrick; commended, A. McGuffie, Barhill, Stonekirk, Stranraer.

IMPLEMENTS.

SILVER MEDALS.—T. Corbett, Shrewsbury, for collection of farm implements; F. Morton and Co. (Limited), Liverpool, for collection of fencing; J. G. Rollins, London, for collection of pumps, hay-racks, &c.; Thornton, Currie, and Co., Edinburgh, for collection of articles of rubber manufacture; Waverley Manufacturing Company, Dalkeith, for sewing-machines; L. R. Mactaggart, Edinburgh, for horse-rake and mowers and reapers; J. Pringle, Edinburgh, Berwick, and Kelso, for collection of farm implements; Richmond and Chandler, Salford, Manchester, for collection of chaff-cutters; A. Boyd, Knockhardy, Ruthwell, Annan, for broadcast sowing-machine, and combined drill for sowing turnips; Brigham and Bickerton, Berwick-on-Tweed, for collection of reaping-machines; Carnthers and Allan, Dumfries, for portable sheep-dipping apparatus; J. Drummond, Cumnock, for collection of thrashing-machines, cheese presses, and card mills; G. Finlayson, Abroath, for sowing and reaping machines; Gibson and Tait, Fountainbridge, Edinburgh, for collection of gates, fencing; J. Gordon, Castle Douglas, for collection of ploughs; J. Gregory, South Shields, for single horse reaping-machine; Halliday and Thompson, Dumfries, for collection of reapers, grubbers, &c.; Haughton and Thompson, Carlisle, for collection of hay-rakes and corn-dressers; A. Jack and Sons, Maybole, for collection of mowers, reapers, and rollers; Kemp, Murray, and Nicholson, Stirling, for collection of reapers, mowers, grubbers, &c.; Lillie and Elder, Berwick-on-Tweed, for collection of reapers, mowers, grubbers, &c.; Lindsay and Anderson, Dumfries, for collection of fire-clay articles and designs for workmen's houses in brick; Mackay and Fairbairn, Sciennes, Edinburgh, for gates, fencing, &c.; A. and J. Main and Co., Glasgow, for collection of fencing, wire strainers, &c.; R. Mitchell and Son, Peterhead, for collection of ploughs; G. W. Murray and Co., Banff, for collection of ploughs, &c.; Piekley, Sims, and Co. (Limited), Leigh, Lancashire, for chaff-cutters, mowers and horse-rakes, &c.; T. Pirie and Co., Aberdeen, for collection of ploughs; B. Reid and Co., Aberdeen, for seed-drills, manure distributors, &c.; G. Sellar and Son, Huntly, for ploughs; T. Sheriff, Dunbar, for sowing-machines, &c.; W. Shivas, Old Machar, for ploughs; Leighe and Smith, London, for Garrard's rick-cover; A. Walker, Gorebridge, for reaping-machine; B. and S. Massey, Manchester, for steam-hammers; North British Rubber Company, Edinburgh, for improved rubber valve, and collection generally.

MEDIUM SILVER MEDALS.—T. Bradford and Co., Manchester and London, for collection of washing machines, &c.; F. Campbell, Dumfries, for collection of wagonettes and dogcarts; J. Dand, Carlisle, for collection of horse-shoes; De Leon and Andre, London, for collection of type machines; J. Fallas and Co., Dumfries, for collection of harness; E. Gray, Sheffield, for collection of cast and rolled steel implements; F. J. Heap, Manchester, for collection of earth closets; E. Hoatson, Dumfries, for collection of broughtams; W. W. Kennedy, Edinburgh, for collection of sewing and knitting machines; Kimball and Morton, Glasgow, for collection of sewing machines; T. Mackenzie and Sons, Cork, for collection of knife-grinders, &c.; J. C. Milligan, Castle Douglas, for collection of saddlery; W. Mitchell and Co., Manchester, for collection of knife-sharpeners; Moules Patent Earth Closet Company (Limited), London, for collection of earth commodes; D. Rae, Newton-Stewart, for collection of harness; J. Richardson, Carlisle, for collection of fanners and dressing machines; Shiels and McDonald, Edinburgh, for collection of carriages; W. Sinton, Jedburgh, for collection of churns; Ingham, Taylor, and Wheatley, Manchester, for collection of washing machines; J. and T. Young, Ayr, for collection of reapers, mowers, and engines; J. Hislop, Coatfield, Haddington, for wagonette and Whitechapel cart; T. Hunter, Maybole, for Armstrong's harrows; W. McCormick, Dumfries, for steel moulds; G. T. Stirling, for Whitechapel cart and wagonette; J. Baker, Wisbeach, Cambridgeshire, for collection of fanners; Barr and M'Janet, Ardrossan, for collection of fire-clay articles; P. Brown, Pencaitland, Frauent, for reaping machine; W. and A. Douglas, Stranraer, for reaping machine; H. Field and Son, Glasgow, for collection of wringers, boilers, and freezers; J. Glover, Gelston, Castle-Douglas, for collection of sheep-bars and sowing machine; A. Guthrie, Craigo, Montrose, for ploughs; A. Hogarth, Kelso, for reaping machines; D. Hunter, Dumfries, for thrashing machines; M. Jack, Cra-

mond, for collection of spades, &c.; H. and G. Kearsley, Ripon, for reaping machines; J. Kerr, Dumfries, for farm-cart and sowing-machine, also for collection of ploughs and sowing machine. Law, Duncan, and Co., Shettleston, Glasgow, for collection of farm implements; J. B. A. M'Kinnel, Dumfries, for collection, and especially for patent turnip-cutters.

MINOR SILVER MEDALS.—J. R. Stiles, London, for collection of refrigerators; W. Hudspeth, Haltwhistle, Northumberland, for earthenware pipes; W. Carson, Carlisle, for potato separator; T. M'Cririck, Cumnock, for churning-machines; J. M'Kie, Woodhead, Penpont, Thornhill, for double mould plough; E. Martin, Closeburn, Thornhill, for collection of swing ploughs and harrows; C. Rigg and Son, Saughar, for set of drainage tools; T. Rogerson, Loehmaben, for harrows and grubber; J. Watt, Biggar, for broadcast sowing-machine; D. Williamson, Cample Bridge, Thornhill, for carts and pulper; Wingate and Lowe, Alloa, for collection of meat-coolers and turnip-slicers; W. Milligan, Dumfries, for collection of plants and flowers; Little and Ballantyne, Carlisle, for collection of agricultural seeds, plants, &c.; J. Dickson and Sons, Edinburgh, for seeds and plants; T. H. Oney, Dumfries, for collection of seeds and plants.

RECOMMENDED FOR TRIAL.—R. L. Mactaggart, Edinburgh, for self-delivery reaper, mowing-machine, self-acting horse-rake, and combined reaper and mower; R. Hornsby and Sons, Grantham, for governor self-raker reaper; G. M'Cartney and Co., Cumnock, for three or four horse-power thrashing-machine.

THE DINNER

took place on Wednesday evening. The EARL OF DALKEITH, who presided, said he might refer to the fact that this was the third best show that had taken place under the auspices of the Society. The show in Glasgow in 1857 was the largest, and the Edinburgh Show was next, Dumfries being the third best as regarded stock, and second as regarded implements. He thought they might congratulate themselves on this position of matters. In regard to the implement department, which was very useful to agriculturists, it was unfortunate that the space allotted to implements was not a little more, but by the judicious arrangements which had been made by the secretary, visitors had been enabled to see the implements pretty well. With reference to the stock, he must call attention to the Galloways, Shorthorns, and Ayrshires, which were very good, and superior to many that had been seen at previous shows. The sheep, too, were particularly good, while the Border Leicesters and Cheviots had never been excelled. The draught horses were very superior, and there were a great many of them. The saddle and other horses hardly came up to the mark; but he thought the country could produce better.

Mr. JACOB WILSON, in reply for the National Agricultural Societies of England and Ireland, recommended some sort of international show every ten years, in order that Scotch and English breeders and farmers might interchange more thoroughly and effectively their ideas on feeding and breeding, and farm cultivation. He and other agriculturists in England had looked forward to the report of the Highland Society's Committee on steam-cultivation in East-Lothian; and he was sorry at the terms of the report, because he knew that steam-cultivation had received an impetus from Scotland, if not from the county of Dumfries itself. He hoped that many Scotch makers would come forward and compete next year for the £1,000 which the Royal Society offered for the best system of steam-cultivation.

The Duke of Buccleuch said that the fact of his being a successful competitor was no fault of his own. Why did not any of them beat him? Never venture, never win. They could never tell the value of their stock until it was measured with others. He had shown stock, and had been beaten, and had accepted the defeat because it was deserved. He agreed with Major Walker that breeders did not show stock in order to get prizes, but for the purpose of exhibiting what they had, and what really was the stock of the country. Many people nowadays were going in for crosses. They were profitable and seductive. He was afraid that by going so much into crossing they would have nothing else, and he wanted to keep up the pure blood. If crossing were carried too far, animals would be deteriorated. They would get the weaknesses of all, without the strength and purity of any one of them,

What he wanted to do was to keep up the purity of the breeds. He could not farm the whole of his land, and he was compelled to let it out to those excellent agriculturists who had now farmed the land for years. They had grown upon this, and he might say that his tenantry and himself were like one family. What hurt one hurt the others, and what rejoiced one was a source of joy to the others. Long might they continue so! He was not going to humbug them, however, and say "You are the finest set of fellows in the world," for that was as much as to say that the tenantry of Scotland were perfect.

That was the *argumentum in absurdum*. Neither were they the best agriculturists in the world. No doubt they had to contend against the climate; but, by the way, he thought too much had been said of the climate. It was an excuse for everything. For instance, a farmer allowed his hay to rot, and it was the climate; he soaked his potatoes and turnips, and the climate again was to blame; he forgot to plough at the proper time, and the climate was blamed for that folly also. He might say that when he got to the south of Scotland he was proud of the tenantry.

BRIDLINGTON AGRICULTURAL SOCIETY.

This Society, one of the oldest of its class in Yorkshire, continues successfully the sphere of its operations. The thirty-fifth anniversary was celebrated on Wednesday, July 27, and the show was perfectly successful. The weather was fine, the attendance of company numerous, and the display of stock of a superior description.

The entry of cattle was double that of last year, and the sheep and pigs, although numerically small, were yet above average merit; while the class for hackney mares or geldings of any age brought no less than twenty-one animals to the post.

The following were judges: For sheep, cattle, pigs, and agricultural horses—W. Bartholomew, Waddington Heath, Lincoln; John Clark, North Ferriby, Brough; and Thomas Dodds, Mount Pleasant, Wakefield. For hunting, coaching, and roadster horses—Jacob Smith, Humberston, Borough-bridge; John Wood, Market Overton, Oakham; and Francis Jones, Cheltenham.

PRIZE LIST.

E.E.P.

Shearling ram, E. Riley, Kipling Cotes Farm, Beverley; second, E. Rily.

Three shearling rams, E. Riley; second, J. J. Simpson, Pilmour House, Hunmanby.

Aged ram, E. Riley; second, G. Bourdass, Bridlington.

Five Shearling gimmers, E. Riley.

Fat wether, ewe or gimmer, F. Day, Carnaby

EXTRA STOCK.—G. Taylor, Sewerby Cottage, Bridlington, for ten cross-bred sheep.

SHORTHORNS.

Two years old or aged bull, F. C. and E. G. Warren, Manor Farm, Dunnington, Siggleshorpe; second, T. Franks, Fylingdales, for Hopewell.

Yearling bull, W. Linton, Sheriff Hutton, for Lord Irwin, he also taking the cup for the best animal in the Shorthorn classes; second, J. S. Jordan, Elmswell, for Nestor.

Cow in calf or milk, W. Linton; second, F. Joreau's executors, Eastburn.

Two years old heifer, Rev. Y. Lloyd-Greame, Sewerby House, Bridlington.

Yearling heifer, T. Hornby, Flotmanby; second, G. Taylor.

Heifer calf under twelve months old, W. Linton; second, T. Hornby.

Fat ox of any age, G. Taylor.

Fat cow or heifer of any age, Rev. Y. Lloyd-Greame.

HORSES.

Hunting mare and foal, G. C. Jarratt, Harpham; second, J. Smith, Marton Lodge, Bridlington.

Three years old hunting gelding, Sir G. Cholmley, Boynton; second, R. Wise, Sewerby Field, Bridlington.

Two years old hunting gelding or filly, T. Woodcock, Tibthorpe; second, F. Leighton, Osgodby.

One year old hunting gelding or filly, T. Cranswick, Rudston; second, G. C. Jarratt.

Three years old hunting filly, Sir G. Cholmley; second, J. S. Darrell, West Ayton.

Coaching mare and foal, J. Smith; second, J. Johnson, Brigham.

Two years old coaching gelding or filly, W. Coleman, Fraisthorpe; second, J. Taylor, jun., Burton Agnes.

One year old coaching gelding or filly, Mr. Piercy, Garton, Driffild; second, M. Rounding, Fraisthorpe.

Three years old coaching filly, J. Johnson; second, R. Lowish, Haisthorpe.

Hackney mare and foal, W. Major, Sledmere; second, F. Jordan's executors.

Two years old hackney gelding or filly, T. B. Wilson, Folkton; second, H. Crompton, Rnston Parva.

Mare and foal for agricultural purposes, Mrs. Smith, Bempton; second, W. Milner, Lissett.

Horse or mare for agricultural purposes, G. Angus, Beeford Grange; second, H. C. Babington, Bridlington.

Two years old agricultural gelding or filly, G. Angus; second, J. Smith.

One year old agricultural gelding or filly, R. Davison, Bempton.

Pair of horses, either sex, for agricultural purposes, J. Simpson.

Nag or mare pony, not exceeding 12 hands high, W. F. Watkinson, Hull; second, J. W. Jordan, North Burton.

Stallion for hunters, H. S. Constable, Wassand; second, W. Shaw, Skipton.

Stallion for roadsters, T. Brown, Butterwick; second, P. Triffitt, Holme-on-Spalding Moor.

Stallion for coach horses, J. Stockdale, Skerne; second, W. Ilance, Garton.

Stallion for agricultural purposes, W. Simpkin, Burton Agnes; second, J. Johnson, Bempton.

Four years old hunting mare or gelding, W. Myers, Ulrome; second, W. Stephenson, Cottingham.

SPECIAL PRIZES.

A silver cup, for the best hunting mare or gelding four years old or upwards, Henry Jewison, Raisthorpe; second, J. S. Darrell, West Ayton.

A silver cup, for the best three years old coaching gelding, R. Omler, Park House, Genbling; second, J. Thompson, Mount Pleasant, Bishop Burton.

A silver cup, for the best hackney mare or gelding of any age, J. Robson, Rose Villa, Old Malton; second, W. Stephenson, Cottingham.

A silver cup, for the best hunting mare or gelding four years old and upwards, J. S. Darrell; second, J. Robson.

A silver cup, for ponies not exceeding 14 hands high, W. Simpkin, Burton Agnes; second, Mr. Medcalf, Bridlington.

PIGS.

Boar, large breed, G. Chapman, Seamer; second, G. Chapman.

Sow or gilt, large breed, J. Thompson, Seamer; second, G. Chapman.

Boar, middle breed, G. Chapman; second, G. Chapman.

Sow or gilt, middle breed, G. Chapman; second, G. Chapman.

Cottager's pig, R. Atkinson, Seamer.

EXTRA STOCK.—J. Thompson, Seamer.

THE YORKSHIRE AGRICULTURAL SOCIETY.
MEETING AT WAKEFIELD.

The horse, as the character of our reports will serve to show, is becoming more and more the hero of these occasions; as, indeed, at the North Country meetings a very large proportion of the visitors would seem to have no other object in view. The talk of people as they journey to and fro—for no one who could possibly avoid it ever thought of staying in Wakefield—turns almost altogether on the four-year-old class or the entry for the Badsworth Hunt Cup. Nor did the disposition of the show-ground serve very materially to correct this propensity. So admirably arranged, as usual, was the trial ring, that men settled themselves by its side forthwith, or took their seats in the Stand, resolved not to have their attention in any way distracted from the great business of the day. There was, to be sure, in an adjoining inclosure a very creditable display, as times go, of Shorthorn cattle, but it would be almost impossible to convey an idea of how little interest was taken in this section of the proceedings. Some dozen or two of listless-looking gentlemen watched the wards, tolerably proof against the attractions of the other circle; but even these spoke more of stock just shipped for Cauada than of the animals paraded before them. Further afield there were Leicesters and Lincolns, and big whites and Berkshires, but beyond an anxious exhibitor or so, it is doubtful whether anybody ever inspected such "kind of cattle," unless he had lost his way on a run through the horse boxes. He must have been a very keen hand who faced the opposite hill where the implement stands were arranged; as, in fact, however good the intention, he would most probably be stopped in the outset by a glimpse of the Captain on Borderer, or of his "very faithful servant" vainly endeavouring to get Don Juan's head into its proper place.

As usual the shedding and boxes were capital, for horses cannot be better cared for than at the Yorkshire Agricultural Society's meeting. But those who have to get these up go to work in a very different way, as regards £ s. d., to that of the Royal Society's people. For at Beverley last year it cost this Society £356 13s. 9d. for boxes and stalls for 359 horses, while the Royal Society in the same year at Manchester pay £1,185 9s. 1d. for housing 396 entries! Verily there is nothing easier than squandering money; but surely a £100 or two may be spared out of this as prizes for thorough-bred stallions and hunters without stinting the workmen, during the erection, of iced champagne or any other delicacy of the season. The Wakefield horse ring might have been better going with a little tan, as it was very slippery in places, while there was not quite the care paid to the numbering of the horses as we have seen, for several came in without any number, and others only ticketed on one side the head, while many numbers were flapping about like the direction on a flying hamper, and others so crumpled as to be quite illegible. In other respects everything was in the customary apple-pie order. Instead of two sets of judges going to work on the first day, as of yore, there was only one, as the agricultural bench did not commence their duties until the Thursday. As the public pay more than double on the first day, we think they should be shown as much as could be, time being precious, for many a familiar show-going face that was in the stand or round the ring on the Wednesday was not

to be met with on the Thursday. As a show, for Yorkshire even, it was good, but not so grand in many classes as we have seen. For instance, there have been better thorough-bred, coaching and roadster stallions, and hunting and roadster brood mares, and we think a better lot of hunters at Beverley. We are not judging them by the winner of the Badsworth prize, as if he were the best they were poor indeed, for his action in his slow paces is that of a hack or machiner. In a gig or dog cart we will allow he would be grand, but no one would cry shame on seeing him between the shafts, as in his gallop he labours and does not get his forelegs away, but goes as round as a Dutch cheese—action that looks more like turning a churn than living with hounds. We have had on Oliver Cromwell's helmet, and slept in the same bed as Queen Elizabeth, as well as shaken hands with the man that refused two thousand guineas for a cow, but never did we dream of travelling from London to Wakefield to see a neat gig horse awarded a hundred guinea hunter prize. "The Cap'un is getting fond of his mount, and you bay will have the prize, if the auld 'un ever tires of riding him round," says one. "Ah! he is a good 'un is you bay. You cannot stick a bad 'un into Master Sammy," rejoins another. Then the Captain mounts horse after horse, and our neighbours prophesy each will have the "prize," for the Captain is as fond of a ride as a lad on a round-about, and to these interminable gyrations smacking of the whirlpool, are we indebted for the extraordinary verdict given in for the Badsworth Hunt cup, as we think such doings would muddle the heads of Minos, Rhadamanthus, and Eacus, saying nothing of any ordinary men. It is a grand class, this for the cup, with at least fifty horses, and many very taking ones as hunters. The judges have a difficult task before them, and go boldly to work by drafting at one fell swoop more than half of them, though some of the drafted strike us as looking more like hunters than several left in; but such is the chance of war. Round they go again, and ten more have got their tickets of leave, that neat quiet horseman, Mr Jacob Smith, trying all he knows, with his fine hands, to win the eye of a judge; but it's no go, and out he goes as their whipper-in, without creating a "sensation," although mounted on a lofty chesnut of that name. Six more are on the retiring list, Mr. Jewison's chesnut mare Marigold being one of them, and as good a galloper as any of the fifty. Now eight are left in to fight it out: Loiterer, Julius, Cowthorpe, Don Juan, Young Artillery, Brian Boru, The Knight, and Chorister. The Captain is up again, on the powerful-framed fiddle-headed Knight, of Drillfield and Bridlington renown, and now Mr. Elliott, a good horseman, jumps up, but never did we see any man try so hard to be on bad terms with his mounts. As there are whispers as to the Knight's wind, a rare dressing the poor fiddle-headed fellow comes in for. It was an unseemly sight in a show-ring, and such things ought to be left to the veterinarian, as it must be tantalizing in the extreme for an owner to see his horse kicked, thumped, jagged, and jerked about as the Knight was. Now they are on to Julius, by Orpheus, not unknown to the show-yard, but more often in the entries than in the flesh. Here he comes going with his nose poked out, more like a crocodile than a hunter, and his white heels never under him; in fact, he is a washy sort of loose framed horse, that

when extended, looking at his nose and heels, if it be possible to take them in at once, seems as long as the Great Eastern, and to take almost as much time to wear round. Then Juan, a better framed nag, although we fancied they both went gingerly behind, more especially after standing still, is all wrong in his neck, and as his head is not in the right place, in form he cannot be a hunter, as we have said from the day he was first shown. He is very well steered by "Auld Bob." The white-legged bay goes all round like a hunter, and if Loiterer could move like the second at Manchester we would sing his praises all the day long, for the Young Artillery horse wants just a dash more blood; but, nevertheless, he is a most useful one, and, no doubt about it, the best goer of the eight, while many think he will be there or thereabouts, although to give Chorister, the second at Ripon, his due, the judges never mounted him. The Captain appears to be over sweet on the Young Artillery horse, and prevails on Mr. Elliott to get up, who commences with one of his ferocious jerks, to see if he can pull the horse off his legs, we suppose, or try if his mouth is of iron, brass, or adamantite rock. The lengthy short-legged powerful Cowthorpe, though a bit shelly, a loose goer, and of a bad colour, is a big-framed growing animal, in his fifth year, that we shall expect to see again in better form. Brian Boru the judges don't take to, or send along like his owner, who rides sixteen stone. But it's over, and Mr. Booth leads him away something after the fashion Sam Chifney did Young Rowland after a Derby of our younger days. Colonel Markham's old grey was of a rare mould, but we have not space to give a word for all the good looking ones or prize horses we ticked, and as we could not catch the numbers of some it would be unfair, but we have no doubt another set of judges might select half-a-dozen or more among them and give quite as much satisfaction as those put on the prize list.

With nineteen in the flesh out of an entry of twenty-six, the four-year-olds made a very good show, including Comrade and Borderer, the first and second at Islington, and Mr. Paddison's bay by Epicurean, who beat Comrade and Borderer at Sleaford, Comrade playing second and Borderer only coming for a commendation. The Islington horses are now the property of the Master of the Rufford, and Borderer here turns the tables on both his rivals, as we described him when second at Islington as "a very good-looking, hunting-like horse of Mr. Booth's," since when he has greatly improved, while Comrade we described as more of a charger. Still the Sleaford bench reward the charger as a hunter, and only commended Borderer, while here Comrade is drafted, not that that matters much, as with him goes a thorough-bred, hunting-like horse, with great thighs, that the judges do not condescend to look at, although as slashing a goer as ever came into a show-yard. This is Goucaway, by Cape Flyaway, and the property of Lord Feversham. Then Sir George Cholmley's Brunswick looked like a used-up swell that never had any life or go in him; while Mr. Kendall's Falcon could move, though raw and common-looking, and he was honoured by being kept in by the judges, for which act of courtesy Falcon had a great inclination to treat them as four-corner pins, and attempted several swoops among them. The third, with a name now getting as common as Albert, is a big lazy, deep-topped, bad shouldered horse and no mover, that looks like laying on you if he fell, so that you would "always find a protector in Lothair," as they say in the play. It may be added, that on the objection of Mr. Clarke, of Howden, Comrade was disqualified by the Sleaford Veterinarian as lame, although two at least of the Judges are ready to say he was not. The first and second four-year-old fillies were fair samples, the first having more power and the second the best action; while the

third of Mr. Robson's had not much form, and Mr. Wellitt's Colleen was remarkable for great bargey buttocks besides going wide behind. Dandy, a gentlemanly-looking three-year-old, by Angelus, has a little too much light under him towards the stifle; but the second was a deep-framed one; and the third a powerful-looking colt, but lacking quality, and a trifle deficient in bone below the knee for his grand top. The three-year-old fillies were poor, and only half a dozen of them, the third, Miss Annie, having taken a second at Thirsk. The two-year-olds were a trifle better, Portland being a lathy colt, with breed; and Hugh, by Strathern, of fair form; while Tom Benact was a rather leggy brown, showing blood, but shortish in his quarters. The celebrated Go-ahead was again in the fore in hunting brood mares; but Heliotrope, who we said when third at Oxford and second at Sleaford had a slice too much of the coacher in her, was unnoticed. The second and third were nice mares, the third falling off a trifle in her quarters, but she has great quality with a nice forehead. The thoroughbred stallions, always an interesting class, are not quite up to Yorkshire form, but still comprise Stampedo by Alarm, Grand Master by The Great Unknown, Volturco by Codrington, The Provost by Dundee, Bertie by Newminster, Schuloff by The Cossack, Laughing Stock by Stockwell, Sincerity by Red Hart, Poynton by Poynton, Precceptor by Rataplan, Rowsham by King Tom, Spendthrift by Wild Dayrell, and Ancient Briton by Cothelstone. Cragune, a grey coachy-looking animal was also in the class; but Redoubt, and Vansittart by Young Melbourne were absentees. The contest was between Stampedo, Sincerity, Laughing Stock, and Grand Master. The first on the list is Stampedo, with the white face of his sire, and a winner, if we recollect, of the Northamptonshire Stakes, that we afterwards saw sold at the old Tattersall's, accompanied by his dam and an Irish Birdcatcher mare that went to Eltham. He was then in training, and Captain Skipworth now puts away his long tail with his stick to show Mr. Elliott and Mr. Parrington—own brother to Secretary who is acting for the absentee, Mr. Milne—his curby hocks, which when in training were fearfully blemished. But he is not the first that could go with such infirmities for Master Frederic a steeplechaser and hurdle racer, about whom there was such a row, was one of many, we recollect, with much worse hocks than Stampedo, that could go through dirt like a Ransome or a Howard, as could that wiry gelding British Yeoman, that Jem Mason loved to ride, and that, like Stampedo, inherited none of the best hocks from his dam. But these are exceptions to the legion of beautifully-made horses which, as with Achilles, are invulnerable everywhere but just in that most important part. If it were not for his hocks, the white-faced brown, with his quality, must have won in a canter, what with his grand, lengthy, muscular frame, good short limbs, and really capital foreleg-action—so different from Laughing Stock's fibbing pump-handle work, which is all very well when running up and down a market-place as a bait for a London dealer. Sincerity looked better than at Oxford, but wants a little more quality; as we quite agree with transposing the Oxford verdict, and putting him before Laughing Stock, a horse that we do not believe in at all. The nicely-formed Grand Master we have seen in better company take a higher place; but he goes more hobbling than ever. Then Sir George Cholmley appears to have a fondness for wide, straddling hind-leg-action and weak, curby hocks, as he is now the owner of the otherwise good-looking and taking Volturco. There is something taking about old Schuloff, while Bertie looks more like getting racing galloways than weight-carrying hunters, and Cape Flyaway has some quality and good points, if heavy at the points of his shoulders, and with his tail not set

on but tucked into his rump like that of a rocking-horse. Poynton is a coach-horse; Wrosham has bad ankles, and we are not in love with him; while the wiry-looking Ancient Briton is also bad in his ankles, and with his light, hollow-backed middle and length of leg, anything but a show-horse. The others rather weakened the class than strengthened it, except in numbers. On the whole, hocks and all, we go with the verdict.

There were only eight coaching stallions to twenty-one at Beverley last year; but then the stylish-looking well-known Emperor, who was second there, was here, without doubt, at the head of the poll; while the third at Beverley, Tramp, took the same position here, having to make room for Richmond, a very level good-limbed promising three-year-old of Mr. Holmes', out of his old mare Betsy, who took the all-England prize at Battersea. The mares only mustered four, the first being a nicely-formed one, and a winner of a few prizes; while the second was of a good mould on a short leg. There were several capital specimens in the two-and-three-year-old coaching geldings and fillies; in fact, the bad were scarce, but then they did not muster more than sixteen in all. The roadsters, in force, were about half as strong as at Beverley, there being only ten stallions to seventeen there, and a horse, Lord Derby, unnoticed at Beverley, was placed first here. He is of fair form, a little over at his shoulder-point, and back at his knees; but he can move. Shepherd F. Knapp, the well-known American trotter, who now stands at Myton Hall, was thought by the Beverley bench to be the best in a much superior lot; a verdict that many coincided with, but here he was scarcely noticed! He is a horse that wants showing, and when the Major purchased him we think he should have bargained for "Mac" also, as if he be not properly shown, it is something like having Punch and expecting him to be funny without engaging the gentleman who does the hoity-toity business. Commander-in-Chief is a big brown three-year-old, on a short leg, that struck us as being too large for the purpose, and deficient of roadster character; and we were better pleased with the size, form, and action of Blazeaway, who went all round; or Bay President from Malton, a horse of quality, form, and action, who has that peculiar rattling or chuckling noise in the sheath when run up and down. In a class of four our great aversion, Hammering Polly from Sledmere, was the chosen.

The three-year-old roadster, hackney, or pony geldings and fillies were an ordinary lot, that one may get a sight of every day, as the ploughman said of the vegetables when handing up his plate to the squire for the fourth helping of beef. "Don't you eat vegetables, John?" "No, zur; I can get a sight of them every day in the week." In a very good class Mr. Hornsby's grand old mare Bada had to play second to Fugleman, a lengthy strong cob in roadsters, up to fourteen stone; while in those up to twelve stone, the neat lady-like mare Marguerite, with park action, won; the second being a powerful cob of Mr. Holmes', that with another dash of blood would be more valuable, though still a very useful animal; the third was a nice one, and Mr. Hornsby's, Odd Trick, was anything but a bad one. There was a good class of ponies under fourteen and a-half, and three little things under twelve and a-half hands.

Of agricultural horses there was a good display, commencing with a grand class of eighteen stallions. Lincolnshire, a one-eared horse and a great prize-taker in Yorkshire, that beat Honest Tom at Beverley last year, being quite lost and almost appearing as a pony among them. But certainly it struck us that these horses, though active, were more dray horses than farm horses. The first, Nonsuch, has as good a head as was ever put on a cart horse, for he has less of the dray horse than the

others and a grand forehead, with a capital middle on good short limbs, and if there be anything to attract the eye from his beautiful even form it is a rather goosey rump. He beat Lincolnshire at Thirk the other day. The second, Clydesdale Tom, is a deep, thick-set, short-legged horse, not a lively mover, especially behind; while the third, Active, was a powerful handsome roan.

In the three-year-olds Royal Duchess, who we noticed in our Sleaford and Oxford report was first, the second being an active filly of fair form but rather high on the leg, while Bonny is a very powerful lass. In a capital mixed class of four-year-old fillies and geldings, with some really handsome animals among them, Diamond, a winner we were told of a hundred prizes, and a deep, lengthy, short-legged black mare, quite a model, that the most particular would scarcely wish to alter, went to the fore as active as a kitten; followed by Warwick, a beautifully-made chestnut, whom we have seen before, and Mr. Brierley had also a very handsome grey, Sensation, who moved as light as a coach horse, and that we noticed at Birmingham, is a little back at the knee and deficient of bone. The third, Nancy, another grey, is a very good-looking one as well as a mover, but injured about one of her hocks. There was a small but good class of black brood mares and foals—real Yorkshire—with one chestnut among them, viz., Mr. Statter's Fanuy, by Lincolnshire, that was first at Beverley last year, but now unnoticed. Mr. Hutchinson's Darling was a model, if all right.

As times go we have said the Wakefield was a creditable show of Shorthorns, but no doubt it is a weak year, in the way at least of exhibition stock; while there are authorities who maintain that although we breed more we do not breed such grand specimens of the Durham as we did. Or put it in another light, the absence of such a name as that of Mr. Booth from the lists makes a great hole that is not easily filled up; although clearly the best show Shorthorn of his time was at Wakefield. This is Mr. Brierley's Bolivar, who came on from Oxford and Sleaford in rare bloom, and in turn took the first prize of his class, another prize as the best of all the bulls, and the £50 cup as the best Shorthorn in any of the classes. He had, in truth, but one competitor, and this was Queen of Rosalea for the cup, a cow that at six years old is still improving in the most marvellous manner, tining rather than growing coarse as she once threatened to, and now presenting a very handsome if not actually elegant appearance. But then Mr. Ward is a most wonderful manager. He is now out with his troop for the season, bound still further north, and the more they travel the more they are knocked about, only all the better do they look; so that there must be something very sound in the system. Thus we never fancied Bythis so much as we did at Wakefield, for he really seems to have got more level in the interim, although of course the Oxford "mistake" was corrected at Sleaford, where three such men as Mr. Drewry, Mr. Sanday, and Mr. Charles Howard, placed Heydon Duke before Bythis. But the Yorkshire Society once more afforded a Court of Appeal, more particularly as the three Royal prize yearlings were all sent on, and a fresh bench placed these precisely as they had finished at Oxford—that is, Bythis *first*, Lord Irwin *second*, and Heydon Duke *third*. It should be stated, moreover, that neither Mr. Atkinson nor Mr. Parker had previously seen any of these animals, while the third judge, Mr. George Garne, who knew the three well enough, kept his opinions to himself until his colleagues had declared, and then the decision was found to be unanimous. Nor are we disposed to quarrel with this. As our Sleaford report of last week said, "travelling does not seem to agree with Heydon Duke, or his trainer has not the knack of keeping him in condition," and never certainly

has a beast gone to pieces so rapidly. He showed more faults at Wakefield than we should have imagined he could have developed; he has lost his flesh, fallen terribly flat in his sides, got bare above, and but for a certain style and quality could scarcely have finished where he did. We always liked Mr. Linton's white, a very neat young bull that has only to thicken to grow into the best of the three yet. At the same time, we are quite willing to allow that the Oxford "mistake" is now by no means so glaring as it then appeared to be, while by public appraisal the merits of the two bulls are so far exactly equal. Thus at Saffron Walden, Heydon Duke beat Bythis, at Oxford Bythis beat Heydon Duke, at Sleaford Heydon Duke beat Bythis, and at Wakefield Bythis beat Heydon Duke. Never was there a finer illustration of turn and about; but it should end here, at least for the present, and the Duke be booked back for Essex by the next Express up.

In the old class Lord St. Leouards from Mr. Fawkes' herd, a good deep bull of fine character, but not very level, beat Bolivar's half-brother Charlie for second, although the red has grown into a very handsome beast forward, if he fails behind, standing very in and bad on his hocks. The judges added no commendation in the return for this class of five only, and so left out Robin, a stylish but slack bull that was put above Charlie at the Lincolnshire show in the previous week. With nice discrimination the council gave the smallest money prize for bulls to the worst lot, that of two-year-olds, where the very moderate Baron Hubback won, although we infinitely prefer the second, Prince Leopold, who is fulfilling all his early promise, and growing into a straight, lengthy, broad bull, combining some fashion with much use. With Mr. Stratton out of the way the bull calves were very much in the same order as at Oxford, Mr. Dudding's "lengthy and stylish" Robin Hood again winning, and the Oxford Butterflies having the next best of it. Then Lady Ann was again next to Queen of Rosalea; but Lady's Slipper, an extraordinary cow at eleven years old, who has preserved much of her shape, has a great bag, and is again in-calf, was put out by a plain, paunchy, white heifer, very narrow and mean behind—the worst decision of the day; although the judges had the grace to highly commend Lady's Slipper and a couple of nice cows from Mr. Bradburn's herd. The Double Butterfly three-year-old, or two off, does not look like training on; and Windsor's Butterfly, her second, a coarse heifer with not much of the Butterfly about her, still again beat some of the home-bred Butterflies, of which they seemed to have picked over a sample for Wakefield, some of the entry not being sent. Vesper Queen, the third in the grand Royal class of yearlings, with her two five-hundred-guineas superiors shipped off, here succeeded to first place; and a thick good-bodied heifer she is, but with her head tapering away very narrow to her nose, and somewhat mean in the finish off of her quarters. The Branches Dame Swift is coarse and common, and not nearly so good to look on as Mr. Brierley's Scrapp, or the highly commended Concert from Osberton, where they are getting on again with another herd. Their Fleur-de-Lis, indeed, the best heifer calf at Sleaford, was here a close second to Baron Oxford's Duchess, first at Oxford; while a very handsome telling heifer, bred by Major Stapylton, was third in a class so generally good that everything shown was commended. And then the dam of the best heifer-calf, Duchess of Lancaster 2nd, was declared to be the best dairy cow; the Foljambe Rosebud, which was best at Beverley, being now nothing more than bag and bones, or a bag of bones, and, of course, not as such to be esteemed by Shorthorn judges. The Alderneys or Jerseys were nearly all fawns, and nearly all coarse in their character. Is there anything in this, for Mr.

Duncey's fawns were generally coarse? and they seem to breed a number of their own Alderneys in Yorkshire.

The Leicester judges came back to the Royal reading, and put Mr. Borton's ram, first at Oxford and nowhere at Sleaford, first again here, with the Sleaford first now second. The judges considered a sheep shown by Mr. George Turner, jun., to be a particularly good ram in a not particularly good class, but they gave Mr. Borton all the prizes, took little note of Mr. Hutchinson's, or the rams exhibited by other well-known breeders, as we are inclined to think with them, or rather as we said of the Leicesters at Oxford, they do not this year show any very remarkable merit; although Sir Tatton Sykes takes the first shearling for the season at quite "an average" good figure. In the old rams the Royal Blue Cap was beaten by a five-year-old sheep of Mr. Sanday's, an extraordinary ram certainly at his age, with a capital touch, and really keeping his wool well for his time of life, while he has a deal of breeding, if not backed by any great size. The Holme Pierrepont best sheep of last season took nothing, and the good ram with which young Mr. Turner was made reserve at Oxford was nowhere now, the third prize going to another entry from the same flock; but the judging here, as in the previous class, was no doubt occasionally a little wild. The Brandsby ewes are as beautiful and as high-bred as ever; a long way, according to Mr. Torr, the best Leicesters on the ground; and Mr. Hutchinson and Mr. Borton were once more just one above the other, as they were at Oxford and Sleaford, with some of the same ewes. The competition in the Lincoln classes was very limited; and Messrs. Wright, Dudding, and Cartwright, continue to maintain, in the three classes of shearling rams, old rams, and ewes, very much the positions they have held so far during the season. Mr. Gunnell from Cambridgeshire made no entry; and Mr. Marshall, like Mr. Booth, seems to have "sold out." Still this was a very meritorious exhibition, while to the remarkable merit of the old Lincoln rams we spoke at Oxford, as the judges did here. With the aid of an equally active colleague, Mr. Henry Overman came all the way from Norfolk for some half hour's work, as by the time some of the other "sets" were beginning the short-wool men had finished. They could see nothing particular amongst the Shropshires but Lord Chesham's neat smart sheep, which took every prize for which they were entered, and, of course, the goblet for the best of all the rams; although nothing was sent from Latimer into the old class, where the best sheep, as it was, had a deal too much wool. The Yorkshire Society employs no shearing inspector, but Mr. Parrington might originate an amendment that it is said will shortly be required of the Royal Agricultural Society. This is that servants be engaged by the management to lead the sheep out before the judges, as it is contended that the presence of a well-known shepherd directly identifies the owner of a sheep, and no doubt it does. For our part, we really cannot see why all stock, excepting bulls, stallions, and riding-horses, should not be shown by "Society's men;" at any rate, the experiment would be worth trying. At the same time, we are not so sure but that it might occasionally result in some very startling transpositions.

We have frequently cited a very excellent rule of this Society whereby any judge who has acted at the Royal meeting shall not be eligible in the same year for the Yorkshire; but the direction thought fit to break through this enactment in the matter of pigs, and Mr. Fisher was again in office. Of course there could be no better man, but if laws are not to be held of general observance they will very soon come to be worth little or nothing. Not, however, that the awards went precisely as at Oxford, a

Royal winner or so being occasionally put out, although almost all the best pigs came on. Thus we had Messrs. Eden, Duckering, Hatton, Fox and Nield again in prominent places on the prize-list, if with the exhibition telling more of Yorkshire bacon. The large pigs were horribly coarse, and the smaller sorts of whites far preferable. Indeed the best boar in the show was declared to be a young white of Mr. Eden's that was first at Manchester, and the best sow Messrs. Duckering's Berkshire! It is not so many years since that a black pig would have been an object of ridicule at a North Country meeting, but the Yorkshire fanciers are clearly getting free from such a prejudice, as although Black Bess was bred in Essex all the other Berkshires were born hereabouts, in Wakefield, York, and Halifax, and the judges commended the class!

The exhibition of implements was made up, according to the catalogue, in this way: Machinery in Motion.—Clayton and Shuttleworth, Humphries, Tuxford, Hornsby, Ruston and Proctor, Ransomes and Sims, Lewin, Marshall and Co., Foster and Co., Robey, Robinson, Wilson, Bradley and Craven, Ashby, Amies and Barford, and Marsden; while the stands ran on in this order: Roberts, Shackleton, Hill, Fowler and Co., Brown and Maude, Fiskin, Hunt, Picksley and Sims, Beverley Waggon Company, Clay, Crosskill, Sawney, Hydes and Wigfull, Barker, Howard, Coleman and Co., Stead, Vickers and Co., Cooke and Co., Bushell, Richmond and Chandler, Kearsley, Sanderson, Tong, Ashton, Mattison, Woods and Co., Bamlett, Thackray, Beckwith, Baker, Wray, Mason, Sherwood, Kitmer, Burgess and Key, Wade, Edwards and Son, Markall, Rainforth and Son, Green and Son, Penny and Co., Coultas, Harrison, Robey, Le Butt, Smith, Hopperton, Middleton, Eastwood, Rhodes, Ingham, Waide, Edgecombe, Mitchell, Bradford, Piggott, Jones, Bigg, Carson, Smith, Thorn, Barker, Hingate, Puckering, Hartley, Wales, Firmin, Roberts, Taylor, Smith, Boyall, Betsley, Davis, Greenwood, Spoug, Lyon, Sampson, Keighley, Cheavin, Taylor, Knowles, Smith, Belcher and Co., Reyner, Richardson, Native Guano Company, Drilfield Cake Company, Matthews, Carter, Inman.

But horses and hounds sadly interfere with machinery in or out of motion at a Yorkshire show; and at Wakefield, moreover, as at Oxford, there was no need to run the gauntlet of the implements to get at the stock, so that, if there could be any cool shade hereabouts, the cunning artificer in metal and wood must have, like Tityrus, realized the *recubans sub tegmine*, and have felt ready, for want of something better to do, to challenge chaff-cutting Melibœus to a song.

JUDGES.

CATTLE.—G. Atkinson, Hall Farm, Seaham; G. Garne, Churchill Heath, Chipping Norton; W. Parker, Carleton Hill, Penrith.

SHEEP.—Long-woolled: W. Torr, Aylesby Manor, Grimsby; J. Wood, Stanwick Park House, Darlington. Short-woolled: H. Overman, Weasenham, Brandon; P. Purves, Brampton, Huntingdon.

PIGS.—W. Goodrick, Corbridge-on-Tyne; J. Fisher, Wood House, Cross Hills.

HORSES.—Hunters and Roadsters: J. M. K. Elliott, Heathcote, Towcester; J. Farrington, Brancepeth; J. H. Skipworth, Howsham, Brigg. Coaching and Agricultural: B. Spraggon, Nafferton, Stocksfield-on-Tyne; W. Robinson, Hutton Hall, Darlington; W. Godson, Normanby-by-Stowe.

WOOL.—I. Clayton, Stainley House, Ripley.

HOUNDS.—Major Dowker; Viscount Galway; J. Farrington.

VETERINARY INSPECTOR.—Professor Spooner.

SHORTHORNS.

Bull of any age above three years.—First prize, £30, C. W. Brierley, Rhodes House, Middleton, Manchester (Bolivar);

second of £10, W. Fison and Co., Greenholm, Burley-in-Wharfedale (Lord St. Leonards); third of £5, T. Statter, jun., Stand Hall, Whitefield, Manchester (Charlie).

Bull above two and not exceeding three years old.—First prize, £20, Col. Towneley, Towneley, Burnley (Baron Hubbard); second of £10, Crawshaw and Blakeley, Headfield, Dewsbury (Prince Leopold); third of £5, W. C. Worsley, Hovingham (Duke of Roxburgh).

Bull above one and not exceeding two years old.—First prize, £30, Lady Pigot, Branches Park, Newmarket (Bythis); second of £10, Wm. Linton, Sheriff Hutton (Lord Irwin); third of £5, Lord Braybrooke, Audley End (Heyden Duke). Highly commended: Earl Faversham, Duncombe Park (Colonist). Commended: W. Bradburn, Wednesfield, Wolverhampton (White Satin).

Bull calf above five and not exceeding twelve months old.—First prize, £10, Messrs. Dudding, Pantou House, Wragby (Robin Hood); second of £5, Col. Towneley (Oxford Buttery); third of £2, Col. Towneley (Maid of Oxford's Baronet). Highly commended: Major Stapylton, Myton Hall (Lord of the Manor).

A silver cup, value £10, for the best bull in the show, to Bolivar.

Cow of any age above three years, in calf or milk.—First prize, £25, Lady Pigot (Queen of Rosalea); second of £10, J. How, Broughton (Lady Ann); third of £5, J. R. Tennant, Seacroft Lodge, Leeds (White Rosa). Highly commended: J. W. Botcherby, Middleton-one-Row (Betsy Gwynne), H. J. Robinson, The Cliff, Leyburn (Lady's Slipper), and W. Bradburn (Miss Muehy and Miss Chesterfield).

Heifer not exceeding three years old, in calf or milk.—First prize, £20, R. Eastwood, Thorneyholme, Clitheroe (Double Butterfly 2nd); second of £10, J. How (Windsor's Butterfly); third of £5, J. Outhwaite, Baines (Vivandiere). Highly commended: J. R. Tennant (Lady Frederick), and Colonel Towneley (Alice Wharfedale's Butterfly). Commended: W. Bradburn (Red Rose).

Heifer not exceeding two years old.—First prize, £20, J. How (Vesper Queen); second of £10, Lady Pigot (Dame Swift); third of £5, C. W. Brierley (Seraph). Commended: J. R. Tennant (Daisy) and Lord Bolton, Bolton Hall, Leyburn (Prestonia).

Heifer calf above five and not exceeding twelve months old.—First prize, £10, Col. Towneley (Baron Oxford's Duchess); second of £5, F. J. S. Foljame, M.P., Osberton Hall, Worksop (Fleur-de-lis); third of £2, Major Stapylton (Rose of Myton). Commended: B. Baxter, Elslack Hall, Skipton (Lady Hudson Baxter 2nd), and Major Stapylton (Honesty). A silver cup, value £50, for the best Shorthorn, to Bolivar.

DAIRY CATTLE.

Cow for dairy purposes.—First prize, £10, Col. Towneley (Duchess of Lancaster 2nd); second of £5, J. T. Robinson, Leekby Palace, Thirsk (Dairymaid); third of £2, H. Crossley, Broomfield, Halifax. Commended: H. Crossley.

Alderney or Jersey cow or heifer, in-calf or milk.—First prize, a silver cup, value 10 guineas, Major Stapylton; second of £2, J. Rhodes. The class commended.

Guernsey cow or heifer, in-calf or milk.—First prize, a silver cup, value 10 guineas, the West Riding Asylum, Wakefield.

SHEEP.

LEICESTERS.

Shearling ram.—First prize, £20, J. Borton, Barton House, Barton-le-Street; second of £10, J. Borton; third of £5, J. Borton. Highly commended: G. Turner, jun. Commended: J. Borton.

Leicester aged ram.—First prize, £15, G. H. Sunday, Holme Pierrepont; second of £7, J. Borton; third of £3, G. Turner, jun., Alexton Hall, Uppingham. Commended: J. Borton.

Leicester shearling gimmers.—First prize, £20, S. Wiley, Brandsby; second of £10, T. H. Hutchinson, Manor House, Catterick; third of £5, J. Borton. Commended: E. Riley, Kipling Cotes Farm, Beverley.

LINCOLNS.

Shearling ram.—First prize, £15, R. Wright, Nocton Heath, Lincoln; second of £7, R. Wright; third of £3, C. Lister, Coleby Lodge, Lincoln. Highly commended: R. Wright.

Lincoln aged ram.—First prize, £10, Messrs. Dudding; second of £5, T. Cartwright, Dunstan Pillar, Lincoln.

Lincoln shearing gimmer.—First prize, £10, T. Cartwright; second of £5, T. Cartwright.

SHROPSHIRE DOWNS.

Shearing ram.—First prize, £15, Lord Chesham, Latimer, Chesham; second of £7, Lord Chesham; third of £3, W. Baker, Moor Barns, Atherstone.

Shropshire Down aged ram.—First prize, £10, W. Baker; second of £5, Lord Wenlock, Escrick Park.

A silver goblet, value £5, for the best ram to Lord Chesham. Shropshire Down shearing gimmers.—First prize, £10, Lord Chesham; second of £5, T. Horton, Harnage Grange, Shrewsbury.

MOUNTAIN OR BLACK-FACED.

Shearing ram.—First prize, £10, J. M. Green, Black Hill, Keighley; second of £5, J. Peel, Knowlmere, Clitheroe.

Mountain aged ram.—First prize, £7, J. Peel; second of £3, J. Peel.

Mountain ewes.—First prize, £7, J. Peel; second of £3, J. Peel.

PIGS.

Twelve months old and upwards.

Boar of large breed.—First prize, £5, P. Eden, Cross Lane, Salford; second of £2, R. E. Duckering and Son, Northorpe, Kirton Lindsey; third of £1, R. E. Duckering and Son. Highly commended: W. Lister, Armley, Leeds.

Sow, large breed.—First prize, £5, R. E. Duckering and Son; second of £2, R. E. Duckering and Son; third of £1, W. Hatton, Addington, Leeds.

Boar, small breed.—First prize, £5, R. E. Duckering and Son; second of £2, H. Nield, The Grange, Worsley, Manchester; third of £1, P. Eden. Highly commended: G. Mangles, Givendale, Ripon.

Sow, small breed.—First prize, £5, W. Hatton; second of £2, T. Nicholson, York. Highly commended: Viscount Galway, M.P.

Boar, black or Berkshire breed.—First prize, £5, F. Walton; second of £2, West Riding Asylum, Wakefield; third of £1, H. Crossley, Broomfield, Halifax.

Sow, black or Berkshire breed.—First prize, £5, R. E. Duckering and Son; second of £2, West Riding Asylum; third of £1, H. Crossley. The class commended.

Boars of any breed not qualified to compete in previous classes.—First prize, £5, J. E. Fox, Great Horton, Bradford; second of £2, S. Appleby, Armley; third of £1, C. Roberts, Wakefield.

Sows of any breed not qualified to compete in previous classes.—First prize, £5, P. Eden, Salford; second of £2, J. C. Taylor, Outlands; third of £1, R. E. Duckering and Son. Highly commended: W. Hatton, Leeds.

Pig, not exceeding twelve months old.—First prize, £3, G. Chapman, Seamer; second, £1, R. E. Duckering and Son, Kirton Lindsey. Commended: C. W. Graham, Leeds.

Sow, large breed.—First prize, £3, P. Eden; second, £1, R. E. Duckering. Commended: F. Walton, Halifax.

Boar, small breed.—First prize, £3, P. Eden; second, £1, Viscount Galway, M.P., Serlby Hall, Bawtry. Highly commended: J. Umpleby, Guiseley.

Sow, small breed.—First prize, £3, C. R. N. Beswicke-Royds, Littleborough; second, £1, Crawshaw and Blakeley, Headfield, Dewsbury. Highly commended: W. Greetham. The class commended.

Boars, black or Berkshire breed.—Prize, £3, G. Knowlson, Thormanby, Thirsk.

Sow, black or Berkshire breed.—First prize, £3, and second, £1, J. Oldroyd, Fixby Park, Huddersfield.

Pen of three store pigs, of any breed, from four to nine months old.—First prize, £3, J. Bullock, Bradford; second, £1, West Riding Asylum. Highly commended: W. Routledge, York, and R. E. Duckering. The class commended.

A silver cup, value £10, to P. Eden, for small white (Young Prince), as the best boar in the show.

A silver cup, value £10, for the best sow in the show to Messrs. Duckering, for Berkshire (Black Bess).

HORSES.

Thorough-bred stallion, for getting weight-carrying hunters.—First prize, £30, A. Beaumont, Honley, Huddersfield (Stamper); second, £10, J. Casson, Burgh-by-Sands, Carlisle, (Sincerity); third, £5, W. Moffatt, Kirklington Park, Carlisle, (Laughing Stock).

Coaching stallion.—First prize, £20, W. Laverack, Everthorpe Grange, Brough (Emperor); second, £7, G. Holmes, Bar House, Beverley (Richmond); third, £3, J. Hind, Rowland Hall, Howden (Tramp).

Roadster stallion.—First prize, £20, J. Leake, Drewton, Brough (Lord Derby); second, £7, P. Kirby, North Duffield, Selby (Commander-in-Chief); third, £3, W. Axe, Doncaster (Blaze-away).

Agricultural stallion.—First prize, £20, J. Forshaw, Burley-in-Wharfedale, Leeds (Nonsuch); second, £7, M. Reed, Chester-le-street, Durham (Clydesdale Tom); third, £3, W. Johnson, Hatfield, Doncaster (Active). Commended: M. Strickland, Tadcaster (Lincolnshire).

Hunting brood mare and foal.—First prize, £15, J. T. Robinson, Lecky Palace, Thirsk; second, £7, J. Clark, Beeston, Leeds; third, £3, H. W. Jackson, Wakefield. The class commended.

Coaching brood mare and foal.—First prize, £10, J. Johnson, Brigham, Driffield; second, £5, S. Frank, Brandsly, York.

Roadster brood mare and foal.—First prize, £10, W. Major, Sledmere, York; second, £5, J. Clark, Leeds. Commended: T. Statter, jun., Whitefield, Manchester.

Agricultural brood mare and foal.—First prize, £10, T. Makin, South Millford; second of £5, T. Upton, Tadcaster. Commended: W. Hutchinson, Howden, and W. and R. Jewitt, Howden.

HORSES FOR AGRICULTURAL AND DRAY PURPOSES.

Two years old gelding or filly.—First prize, £7, T. Duckett, Bentley, Doncaster; second of £3, T. Baum, Pontefract. Commended: G. Atkinson, Seaham.

Three years old gelding or filly.—First prize, £8, C. Lister, Lincoln; second of £4, Reed, Chester-le-street, Durham; third of £2, J. Wood, Beeston Royds, Leeds. Commended: S. Barker, Marr, Doncaster.

Four years old and upwards agricultural gelding or filly.—First prize, £15, S. Thompson, Skipwith, Selby; second of £10, C. W. Brierley, Middleton; third of £5, J. Clark, Beeston.

Four years old gelding or mare, suitable for dray purposes.—First prize, £15, C. W. Brierley; second of £7, T. Statter, jun.; third of £3, S. Barker.

COACH HORSES.

Two years old gelding or filly.—First prize, £12, T. Plummer, Birdforth, Easingwold; second of £6, R. Prince, Chapel Haddersley, Selby; third of £3, J. H. Harris, Houndalee, Morpeth.

Three years old coaching gelding.—First prize, £15, J. Thompson, Bishop Burton; second of £7, J. Johnson, Bingham, Driffield; third of £3, T. Plummer.

Three years old coaching filly, £10, W. Wadsworth, Dunnington; second of £5, T. Rennison, Holme-on-Spalding Moor.

ROADSTERS, HACKNEYS, AND PONIES.

Three years old gelding or filly.—First prize, £10, W. Moffat, Kirklington Park, Carlisle; second of £5, T. Shearman, Warnsworth, Doncaster. Commended: J. C. Forth, Featherstone Hall, Pontefract.

Hackney or roadster, of any age or sex, equal to carry 14 stones.—First prize, £10, C. Stephenson, Newcastle-on-Tyne (Fugleman); second of £7, J. Hornsby, Grantham (Beda); third of £4, J. Robson, Malton (Miss Patty).

Hackney or roadster, of any age or sex, equal to carry 12 stones.—First prize, £10, Sir Lionel M. S. Pilkington, Bart., Chevot Park, Wakefield (Marguerite); second, G. Holmes, Bar House, Beverley (Polly); third, G. Burton, Thorpe Wilowby, Selby.

Ponies, any age or sex, not less than 12½ and not exceeding 14½ hands high.—First prize, £8, J. S. Darrel, West Aytton, York; second of £4, W. Hill, Doncaster; third of £2, W. Simpkin, Burton Agnes, Hull. Highly commended: R. Milward, Thurgarton Priory, Southwell. The class commended.

Ponies, any age or sex, not exceeding 12½ hands high.—First prize, £6, F. W. Watkinson, Hull; second of £3, E. Green, Wakefield; third of £1, Crawshaw and Blakeley, Headfield, Dewsbury.

HUNTERS.

Two years old geldings or fillies.—First prize, £12, J. B. Barkworth, Raywell, Brough; second of £6, J. Cattle, Barton-le-Street, Maldon; third of £3, R. Brunton, Marton, Middlesbro'. Commended: T. B. Ireland, Tadcaster.

Three years old hunting gelding.—First prize, £15, Sir G. Cholmley, Bart., Howsham House, York (Dandy); second of £7, S. Wiley, Brandsby, York; third of £3, H. Brunton (Joe Bennett).

Three years old hunting fillies.—First prize, £10, R. Jackson, Normanby, Middlesbro' (Omi); second of £5, Sir G. Cholmley (Carnation). Commended: G. Knowlson, Thormanby, Easingwold (Miss Annie).

Four years old hunting geldings.—First prize, £20, T. H. D. Bayly, Ickwell House, Biggleswade (Borderer); second of £10, E. Paddison, Ingleby, Lincoln; third of £5, J. B. Barkworth (Lothair).

Four years old hunting filly.—First prize, £15, J. Bulman, East Greystone, Gainford (Sally); second of £7, S. B. Robson, Windle Beck, Ganton (Maid of Derwent).

Hunter, gelding or mare, five years old and upwards, and qualified to carry at least twelve stones with hounds.—First prize, the Badsworth Hunt Cup, value 100 guineas, S. J. Wellitt, Tathwell Hall, Louth (Loiterer); second of £50, Sir G. Cholmley (Julius); third of £25, H. Jewison, Raisthorpe (The Knight); fourth of £15, Sir G. Cholmley (Don Juan); fifth of £10, T. H. Foden, Givendale Grange, Ripon (Young

Artillery); sixth of £5, J. B. Booth, Killerby Hall, Catterick (Brian Boru).

WOOL.

Five hogg fleeces, long wool.—First prize, £5, M. Tomlinson, Cowthorpe, Wetherby; second of £3, C. Barroby, Baldersby, Thirsk; third of £2, C. Barroby.

HOUNDS.

Entered Hounds.—Dogs: First prize, £20, The Burton (Striver, Vanquisher, Gallant, and Prompter); second of £10, The Broeklesby (Bentinck, Finder, Royal, and Rampart).

Bitches: First prize, £20, The Burton (Sportive, Heeuba, Bashful, and Tidings); second of £10, The York and Ainsty (Timely, Nosegay, Novelty, and Liberty).

Unentered Hounds.—Dogs: First prize, £10, and second of £5, The York and Ainsty (Beadsman and Damper).

Bitches: First prize, £10, The York and Ainsty (Fair Maid); second of £5, The Burton (Careful).

Stallions.—Prize of £5, The York and Ainsty (Racer).

Brood Bitches.—Prize of £5, The Broeklesby (Gaiety).

At the meeting of the Council the only deputation was from York; and it was decided to hold the meeting in that city in 1871.

THE BATH AND WEST OF ENGLAND SOCIETY, AND SOUTHERN COUNTIES ASSOCIATION.

A meeting of the Council was held at the White Lion Hotel, Bristol, under the presidency of the Earl of Cork and Orrery. There were also present Sir J. T. B. Duckworth, Bart., Hon. and Rev. J. T. Boscawen, Messrs. T. D. Acland, M.P., J. D. Allen, R. G. Badoock, R. Bremridge, R. Brent, C. Bush, R. H. Bush, W. A. Bruce, J. Dav, F. W. Dymond, T. Danger, E. S. Drewe, A. F. Milton Druce, J. T. Davy, M. Farrant, H. Fookes, Jonathan Gray, C. Gordon, J. Hole, H. P. Jones, J. F. Lennard, H. A. F. Luttrell, J. Lush, H. G. Moyses, H. St. John Maule, H. Middleton, T. Phillpotts, J. Ramsden, W. R. Scott, R. J. Spiers, R. Trood, E. W. Williams, H. Williams, H. Spackman (Official Superintendent), W. Smith (Official Accountant), and J. Goodwin (Secretary and Editor).

Mr. HERBERT WILLIAMS, as chairman of the Finance Committee, took the opportunity of congratulating the members on the very satisfactory position of the Society, and the success which had attended its operations during the past year. He concluded by moving that £1,500 additional stock be purchased in the name of the Trustees, thus raising the funded capital to 47,000. This proposition was seconded by Mr. C. BUSH, and carried.

The Committee appointed to inquire whether any saving could be effected in the cost of producing the Journal, having, at a former meeting, recommended that only one Journal should be published in the year, now further reported that, after an interview with Mr. Dorrell, representing the firm of Messrs. Clowes and Son, the Society's printers, they had arrived at the conclusion that it was impossible to effect any sensible reduction in the cost per sheet upon the present number of copies printed. With reference to the expense of illustrations, they reported that this might, of course, be cut down, but they feared that a reduction in the attractiveness of the Journal might operate prejudicially on the interests of the Society. This head of expenditure would, however, be closely watched by the Journal Committee. The report was received and adopted. Colonel Luttrell and Mr. Herbert Williams were added to the Journal Committee.

The Committees and Stewards of the several departments at the Taunton Meeting were nominated for re-appointment for the current year, with the addition of the name of Mr. C. Edwards to the Finance Committee; Mr. Milton Druce to

the Stock Prize Sheet Committee; Mr. Grenfell to the Implement Regulations Committee; and Sir John Duckworth, Colonel Lennard, Mr. Jonathan Gray, Mr. Ramsden, and Mr. Gordon to the Railway Arrangements Committee. The Arts Committee was also re-appointed; Dr. Scott and Mr. E. W. Williams being nominated as stewards of No. 1 section, and Mr. John Daw and Mr. Ramsden as stewards of No. 2 section.

The constitution of the Judges Selection Committee led to a discussion which ended in the affirmation of the principle that no one being himself a breeder of stock, or having intimate connections with any such breeder, is eligible to serve on this committee where the strictest impartiality and secrecy are absolutely indispensable as a guarantee of good faith to exhibitors and the public.

GUILDFORD MEETING, 1871.—For this meeting grants of money were taken to enable the several committees to arrange and mature their prize sheets on a scale of greater liberality and completeness than hitherto attempted by the Society. The Guildford Local Committee also announced their intention to offer liberal special prizes.

A proposal by Mr. Gordon, seconded by Dr. Scott, to hold the Council Meetings for the current year at Salisbury, was withdrawn, after a very general expression of opinion that Bristol is the most generally convenient and accessible centre.

The Council unaniously voted a complete set of the Society's Transactions, from the year 1852 to the present time, to the Library of the Taunton and Somerset Institution, in commemoration of the Society's second visit to the town, and of the hearty and cordial reception afforded by the inhabitants.

The following new members were elected:—The Hon. Capt. Hood, M.P., Crickett St. Thomas, Chard; the Hon. H. H. Jolliffe, Heath House, Petersfield; Major-Gen. Charles Riddell, Athenicum Club, London; H. A. Adair, Mountlands, Taunton; T. Bradford, Fleet Street, London; J. Carpenter, Lady Down, Trowbridge; T. Marriott Dodington, Combe, Dulverton; T. Fooks, Totnell Corner, Sherborne; J. Gollidge, Whaddon Grove, Trowbridge; T. Hyatt, Shepton Mallet; W. S. Loder, Bathwick Lodge, Bath; J. Redman, Whaddon, Trowbridge; J. C. Sutton, Shirley, Southampton; T. P. Waltham, Kilton Farm, Bridgwater; R. Warren Childokeford, Blandford.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

MONTHLY COUNCIL: Wednesday, August 3.—Present, the Earl of Powis, trustee, in the chair; Lord Walsingham, Sir Massey Lopes, Bart., M.P.; Sir A. K. Macdonald, Bart.; Sir Watkin W. Wynn, Bart., M.P.; Mr. Acland, M.P.; Mr. Barnett, Mr. Cantrell, Colonel Challoner, Mr. Davies, Mr. Druce, Mr. Braudreth Gibbs, Mr. Jonas, Colonel Kingscote, M.P.; Mr. Leeds, Mr. Pain, Mr. Randell, Mr. Ransome, Mr. Shuttleworth, Mr. Thompson, Mr. Whitehead, and Dr. Voelcker.

The following new members were elected:—

Bennett, Alfred W., Wharton, Ross.
Compton, Thomas, Fisherton Delamere, Heytesbury.
Crofts, Lieutenant Richard B., R.N., Great Cozens, Ware.
Giles, John, Bradford House, Chaddeley, Corbett, Kidderminster.
Harding, Thos. King, Marden Bradley, Bath.
Hill, John, Severnstoke, Worcester.
Hope, Thos. R. Henfry, Rhyll.
Jackson, George, Tattenhall Hall, Tattenhall, Chester.
Jeyes, Francis C., Buxworth, Northamptonshire.
Kynnersley, C. T. Sneyd, High Fields, Uttoxeter.
Laurence, Wm., Brockworth Park, Gloucester.
Martin, Joseph, Highfield House, Littleport.
Middleditch, E. Taylor, Blansdon House, Highworth.
Noek, Charles, Norton, Shifnal.
Pickering, James, Whitby, Chester.
Riddell, Major-General Charles J. B., Oaklands, Chudleigh, Devon.
Robinson, Wm. Wembdon, Bridgwater.
Scott, Louis G., 79, Eaton Square, S.W.
Snow, Thomas Owen, Lack Hall, Chester.
Stanton, Rev. J. John, Lovington Vicarage, Bath.
Swinnerton, Wm. Weston, Styvechall Grange, Coventry.
Torr, Thos. Joseph, Dunmaer House, Basingstoke.

The following recommendations of special Councils held in the showyard were unanimously adopted:—

- (1.) That as only £3 had been awarded by the judges in Section IX. Class 3, the remaining amount of £7 be specially given for churms adapted to small occupations.
- (2.) That a third prize of £25 be given to Mr. R. Craddock, for the reserve number and highly commended farm occupied by him.
- (3.) That the country meeting for 1871 should be held in the week commencing July 10, instead of that beginning July 17.

FINANCE.—Colonel Kingscote, M.P., presented the report, from which it appeared that the Secretary's receipts during the past month had been examined by the committee, and by Messrs. Quilter, Ball & Co., the Society's accountants, and had been found correct. The balance in the hands of the bankers on July 31 was £7,608 7s. 4d., the sum of £3,800 remaining on deposit. Cheques to the amount of £9,176 17s. 1d. were ordered to be drawn. The committee recommended that the Secretary be authorised to transfer £2,000 from the deposit to the current account; and that the office be closed at 2 p.m. on Saturdays from after the first Council meeting following the country meeting, until the April Council meeting. The committee also reported that on the appeal against the parish rating of the Society's house, the assessment was reduced from £280 to £160 per annum.—This report was adopted.

JOURNAL.—Mr. Thompson (chairman) reported that the judges had withheld the prize offered for the best essay on the preparation, preservation, and use of sprouted grain as food for horses, cattle, and sheep, based on practical experience, the candidates not having com-

plied with the conditions on which the prize was offered. It was also reported that the judges had awarded the prize offered for the best description of the most improved form of kiln for burning lime for agricultural purposes to the writer of the essay bearing the motto "Improved Perpetual." This report having been adopted, the chairman announced that the prize essay had been written by Mr. Charles Turner, C.E., of Maguolia Cottage, Shirley, near Southampton.

IMPLEMENT.—Mr. B. T. Braudreth Gibbs reported that the committee had discussed the conditions to be added to the Wolverhampton prize-sheet, and that they recommended that the secretary be instructed to draw up a draft of those agreed upon, and to circulate a preliminary proof amongst the exhibitors of steam-cultivating machinery, inviting suggestions thereon, so that a complete prize-sheet may be published in November. This report was adopted, subject to a proposed regulation prohibiting exhibitors from entering duplicate implements being postponed for further consideration.

GENERAL OXFORD.—Lord Walsingham reported that the committee had examined the Oxford accounts, and recommended them for payment. This report was adopted.

GENERAL WOLVERHAMPTON.—Mr. D. R. Davies presented the report of the committee, recommending that Mr. R. H. Masfen be requested to accept the office of steward of forage for the Wolverhampton meeting, and that the secretary be instructed to supply him with the particulars of quantities likely to be required. It was also reported that an agreement and plan had been arranged between the mayor and town-clerk of Wolverhampton, on behalf of the corporation, and the honorary director and the secretary on behalf of the Society; and the committee recommended that the common seal of the Society and the signature of the secretary be affixed to the said agreement. This report was adopted.

SHOWYARD CONTRACTS.—Mr. C. Randell reported the recommendation of the committee that so much of the plan of the Wolverhampton showyard recommended by Mr. Gibbs, as shows the land required and the situation of the entrances and implement sheds, be adopted, leaving the completion of the plan to be afterwards settled by the honorary director and the surveyor. The surveyor's report on the showyard works at Oxford had been received, and the committee recommended the payment of the fourth instalment of the contractor's account, the sum due for additions to the permanent plant, and the surveyor's account for travelling expenses and salary. The committee submitted the following comparative statement of the cost of showyard works, and of the sums paid by exhibitors at the last three country meetings of the Society:—

	Cost of Showyard Works.	Paid by Exhibitors.
Leicester, 1868.....	£1,290	£2,041
Manchester, 1869.....	5,476	2,724
Oxford, 1870.....	5,396	2,774

—showing that the cost of showyard works at each place bears very nearly the same proportion to the amount paid by the exhibitors. An application having been made to the surveyor to furnish to the "Société des Agriculteurs de France" plans of the Royal Agricultural Society's showyard works, the committee recommended that the Secretary be requested to ascertain whether they are asked for on behalf of the Society, or for the use of intending

contractors. In the former case, the committee recommended that such plans be furnished at the cost of the Royal Agricultural Society. This report was adopted, after a conversation on the position of the entrance to the Wolverhampton showyard, Mr. Thompson being in favour of a central entrance, as at Oxford, and considering this the general opinion; while Mr. Randell maintained that the position of the entrances at Oxford entailed a loss to implement exhibitors, and was adopted in that case only because the form of the ground rendered it a necessity. The Secretary was authorised to sign and seal an agreement with the Corporation of Wolverhampton, and a supplementary agreement with the Society's contractor.

Mr. C. WHITEHEAD moved—"That prizes be offered for implements and machinery used in the cultivation and management of hops." In support of his motion he urged the agricultural and economic importance of hop cultivation, and stated that while the cost of cultivation had formerly been estimated at more than £30 per acre, recent improvements in implements and machinery had reduced this cost to the extent of £5 or £6 per acre; he therefore expected that the stimulus which would be given by the Society offering prizes for implements and machinery used in the cultivation and management of hops would still further reduce the cost of production, and enable English growers to compete on more even terms with those foreign and colonial hop farmers who had the great advantages of cheaper labour and more favourable climate. Amongst the implements for which prizes might be offered by the Society he mentioned a plough or digging machine which would supersede the hand labour with the "spud," at present the general but costly method of turning over the soil, and would ameliorate the physical condition of the labourers in the hop growing counties, which are at present notorious for the labouring men being prematurely bent in consequence of this "spud" labour. As specimens of other *desiderata*, he mentioned a machine for packing hops, and an adaptation of steam for drying them, and he concluded by stating that in the event of the Council accepting his motion, and referring the details to the implement committee, he would have pleasure in rendering any assistance in his power. The motion having been seconded by Mr. T. Pain, who urged that the subject was too important for delay, a discussion ensued in which Lord Walsingham and Mr. Shuttleworth suggested that the details should be left to the implement committee, Mr. Ransome preferring

that the subject should be dealt with as a whole irrespective of the Society's classification. Finally, the principle of Mr. Whitehead's motion having been adopted, it was referred, on the suggestion of the Chairman, to the implement committee to consider what prizes for implements and machinery for the cultivation of hops can be inserted in the Society's prize-lists.

Mr. T. Pain, having called the attention of the Council to the implement entries at Oxford which had no reference whatever to agriculture, and also to the number of duplicate entries, a discussion ensued, in which Lord Walsingham, Mr. Thompson, and Mr. Randell urged that by prohibiting the exhibition of duplicate articles, the inconvenience would be removed, without drawing too hard a line. Mr. Ransome and Mr. Shuttleworth suggested that so large a subject should be allowed to stand over for more ample discussion in November; while Lord Powis, Colonel Challoner, and other members of Council, advocated the admission into the showyard of certain articles not strictly agricultural, such as carriages, &c., for the convenience of farmers and others living in sequestered parts of the country. The distinction between the two portions of the subject having been insisted upon by the Chairman, who agreed with a suggestion from Lord Walsingham that, although it might be advisable to prohibit the exhibition of duplicates, an exception should be made in favour of implements belonging to the classes for trial, in each year, it was finally moved by Mr. Thompson, seconded by Mr. Ransome, and carried unanimously, "That the implement committee be requested to consider and report in November, whether any and what restrictions should in future be imposed on the exhibition of duplicate implements, especially by agents, and on the exhibition of miscellaneous articles."

On the motion of Lord Walsingham, seconded by Mr. Thompson, it was unanimously resolved that the thanks of the Council be specially conveyed to Mr. J. Mason, late High Sheriff of Oxfordshire, for his liberality in offering the prize of a silver cup, value 100 guineas, for the best-managed farm in the Oxford district.

Protests from exhibitors of live stock were reported upon by the senior steward, and the Secretary was instructed to communicate with the several persons concerned, in accordance with the terms of the report.

The Council, having granted the usual leave of absence so the Secretary and clerks, adjourned over the recess until Wednesday, November 2.

ROYAL AGRICULTURAL SOCIETY OF IRELAND.

MEETING AT BALLINASLOE.

There is something particularly satisfactory in the continued prosperity of the Societies of Agriculture. There is now scarcely an institution of the kind, but that with anything like proper management is flourishing exceedingly. And yet it is not so long since that many of these associations were in a very languishing condition. They seemed chiefly to rely upon as directly to court a certain unwholesome sort of patronage. They were overlaid by the great people of the district, and if the Duke did not come to the dinner they stared ruin in the face. By this time there is often enough no dinner to go to, and if his Grace visits the show he walks about very much like any other man, handles the Shorthorns, criticises the horse judges, and possibly ventures to buy a Southdown shearling on his own account. Some twenty years since the exception was to attend the ploughing

match or the stock show, and the rule to be just in time for "the banquet," where sundry long orations were delivered, at which country-folks cheered and townspeople laughed. The leading societies of the kingdom, like the Royal, the Yorkshire, and the West of England, have gradually abandoned such entertainments, and yet they have never been doing so well. The reason of this is sufficiently plain. The actual business of such occasions has come more and more to be encouraged, the practical element has been developed, and taking five hundred pounds at the gates does a deal more good than would a donation of double the amount from the Lord-Lieutenant of the county.

Nevertheless, there is at this very moment one such national institution whose case comes in marked contrast to that of its fellows. The Royal Agricultural Society o

Ireland is evidently in a bad way, as perhaps the worst show ever held under its auspices has just been celebrated at Ballinasloe. The entries were small, and, with an exception or so, the sample indifferent. On the first blush it would look as if the uncertainty engendered by the new Land Bill had put the farmers out of heart, and that in such a state of transition they had resolved to do as little as possible. But it is not so. The stock, cattle, sheep, and pigs are not only increasing in numbers, but rising in reputation. Shorthorn fanciers will tell you that they have some of our best strains of blood in Ireland, and that the effect of this is already apparent. At the annual banquet the other evening—for they still hold to such festivals in Ireland—the Lord Lieutenant said, “I would wish to call attention to the stock of this country, which has had such great reputation of recent years, which produces such wealth to the country, and which is so eagerly sought for on the other side of the Irish Channel. I believe that the stock in Ireland has been greatly increasing, and consequently the wealth of the country, in regard to stock, has also increased very considerably during the past few years. I am not able to give you many statistics, but I can give you a few figures. With regard to the stock of this country during the last year, I find that the value of stock in Ireland has increased over the value in 1869 by nearly half a million sterling. If we go into the subject further, we shall find that the number of cattle increased by nearly 67,000 since last year, and what is still more remarkable is, the number of pigs in the country, an important item to the poor farmer, has increased by about 367,468.” And yet, in the face of this, the national Agricultural Society of the sister kingdom is fast going to the bad. With the stock increasing so extensively, the Society can get up no show of stock. The costly Shorthorn, the much-lauded Roscommon sheep, and that poor man's friend, the pig, all alike hold aloof from a meeting the object of which is to do them and their breeders every proper honour.

If not overlaid by great people, the management here is made to depend too much upon the amateur element. The practical farmer is, as a rule, carefully kept at arm's-length. He is taught to feel that he has at best only an outside interest in the proceedings, and he has become indifferent accordingly. The Royal Agricultural Society of England was at one period fast drifting into the same state of things; when the fact of a tenant farmer offering an opinion at a general meeting was regarded as an impertinence, and the proposal to put a farmer on the council as an act of rebellion. But a better spirit prevailed, and the wholesome constitution of the Society was recovered. Practical men, that is men who live by their business, now have quite their fair share and weight in all that is done in Hanover Square, while none of course are of more service when on duty at the show. In Ireland there would seem to be a very legion of Stewards, who are very active in getting into each other's way, if they do not accomplish much more. And this leads on the point as to how strong a proportion of these gentlemen in office are farmers, and how many are mere amateurs, agents, or otherwise? The same question of course would apply to the organisation of the Council, and this we ask in mere ignorance, as our experience has been rather of the meetings than the internal arrangements of the Society. If, however, as we are inclined to suspect, the direction has been confined almost exclusively to the gentlemen and their people, there can be little wonder that the Society has advanced so slowly. Every man likes to have something of a voice and a hand in the management of his own business, and here in England we have gradually come to see that the working of an agricultural association is especially the

business of agriculturists. When his Excellency turns to his own county he will remember that the Northamptonshire Agricultural Society is mainly under the management of the Northamptonshire farmers. The working committee is a committee of working men, who are always ready to welcome the landlords to their councils, but who are by no means prepared to stand aside while others do their work for them. Nay, to the credit of the country-gentlemen, this is never attempted. They pay their subscriptions; many of them make entries of stock, and some occasionally hold office on the ground, but in the Lord Lieutenant's own home the occupiers rather than the owners are responsible for the success of their Agricultural Society.

“I believe that the Land Act will set at rest the land agitation in Ireland. It is my honest conviction that good landlords will not be seriously affected by the measure; that their influence will not be diminished, but rather increased; and that the influence of their order will be much greater in consequence of the checks and restrictions which will now be placed on those whose conduct towards the tenants has hitherto lowered them in general estimation.” So says her Majesty's representative when addressing a company of agriculturists; and at such an era in the history of the country it would be very lamentable, as it would be a very bad sign if such an institution as the national Agricultural Society were suffered to fall through. It would seem to argue that the landlords and tenants in Ireland could not work together for one common object, that they had no confidence in, and no desire for communion one with the other. And yet the fortunes of the Society are coming very much to this. Ballinasloe is not an exceptionally bad show, as such an accident might happen anywhere; but for years these meetings have been gradually but certainly declining in interest and influence. The presence, in fact, of the Lord-Lieutenant has alone of late served to give any importance to the occasion; while however able a man like Lord Spencer may deport himself, however sound and encouraging may be the tone of his remarks, it must still be uphill work to compliment a country through the agency of an institution, which his well-practiced eye would tell him was so unmistakable a failure.

The sheds and fittings-up were admirable, and the best that the Society ever had; the area fenced in containing about eight acres; but despite the puff preliminary, this was about the worst show in point of numbers of Shorthorns ever known. It is now exactly twenty-five years since the Society held its show here (in 1845), when eighty-nine Shorthorns of all ages were shown; while the entry for the year 1870 was but fifty-six, with five of these making no appearance, so that but just over fifty were brought forward. Indeed, had not Mr. Gauly, the Irish cattle salesmaster and auctioneer, have come to the rescue, and brought in no less than seventeen for the several sections, the Irish Royal Shorthorn Show would have dwindled down to thirty-four. Such well-known breeders as Messrs. Barns, Pratt, Tynte, Welsted, Jones, Woods, Groves, and a host of others, made no sign, and not a single animal from England or Scotland was entered, notwithstanding that Ballinasloe lies in the centre of a fine grazing and arable country, and is approachable from every direction, by both railway and canal. There must be something radically wrong in the conduct of Irish agricultural matters, as there would seem to be too many non-practical honorary officials flourishing about, decorated with several coloured ribbons, and too few working men. In fact, an official prize list is never even prepared, and the press must get it as best they may. The managing men do not seem to know their own minds, and there are so many conflicting interests to reconcile, that any attempt at arranging matters in a busi-

ness-like manner is paralysed. Early in last year it was arranged to hold this season's show in Dublin; but in the migratory arrangements the right fell to the province of Connaught, and by great exertion the decision was rescinded. The sooner that the Society adopts some more steady course the better, for it is perfectly apparent now that its days are numbered, unless the Royal Agricultural and Royal Dublin Societies amalgamate, for the jealousies and eliquism that prevail will end most disastrously to one or the other, and the country be thrown back an age in its most vital function.

In the old Shorthorn bull section, Mr. Chaloner's Sovereign and Mr. Smith's Lictor met again with the old result: they have been so repeatedly before the public that it is needless to recapitulate their separate points, and we need only say that Sovereign took on this occasion the Purdon Challenge Cup. In the next section Mr. Smith's Lictor holds the first position, as gained at the Dublin Royal Spring Meeting; but Mr. Cosby's Colonel Frank and Mr. Moffet's Dey of Algiers change places since that meeting, and Major D'Arcy's St. Valentine takes a new prize, the Bristol Cup, to be competed for locally. Nine yearling bulls formed the next section; but the judges made a grievous mistake in putting Mr. Reynell's Prince Arthur Patrick first, as he is a weak-backed bull with bad crops, while N. M. Archall's unplaced Sam was much better. The baby bulls were three, of which Mr. Massy's Baronet, put first, and Mr. Ganly's unplaced Prince of Rosedale have good pedigrees, and are nice things enough; but Mr. Cosby gives no pedigree with his King Herod. In the aged cows Mr. Ganly shows no less than five, taking all the honours. His first-placed cow Leah, with a good dash of Booth blood in her, is a fine, roomy, wealthy cow, and possesses much sweetness. There were but two for three-year-old heifer honours, both entered Mr. Ganly's, who had a walk-over. They were by British Flag, and, very good, but shown in poor condition. In the two-year-old section for heifers Mr. Bolton's Ally Gwynne, the commended at Oxford, and the first at the Royal Dublin Spring Meeting was put justly first, though Mr. Ganly's Queen of Denmark, from the Straffan pastures, a sweet handler and of prime quality, made a capital second. The yearling heifers were remarkably good, as amongst them were Mr. Meadows' splendid heifer Chaumontel, now Mr. Bolton's, and Mr. Smith's lovely Gertrude, which caused the judges at the Dublin Spring Meeting such a lengthened discussion as to their relative merits; but they met again, only with the same result. Mr. Bolton had another beauty, Glossy's Woodbine, now highly commended, and that, with Chaumontel, took the Purdon Challenge Cup for the best two yearling heifers. The commendations were Mr. Massy's Lady James and Mr. Smith's Victoria Albert. The heifer calves were both entered by Mr. Ganly, and very neat things they are, as more than likely they will be heard of again.

The Herefords, as usual at Irish shows, were few—but one bull, three cows, and two heifers. The Devons mustered stronger, with three bulls, five cows, and three heifers, while seven polled Angus and Galloways were classed together. As a semi-mountain breed, the polled Angus stands pre-eminent in Ireland, as Mr. Owen finds to his profit, and a finer bull than his imported Crathie Joek 2nd, would be hard to find, while his fine cow Maggie is scarcely inferior, though bred in Ireland. The other breeds exhibited were West Highlands, four, a profitable race; Ayrshires, seven; Kerries, eight; and miscellaneous breeds, seven. The tenant class, valued for poor rate under £100 per annum where some had the pluck to come from the north and Tipperary, exhibited ten very superior cows.

Eight thoroughbred stallions were paraded for the Croker Challenge Cup, which went to Mr. St. George, Tyrone House, for Tom King; but four entered for the four-year-old gelding or filly prizes, to be up to at least 13 stone; some very good and sound breeding mares, not thorough bred, were shown among the nine entered, two of which were commended along with the two prizes. Some really good Clydesdale stallions and draught mares finished the show of horses, which it was expected would have been much better and more numerous than it turned out to be.

Amongst other disappointments connected with the Irish Royal meeting of 1870, must be classed the show of sheep, which for months past was given out as to be the best ever held by that Society. The pure Leicester rams were well represented by Mr. Seymour Mowbray, Allan Pollok, William Owen, and William R. Meade, the latter having had by far the greater number. Mr. Marris, from Lincolnshire, though entered for several in most of the sections, did not show one. Twelve shearling and ten aged rams filled the pens in this class. The ewes were poorly represented, there being but three pens of shearlings and three pens of lamb ewes in the yard. The Border Leicesters numbered but seven shearlings and three aged rams, one pen of shearlings, and three pens of lamb ewes; the rams for the greater part were good, and Mr. L. Bland's four-shear particularly so; in fact, he is a magnificent sheep. But the greatest disappointment was in the numbers of Rosecommon sheep shown, after so much talk being made about them; probably the breeders are keeping up their strength for the Great Horse and Sheep Show, about to be held by the Dublin Society. However, though there was a paucity in numbers, the quality was good, and it appears that all the most noted breeders were represented; such as Messrs. J. Blood Smith, County Limerick; the two Cottons, Longford House; R. Flynn, Tuls; Glancy, Skapard; Roberts, Farr; David Lynch, Springfield; and Allan Pollok, Lismanny; all of County Rosecommon. There were ten each of shearling and aged rams, with two pens of shearling ewes, and four of lambs exhibited. Of other long-wooled sheep, the most extensive exhibitor was Mr. Beale Brown, who had six shearling, two aged rams, and one pen of shearling Cotswold ewes, with which he took prizes. The Shropshire Downes were weak in numbers, and Mr. C. W. Hamilton made sure of all the money prizes and a medal.

The shows of pigs and poultry were most excellent, and the best features of the meeting.

The dairy produce was very good, and the flax was also good, but lacked sufficient competition.

The implements and machinery occupied about fifty stands. The English exhibitors were—Bradford Manchester and London; Garrett, Leiston, Suffolk; Reading Iron Works, Reading; Hodgkin, West Derby, Liverpool; De Leon and Andre, London; W. A. Wood, London; Dodge, London; Richmonds and Norton, Liverpool; Teighe and Smith, London; Cambridge, Bristol; Ashby, Jeffery, and Luke, Stamford; Samuelson, Banbury; Hilton, Liverpool; Eastwood, Blackburn; Gibbs and Co., London; Waide, Leeds. From Scotland—Gordon and Co., Ayr; Gray, Uddingston. From France—Collyer. Irish—R. W. Morgan, Dublin; Goulding, Cork and Dublin; Kennan, Dublin; Ferrier, Athlone; McKenzie and Sons, Cork, Dublin, and Belfast; Barré, Dublin; Madden, Ballinasloe; Harpur, Ballinasloe; Alexander, Dublin; Jacques, Dublin; Baldwin, Dublin; Brown, Dublin; Gray, Belfast; Askiu, Newtownwards; Martin, Dublin; McMaster, Hodgson, and Co., Dublin; R. Irvine, Athlery; W. Carson and Sons, London and Dublin.

JUDGES.—H. Thornball, N. G. Barthorp, B. Wainman, H. Heywood, J. Pollock, S. Mowbray, E. Rae, G. Huston, W. Richardson, N. Archdall, L. Plunder, T. Harris, J. Pynnter, J. Bogge, J. A. Purdon, R. Reynell, Major D'Arcy, S. Garnett, G. Cueston, H. Pigstock, T. Boad, A. Warburton, M. Staunton, W. Merry, Rev. J. Bradshaw, De C. Kennedick, R. C. Wade, W. Fetherston, H. Greene, and W. Greene.

P R I Z E L I S T .

The Purdon Challenge Cup, value 60 gs., for the best Shorthorn bull calved on or after 1st January, 1865 (won last year by R. Chaloner).—R. Chaloner, of Kingsfort, Kells (Sovereign).

The Purdon Challenge Cup, 60 gs., for the two best Shorthorn heifers (won in 1869 by Wm. Bolton).—Wm. Bolton, The Island, Oulart, county Wexford (Chaumontel and Alley Gwynne).

The Bristol Challenge Cup, for the best bull in the district.—Major D'Arcy, Castlepark (St. Valentine).

The Croker Challenge Cup, value £50, with £20 added, for the best weight-carrying thoroughbred stallion (won last year by F. H. Power).—W. St. George, Tyrone House, Oranmore (Tom King).

The Cork Challenge Cup, value £20, for the best shearing ram (won last year by F. H. Power).—W. Owen, Blessington.

CATTLE.

SHORTHORNS.

Full, calved on or after the 1st January, 1865, and previous to the 1st January, 1868.—First prize, 10 sovs., R. Chaloner, Kingsfort, Moyalty, Meath (Sovereign); second, 5 sovs., E. J. Smith, Islammore, Croom, county Limerick (Lictor).

Bull calved in the year 1868.—First prize, 15 sovs., E. J. Smith, Islammore, Croom, Limerick (The Earl); second, 5 sovs., R. G. Coshy, Stradbally Hall, Queen's County (Colonel Frank).

Bull calved in 1869.—First prize, 15 sovs., R. W. Reynell (Prince Arthur Patrick); second, 5 sovs., N. M. Archdall, Crocknacrieve, Ballinamallard (Sam).

Bull calf, calved in 1870.—First prize, 5 sovs., Hon. J. Massy, Limerick (Baronet); second, 3 sovs., R. Coshy (King Herod).

Cow, in calf or in milk, calved previous to 1st January, 1870.—First prize, 10 sovs., J. Ganly (Leah); second, 5 sovs., J. Ganly (Modesty).

Heifer, in calf or in milk, calved in 1867.—First prize, 10 sovs., J. Ganly (Spring Rose); second, 5 sovs., J. Ganly (Lady Clarina).

Heifer, in calf or in milk, calved in 1868.—First prize, 10 sovs., W. Bolton (Alley Gwynne); second, 5 sovs., J. Ganly (Queen of Denmark).

Heifer, calved in 1869.—First prize, 10 sovs., W. Bolton (Chaumontel); second, 5 sovs., E. J. Smith (Gertrude).

Heifer calf, calved in 1870.—First prize, J. Ganly (The Angel); second, J. Ganly (Leah 2nd).

HEREFORDS, DEVONS, AND POLLED ANGUS.

Hereford bull, calved on or after 1st January, 1865.—Prize 15 sovs., R. W. Reynell.

Hereford cow, in calf or in milk, calved previous to 1st January, 1867.—Prize, Joseph Tuite, Souna and Calleen, Mullingar.

Hereford heifer, calved in 1868 or 1869.—Prize, R. W. Reynell.

Devon bull, calved on or after 1st January, 1865.—Prize, J. Peake.

Devon cow, in calf or in milk, calved previous to 1st Jan., 1867.—Prize, J. Peake.

Devon heifer, calved in 1868 or 1869.—Prize, C. Boyle.

Polled Angus or Galloway bull, calved on or after 1st Jan., 1865.—Prize, 10 sovs., Wm. Owen, Blessington, county Wicklow.

Polled Angus or Galloway cow, in calf or in milk, calved previous to Jan., 1867.—Prize, W. Owen.

Polled Angus or Galloway heifer, calved in 1868 or 1869.—Prize, F. Tyrrell, Donnerbrewer, Londonderry.

OTHER BREEDS.

West Highland cow, in calf or in milk, calved previous to 1st Jan., 1867.—Prize, A. Pollok.

West Highland heifer, calved in 1868 or 1869.—Prize, A. Pollok.

Ayrshire bull, calved on or after 1st January, 1865.—Prize, Patton.

Ayrshire cow, in calf or in milk, calved previous to 1st January, 1867.—Prize, D. Patton.

Ayrshire heifer, calved in 1868 or 1869.—Prize, David Patton.

Kerry Bull, calved on or after 1st January, 1865.—Prize, Captain Bayley.

Kerry cow, in calf or in milk, calved previous to 1st Jan., 1867.—Prize, J. T. Collins, Ballinasloe.

Kerry heifer, calved in 1868 or 1869.—Prize, Captain Bayley.

Cow of any breed, in calf or milk, calved previous to 1st Jan., 1867, not qualified to compete in foregoing sections.—Prize, J. Ganly, Hillsboro', Lucan.

Heifer of any breed, calved in 1868.—Prize, F. Trevor, Beech Hill, Donnybrook.

Cow, in calf or in milk.—First prize, D. Patton, Trynanny; second, W. T. D. W. Wood, Lisduff, Killimore.

Heifer, in calf or in milk, calved in 1867.—Prize, D. Patton.

Heifer calved in 1868 or 1869.—First and second prizes, P. Quin.

HORSES.

Croker Challenge Cup, value 50 sovs., with 20 sovs. added, weight-carrying thoroughbred stallion.—Prize, W. St. George, Tyrone House, Oranmore (Tom King).

Gelding or filly suited for hunting purposes, and up to at least 13 stone, foaled on or after 1st January, 1866.—First prize, 10 sovs., A. Pollok; second, 5 sovs., Major Seymour.

Brood mare, not thoroughbred, in foal, or having a foal at foot, or having reared a foal in 1870.—First prize, 10 sovs., T. Glancy, Frenchlawn, Ballintubber, Castlerca; second, 5 sovs., R. Bodkui, Annagh, Co. Galway.

Gelding or filly, suited for coaching purposes, foaled on or after 1st January, 1866.—First prize, 10 sovs., A. Pollok; second, 5 sovs., R. Bodkui.

AGRICULTURAL HORSES.

Stallion of any breed, for agricultural purposes, foaled on or the 1st of January, 1863, and previous to the 1st Jan., 1867.—Prize, 20 sovs., W. G. Benner, Tralee.

Stallion, foaled on or after the 1st January, 1867.—Prize, 10 sovs., R. Kerr.

Draught mare, in foal, or with foal at her foot, or having reared a foal in the year 1870.—First prize, 10 sovs., S. R. Kerr, Rathmoyle, Edenderry; second, 5 sovs., A. Pollok.

Draught gelding or filly, foaled on or after 1st Jan., 1867.—First prize, Sylvester Kerr, Eyrecourt, Ballinasloe; second, A. Pollok.

SHEEP.

LEICESTERS.

Shearling ram.—First prize, 10 sovs., W. Owen; second, 5 sovs., W. R. Meade.

Ram of any other age.—First and second prizes, W. Owen. Five shearing ewes.—First prize, Sir A. Walsh, Bart.; second, S. Mowbray.

Five ewe lambs.—Prize, Sir A. Walsh, Bart.

BORDER LEICESTERS.

Shearling ram.—First prize, 10 sovs., J. Pedder, Furlong, D'Loughtane; second, 5 sovs., A. Pollok; third, medal, John Pedder, Furlong.

Ram of any age.—First and second prizes, L. H. Bland, Q. C.

Five shearing ewes.—Prize, A. Pollok.

ROSCOMMON SHEEP.

Shearling ram.—First prize, 10 sovs., T. Roberts; second, 5 sovs., R. Flynn; third, medal, R. Flynn.

Ram of any age.—First prize, J. B. Smith; second, R. Flynn; third, T. Roberts.

Five shearing ewes.—First prize, C. Cotton; second, Wm. Cotton.

Five ewe lambs.—Prize, W. Cotton.

OTHER LONG-WOOLED SHEEP.

Shearling ram.—First prize, T. B. Brown; second, J. B. Smith, third, T. B. Brown.

Ram of any other age.—First and second prizes, T. Beale Brown.

Five shearing ewes.—First prize, T. B. Brown; second, J. B. Smith; third, T. Cornwall.

SHROP OR OTHER DOWNS.

Shearling ram.—First prize, 10 sovs., C. W. Hamilton;

second, 5 sovs., C. W. Hamilton; third, medal, C. W. Hamilton.

Ram of any other age.—First and second prizes, C. W. Hamilton; third, S. Mowbray.

Open for competition to Tenant Farmers whose Poor-Law valuation is under £100 per annum.

Five ewes which have reared lambs in 1870.—First prize, P. Quinn; second, M. Marnane.

Five hogget ewes.—First prize, P. Quinn; second, Pat. Rogers.

PIGS.

COLOURED BREED.

Boar under 18 months old.—First prize, Major D'Arcy; second, J. J. McCabe.

Boar over 18 months and under 36 months old.—First prize, F. Trevor; second, R. G. Cosby.

Breeding sow under 18 months old.—First prize, A. Pollok; second, Lieut.-Colonel C. R. Cliechester.

Breeding sow over 18 months old.—First prize, J. C. Cooper; second, R. W. Reynell.

Three breeding pigs of the same litter, above 4 and not exceeding 8 months old. First prize, Lieutenant-Colonel C. R. Cliechester; second, J. Molloy.

Sow and litter of not less than six pigs.—First prize, Allan Pollok; second, R. G. Cosby.

WHITE BREED.

Boar under 18 months old.—Prize, J. C. Cooper.

Boar over 18 months old.—Prize, J. W. B. Magill.

Breeding sow under 18 months old.—Prize, J. C. Cooper; second, J. W. B. Magill.

Sow and litter of not less than six pigs.—J. Molloy.

Three breeding pigs of the same litter, above 4 and not exceeding 8 months old.—Prize, J. L. Naper.

Open for competition to Tenant Farmers whose Poor-Law valuation is under £100 per annum.

Breeding sow, over six and under twelve months old.—Prize, M. Marnane, Ballyryan West, Tipperary.

Breeding sow, over 18 months, in pig or with litter.—Prize, P. Marnane.

At the banquet at Balinasloe, his Excellency, The LORD LIEUTENANT said: I would wish to call attention to the stock of this country, which has had such great reputation of recent years, which produces such wealth to the country, and which is so eagerly sought for on the other side of the Irish Channel. I believe that the stock in Ireland has been greatly increasing, and consequently the wealth of the country, in regard to stock, has also increased very considerably during the past few years. I am not able to give you many statistics, but I can give you a few figures. With regard to the stock of this country during the last year, I find that the value of stock in Ireland has increased over the value in 1869 by nearly half a million sterling. If we go into the subject further, we shall find that number of cattle increased by nearly 67,000 since last year, and what is still more remarkable is, the number of pigs in the country, an important item to the poor farmer has increased by about 367,465. The exports have not been much greater than former years. Up to May the trade in cattle was very brisk, but that in store cattle was very much diminished, in consequence of the almost unprecedented drought that existed. I believe I am correct in stating that in England, and especially my own neighbourhood of the midland counties, the stock had to be fed with oilcake. As far as the farmers of this country are concerned, I think they should look carefully to this stock, for if I am not much mistaken towards the end of the year there will be a great demand for cattle in Ireland, in consequence of the great number penned up in Germany, for there is annually a great importation of cattle here from Germany, and consequently a vigorous demand will ensue for Irish cattle. The question of the cattle trade is one of great importance to this country. On previous occasions I have been obliged to allude to it, and since I have been here I have had a good deal of business to transact on the subject. I believe that the value of the cattle trade of this country amounts to over £7,000,000 a-year. Last year I referred to the Act which had for its object the prevention of contagious diseases of cattle in England. I then expressed a hope that before another Session had passed the same benefit would be extended to this country. I am glad to say that the same benefit has been extended to this country, and has had the effect of diminishing the amount of disease

in Ireland in store and other stock; but I would also wish to draw attention to an incident which recently occurred in the House of Lords, and in which a noble peer, who represented Scotland, endeavoured to introduce a clause which would have hampered very much the cattle trade of the country. I am happy to say that the Government were able to resist that motion without going into a division. It shows that there is a very strong feeling on the subject of Irish cattle in Great Britain, and I was obliged, when I had the responsibility of answering the objection raised, to undertake on the part of the Government that we should use in this country every possible means to check the spread of disease, and put the cattle traders of this country on the same footing as the rest of the United Kingdom. I most sincerely trust that we shall continue to receive the support which, I am happy to say, we have already received from the farmers and proprietors of this country in carrying the necessary restrictions. After saying this I am glad to be able to state that in comparison with this time last year, the health of the stock in Ireland is exceedingly good, though we had an outbreak of pleuro-pneumonia, we have in existence at the present moment some regulations which were not legally in force in the spring, by means of which we were able to reduce the number of cases of this kind reported to us to 11. That is a satisfactory proof of the condition of stock in Ireland. Having alluded to the stock of the country, I may be permitted to come to a subject still more important. I mean the tillage of the land of this country. I believe that every one who has travelled about in this country will admit that there is very great room for improvement in the manner in which the husbandry of this country is conducted. It is a mistake to suppose that if we advocate an improvement in the cattle of this country, it is our wish to diminish the tillage of the land. If we improve the tillage of the land, there is a great demand for manure and for store cattle. But I believe every one will admit that there is vast room for improvement in this respect. Everyone who goes over the country will see farms, full size, large, and small, in a terribly backward condition, very little manure being put into them by the money of the tenant. We too often find the tenant living in a house which a stranger would hardly think fit for the habitation of his stock. The stranger would think that the tenant farmer was exceedingly poor; but I am assured that that is not the case, and that he is able to have a decent home for himself, his wife, and his children—is really a man who has a large sum of money, which he hides, perhaps, in the thatch of his house. I do not know whether the story is true or not, but I was told it; and I was also informed that in the country banks of Ireland nearly twenty millions of money is deposited belonging entirely to the tenant-farmers of this country. I say that if that money were laid out on the farm it would return the farmer greater interest than it could when lying in the banks. There is really something terribly wrong in this state of things. I know not with what force it is said that the tenant is afraid to show his wealth and prosperity to his landlord. I myself don't feel such want of confidence in the landlords of Ireland. On the last occasion I had the honour of addressing this society I was at Tralee. I then referred to a matter that was beginning to be warmly discussed in the country. I allude to the Land Bill. Towards the close of my speech I called upon my hearers to treat that subject with fairness and impartiality, and especially in a practical spirit. I do not know how far my advice can be said to have been followed during the past winter, but I think I may state that Her Majesty's Government did honestly endeavour to introduce a measure in the spirit in which I then spoke. From being a party question it has now happily passed into the law of the land. I believe that no great question has ever been treated in Parliament with so much generosity, and so little of the bitterness of party feeling. I think we may congratulate ourselves on that result. I think that great praise is due to that numerous class in the country who hold responsible and difficult positions among us, and who, though they may have differed from the course the Government adopted, offered no serious opposition to the proposed measure. I think that the working of the Act will be marked with the same feeling in the future. I believe that the Land Act will set at rest the land agitation in Ireland. It is my honest conviction that good landlords will not be seriously affected by the measure; that their influence will not be diminished, but rather increased; and that

the influence of their order will be much greater in consequence of the checks and restrictions which will now be placed on those whose conduct towards the tenants has hitherto lowered them in general estimation. There is another point to which much allusion has been made. I refer to the probability that much litigation may be incurred by the Land Bill in this country; but I have too high an opinion of the good sense of the landlords and tenants of this country to think anything of the sort. There is no one who is a better counsellor than the lawyer on the proper occasion, but there is no one whom the sensible man will fly further from. Wherever a dispute may arise, I hope there may be very few of them between landlord and tenant, and I sincerely trust and advise that they may try some other course before referring to these gentlemen; but if these disputes are referred to the authorities who have charge of them, I feel convinced that they will discharge their responsible duties with all the ability

with which they have discharged their duties in this country. I trust, however, that it will not be a bad advice to them to forget their lawyer. There is one thing which I hope will come about in consequence of the Land Bill, and that is the removal of the feeling of insecurity from among the small tenants of the country. I believe that it will be in favour of the prosperity of the small tenants, who will look upon it as a source of security. We have had allusion to the farming, the bad horses, and the want of investment of capital, and of other things which the farmers of Ireland have been accustomed to; but I think that when this security has been given, when this Land Bill has been passed, that it will leave those illegally inclined without any excuse. The small farmers who have farms in this country will feel more secure than those in a similar position before, and I trust they will be able to show that they are more industrious and energetic than they have hitherto been.

DARLINGTON, SOUTH DURHAM, AND NORTH YORKSHIRE SHOW.

The twelfth annual exhibition was held in the grounds occupied by Mr. D. Hurworth, in Four Riggs-lane, Darlington. The number of entries was 1,223, which was less than last year. The show of horses, however, was in advance of any former year, exceeding those of 1869 by 55, the falling off being in the other departments of the show.

JUDGES.—Thorough-bred stallions and hunters: N. Clarke, Beamish Park, Fence Houses; J. E. Bennett, Bosworth Grange, Rugby, and J. Furness, Coxhoe. Roadsters and ponies: R. Ridsdale, Cape Farm, Sheriff Hutton; J. Thomas, North Otterington, Northallerton; and W. Carr, Lilling Grange, York. Agricultural stallions, harness, and agricultural horses: W. W. Hawden, Walkerfield, Staindrop; J. Mewburn, Ingleby, Yarm; and J. Outhwaite, Bainesse, Catterick. Dairy produce: Mrs. Wade, Little Burdon, Darlington, and Miss Lawson, Mordon, Ferryhill.

PRIZE LIST. HORSES AND FOALS.

HUNTERS.

Cart foal.—First prize, £2, G. Collard, Trafford Hill, Yarm; second of £1, R. Emmerson, Over Dmsdale.

Filly foal.—First prize, £2, J. Dodsworth, Great Stainton; second of £1, E. Waldy, Barmpton.

Yearling gelding.—First prize, £3, G. Pollard, Trafford Hill, Yarm; second of £1 10s., J. T. Robinson, Lecky Palace, Ashenby, Thirsk.

Yearling filly.—First prize, £3, R. Emmerson; second of £1 10s., W. Clark, Asenby, Thirsk.

Two years old gelding.—First prize, £4, J. Cattle, Barton-le-Street; second of £1 10s., R. F. Trenholme, Butterwick, Sedgfield.

Two years old filly.—First prize, £4, J. T. Robinson; second of £1 10s., J. A. Arnett, Togston, Acklington.

Three years old gelding.—First prize, £4, R. Brunton, Marton, Middlesbrough; second of £1 10s., S. L. Laue, Baldersby Park.

Three years old filly.—First prize, £4, Miss E. A. Aglionby, Eastwaite Lodge, Hawkshead; second of £1 10s., G. Knowlson, Thormanby, Easingwold.

Brood mares, by a thorough-bred horse, having a foal at her foot, or stinted.—First prize, £4, B. Spraggon, Nafferton; second of £1 10s., J. T. Robinson.

ROADSTERS.

Colt foal.—First prize, £2, T. Harrison, Wheldrake; second of £1, H. Pease, Pierremont, Darlington.

Filly foal.—First prize, £2, B. Spraggon; second of £1, F. Greathed, Darlington.

Yearling gelding.—First prize, £4, T. Barnard, Birdforth; second of £1 10s., S. R. C. Ward, Darlington.

Yearling filly.—First prize, £4, the Rev. J. C. Wharton, Gilling; second of £1 10s., J. M. Muggleswick, Durham.

Two years old gelding.—First prize, £4, J. Carter, Marske; second of £1 10s., R. White, Seaton Carew.

Two years old filly.—First prize, £4, E. Waldy, Barmpton; second of £1 10s., R. Emmerson.

Three years old gelding.—First prize, £4, J. S. Stowell, Darlington; second of £1 10s., C. Knowlson, Birdforth.

Three years old filly.—First prize, £4, G. Askwith, Hutton Sessay, Thirsk; second of £1 10s., W. Stead, Cleckheaton.

Brood mare, having a foal at her foot, or stinted.—First prize, £4, G. Leng, Highcliffe, Winston; second of £1 10s., T. Harrison, Wheldrake.

Colt foal for harness.—First prize, £2, M. Willey, Highington; second of £1 10s., M. Robinson, Hawxwell, Bedale.

Filly foal.—First prize, £1 10s., J. W. Botcherby, Middleton St. George; second of 10s., M. Robinson, Hawxwell.

Yearling gelding.—First prize, £3, Mrs. J. Dixon, Cocker-ton; second of £1 10s., J. W. Blair, Darlington.

Yearling filly.—Prize, R. Watson, Stockton-on-Tees.

Two years old gelding.—First prize, £3, G. Liddle, Great Chilton, Ferryhill; second of £1 10s., T. Plummer, Easingwold.

Two years old filly.—First prize, £2, J. C. Johnson, Manfield, Darlington; second of £1, J. Plews, Whitby.

Two years old gelding.—First prize, £3, G. D. Trotter, Upleatham, Marske; second of £1 10s., T. Plummer, Easingwold.

Three years old filly.—First prize, £2, R. Garnett, Northallerton; second of £1, J. Donaldson, Great Ayton, Northallerton.

Brood mare, to have a foal at foot or stinted.—First prize, £4, M. Robinson, Hawxwell; second of £1 10s., R. Watson, Stockton-on-Tees.

Ponies not exceeding 12 hands.—First prize, £2, G. B. Blakey, Newcastle; second of £1, H. Pease, Darlington.

Colt or filly foal for agriculture.—First prize, £2, Lieut.-Col. C. L. Wood, Bishop Auckland; second of £1, M. Tomlinson, Cowthorpe, near Wetherby.

Yearling gelding.—First prize, £3, T. Cumming, Lancaster; second of £1 10s., J. Atkinson, High Beaumont Hill, Darlington.

Yearling filly.—First prize, £3, J. Henderson, South Shields; second of £1 10s., N. Stonehouse and Son, Marske-by-the-Sea.

Two years old gelding.—First prize, £4, G. Atkinson, Seaham; second of £1 10s., J. F. Green, Darlington.

Two years old filly.—First prize, £4, Lieut.-Col. Wood; second of £1 10s., G. F. Stelling, Darlington.

Three years old gelding.—First prize, £4, W. C. Carr, Newcastle-upon-Tyne; second of £1 10s., N. Stonehouse and Son.

Three years old filly.—First prize, £4, M. Reid, Chester-le-Street; second of £1 10s., J. Hopps, Bedale.

Brood mare, to have a foal at foot or stinted.—First prize, £4, G. Atkinson, Hall Farm, Seaham; second of £1 10s., E. and A. N. Pawson, Burley-in-Wharfedale.

Thoroughbred stallion.—Prize, £50, T. Winteringham, Croft, near Darlington (Underhand).

Agricultural stallion.—Prize, £20, J. Forshaw, Burley-in-Warfdale (Non-such).

Four years old mare or gelding, by a thoroughbred horse, for the field.—A cup, value £10, J. Bulman, East Greystones, Gainford; second of £3, G. Lancaster, Morton Grange, Northallerton.

Four years old mare or gelding, roadster.—A silver cup, value £5, T. Sutton, Middleton-one-Row; second of £3, H. R. W. Hart, Dunnington Lodge, York.

Mares or geldings, any age, not exceeding 15½ hands high. A silver cup, value £5 5s., J. H. Harris, Houndales, dales, Morpeth; second of £3, J. S. Stowell, Faverdale House, Darlington.

Mare or gelding that leaped the fences best to the satisfaction of the judges.—First prize, £7, C. Rose, Market Hill, Malton; second of £3, R. Applegarth, Bishop Middleham.

Pony, mare or gelding, not exceeding 14 hands high, that leaped the fences best to the satisfaction of the judges.—Prize, £4, J. S. Stowe, Faverdale House, Darlington.

BUTTER, EGGS, &c.

Fancy butter.—Silver cream jug, value £2, Mrs. Shepherd, Sadberge, Darlington; second of 10s., Miss J. Burnside, Low Bottom House, Cockerton.

Plain butter.—First prize, £2, Mrs. G. T. Stephenson, Whitecross, Darlington; second of 10s., Mrs. Shepherd, Sadberge, Darlington.

DRIFFIELD AND EAST RIDING AGRICULTURAL SOCIETY.

This Society celebrated their sixteenth show of stock and implements in fields adjoining the Beverley-road, Driffield.

The cattle found many admirers, being of pure blood and quality, the bulls of any age comprising the best animals in the East Riding. The cows in calf or milk were no less commendable. Pigs and sheep were limited in extent, but their merit was unmistakable, as they constituted the cream of the district. Horses were the great feature of the show, and in the aggregate they made up a capital display of various breeds.

The following were the judges:

SHORTHORNS, SHEEP, AND PIGS.—E. Hodgkinson, Morton Grange, Retford; J. Angus, Bearn, Stocksfield; and C. Clark, Minskip Lodge, Borough-bridge.

HORSES.—W. Uppley, Bonby, Lincolnshire; J. R. Kirkham, Andley Villa, Caistor; A. L. Maynard, Skinnin Grove, Saltburn-by-the-Sea; Jackson, Everett, Loughton, Gainsbro'; T. Scott, Broom Close, Boroughbridge; and J. Turner, The Grange, Ulechy, Lincolnshire.

PRIZE LIST.

SHORTHORNS.

Bull of any age.—First prize, £10, W. Linton, Sheriff Hutton, York; second of £5, T. Frank, Fylingdales, Whithy.

Cow in calf or milk.—First prize, £5, T. Frank, Fylingdales, Whithy; second of £3, W. Linton, Sheriff Hutton.

Yearling heifer.—First prize, £3, T. Hornby, Flotmanby, Ganton; second of £1, R. H. Robinson, Langtoft Field.

Heifer calf under twelve months old.—First prize, £2, W. Linton; second, H. F. Smith, Sattton, Hull.

Fat ox of any age or breed.—First prize, £2, P. Dunn, Pasture House, Siggleshorpe; second, executors of F. Jordan, Eastburn.

EXTRA STOCK.

First prize, J. Sterriker, Driffield, for half-bred Alderney heifer; second, G. Angus, Beeford Grange, for pure Hereford cow; third, G. Angus, for pure Hereford bull calf.

Best yearling bull.—First prize, silver cup value £10, J. S. Jordan, Emswell (Nestor); second of £3, R. Fisher, Leconfield, Beverley (Royal Prince).

SHEEP.

Shearling ram.—First prize, £7, E. Riley, Beverley; second of £3, E. Riley.

Three shearling rams.—First prize, £5, E. Riley; second of £2, E. Riley.

Aged ram.—First prize, £5, E. Riley; second of £2, J. W. Sharp, Ulrome, Lowthorpe.

Pen of five breeding ewes and lambs.—First prize, £5, S. Staveley, Tibthorpe; second of £2, J. Dickson, Nafferton.

Five shearling wethers.—First prize, £4, W. Brown, Holme-on-Spalding Moor.

Five shearling gimmers.—Prize, a silver tankard, E. Riley.

HORSES.

Thoroughbred stallion, for hunters.—First prize, £6, Mr. Shaw, Market Weighton (Prince Plausible); second of £2, G. Lamplough, Nafferton (Strathern).

Stallion for coach horses.—First prize, £6, W. Jackson, Garton (Helicon); second of £2, W. Haunce, Garton (Garton Groz).

Stallion for roadsters.—First prize, £6, T. Brown, Butterwick (Bay President); second of £2, P. Triffitt, Holme-on-Spalding Moor (Fireaway).

Stallion for agricultural purposes.—First prize, £6, F. Simpkin, Brough (Lord of the Manor); second of £2, R. Marshall, Keyingham (Simon Pure).

Mare and foal for hunting.—First prize, G. C. Jarratt, Harpham; second of £2, W. H. Harrison Broadley, M.P., Welton.

Two years old hunting gelding or filly.—First prize, £3, Sir G. Cholmley.

Yearling hunting gelding or filly.—First prize, £2, Sir G. Cholmley.

Mare and foal for coaching.—First prize, £5, J. Johnson, Brigham.

Coaching mare without a foal.—First prize, £3, J. Stephenson, Winestead.

Three years old coaching gelding.—First prize, £5, J. Johnson; second of £2, W. Coleman, Fraithorpe.

Two years old coaching gelding.—Prize, £3, W. Coleman.

Yearling coaching gelding or filly.—Prize, £2, J. Stephenson, Winestead.

Coaching filly under four years old.—Prize, £4, John T. Marshall, Beeford.

Roadster mare and foal.—Prize, £5, J. Wilde, Holme, York.

Three years roadster nag or mare.—Prize, £3, R. Lowish, Haithorpe.

Mare and foal for agricultural purposes.—Prize, £5, Smith, Bempton.

Three years old gelding or filly for agricultural purposes.—First prize, £4, J. Thompson, South Dalton; second of £2, G. Angus, Beeford Grange.

Two years old gelding or filly for agricultural purposes.—Prize, £3, W. Walker, Scorbro' Deocy.

Yearling gelding or filly for agricultural purposes.—Prize, £2, W. Walker, Scorbro' Deocy.

Pair of horses, of either sex, for agricultural purposes.—Prize, £4, R. Beckett, Watton.

Ladies' pony under 14 hands.—Prize, £3, P. Jordan, Caythorpe, Bridlington.

Pony not exceeding 12 hands.—First prize, £1, J. W. Jordan, North Burton; second, A. Duggleby, Laurel House, Beswick.

EXTRA STOCK:

Roadster, gelding or mare of any age, not less than 14½, and not exceeding 15 hands high.—Prize, a silver cup, value £25, J. Robson, Old Malton.

Hunting mare or gelding, four years old.—Prize, a silver cup, J. B. Barkworth, Raywell, Brough.

Hunting mares or geldings, all ages.—Prize, a silver cup, value £25, H. Jewison, Raithorpe.

Hunting mare or gelding, three years old.—Prize, a silver cup, value £10 10s., Sir G. Cholmley.

Mare or gelding, not exceeding 15 hands 2 inches high.—

Prize, a silver cup, value £10 10s., Capt. G. Boynton, Manthorpe, Barton Agues.

PIGS.

Boar, large breed.—Prize, £2, J. and H. Sugden, Leconfield.
Sow, large breed.—Prize, £2, J. Thompson, Seamer.
Boar, small breed.—Prize, £2, D. Sellers, Driffield.
Sow, small breed.—Prize, £2, D. Sellers.
Store pig, the property of a labourer or working mechanic.—

First prize £2, T. Dawson, Driffield; second of £1, J. Storey, Wuter.

DAIRY PRODUCE.

The best 6 lbs. of butter.—Prize, a silver butter cooler, J. Major, Sledmere Grange.

The best and heaviest 12 hen's eggs.—Prize, a silver egg stand, Mrs. Holmes, Sunderlandwick.

COUNTY CORK AGRICULTURAL SOCIETY—MEETING AT CORK.

In point of numbers and in regard to the quality of some of the classes, the show of the Cork Agricultural Society was a decided improvement. The Shorthorns and Ayrshires were up to the average, as were also the sheep; while the dairy cattle were superior to those exhibited on the last occasion.

JUDGES.

HORSES.—H. Briscoe; Major Browne, Scots Greys; W. Quinn.

SUORTHORNS.—C. Cole Hamilton; A. Warburton.

MISCELLANEOUS.—J. Bogue; G. Hewson.

P R I Z E L I S T.

CATTLE.

SHORTHORNS.

Bull calved previously to January 1st, 1868.—First prize, E. J. Smith, Islamore, Croom; second, F. W. Lowe, Kilsbane, Tipperary.

Bull calved in the year 1868.—First prize, E. J. Smith; second, W. H. Massy, Mount Massy, Macroom.

Bull calved in the year 1869.—First prize, R. J. M. Gumbleton, Curryglass; second, E. J. Smith.

Bull Calf, calved in 1870.—First prize, the Representatives of the late T. Hungerford, Clonakilly; second, E. J. Smith.

Cow, in calf or in milk, of any age.—First prize, R. J. M. Gumbleton; second, Christy Brothers, Fort Union, Adare.

Heifer calved in 1868.—First prize, J. Popham, Bandon; second, Christy Brothers.

Heifer calved in 1869.—First prize, E. J. Smith; second, R. J. M. Gumbleton.

Heifer Calf, calved in 1870.—First prize, E. J. Smith; second, R. Smith, Mallow.

AYRSHIRE.

Bull calved previously to Jan. 1st, 1869.—First prize, H. Jones; second, J. Roche, M.D.

Bull calved on or after Jan. 1st, 1869.—First prize, H. Jones; second, R. Barter, jun.

Cow, in calf or in milk, of any age.—First and second prizes, T. Forest.

Heifer calved in the year 1868.—First prize, H. Jones; second, J. Roche, M.D.

DAIRY COWS.

Lot of three Dairy Cows, of any age or breed.—First prize, D. Driscoll; second, T. Forrest.

EXTRA STOCK.—The prize to M. Ahern, of Blarney.

H O R S E S.

Cart Stallion.—Prize, H. Irvine, Dunvale, Cork.

Draught mare in foal, or with a foal at her foot.—First prize, J. McKeuzie, Innishannon; second, J. B. Roberts, Ballinhassig.

Three-year-old Colt or Filly for farming purposes.—First prize, M. Ahern; second, Mrs. Forrest, Killcens.

Two-year-old Colt or Filly for farming purposes.—First prize, M. Ahern; second, T. Forrest.

SHEEP.

LEICESTER.

Shearling Ram.—First prize, S. Mowbray; second, W. R. Meade.

Ram of any other age.—First prize, W. R. Meade; second S. Mowbray.

Pen of five Shearling Ewes.—Prize to S. Mowbray.

BORDER LEICESTER.

Shearling Ram.—First and second prizes, J. P. Furlong.

Ram of any other age.—Prize, R. Briscoe.

OTHER LONG-WOOLLED.

Shearling Ram.—Prize, J. P. Furlong.

Ram of any other age.—Prize, J. B. Smyth.

Pen of five Shearling Ewes.—Prize, J. B. Smyth.

SHORT-WOOLLED.

Shearling Ram.—First prize, R. W. G. Adams; second, J. P. Furlong.

Ram of any other age.—Prize, R. W. G. Adams.

Pen of five Shearling Ewes.—Prize, R. Barter, jun.

P I G S.

Boar of the white breed, over 12 months old.—First prize, R. Lawe; second, I. W. B. Magill.

Boar of the white breed, under 12 months old.—First prize, J. C. Cooper; second, W. J. Rumley.

Boar of the coloured breed, over 12 months old.—First prize, J. C. Cooper; second, A. C. J. Warren.

Breeding Sow of the white breed.—Prize, J. C. Cooper.

Breeding Sow of the coloured breed.—First prize, J. C. Cooper; second, A. C. J. Warren.

Lot of three breeding pigs of the same litter, born in 1870.—Prize, I. W. B. Magill.

FOR TENANT FARMERS ONLY.

Cow for dairy purposes, of any breed or cross-breed.—First prize, D. Driscoll, Blarney; second, J. McDonnell, Carrigaline; third, M. Forrest, Blarney.

Heifer, of any breed or cross-breed, calved in 1868.—First prize, Christy Brothers; second, T. Dorgan.

Heifer, of any breed or cross-breed, calved on or after Jan. 1, 1869.—First prize, Christy Brothers; second, D. Driscoll.

Five Ewe Lambs.—First prize, T. Forrest; second, R. J. Nash.

Yearling Shorthorned Bull.—First prize, M. Ahern, Blarney; second, T. Forrest, Blarney.

Thoroughbred Sires.—First prize, St. George Mansergh, Friarsfield, Tipperary; second, F. H. Power, Mallow.

HUNTERS.

Weight-carrying Hunter, not less than five years old, equal to 14 stone.—First prize, E. H. Reeves, Mallow; second, J. B. C. Justice, Riverstown.

Hunter, not less than five years old, equal to 12 stone.—First prize, Colonel Ainslie, Royal Dragoons; second, R. D. Hare, Queenstown.

Four-year-old Horse or Mare for hunting purposes.—First prize, J. Bruce, Charleville; second, R. Lawe, Ballynova.

Three-year-old Colt or Filly for hunting purposes.—First prize, F. H. Power, Mallow; second, T. Hayes, jun., Crosshaven.

Ladies' Riding Horse or Mare.—First prize, Viscountess Doneraile; second, T. Garde, Middleton.

Park Haek.—Prize, J. Bruce, Charleville.

Harness Horse.—Prize, J. Bruce.

Pony under 12 hands high.—Prize, R. Clifton, Clifton Grange.

Neatest and smallest pony, over three years old.—Prize, H. Morris, Douglas.

Thoroughbred Mare, in foal, or with foal at foot.—First prize, E. Burke, Ringaskiddy; second, W. Barry, Carringtonhill.

Brood Mare, for producing weight-carrying hunters, in foal, or with a foal at foot.—Prize, J. Delany, Riverstown.

Mare calculated to produce weight-carrying hunters, in foal, or having had a foal in '69 or '70.—First prize, W. S. Hunt, Killeagh; second, J. B. C. Justice.

THIRSK AGRICULTURAL SOCIETY.

The first show of this newly-established Society was held near Thirsk. There were some very good animals in the cattle classes, especially the dairy cows, for the best three of which a silver cup was awarded to Mr. T. H. Hutchinson, of Manor House, Catterick. Major Stapylton took the first prize for bulls with Lord Wetherby. Mr. T. H. Hutchinson carried off all the prizes for Leicester sheep. The two prizes for thorough-bred entire horses for hunters went to J. R. Dennison, for Grand Master, and to J. Meggison for Shibolet. The prize for the best entire agricultural horse was obtained by J. Farsham for Non Such.

JUDGES.

HORSES.—Hunters and Roadsters: A. L. Maynard, Skinninggrove; G. Bolau, Alwinton, Rothbury. Coach and Cart Horses: J. Mewburn, Ingleby Hill, Yarm; W. Hill, North Charlton, Embleton.

CATTLE, SHEEP, AND PIGS.—T. P. Outhwaite, Goldsborough; T. Scott, Broom Close, Ripon; J. Culshaw, Towneley Hall, Burnley.

PRIZE LIST.

CATTLE.

SHORTHORNS.

Best bull, two years old and upwards.—First prize, Major Stapylton, Myton Hall; second, the Hon. P. Dawney, Benningbrough Hall.

Bull, above one year and under two years.—First prize, Cap. R. Tennant, Scarcroft Lodge, Leeds; second, S. Barker, Pockley, Helmsley.

Calf, under twelve months old.—First prize, Major Stapylton; second, Capt. R. Tennant.

Cow or heifer, in calf or milk, three years old and upwards.—First prize, Capt. R. Tennant; second, J. W. Botcherly, Middleton-one-row, Darlington.

Cow or heifer, in calf or milk, under three years old.—First prize, Capt. R. Tennant; second, I. Garbutt, Brag House, Farndale.

Heifer, one year old and under two years.—First prize, T. H. Hutchinson; second, Capt. R. Tennant.

Heifer calf, under twelve months old.—First prize, Major Stapylton; second, Major Stapylton.

ANY BREED OR CROSS.

Cow, for dairy purposes.—First prize, J. T. Robinson, Leckby Palace, Thirsk; second, C. Douthwaite, Northallerton.

Cow, the property of a cottager.—First prize, J. Cummings, Weswick, Ripon; second, J. Todd, Sion Hill, Thirsk.

Three dairy cows, in calf or milk, the property of a tenant farmer.—Prize, a silver cup, T. Hutchinson, Manor House, Catterick.

A silver medal to Capt. Tennant's first prize cow.

SHEEP.

LEICESTER OR LONG WOOL.

Ram, one shear.—First prize, T. H. Hutchinson; second, T. H. Hutchinson.

Ram, aged.—First prize, T. H. Hutchinson; second, T. H. Hutchinson.

Pen of three gimmer shearlings.—First prize, T. H. Hutchinson; second, T. H. Hutchinson.

Pen of three ewes, having suckled lambs in 1870.—First prize, T. H. Hutchinson; second, T. H. Hutchinson.

OTHER BREEDS.

Pen of three Marsham ewes, having suckled lambs in 1870.—First prize, H. Walton, Low Gingerfield, Richmond; second, W. T. Wells, Kirklington, Ripon.

PIGS.

Boar, large breed.—First prize, W. Lister, Armley; second, G. Chapman, Seamer.

Boar, small breed.—First prize, G. Knowlson, Thormanby; second, W. Lister.

Boar, any other breed, not qualified to compete in the two previous classes.—First prize, S. Appleby, Armley; second, G. Sedgwick, York.

Sow, large breed, in pig or milk.—First prize, W. Lister; second, G. Chapman.

Sow, any other breed, not qualified to compete in the two previous classes.—First prize, J. Greaves, Clothholme; second, G. Chapman.

Three gilt pigs, under twelve months old.—First prize, W. Routledge, York; second, G. Chapman.

Pig, the property of a cottager.—First prize, T. Greenwood, Leeds; second, J. Eden, Thirsk.

A silver cup for the best female pig to W. Lister.

HORSES.

Thoroughbred stallion for hunters.—First prize, J. R. Dennison, Minsthorp, Pontefract; second, J. Meggison, Brompton Moor, Northallerton.

Stallion for agricultural horses.—Prize, J. Forsham, Burley-in-Wharfedale.

Brood mare for breeding coach horses, with foal at foot.—First prize, J. Curry, Bolby; second, W. Mothersill, Brockholme, Northallerton.

Brood mare for breeding roadsters, with foal at foot.—First prize, F. Cookson, Roundhay, Leeds; second, A. Hawxwell, Thirsk.

Brood mare for breeding agricultural horses, with foal at foot.—First prize, T. Upton, Pallathorpe, Tadcaster; second, J. Pinkney, Bagby Grange.

HUNTERS.

Yearling gelding for the field.—First prize, G. M. Lomas, Dishforth, Thirsk; second, J. T. Robinson, Leckby Palace, Thirsk.

Yearling filly for the field.—First prize, W. Clark, Asenby, Thirsk; second, R. Emmerson, Over Dinsdale.

Two years old gelding for the field.—First prize, J. Cattle, Barton-le-street, Malton; second, R. Brunton, Marton, Middlesbro'.

Two years old filly for the field.—First prize, G. B. Peirson, Baldersby; second, J. T. Robinson.

Three years old gelding for the field.—First prize, S. L. Lane, Baldersby Park; second, S. L. Lane.

Three years old filly for the field.—First prize, J. Kirby, Knayton; second, G. Knowlson, Thormanby.

Hunting gelding or mare four years old, to be ridden in the ring.—First prize, D. Batty, Myton; second, J. Kirby.

COACH HORSES.

Yearling gelding.—Prize, W. Mothersill, Brockholme, Northallerton.

Yearling filly.—Prize, J. Walls, Kilvington.

Two years old gelding.—First prize, T. Plummer, Birdforth, Easingwold; second, J. Wells, Hutton Hall, Ripon.

Two years old filly.—First prize, J. Cleasby, Carlton Miniott, Thirsk; second, J. Plews, Howlett Hall, Whitby.

Three years old gelding.—First prize, T. Plummer; second, M. and W. Boville, Walk Mills, Osmotherley.

Three years old filly.—First prize, J. Donaldson, Great Ayton; second, — Garnett, Welbury, Northallerton.

ROADSTERS.

Two year old gelding.—First prize, J. Orrell, Byland Abbey; second, J. Carter, Marske.

Two years old filly.—First prize, G. B. Carter, Thirsk; second, W. Sanderson, Hambleton.

Three years old gelding.—First prize, R. M. Bowman, M.D., Ripon; second, C. Knowlson, Birdford.

Three years old filly.—First prize, W. Snowden, Slingsby; second, W. Robinson, Morton-on-Swale.

Gentleman's hackney, any age or sex, not exceeding 15 hands in height.—First prize, T. Robson, Thornton Marishes; second, R. M. Bowman, M.D.

CART HORSES.

Yearling gelding.—Prize, C. Boroby, Baldersby, Thirsk.

Two years old gelding.—First prize, Mrs. Hedon, Baldersby; second, Hon. G. E. Lascelles, Thirsk.

Three years old gelding.—Prize, P. Stephenson, jun., Rainton.

Three years old filly.—First prize, M. Reed, Beamish Burn, Chester-le-street; second, J. Hopps, High Burton.

Pair of Agricultural horses, of either sex.—First and second prizes, Major Stapylton, Myton Hall, Helperby.

Best jumper.—First prize, H. Johnson, Spofforth; second, C. Rose, Malton.

Mare for breeding weight carrying hunters, with a foal at foot.—First prize, silver cup, W. H. Clark, Howden; second, J. T. Robinson, Leckby Palace, Thirsk; third, R. Cattley, Wigginthorpe.

Pony, not exceeding 14 hands in height, any age or sex.—First prize, A. Hawxwell, Thirsk; second, T. Brooks, Manor House, Thirsk.

THE DURHAM COUNTY AGRICULTURAL SOCIETY.

MEETING AT SUNDERLAND.

The twenty-second annual exhibition of this Society was held on the farm of Mr. R. Smith, High Hendon. This year's show, that a larger number of silver cups were offered by gentlemen of the town and neighbourhood of Sunderland than at any previous meeting in other parts of the county. The number of Shorthorns on the show-ground last year, at Bishop Auckland, was 29, and this year 47; and horses 143 last year, and this year 220. One of the principal features of the show was, of course, the exhibition of hunters. Amongst them were several very fine animals. The special prize for the best shorthorned breeding animal was awarded to Mr. Outhwaite's heifer Vivandiere; the special prize for the best shorn, the property of a landowner or occupier in the county of Durham, was taken by Mr. Geo. Atkinson's heifer Village Bell, which also took the special prize, consisting of a piece of plate of the value of 25 guineas.

JUDGES.

CATTLE, SHEEP, AND PIGS: John Wood, Stanwick Park, Darlington; Jefferson, Preston Howe, Cumberland; George Wilkinson, Herrington.

HORSES.—Field and Harness: W. Hawdon, Walkerfield; J. Atkinson, Doddington, Wooler; R. Hodgson, Biamper. Cart: B. Spraggon, Nafferton; R. Wade, Little Burdon; C. Hubbick, Durham.

DAIRY PRODUCE: The Mayoress of Sunderland; the Hon. Lady Williamson; Lady Julia Wombwell.

P R I Z E L I S T .

CATTLE.

SHORTHORNS.

Bull of any age.—First prize, £5, W. H. Raine, Morton Tinnmouth, Darlington; second, Earl Vane, Wynyard Park (Sultan 2nd).

Hunter.—First prize, a silver cup, Captain A. H. Hunt, Birtley; second, £5, E. T. Smith, Colepike Hall.

Leaper.—First prize, a silver cup, T. Dobson, Newcastle; second, £2, Robert Woodfield, East Herrington; third, £1, R. T. Walker, Fence Houses, Greatham, Stockton-on-Tees.

Saddle Mare.—First prize, £5, John Thomas Robinson, Leckby Palace, Aseby, Thirsk; second, £2, B. Spraggon, Nafferton, Stocksfield-on-Tyne.

Three-year-old colt for the field.—First prize, £4, R. Burdon, Castle Eden; second, £1, R. Brunton, Marton, Middlesborough.

Three-year-old filly for the field.—First prize, £4, Philip Kirkup, Bishopwearmouth; second, £1, G. Mears, Tatham-street, Sunderland.

Two-year-old colt for the field.—First prize, £3, R. F. Trenholm, Butterwick, Sedgfield; second, £1, W. Smith, Carr House, Darlington.

Two-year-old filly for the field.—First prize, £2, John Thomas Robinson; second, £1, A. Hedley, Elyhaugh, Felton.

Yearling colt for the field.—First prize, £2, J. T. Robinson; second, £1, A. Hedley.

Yearling filly for the field.—First prize, £2, R. Emmerson, Over Dinsdale, Darlington; second, £1, William Forster, West Herrington.

Harness mare.—First prize, £5, William Laing, Sunderland; second, £2, Robert Crow, Low Raisby, Kelsoe.

Three-year-old colt for the field.—First prize, £4, J. Beach, Durham Hotel, West Hartlepool.

Three-year-old filly for harness.—First prize, £1, Robert Garnett, Welbury, Northallerton; second, £1, John Donaldson, Great Ayton, Northallerton.

Two-year-old colt for harness.—First prize, £3, J. H. Harris, Houndalee, Morpeth.

Three-year-old filly for harness.—First prize, £3, W. Palister, Houghton-le-Spring.

Foal for the saddle.—First prize, J. T. Robinson; second, 10s., R. Emmerson, Over Dinsdale, Darlington.

Foal with harness.—Prize, W. Minto, Hetton-le-Hill, Easington Lane.

Cart foal.—First prize, Colonel Wood, Howlish Hall; second, 10s., J. Rennoldson, Cleadon Laws, Cleadon.

FOR AGRICULTURAL PURPOSES.

Cart mare.—First prize, £5, G. Atkinson, Hall Farm, Seaham; second, £2, J. Laws, Eachwick Red House, Dalton, Northumberland.

Three-year-old cart colt.—First prize, £4, W. C. Carr, South Benwell, Newcastle; second, £1, N. Stonehouse and Son, Skelton Mill, Marske-by-the-Sea.

Three-year-old cart filly.—Prize, £4, M. Reed, Beamish Burn.

Two-year-old cart colt.—First prize, £3, G. Atkinson; second, £1, T. Gibbons, Cleadon Hills, Harton, South Shields.

Two-year-old cart filly.—First prize, J. Atkinson, Bywell Hall Farm, Stocksfield-on-Tyne; second, £1, M. T. Clark, Pittington Hallgarth.

Yearling cart colt.—First prize, £2, T. Cumming, Lancheater, Durham; second, £1, J. Fowler, Claypath, Durham.

Yearling filly.—First prize, £2, J. Henderson, Horsley Hill, South Shields; second, £1, T. Cumming,

Pair of daught horses.—First prize, a silver cup, G. Atkinson; second, £2, G. Wilkinson, East Herrington, Sunderland.

ROADSTERS.

Roadster.—First prize, a silver cup, value 10 guineas, G. Dale, West Lodge, Carlington; second, £3, H. H. Thompson, The Oaks, Sunderland.

LADIES' HACKNEY.

Ladies' hackney.—First prize, a silver cup, D. Dale; second, £3, H. H. Thompson.

Pony, not exceeding twelve hands high.—First prize, £2, C. Taylor, 1, Thornhill-terrace, Sunderland; second, £1, R. L. Pemberton, The Barnes, Sunderland.

LOCAL PRIZES.

Pair of draught horses, the property of an inhabitant of the borough.—First prize, a silver cup and £5, W. H. Allison, Undercliffe, Sunderland; second, £2, E. and F. Richardson, Steam Mills, Bishopwearmouth.

Single draught horse, the property of an inhabitant of the borough.—First prize, £2, W. H. Allison; second, £1, J. J. Allison, Roker.

Pony, not exceeding fourteen hands in height, the property of an inhabitant of the borough.—First prize, L. Briggs, The Cedars, Sunderland; second, J. Crisp, Lane House, Hylton-road.

DAIRY PRODUCE.

Four pounds of fresh butter.—First prize, J. Henderson, Horsley Hill, South Shields; second, Mrs. Atkinson, Seaham Hall Farm; third, Mrs. Burnside, Hollar House, Cockerton.

Two half-pounds of fresh butter.—First prize, W. Smith, East Boldon; second, Jane Newby, Littlethorpe, near Easington.

Four pounds of fresh butter.—First prize, Miss Peacock, Springwell House; second, Mrs. J. Fish, East Boldon.

Basket of fresh hen eggs.—First prize, Mrs. G. Dawson, Tunstall; second, G. H. Proctor.

The dinner was well attended; Sir H. Williamson, Bart., M.P., occupied the chair.

THE NORTHUMBERLAND AGRICULTURAL SOCIETY.

MEETING AT MORPETH.

The weather was very favourable, and the number of visitors during the day was very great. The show in many respects deserves to be regarded as one of the most successful the Society has ever held, both as regards number and quality. In 1868, when at Cornhill, the total number of entries was 734, in 1869, when at Hexham, the total was 907; and this year, at Morpeth, the total was 939. The first prize for the aged bull was carried off by Mr. Coulthart, Brampton, with Ace of Trumps. Lady Pigot, Branches Park, Newmarket, gained two silver medals, one for the year old bull, Bythis, and the other for her celebrated cow, Queen of Rosalea. The display of Gallows was small, but excellent in quality.

JUDGES.

CATTLE.—Shorthorns: T. C. Booth, Warlaby, Northallerton; J. Knowles, Wetherby Grange, York; and G. Mitchell, Meikle, Heddoe, N.B. Gallows: W. Forster, jun., Stonegarth Side, Longtown; W. Armstrong, Tarnend, Milton; and J. Little, Guards' Farm, Greta.

SHEEP.—Border Leicesters: A. Geekie, Baldowrie, Glasgow; F. P. Lynn, Mindrim Mill, Coldstream; and W. C. Thompson, Dilstonhaugh, Cumberidge. Cheviot and blackfaced: W. Henderson, Powberry Mains, Belford; J. Hogarth, Julien Bower, Penrith; and H. H. Scott, Alham, Alnwick.

HORSES.—Agricultural purposes: J. Atkinson, Brandon, Alnwick; J. Bolam, Glororum, Belford; and J. Blackstock, Hayton Castle, Maryport. Horses for the field: J. Parrington, Brancepeth, Durham; J. Smith, Humburton, Borobridge; and J. Usher, Stodrigg, Kelso. Hackneys and ponies: G. Coulthard, Lanercost Abbey, Brampton; R. Craig, Lyham, Belford; and L. C. Chrisp, Hawkhill, Alnwick.

PIGS.—J. Rutherford, Way-to-Wooler, Wooler; J. A. Armstrong, Baysleap, Newcastle; and C. Borthwick, Mindrim, Coldstream.

WOOL.—J. Humble, Newcastle.

PRIZE LIST.

CATTLE.

SHORTHORNS.

Bulls, above two and under seven years old.—First prize, Coulthard, Smith, and Bell, Brampton (Earl of Chester); second, J. Newton, Cholerton (Ace of Trumps); third, J. Wright, Greengill, Penrith.

Bulls, above one and under two years old.—First prize, Lady Pigot, Branches Park, Newmarket (Bythis); second, W. Linton, Sheriff Hutton, York; third, J. Outhwaite, Bainesse, Catterick.

Bull calves, under twelve months old.—First prize, R. Harrett, Kirkwelpington (Gipsy Queen); second, Sir M. W. Ridley, Bart., Blagdon.

Cows.—First prize, Lady Pigot (Queen of Rosalea); second, W. Linton.

Heifers, above two and under three years old.—First prize, Sir W. C. Trevelyan, Bart., Wallington (Yetholm Daisy); second, J. Outhwaite.

Heifers, above one and under two years old.—First prize, T. H. Hutchinson, Manor House, Catterick (Lady Blanch); second, G. and J. Atkinson, Bywell Hall Farm.

Heifer calves, under twelve months old.—First and second prizes, Sir W. C. Trevelyan.

Heifers, above two and under three years old.—First prize, G. and J. Chirney, Ellington, Morpeth; second, G. G. Lee, West Laud Ends, Haydon Bridge.

Heifers, above one and under two years old.—First prize, S. Langdale, High Espley, Morpeth; second, G. G. Lee.
Heifer calves, under twelve months old, S. Langdale; second, G. G. Lee.

GALLOWAYS.

Bulls above two years old.—James Graham, Parcelstown, Carlisle.

Bulls under two years old.—James Cunningham, Tarbreock, Dalbeattie.

Cows or heifers above three years old.—First prize, James Cunningham; second, James Graham.

Cows or heifers under three years.—James Graham, Parcelstown, Carlisle.

SHEEP.

BORDER LEICESTERS.

Rams of any age.—First and second prize, Rev. R. W. Bosanquet, Rock, Alnwick.

Shearling rams.—First prize, George Torrance, Sisterpath; second, Mr. Simson, jun., Bainslie, Lauder; third, Messrs. Dinning, Nilston Ridge.

Pen of five ewes.—First prize, George Simson, Courthill, Kelso; second, J. and G. Laing, Wark.

Pen of five gimmers.—First prize, Rev. R. W. Bosanquet, Rock; second, John Langdale, Newton Red House.

CHEVIOTS.

Rams of any age.—First and second prize, Thomas Elliot, Hindhope. Commended, John Douglas, Swininside Hall, Jedburgh.

Two shearling rams.—First and second prize, Thomas Elliot, Hindhope, Jedburgh.

Pens of five ewes.—First prize, T. Elliot; second, R. Shortreed, Attonburn.

Pen of five gimmers.—First and second prize, T. Elliot, Hindhope.

BLACK-FACED MOUNTAIN BREEDS.

Rams of any age.—First prize, T. Oliver, Redburn, Stanhope; second, H. T. Thompson, Lamparts, Gilsland.

Shearling rams.—First prize, T. Oliver, Redburn; second, T. White, Westburnhope.

Pens of five ewes.—First prize, D. Tweedie, Lanarkshire; second, C. Armstrong, Garrigill.

Pens of five gimmers.—First prize, D. Tweedie; second, C. Armstrong.

ANY OTHER DISTINCT BREED.

Pens of five ewes and gimmers.—Prize, T. H. Hutchison, Manor House, Catterick.

HORSES.

FOR AGRICULTURAL PURPOSES.

Brood mares, with foal at foot.—First prize, J. and G. Atkinson, Bywell Hall Farm; second, J. Laws, Eachwick Red House.

Three years old geldings or fillies.—First prize, C. Lister, Coleby Lodge, Lincoln; second, B. Spraggon, Nafforton.

Two years old geldings or fillies.—First prize, J. Dinning, Belford; second, T. Gibson, Cleadon Hills.

One-year-old geldings or fillies.—W. Laws, Black Heddon; second, J. Laycock, Low Gosforth.

Pair of geldings or mares of any age.—W. Smith, Melkington.

Pairs of mares of any age.—Gibbons, Burnfoot.

FOR THE FIELD.

Brood mares.—First prize, Mr. Robinson, Lechby Palace; second, Mr. Crisp, Hawkhill.

Three-years-old geldings or fillies for the field.—First prize, Messrs. Armstrong, Carlisle; second, Mr. Smith, Melkington.

Two-years-old geldings or fillies for the field.—First prize, Mr. Calder, Kelloe Mains; second, Mr. Smith, Carr House.
One-year-old geldings or fillies for the field.—First prize, R. Dand, jun., Field House, Bilton; second, Mr. Thompson, The Frolic, Capheaton.

Horses or mares, above five and under ten years old.—First and second prize, Sir W. C. Trevelyan.

Hunters.—First prize, T. E. Smith, Gosforth House; second, T. Parker, Shellaeres, Norham.

Horses or mares, four-years-old.—First prize, Mr. Turnbull, Branton West Side; second, J. Wilson, Woodhorn Manor.

Hackneys, horse or mare.—First prize, C. Stevenson, Newcastle; second, J. H. Harris, Hounddale, Morpeth.

Ponies, horse or mare.—First prize, J. Newton, Chollerton; second, T. Sample, Bothal Castle; third, Master Annett.

SWINE.

Boars of the large breed, of any colour.—First and second prize, Mr. Duckering, Northorpe, Kirtou, Lindsey.

Boars of the small breed, of any colour.—First prize P. Eden, Salford; second, Mr. Mangles, Ripon.

Sows of the large breed, of any colour.—First and second prize, Mr. Duckering, Northorpe.

Sows of the small breed, of any colour.—First prize, Mr. Eden, Salford; second, Mr. Duckering, Northorpe.

Sows of the middle breed.—First prize, Mr. Eden, Salford; second, Mr. Duckering, Northorpe.

Sow pigs, pen of 3 of the large breed, under sixteen weeks old.—First prize, Mr. Eden, Salford.

Sow pigs, pen of 3 of the small breed, under sixteen weeks old.—First prize, Mr. Eden, Salford.

WOOL.

Leicester, best five fleeces.—First prize, Messrs. Laing, Wark; second, The Executors of the late J. Angus, Whitefield.

Cheviot, best five fleeces.—First and second prize, R. Donkin, Ingram.

Half-bred, best five fleeces.—First and second prize, R. Donkin, Ingram.

Black-faced, best five fleeces.—First and second prize, Earl of Tankerville.

About 300 gentlemen sat down to the dinner, in a large pavilion erected on the show ground. The chair was occupied by the Right Hon. Lord Vernon, President of the Royal Agricultural Society (of Sudbury Hall, Derbyshire, and the owner of the Widdrington estate).

The CHAIRMAN, in proposing "Success to the Northumberland Agricultural Society," alluded to the great agricultural improvements which had taken place in the county of Northumberland during the last few years. These, he believed, were in great part due to the energy and activity of the various persons engaged in the cultivation of the soil, and also to the good relations which subsisted between landlord and tenant. He next alluded to the subject of women labouring in the fields, and contended that the occupation was quite as healthy as many others in which women were engaged, and in no degree more degrading. He spoke at some length of the improvements which might yet be introduced into agricultural affairs by a more extended use of steam power in the cultivation of the soil. Northumberland, he thought, was in many respects well suited for the introduction of steam power as the fields were generally large, and as some of them knew to their cost, the soil was stiff and heavy. He concluded by coupling the toast with the name of the secretary, to whose abilities he paid a warm compliment.

GLOUCESTERSHIRE AGRICULTURAL SOCIETY.

MEETING AT STROUD.

At the annual show of the Gloucestershire Agricultural Society the Entries was very short. The *Hereford Times* describes the stalls of the white faces "a beggarly account of empty boxes;" several of which were entered for the show did not make an appearance. There had

been three entries; viz., Mr. John Baldwin's Lord Ashford; Mr. Thomas Edwards's Leominster the Third; and Mr. Thos. Thomas's (St. Hilary) Sir John the Third—a prizetaker at Taunton and Oxford. Two out of the three stalls were, however, vacant, and Leominster the Third, which was

third in his class at Oxford, and a grand young bull, by Tomboy, a son of the famous Sir Thomas—was alone in his glory. In the next class—bulls above one and under two years old—five out of six entered were shown, viz., Mr. Thos. Edwards's Sir Robert, also by Tomboy; Mr. H. R. Evans's Sir Oliver the 3rd, by the Hampton Court Sir Oliver the 2nd; Mr. John Harding's Count Fosco and Noble Boy, the former by Severus and the latter by Symmetry; and Mr. Richard Hill's, by Interest. Of this lot Count Fosco was placed second at Oxford to that grand young bull Mr. Philip Turner's Trojan; Mr. Hill's President—about which there was so much talk, on the ground of his great size and development for his recorded age—third; while Noble Boy and Sir Oliver the 3rd passed without official recognition. The judges at Stroud reversed the Oxford decisions, for they placed Noble Boy first, and did not notice his stall companion, Count Fosco; Mr. Edwards coming second with Sir Robert, and Mr. H. R. Evans getting the reserve number with Sir Oliver the Third; the big bull from Orleton not at all taking their fancy. In the class for bull-calf under 12 months old, Mr. Richard Hill and Mr. H. R. Evans were the only two who exhibited out of an entry of four; Mr. Hill's Pearl Diver taking first, and Mr. Evans's calf by Chieftain second. The breeding cow class, which had three entries, was a blank; and the class for heifers under two-years-old was just redeemed from that position by the presence of Mr. John Harding's Dahlia. In the class for heifer calf under 12 months' old, three out of four were staled. Thus ended the meagre list of the Herefords. Out of the 49 entries of Shorthorns there were about a dozen absentees. In the aged bull class we understood that the Taunton decisions were reversed.

The entries of horses reached to 103, and nearly all were present. In the class of entire thoroughbred sires for producing hunters or hacks, the first prize fell to Mr. M. Biddulph. The class for hunters of any age, in which there were 13 entries, was a very fair one. The class for hunters under five years old was a good one, and the mare and foal class (13 entries) was a remarkably good one. We subjoin a list of the judges and prizes.

JUDGES.—Cattle: E. Doig, Lillingstone Hall, Buckingham; T. S. Bradstock, Cobrey Park, near Ross. Sheep and Pigs: T. Walker, Stowell Park, near Northleach; A. Edmonds, Longworth, Faringdon. Cart Horses: J. Craddock, Eastington, Northleach; J. Barton, Colne St. Aldwyns, Fairford. Hunters and Roadsters: Col. Kingscote, C.B., Kingscote Park, Wotton-under-Edge; Major Heywood, Ocle Court, Hereford; J. E. Bennett, Husband's Bosworth Grange, Rugby. Cheese: B. Brunsdon, Ross; J. Bretherton, Gloucester.

CATTLE.

HEREFORDS.

Bull above 2 years old.—Prize, £10, T. Edwards, Wintercott, Leominster (Leominster 3rd, 3211).

Bull above 1 and under 2 years old.—First prize, £10, J. Harding, Bieton, Shrewsbury (Noble Boy); second of £5, T. Edwards, Wintercott (Sir Robert).

Bull calf under 12 months old.—First prize, £5, R. Hill, Orleton Court, Ludlow (Pearl Diver); second of £2, H. R. Evans, jun.

Heifer under 2 years old.—Prize, £5, J. Harding, Bieton, Shrewsbury (Dahlia).

Heifer calf under 12 months old.—First prize, £4, J. Harding (Red Dahlia); second of £2, E. J. Morris, Stanley Pontlarge, Winchcombe (Stanley's Delight).

Three dairy cows of any breed, in milk.—First prize, £10, G. Garne, Churchill Heath; second, £5, E. J. Morris.

SHORTHORNS.

Bull above 2 years old.—First prize, £10, the Right Hon. Lord Sudeley, Toldington, Winchcombe; second £5, G. Garne.

Bull above 1 and under 2 years old.—First prize, £10, T. Garne and Son, Broadmoor, Northleach; second of £5, J. Dove, Hambrook House, near Bristol.

Bull calf under 12 months old.—First prize, £5, R. Stratton, Burderup, Swindon, Wilts; second of £2, T. Morris, Maisemore Court, near Gloucester.

Bull, cow, and offspring.—Prize, £10, R. Stratton.

Breeding cows.—First prize, £6, R. Stratton; second of £3, G. Garne.

Heifer under 3 years old.—First prize, £6, R. Stratton; second of £3, T. Garne and Son.

Heifer under 2 years old.—First prize, £5, R. Stratton; second of £2 10s., G. Garne.

Heifer calf under 12 months old.—First prize, £4, R. Stratton; second of £2, R. Stratton.

BREEDING SHEEP.

Long-wools (five theaves).—First prize, £5, Executors of the late T. Gillett, Kilkenny, Faringdon, Berks; second of £5, Sir J. Rolt, Ozleworth Park, Wotton-under-Edge.

Ram of any age.—First prize, £5, Executors of the late T. Gillett; second of £3, T. B. Brown, Salferton Park.

Shearing rams.—First prize, £3, Executors of the late T. Gillett; second of £3, Executors of the late T. Gillett.

Five ewe lambs.—Prize, £5, H. Cole, Ashbrook, Cirencester.

Five ram lambs.—Prize, £5, H. Cole.

Short-wools (five theaves).—First prize, £10, Sir W. Throckmorton, Bart., Buckland, Faringdon; second of £5, Colonel Kingscote, C.B., M.P., Kingscote Park.

Ram of any age.—First prize, £5, Sir W. Throckmorton, Bart.; second of £3, Sir W. Throckmorton, Bart.

Shearing ram.—First prize, £5, Colonel Kingscote, C.B., M.P.; second of £3, Colonel Kingscote, C.B., M.P.

Five ewe lambs.—Prize, £5, Sir W. Throckmorton, Bart.

Five ram lambs.—Prize, £5, G. Wallis, Old Shifford.

OXFORDSHIRE AND SHROPSHIRE.

Ram of any age.—Prize £5, G. Wallis, Old Shifford.

Shearing rams.—Prize £5, G. Wallis.

HORSES.

Cart horses, stallion.—First prize, £20, W. Wynn, Cranhill Leys, Grafton, near Alcester; second of £10, Col. Kingscote, C.B., M.P.

Cart horses, mare and foal.—First prize, £10, G. Finch, Cubberley Court, Cheltenham; second of £5, S. Davis, Woolashill, near Pershore.

Cart horses, gelding or filly.—Prize, £5, J. Theyer, Crickley Hill, near Cheltenham.

Stallion for getting hunters or hacks.—First prize, £25, M. Biddulph, M.P., Ledbury (The Mallard).

Hunters of any age.—First prize, £20, R. Holman, Bays Hill, Cheltenham (Pinlinnion); second of £10, C. Cook, Toddington, Winchcombe.

Hunter under five years old.—First prize, £15, A. Newman, Winchcombe. second of £7 10s., W. Till, Coaley, Dursley.

Mare and foal.—Prize, £10, R. Swanwick, Royal Agricultural College Farm, Cirencester.

Hack not exceeding 15 hands.—First prize, £10, R. N. Hooper, Llansannor Court, Cowbridge; second of £5, W. T. Dewe, Coed Cue, Llanelli.

Pony above 12 and under 14 hands.—First prize, £5, Capt. J. S. Ballard, The Verlands, Cowbridge; second of £4, Major Quinton, Haruhill, Cirencester.

Pony not exceeding 12 hands.—First prize, £5, R. Newcombe, Cirencester; second of £3, H. S. Stephens, Stonehouse.

CHEESE.

1 cwt. of thick cheese.—First prize, £5, G. Gibbons, Tunley Farm, Bath; second of £2 10s., S. M. Harding, Nupdown Thornbury.

1 cwt. of double cheese.—First prize, £5, J. Harris, Court House Farm, Cam, Dursley; second of £2 10s., J. Smith, Nupdown Farm, Thornbury.

1 cwt. of thin cheese.—First prize, £5, J. Harris, Court House; second of £2 10s., T. Wittchell, Nyumphfield.

THE DORCHESTER AGRICULTURAL SOCIETY.—The show of this Society was very small. Mr. John Pittfield, of Symondsbury, with his Triumph gained the Hon. W. H. B. Portman's prize for the best bull. Mr. W. Paull, of Puddleton, showed the best heifers, those from Mr. W. Mayo, jun., of Friar's Waddon, being commended. Mr. T. H. Saunders, of Watercombe, carried off Mr. Wingfield Digby's prize for ewes, and also exhibited some good wethers in the extra stock department. Mr. J. C. Fooks, of Cerne Moss, Mr. G. W. Homer, of Athelhampton, and Mr. James Harding, of Waterson, were the other principal prize takers for sheep. A prize offered by Mr. Brymer for the best cart stallion was won by Mr. F. Kelloway of Stratton. At the dinner which followed the show General Sir John Michel presided. It was agreed to invite the Bath and West of England Society to visit Dorchester in 1872.

WHITBY AGRICULTURAL SOCIETY.

At the thirty-seventh annual show of this society the entries exceeded in number those of last year in all the classes except those of sheep; while the classes for horses, particularly the coaching and hunting breeds, were well filled, some of the animals exhibited being of great excellence. The following were the principal prizes awarded:

HORSES.

Thorough-bred stallion.—Prize, P. Hogarth, Lythe.
 Coaching stallion.—Prize, R. Rhea, Pickering.
 Agricultural stallion.—Prize, R. Cole, Flaxton.
 Coaching brood mare, with her foal or stunted.—First prize, R. Welford and Sons, Newton; second, J. Porritt, Buck Rush.
 Coaching foal, colt or filly.—First prize, R. Welford and Sons; second, J. Plews.
 Yearling coaching colt or filly.—First prize, Messrs. Wormald, Normanby; second, A. Welford, Brock Rigg.
 Yearling coaching filly.—First prize, R. Welford and Sons; second, I. Garbutt, Farndale.
 Two-year-old coaching gelding.—First prize, Jilson Estill, Hawsker; second, M. Wellburn, Fylingdales.
 Two-year-old coaching filly.—First prize, G. Gill, Brotton; second, J. Plews, Uggelbarby.
 Three-year-old coaching gelding.—First prize, T. Jackson, Barnby; second, P. Campion, Overdale.
 Three-year-old coaching filly.—First prize, J. Donaldson, Ayton; second, T. Newton, Easington.
 Agricultural brood mare with her foal or stunted.—First prize, W. Burnett; second, W. A. Wood, Sutton Forest.
 Agricultural foal, colt or filly.—First prize, J. Cross; second, W. A. Wood, Sutton Forest.
 Agricultural yearling colt or filly.—Prize, J. Braithwaite, Ebberston.
 Agricultural two years old filly or gelding.—First prize, W. Brewster, Little Barugh; second, Messrs. Wormald.
 Pair of agricultural horses, having been worked as such during the season, age or sex immaterial.—First prize, C. M. Palmer; second, W. Ward, Fanniel Flat.
 Hunting brood mare, with her foal or stunted.—First prize, R. Jackson, Normanby; second, J. Forster, Newton.
 Hunting foal, colt or filly.—First prize, R. Wood, Pinchthorpe; second, F. Peirson, Westonby.
 Hunting yearling, colt or filly.—First prize, P. Shimmins; second, C. M. Palmer.
 Two-year-old hunting colt or filly.—First prize, Messrs. Wormald; second, W. Ward.
 Three years old hunting gelding.—Prize, W. Ward.
 Three years old hunting filly.—First prize, R. Jackson; second, J. S. Darrell, Ayton.
 Hunting mare or gelding.—First prize, J. S. Darrell; second, H. Jewison, Raisthorpe.
 Horse or mare of any breed, which leaps the artificial fences in the best hunting style.—First prize, C. Rose, Malton; second, J. Forster, Newtown.
 Hunting mare or gelding.—First prize, H. Linton, East Row; second, W. Ward.
 Roadster mare or gelding over 14 hands.—First prize, J. Robson; second, D. Hartley.
 Pony, mare or gelding, over 12½ and not over 14 hands.—First prize, J. S. Darrell; second, J. Weighill.
 Pony, mare or gelding, not over 12½ hands.—First prize, J. Windle; second, T. Boyes.

Donkey, horse or mare.—First prize, T. Richardson, Sandsend; second, S. Wilson, Egton.

CATTLE.

SHORTHORNS.

Bull calf, over six and under twelve months old.—First prize, Cass Smith, Westerdale; second, J. Cross.
 Two years old bull.—First prize, W. C. Worsley; second, D. Hartley.
 Heifer calf, over six and under months old.—First prize, J. Bulmer; second, J. Wilkinson.
 Yearling heifer.—First prize, C. Smith; second, R. Hodgson, Westerdale.
 Two years old heifer, in milk or calf.—First prize, I. Garbutt; second, J. Bulmer.
 Cow, in milk or calf.—First prize, I. Garbutt; second, Cass Smith.

DISTRICT PRIZES FOR CATTLE.

Dairy cow, with special reference to milking.—First prize, H. Ward, Hawsker; second, J. Kerr, Lythe.
 Two yearling steers, which have been the property of the exhibitor six months prior to the show.—First prize, J. Plews; second, T. Beeforth, Sneaton.
 Pair of working oxen.—First prize, T. Watson, Sneaton; second, M. Wellburn.
 Cottager's cow, of any breed, with special reference to milking.—First prize, W. Galloway, Newholm; second, T. Lynass, Goldsbro'.

SHEEP.

LEICESTERS.

Shearling ram.—First and second prizes, I. and E. Tindale.
 Tup lamb.—First prize, W. S. Gray; second, T. B. Scoby, Rook Barugh.
 Pen of five ewes, having reared lambs in 1870.—First prize, E. Corner, Broad Ings; second, J. Elliot.
 Pen of five gimmer lambs.—First prize, W. S. Gray; second, T. P. Scoby.
 Pen of three tup lambs, bred by exhibitor.—First prize, E. Corner, Broad Ings; second, W. S. Gray.
 Two-shear or aged moor tup.—First prize, W. Rudsdale, Dauby; second, C. Smith.
 Shearling moor tup.—First prize, C. Smith; second, W. Rudsdale.
 Moor tup lamb.—First and second prizes, W. Rudsdale.
 Pen of five moor ewes, having reared lambs in 1870.—First C. Smith; second, W. Rudsdale.
 Pen of five moor shearling gimmers.—First prize, W. Rudsdale; second, C. Smith.
 Pen of five moor wethers, two-shear or upwards, bred by exhibitor.—First and second prizes, J. Peirson, Goathland.

PIGS.

Boars of any breed, over six months old.—First prize, G. Chapman, Seamer; second, M. Gray.
 Sow or gilt of any breed, over six months old.—First prize, J. Thompson, Seamer; second, G. Chapman.
 Boar of any small breed, over six months old.—First prize, J. Windle; second, G. Chapman.
 Sow or gilt of any small breed, over six months old.—First prize, R. Bowman, Pickering; second, G. Chapman.
 Cottager's pig, the owner not keeping more than one cow.—First prize, Joseph Ward, Woodlands; second, J. Young, Whitby.

NORTH LANCASHIRE AGRICULTURAL SOCIETY.

MEETING AT BLACKPOOL.

The attendance of visitors on the first day was not large, although the proceedings were unusually interesting to agriculturists, but on Wednesday the showyard was crowded with visitors, not only from Blackpool, but also from the neighbouring districts.

The judges of Shorthorns were W. Torr, R. Smith, and W. Key. The Shorthorns were well represented for a country exhibition such as this, and the class for aged bulls drew a good muster. Bolivar received the silver medal for the best Short-horn aged bull and Mr. Statter, rivalling Mr. Brierly in this

class, received second place, together with a silver cup, for the best three Shorthorns in the yard. A year-old bull belonging to G. Hunt, of Frenchwood, Preston, was placed first in the class for bulls above one and under two years old, for which a silver medal was offered. Mr. Statter's Prince of Thorndale came in second, out of a good contest among 17. The winner of the first medal was a roan cow, exhibited by Mr. W. Bradburn, of Wednesfield, Wolverhampton. The Rev. L. C. Wood's Miranda 10th was placed second; but when judged in the class for cattle of any breed, she gained greater distinction. Mr. Bradburn, of Wolverhampton, for best heifer not exceeding three years, took first and second prizes. For heifers not exceeding two years, Messrs. Statter, junior, and Brierley once more divided honours, Mr. Brierley being awarded the first medal, Mr. Statter the second, whilst Mr. Bradburn had to content himself with a "highly commended." Mr. Baxter, of Skipton, stepped in at the class for heifer calves, taking the chief award, leaving Lady Pigot, Messrs. Brierley, Statter, Farrar, and Hunt to settle the remaining positions. A special prize for the best Shorthorn bull for the locality was awarded to Colonel Clifton, Lytham Hall. For the best bull, two years old and upwards, two silver cups were offered, the first falling to Mr. Statter, jun., of Stand Hill, Whitefield, Manchester, for Thorndale Duke, four years old. There were nine entries in this class, and Duke of Thorneyholme, a three-years-and-ten-months, was placed second. The silver cup offered for the best bull, above one and under two years, was won by Mr. Geo. Hunt, Frenchwood, Preston, with a one-year-old, Knight of the Shire. He also secured the silver cup given for the best calf. In the competition for calves under twelve months, the first prize was given to Mr. Benjamin Baxter, Skipton, Yorkshire. For aged cows, the Rev. C. Wood, Singleton Lodge, Kirkham, received the first premium, Miranda 10th; Mr. J. Farrar, of Thorneyholme, second. For heifers not exceeding three years, in calf or milk, and for the best heifer not exceeding two years, Mr. Brierley, Mr. Statter, and Mr. Hunt again fell together, but for heifers not exceeding three years Mr. Farrar, of Thorneyholme, wrested the first place from both the former. Mr. Statter was placed second with a roan, Rosalea, verging on three years. Yorkshire took the prize for the best heifer calf, by Benjamin Baxter, of Skipton, Lady Hudson Baxter second.

The judges of Horses were Thomas Gibbons and William Kendal. "Laughing Stock," the hunter stallion, was awarded the first prize and the silver cup; having now won this piece of plate three years in succession, will secure it absolutely for his owners, C. and J. Moffat, at Kirklington

Park, Carlisle. For the best roadster stallion Lund and Redman, of Castle Yard, Preston, got the silver cup for a four-year-old, "Octavian." For the best draught stallion the first cup was given to James Forshaw, of Burley-in-Wharfedale, Yorkshire, for "Nonsuch," and the second to Abraham Cooke, of Much Hoole, Preston, for "Young Ploughboy." The best brood mare for draught purposes was shown by R. C. Richards, of Clifton Lodge, Preston. Thomas Fox, of Avenham Hall, Singleton, received the first medal given for the best mare for breeding hunters, and Mr. Statter, of Whitefield, the second. For the best brood mare for harness purposes, Mrs. Porter, of Layton Hall; T. H. Miller, Singleton Grange second. Pairs of draught horses, Mr. Brierley, of Middleton, first and second; Mr. Brierley also won the first and second prize in the next class for the best draught mare or gelding. Mr. Statter secured the first place for three-year-old gelding or filly for draught purposes, and J. W. Holt, Wood-road, Bury, second. Three-year-old geldings or fillies for hunting purposes, E. Twisaday, of Thwaite Moss, Rowland, and A. Aglionby, Esthwaite Lodge, Hawkshead, were first and second. J. McNeil, Faroo Hall Farm, near Fleetwood, received the prize offered for the best gelding for harness; H. Kirkham, Peel Marton, Blackpool, that for draught purposes; J. W. T. Tyler, of Esthwaite Lodge, Hawkshead, the cup for the best gelding for hunting purposes, W. Jackson, of Singleton, second; for two-year-old geldings or fillies for harness, the medals for first and second were won by the latter-named gentleman; W. Kirkham, of Stahine, Poulton-le-Fylde, the best yearling colt or filly for draught; and R. C. Richards, Clifton Lodge, Preston, the second. In the same class, for hunting purposes, W. Roberts, Thorneyholme, Burnley, gained the premium; and in that for hunters, Mrs. Shorroek and Sons, of Wharles; E. Jennison, of Ridge Farm, Pilling, medal for best colt for draught; W. S. Hodgson, of Thistleton, for hunting; and J. Nickson, of Lytham, for harness purposes; roadster mares, J. Scholefield, of Greenroyd, Rochdale, first, and W. Roberts, of Thorneyholme, Burnley, second; G. Wightman, of Preston, first for col above 13½ and not exceeding 15 hands; best gelding for dray purposes, J. Pearson, of St. Michael's Hall, Garstang, and best filly for the same purpose, R. Walsli, jun., of Thornton. Sheep were not numerous. The principal prizes were taken by T. H. Hutehinson, of Catterick, Yorkshire, who, with W. Norman, of Aspatria, Cumberland, and Mrs. Johnson, of Frodsham, divided the awards in the classes of Leicester, Shropshire, and long-wooled sheep. Pigs were also an exceedingly spare show, and P. Eden, of Salford, appropriated the first prizes in all the classes.

SALE OF MR. T. HORLEY'S SHROPSHIRE SHEEP.

AT THE FOSSE, LEAMINGTON,

ON MONDAY, JULY 25, BY MR. W. G. PREECE.

At the luncheon Mr. JOHN CANNING said: The true origin and pure lineage of this flock, and its claiming for its progenitors some of the highest-priced celebrated animals, and most noted Royal winners referred to in the records of Shropshire sheep, were indisputable.

Mr. R. H. MASEN eulogised the Shropshires exhibited at Oxford, and the integrity of the Judges, of whom he was one.

Mr. HORLEY compared the past and present exhibition of South Downs and Shropshires at the Royal shows, and pointed out the superiority of the latter.

The following are the prices realised:

RAMS.—1, Mr. Knight, 17 gs.; 2, Mr. Hand, 15 gs.; 3, Mr. Webb, 11 gs.; 4, Mr. Robins, 13 gs.; 5, Mr. Walker, 20 gs.; 6, Mr. Moore, £8 18s.; 7, not sold; 8, Mr. John Ford, 9 gs.; 9, Mr. Umbers, 10 gs.; 10, Mr. Harris, 8 gs.; 11, Mr. Cox, 19 gs.; 12, Mr. Knight, 16 gs.; 13, Mr. Aston, 11 gs.; 14, Mr. W. Wood, 14 gs.; 15, Lord Lowe, 13 gs.; 16, Mr. Bromfield, 8 gs.; 17, not sold; 18, Mr. Calcott, 8 gs.; 19, Mr. Umbers, 15 gs.; 20, Mr. Loggin, 14 gs.; 21, not sold; 22, Mr. Griffin, 6 gs.; 23, Mr. Lowe, 7½ gs.; 24, Mr. Hand, 8½

gs.; 25, Mr. J. Palmer, 7½ gs.; 26, Mr. Webb, £6 16s.; 27, Mr. E. Greaves, M.P., 10 gs.; 28, not sold; 29, Mr. H. J. Sheldon, 19 gs.; 30, Mr. Perkins, 7 gs.; 31, Mr. Jordan, 7 gs.; 32, Mr. Forman, 9½ gs.; 33, Mr. Bromfield, 7 gs.; 34, Mr. Birch, 8 gs.; 35, Mr. Reading, 10 gs.; 36, Mr. Hamer, 6 gs.; 37, not sold; 38, Mr. Burbery, £6 16s.; 39, Mr. Draper, 10 gs.; 40, Mr. Harwood, £7 17s.; 41, Mr. Palmer, 10 gs.; 42, Mr. Hand, £7 17s.; 43, Mr. Webb, 5 gs.; 44, Mr. Walker, £35 14s.; Mr. Horley, sen., 10 gs.; Mr. Knight, 12 gs.; Mr. Staite, 10 gs.

EWES.—1, Mr. Watson, £17 10s.; 2, Mr. Watson, £13 2s.; 3, Mr. Umbers, £12 10s.; 4, Mr. Umbers, £13 2s. 6d.; 5, Mr. Umbers, £13 2s. 6d.; 6, Mr. Botterill, £13 2s. 6d.; 7, Mr. Botterill, £13 2s. 6d.; 8, Mr. Botterill, £13 2s. 6d.; 9, Mr. Robins, £11 5s.; 10, Mr. Reading, £11 17s. 6d.; 11, Mr. Umbers, £11 5s.; 12, Mr. Reading, £11 5s.; 13, Mr. Webb, £9 7s. 6d.; 14, Mr. Umbers, £5; 15, Mr. Knight, £14 7s. 6d.; 16, Mr. Robins, £13 2s. 6d.; 17, Mr. Knight, £12 10s.; 18, Mr. Knight, £13 2s. 6d.; 19, Mr. Umbers, £12 10s.; 20, Mr. Knight, £13 2s. 6d.

THE ROMFORD SEWAGE FARM.

The Maplin Sands scheme for utilising the sewage of London has come to grief. The promoters have failed to carry out the project, and the Board of Works has declared the £25,000, lodged as security, to be forfeited. And so on Tuesday last the well-known Mr. Hope got up a party to inspect another sewage farm which he has recently established near Romford. The visit was arranged with more particular reference to the Metropolitan Board of Works, and consequently the unexpected death of the Chairman, Sir John Thwaites, on the day previous, threw something like a shadow over the proceedings. Otherwise the occasion was just such a gala day as people feel ready to treat themselves to at the fag end of the season. There was a team of greys, backed by two or three more pairs, awaiting the arrival of the mid-day train from town. There was an enjoyable drive of some three miles or so to Britton's, a walk over the farm, and a champagne luncheon laid out in a quaint old barn, duly decked with bright glass, fresh flowers, and national banners. Then every patch of crop was headed with a card showing when it was sown, how it had been gathered, and what it was worth. And from such particulars the critics were left very much to draw their own conclusions, for nothing could be less obtrusive than Mr. Hope's manner or more in good taste than the way in which he left the experiment to tell so far its own story.

And the company, if more congenial than captious, was certainly well qualified to pass an opinion on that they saw. There was Mr. Chadwicke, "the father of modern sanitary science;" there was Mr. Rawlinson, who "sat for eight years on a Royal Commission;" and Mr. Bailey Denton, "one of the most eminent of agricultural engineers;" and Col. Hogg and Mr. Adams, of the Metropolitan Board, with Mr. Grant, the second engineer of the works; while the local division of Essex agriculturists was headed by Sir Thomas Barrett Lennard, who is quite willing to aid any progressive movement in his own neighbourhood.

A report of the day's doings will be found in the following page, to which it may be as well to add a few particulars here. The farm at Britton's, with an old but unoccupied manor house upon it, is about two-and-a-half miles from Romford; it consists of some 110 acres of poor land, that would look to be worth, as times go, perhaps 30s., or say £2 an acre. Of this, the necessary arrangements having been made with the local Board of Health, Mr. Hope entered on possession at Michaelmas last under a seven years' lease, by which he agrees to pay a rental of no less than £900 a-year; that may be put as £300 for the land and £600 for the sewage, which, with the cost of carriage, would raise the gross rental to close upon £10 an acre. We can thus far go thoroughly with the Chairman of the Romford Board in congratulating the rate-payers on "the excellent tenant they had found," although we can scarcely see, with such figures before us, how "they give him all the manure he requires." The facts, nevertheless, are sufficiently strong and suggestive. Mr. Hope is by this time a man of considerable experience, or, as the phrase runs, one who "should know something of what he is about." Looking, then, to the sewage of Romford with an hungry eye, he seems to have determined to take it on almost any terms and almost any where; for we believe he tried for one or two other farms before he faced so uninviting a prospect as that offered him at Britton's. Anything less like a show

place it would be scarcely possible to imagine; but the new tenant lost no time in turning it to account, and probably nobody ever did so much in so short a period. The growth not only of crops but of weeds is something prodigious; for sewage on a soil, necessarily not very carefully prepared, would threaten to produce an abundance of everything. The tidy farmer would consequently conceive something of a prejudice in the outset, but he might look further into the business with some possible advantage. The system adopted at Britton's is that of garden, or as it appears just at present, experimental farming. As we have mentioned the crops are cultivated in mere patches, and with a view of supplying the vegetable more steadily than the grain markets. There are, of course, continual cuttings of ryegrass, while other new grasses are being introduced; there are peas selling clear, with the straw left, at £15 per acre, but then, as one of the home-bred farmers had it, "nobody else about here has got any peas." Carrots make £41 per acre, or £20 per acre profit; cabbage of all kinds flourishes exceedingly, some sorts reaching to a marvellous size; beet-root is estimated at £80 per acre, and oats and barley sown a fortnight since will be ready to cut in October.

And so the rent of land rises from £2 to £10 per acre, manure included be it remembered; while the farmer in return will get more crops and bigger yields than ever. Nevertheless the Maplin Sands Company fails; and "Farmer So-and-so, near a town," as Mr. Mechi puts it, "declines to have the nasty stuff on his land, and so has obstructed its use." But these Professors all speak in the same strain. Mr. Rawlinson "had been met with furious opposition, bigotry, and prejudice,"—"the result of such men failing to see in the system what he had seen," and so forth. Mr. Johnstone, M.P., found "we had been wasting he did not know how many hundreds of years something we ought to have made a profit of;" and Mr. Chadwicke "knew it was a long time ago when he predicted that that waste manure, which in towns meant pestilence and disease, would in the agricultural districts mean high and enhanced production." This all no doubt sounds prettily enough, but what does it all come to? Mr. Mechi says the farmers "have obstructed the use of sewage," but has Mr. Mechi ever put them in the way of properly, that is profitably, using it? Of the many schemes he has in turn advocated so strenuously, where would the farmer have been had he adopted them? Mr. Rawlinson complacently complains of the prejudice of people who could not see so far as himself, but then what did he see during the eight years he sat on that famous commission? Or, is the problem even now quite so satisfactorily solved as he would have us believe it to be? If it is, from all we remember of Mr. Rawlinson and his sayings and doings, he has solved it continually, not precisely by these same means, during the last eight or eighteen years. Mr. Chadwicke's prophecy may of course still eventually turn out to be true; and gentlemen, like Mr. Johnstone, who know the least about the matter, are the first to declaim of the waste, and the profit, and all that sort of thing, "which ought to be understood by every Englishman."

The world, that is the world of practical men, is coming to pay less and less heed to all this mere talk of "nasty stuff and obstructive farmers"—of "bigotry

and prejudice"—and of men declining to waste their time and money at the bidding of some bystander. Mr. Hope, however, occupies a very different position. As he himself says, he has come in for "some rather severe criticism from his neighbours in Essex;" and great crops have, alas, been too often before now but the forerunners to failure in sewage farming. But should Mr. Hope succeed, his efforts and his example will do far more to further the cause than all the Commissions, windy harangues, or direct attacks on the farmers to which the country has now been periodically treated for so many years past.

On Tuesday, August 9th, a party, amongst whom were Mr. E. Chadwick, C.B., Mr. R. Rawlinson, C.B., Mr. J. G. Fairshaw, J. M. Grant, C.E., Col. Hogg (Member of the Metropolitan Board), Mr. A. Johnstone, M.P., Mr. E. B. Eastwick, C.B., M.P., Mr. T. W. Keates, F.C.S., Mr. J. H. Lloyd, Sir T. B. Lennard, Mr. J. Bailey Denton, C.E., Mr. B. H. Adams (Metropolitan Board), Mr. R. Morgan, C.E., Mr. H. Corbet, Mr. B. Gooch, Mr. A. Tod, Mr. C. Freeman, and a majority of the members of the Romford Local Board of Health were invited by Mr. W. Hope to visit Britton's Farm, Hornchurch, which has been purchased by the Romford Local Board of Health for the disposal of their sewage by irrigation, and let to the well-known Mr. Hope, of the Lodge Farm, Barking. The object of the visit was to inspect the result of the application of sewage to the land and crops. On the arrival of the company at the house they at once proceeded to look over the farm. One of the first crops to which attention was drawn was a piece of Italian rye-grass, sown on the 19th March, since which four crops have been cut, averaging $7\frac{1}{2}$ tons per acre, and sold at £1 per ton. Close by was a piece of Dalmahoy potatoes, planted on the 2nd April, which were producing $1\frac{1}{2}$ cwt. per rod, and worth about £25 per acre. Some of these were very fine. New Rose Kidneys were also shown, which produced ten or twelve at each root, many being from four to five inches in length. Some beans and peas sown on the 2nd April produced—the former £9 and the latter £15 per acre without the straw. Another piece of rye-grass, sown 9th April, will be ready to cut for the fourth time in a few days. Next came some Droona yarns, planted on the 6th June, adjacent to which were some very large Jersey cabbages. A little further on was a specimen patch of clover, sown on the 23rd May, which was very thick and about a foot high. Adjoining were about four acres of transplanted mangold-wurtzel, while another crop of the same kind exhibited some very fine roots. Close to these was a crop of parsnips, sown on the 25th April, which averaged from $1\frac{1}{2}$ to 2 inches in diameter, and of a proportionate length; also a fine crop of cauliflower, planted on the 19th July. Some fine carrots, crimson beetroot, and runner beans, are also growing. In addition to those already named, there were some fine pieces of bunching and other kind of cabbages which promised some good crops, having been planted about the middle of June. A strip of a newly imported kind of grass called *Bromus odoratus Australicus* was sown on the 4th June and was cut on the 1st of August; this, if the trial proves successful, is expected in a great degree to supplant the Italian rye grass, being a perennial and lasting much longer than the latter. After this comes a fine crop of maize, for ripening, sown on the 2nd June, averaging from 3 feet to 4 feet in height, some heads reaching nearly 5 feet. A strip of American oats stands very thick, and carries a great head; as this cut is said to produce about 20 qrs. per acre. Close by is a crop of intermediate carrots, about 4 acres in extent, sown on the 4th April, a month later than usual; some of these have already been sent to market and produced £41 per acre, while those still growing have been sold on the ground at £21, and are to be cleared off by the purchaser in a few days. The above may be considered as the principal crops, but there are many others, most of which have been put in on trial, and are not large in extent, but all appear to be more or less successful. Each crop is labelled, showing the time of planting, and the results that have accrued.

With regard to the manner in which the sewage is put upon the land, it is first pumped to the roof of the engine-house

and then conveyed in sheet iron troughing to about the centre of the farm, where it branches off in all directions, there being outlets at short intervals which can be opened for the discharge of sewage, or plugged up, or even set so as to allow of a certain quantity passing out, as required. The liquid eventually flows into channels of cement or earth, and thence again into smaller off channels, which run along the crown of the beds, the ground having been originally laid out in proper slopes. These smaller channels are dammed up as required, and the sewage then overflows the beds. Of course there is a large amount of effluent water which percolates through the soil, and this is carried back into the tank in a state of purity by means of drain pipes laid at a depth of 5 feet from the surface and 150 feet apart.

The party having completed its survey, adjourned to luncheon at the invitation of their host, after which some little time was spent in speaking on the subject they had just been testing.

Mr. JOHNSTONE said, as the representative of many of them in another sense and in another place, he would ask them first to drink the health of their host. Having spent such a profitable and interesting morning as he had, he thought this system of sewage irrigation was really a thing which ought to be understood by all Englishmen as much as any question of reduction or social economy. Here we had been wasting, for he did not know how many hundreds of years over, something we ought to have made profit of; and now that the country was full of hungry mouths and bellies, any means of filling them ought not to be passed over. This system of irrigation was a grand means of getting rid of a nuisance, and a great source of natural wealth as well (Hear, hear). Of all the men who had given this thing a push up, their host was the greatest, therefore he would ask them to drink the health of Mr. Hope (applause).

Mr. HOPE, in thanking Mr. Johnstone and company for the toast, briefly alluded to the gloom which had been cast over so many of his friends by the death of Sir John Thwaites, the chairman of the Metropolitan Board of Works, which had occurred on the previous morning. He had hoped to have seen him present on this occasion; he had hoped to have had the opportunity of showing the members of the Metropolitan Board how easy the system was; and also of making them acquainted with some of the Essex landowners and farmers, many of whom he hoped would be their future customers. The process was very simple, and he thought there could not be any doubt about the result now. Some of his neighbours had rather severely criticised him, and, though he had spent a good deal of money, he thought it would all come right in the end. Before breaking up, he thought he ought to present to them one gentleman who had assisted as much as any one in carrying out the Main Drainage Works of London; he referred to Mr. Grant, the second engineer to the Board of Works. His name perhaps had not been so prominently before the public as that of Mr. Bazalgette, but perhaps he had done the most work. All those who knew Mr. Grant and his attainments would bear him (Mr. Hope) out that there was not an abler civil engineer. He gave them the health of Mr. Grant and the success of the Main Drainage Works of London.

Mr. GRANT, after thanking the company for the honour placed upon him, and referring to the Main Drainage Works of London as the largest that have been executed in any part of the world, said they had not yet been able to utilize to any extent that which they carried from the metropolis; but the works had been so executed that it might be added to them whenever the time for solution of the difficulty had been arrived at. What they had seen in the morning had helped to so in some degree. Mr. Grant concluded by briefly referring to the death of Sir J. Thwaites.

Mr. RAWLINSON, in proposing the health of Mr. Edwin Chadwick, the father of modern sanitary science and the consistent promoter of sewage irrigation under certain disadvantages, said they had also seen it a very great success. He was speaking in the presence of the members of the Romford Local Board, and he would remember the contest they had as to whether that land should be purchased for the object contemplated. He also remembered some very curious arguments being advanced on that occasion, and he would now appeal to the members of the Board as to whether the opinions he gave them had not been more than fulfilled under the arrangements

of Mr. Hope? This, he believed, the beginning of one of the greatest social movements of the present day. He had been met with furious opposition, bigotry, and prejudice; but he should not like to say that the man who opposed his way of thinking did that which he conceived to be false, did it from dishonest motives, but he would be inclined to believe that the opposition was the result of such men failing to see in the system what he had been able to see. But, apart from all this, they were that day met under the hospitable roof of their friend Mr. Hope; and most heartily did he wish him success.

Mr. CHADWICKE, in reply, said it was a great gratification to him to see that which was the pestilence of their towns—the waste of manure—by this farm made profitable. He hoped it was a long time ago when he predicted that that waste manure which in towns meant pestilence and disease, would in the agricultural districts mean high and enhanced production. He was quite sure that they should see as they had seen that day that that waste which desolates and lowers the condition of the population would in the agricultural districts give the highest amount of production of food that would elevate the condition of the people. He believed that this movement, of which they had seen so brilliant an example that day, would lead to an enormous increase of the productive power of the soil, not only in this country, but through the example set to the countries abroad. It required great labour, great skill, great power; and he thought that the power had certainly, as far as he had seen, been displayed by their host. It had given him pleasure to be present on this occasion; and he hoped, for the sake of the example, that it might have due support and due success.

Mr. HOPE next asked the company to drink the health of Mr. Rawlinson. When the Government sent him down to examine into the complaints of the ill-used people of Romford (laughter), his friend Mr. Hawes and the rest of the local board were saddled with so many heavy rates that, if he (Mr. Rawlinson) had not kept his head cool and his judgment sound, he would very likely have fallen into the views of these people, and would have said it would never have paid to pump the sewage on to this farm; therefore, if anything had been gained, it was much more due to Mr. Rawlinson than to him (laughter). In his official position he was called upon to furnish opinions, and he did so with an unerring decision, which was remarkable.

Mr. RAWLINSON, in responding, said he could not take credit for what Mr. Hope tried to put upon him, but he would take credit for having striven to understand the question. In the first place he would not say that he did understand it, but that he had striven to come to an understanding. As far as he had studied the question, as to whether sewage ought to be treated as the waste product it had been treated or whether it ought to be treated as they had seen it treated that day, he had come to the conclusion that the proper place for sewage was the land. He had been a member of several royal commissions, and sat upon one for eight years which had been appointed to inquire into the best means for utilising town sewage. On that commission the Lords, Commons, chemistry, medicine, and engineering were efficiently represented, the latter branch by Mr. Austin and himself. During the eight years they examined all the places in Great Britain where sewage had been or was attempting to be utilised. They reported and drew up conclusions, in which they said town sewage could be utilised; circumstances might so intervene as to prevent its being utilised for the profit of the town, that was

direct money profit, but it should always be utilised because of the very great profit to the community at large. Romford was so situated that they were able to get rid of their sewage without its being any burden to the community; and some of them would no doubt remember at the inquiry he held he told them that if proper means were taken to utilise sewage on the land, instead of being a burden as many of them feared, it would relieve their rates, get rid of litigation, and put them in a position of comparative comfort. He had sitting at his right hand one of the most eminent agricultural engineers in England, and this movement, he was very happy to say, was supported by him. From what they had seen that day he did not see any need fear the result, but he sincerely hoped that Englishmen would learn a lesson and plain common sense, and that they would do their best, shoulder to shoulder, not to bolster up a delusion, not to try any tricky dodge, but to take that which poisoned their towns, contaminated their rivers, which produced nuisances and disease and discomfort, and do with it what they were doing at Romford, which was an example that all England ought to see. He hoped they would soon see sewage generally applied to land, and have that done which brought produce and food to the multitudes of our country. He then gave the health of Mr. Bailey Denton.

Mr. DENTON happened to be a colleague of Mr. Hope upon a committee which necessitated his presence on this farm occasionally; the first of those visits was several months ago, and he would declare as a man of considerable experience in agricultural matters, that he never before had seen a more forbidding instance or a more forbidding task for any man to undertake than that which Mr. Hope had on this farm set himself. Now, he came here to-day, after two previous visits, when he felt much on account of his friend, as he had the most gallant spirit, would be beaten—not vanquished immediately—but he thought he would not do what he saw to-day had been accomplished. He feared the weeds would over-grow him, and that moreover the arrangements for the delivery of the sewage were not as perfect as they ought to be; he felt that his friend would be encumbered with difficulties which he could not rationally overcome, but he was bound to tell them now that he never walked over a farm on which there were more certain instances and proofs of success. He saw that expanding growth which told him that sewage properly applied would do all that they expected, and to-day's experience was most certain of its success.

Mr. HOPE thought it would be ungrateful if they broke up without drinking one more toast. He begged to propose the "Health of the producers of the Romford sewage, coupled with the name of Mr. T. Hawes as Chairman of the Romford Local Board of Health" (cheers).

Mr. HAWES, in thanking the chairman and the company for the toast, said, perhaps he was an old man in years, but he was a young man in sewage, and he quite agreed with Mr. Denton, that its value and benefit was incalculable. He maintained that sewage utilization was still in its infancy. He certainly had to congratulate the members of the Board and the ratepayers of the town of Romford in having obtained such an excellent tenant as they had. He felt that had they searched England through they would not have found a more efficient man than Mr. Hope to carry the farm on. He must also say one word upon the Board; he thought their tenant would say they were the best landlords in England. They not only let him the land fairly, but they gave him all the manure he required; that was more than ever he knew any one else to do.

The company then broke up.

A SHEEP BREEDER'S STORY.

A great deal of information is often conveyed in the records of improvements effected in the plants and animals that minister immediately to the service of man, even to those who are not directly concerned in the experiments detailed. A farmer will pick out from the description of some change that has been brought about in a variety of wheat suited to special circumstances, a principle that will assist in breeding sheep, and the horticulturist will rarely peruse the manner in which the plastic elements of animal life are moulded to the will of

the breeder of horses, cattle, sheep or pigs, without perceiving an analogy that may be applied with advantage in his own sphere. Under this impression, therefore, of the benefits to be derived from it, even by those who are not immediately concerned in the facts as breeders, we now intend to narrate the story of the Improved Kentucky Sheep, as we glean it from certain agricultural reports of the American Government. The story of the Improved Leicester Sheep has been told over and over again in England, and the prodigious in-

crease in the weight of mutton produced in England since Bakewell began his experiments, shows with what result. The story of the Kentucky sheep is now being impressed upon the American agricultural mind, and is leading to similar results. We have also our breeding tradition, of which the Camden Merino stands first.

The native sheep of Kentucky are hardy and prolific; but like all native kinds they are small, fatten slowly, and yield little wool. Though the general diffusion of them proves their adaptation to the circumstances in which they are placed, yet it is well known that the tendency which all animals have to adapt themselves to climate and subsistence may be materially modified and controlled by judicious crossing, and that the improvement made by these crosses becomes permanent, and thereby stamps distinct varieties of the same class of animals. Chiefly by these influences (crosses, climate and food) the British varieties of sheep have been produced; and their distinctive features, in congenial localities, are as indelible as those of the stocks from which they were produced. In the same manner, no doubt, still other varieties may be produced; nor does there appear to be any insuperable difficulty in blending, in the same animal, any number of valuable qualities which are not actually antagonistic to each other. We have been supplied with certain materials to be combined at our pleasure within certain limits. The work might have been done for us; but we have been left to do it for ourselves, as the occasion required, and the desired development of human skill and character in the operation has followed.

Owing to the tendency of all improved breeds of domestic animals to relapse to their original status, when they are neglected or abused, they must be kept up. Judicious crossing and selection which is required to bring a variety to any given state of perfection, must of course be maintained. Mr. Robert W. Scott, to whose skill the "Improved Kentucky Sheep" is due, seeing nothing in the existing sheep of the district to suit his requirements as a grazer, determined upon beginning to graft upon the original stock something that would in time come nearer to his standard. None of the British breeds would suit his purpose—the Cotswold being too delicate when young to bear exposure to the wet season; the South Down having too short a fleece, and the Merino being too small. Acting on these impressions the improver informs us that he "has perseveringly endeavoured for over thirty years to combine in the same animal the hardness and prolific quality of the native sheep, the size and weight of fleece of the Cotswold, and the symmetry of form and delicacy of mutton of the South Down; and also to combine in the same fleeces the weight and length of the Cotswold, with the thickness and softness of the Merino."

Mr. Scott's *modus operandi* was as follows: In the beginning about thirty ewes were selected from a flock of unimproved native sheep. Amongst these was turned a very large and fine Saxony or Merino ram, the object being in the offspring to increase the thickness of the wool and to impart fineness to the fibre. This step was thought advisable before uniting the coarse fleeces of the native sheep with the coarse and still more open fleeces of the large imported varieties, and the effect was satisfactory. The ewe lambs of this cross were put, on the first of October, after they were one year old, to an imported Bakewell ram, of large, full, round carcase, and a heavy fleece of long wool. The ewe lambs of this latter cross were also, in due time, put to an imported Southdown ram, of large size and high standing, the object now being to infuse into the progeny that active, sprightly and thrifty disposition, and highly-flavoured and beautifully marbled mutton for which the Southdowns are so justly celebrated. This object was also successfully obtained. The wethers of this cross were the delight of the epicure, while the value of the fleece was not diminished; as much being gained by increasing the number of fibres to the square inch as was lost in the length of them.

A very doubtful experiment was next tried, but the operator speaks well of the result. A ram, three-fourths Cotswold and one-fourth Southdown—a large, hardy, active sheep, with a thick and heavy fleece, was put to this progeny. The two next crosses were made by pure-blood Cotswolds; and the next by a "fine full-blood Oxfordshire ram (a Down) of remarkable softness and silkiness of fleece." They were all animals with short necks, round barrels, broad backs, and full briskets. They seem to have added to the flock still more

weight of carcase and fleece; while the texture of the latter and the delicate flavour of the former were not perceptibly impaired, and, therefore, in the next fall the flock was divided between two full-blood Cotswolds.

This sounds like the pranks of an American tapster, in the concoction of one of the slang drinks of that country. The effect, however, is well spoken of by Mr. Scott, who says, "My success in the Improved Kentucky sheep has been great, and the sale and diffusion of them wide." It must have been amusing to have glanced at the flock at this stage, with a view to detect the traces of these crosses. We are informed that they were all perceptible (blended, but still manifest) in the character and habits, as well as in the carcase and in the fleece; but in some a particular cross predominated, which was naturally to be expected, on account of the recentness of the improvement. That the blending might be more entire, a cross with foreign sires was avoided the year following (1854), but sires were selected from the "Improved" flock. "In the fall of the year 1855," says Mr. Scott, "in order to carry out the same design, I tried chiefly to a mixed ram, whose pedigree showed Cotswold, Oxfordshire, Teeswater, and South Down blood." The italics here are our own, for it seems improbable that the object alluded to would be obtained by such means; still the breeder was perfectly satisfied with the result. Something further was done in 1856. A fine large Cotswold ram was used, and year following selected ewes put to him and a ram of mixed blood. This gave a more complete uniformity to the progeny—the ewes crossed with the Cotswold evincing a preponderance of South Down and Merino, those put to the mixed-blood ram exhibiting a preponderance of Cotswold qualities. The rams used in 1855 and 1859 were from his own flock, with a view of fixing the qualities gained, and more entirely blending the blood. "By this time," says Mr. Scott, "these sheep were as essentially alike and uniform, and maintained their identity and imparted their qualities as surely as sheep of any other breed."

Since 1860, well selected rams of his own breeding, together with those of Leicester and Cotswold blood, have been used in such a manner as to impart some valuable qualities either to the fleece or to the carcase, or to the constitution of the progeny; "pure Cotswolds, superior in form, size, and fleece, being raised in 1863 and 1866."

Now let us touch slightly on the economic results of this preparatory blending. One object was to get an animal which should be adapted to the climate and subsistence of the West and South. Was this done? In a new country the housing of sheep is generally too expensive a process to be practised. Therefore a class of sheep is wanted that will live in the open air, and call their subsistence under ordinary conditions. Sheep may be so adapted to a bad climate or to a poor soil, as to get the greatest amount of good out of it. Where some would starve they thrive. Thus the sheep required was one that would face the bleakest winters and the hottest and driest summers without any protection, except that which nature had given them. The Improved Kentucky apparently have fulfilled these conditions. If it be allowable to twist the meaning of an old proverb, we would say "like good wine they need no bush." They bear the climate unaffected by disease. They are free from cough, snuffle, foot-rot. In springs and summers of excessive rain, clothed to the knees and to the ears by a thick, long, and impenetrable fleece, they bid defiance to the wind, rain, and snow, and seem at all times to be comfortable and sprightly. In summer they are changed from pasture to pasture, and they devour almost every green weed. In winter short grass is all that they require, and if that cannot be afforded them they will take the corn fodder or straw with the cattle, and thrive well upon it, though at lambing time, like other sheep, they require a more succulent diet. They get on without grain or hay.

Then as to their thrifty and prolific character, a good deal is to be said. The practice of course is to breed only from the most healthy, symmetrical, and well-wooled ewes; the rest are fed as usual, and fatten with great rapidity. No ram is ever used which has the slightest taint of disease. By such care in the selection of parents, and by the frequent crossing of animals not even remotely related, and also by crossing with rams of different breeds (which is against the received opinions of the majority of breeding authorities) without making noted

crosses (which is a saving clause), "a degree of health and vigour has been infused into this breed which," we are told, "is not surpassed in any other." The native ewes, under favourable circumstances, very frequently produce twins, and rear them well. The improved sheep are quite as prolific. Mr. Scott says: "I have often, when the flock was smaller than at present, raised one-third more lambs than there were ewes, and have rarely failed to raise as many lambs as ewes even under unfavourable circumstances. As thrifty and wool-producing sheep they are preferred to the Cotswold in Kentucky and in the West. Yearling rams will weigh 174lbs., nine months old lambs 104lbs., two-year-old rams 224lbs., same age ewes 180lbs., fed on grass only. Then as to the weight and character of fleece the evidence is conclusive on the point of "improvement." The fleeces of these sheep vary from eight to fifteen pounds—the whole flock of over one hundred breeding ewes having averaged over eight pounds of merchantable wool, free from burrs, tags, &c.; and though not washed on the sheep's back, still clean enough for domestic manufacture. Though the fleeces of these sheep are not perfectly uniform as to length, thickness, and fineness of fibre, still there is a general uniformity, and the diversity is said to be of no practical disadvantage. Their wool is longer than that of any sheep, except that of the Cotswold family, and is equal in length to that of many individuals of that family, while it greatly excels the wool of the Cotswold in fineness and softness of fibre, and in the number of fibres to the square inch. In some individuals it is wavy or

curly, but is never harsh or wiry. Except the face and the legs below the knees, the whole body is covered with a close and compact fleece, which, when full grown, leaves no open line on the back, as with the Cotswold; but gives a perfect protection to the sheep, and causes them to present a smooth, handsome, and portly appearance. The wool is lustrous, and dyes, cards, and spins well, and is much approved by manufacturers. The testimony as to the merits and value of these sheep appears to be very strong. We do not see any quotation of the value of the wool, but a manufacturer is reported to make the following statement: "When we take into consideration the fineness of the texture, the length and evenness of the staple, the weight of the fleece, its clearness of gum, we can say that we prefer the wool purchased of you to any other we use; and in consequence have for years recommended our customers to supply themselves with your sheep." A gentleman who used the sheep for years said of them: "I am not able to supply the demand for ram lambs, 5/ per head; I reared from one of the ewes two lambs, which weighed, at five months old, 105 and 111 lbs. gross, and clipped 5½ and 6 lbs. of wool, they brought me 10/. The mother, when I sold the lambs, weighed 175 lbs. Another lamb at six months old weighed 122 lbs., clipped 6 lbs., and brought 5/." These and other facts of the same kind, go to prove that Mr. Scott, by judicious selection and cross breeding, has produced a really valuable variety. And there is no slight advantage in seeing how the success has been achieved.—*Journal of the New South Wales Agricultural Society.*

A CHAPTER ON SACKS.

BY AN OLD FLOURFACTOR.

It is a remarkable fact that the word "sack," so far at least as the sound is concerned, is the same, or nearly so, in the language of every civilized country in the world, and, in fact, wherever the article itself is used. We are not learned enough ourselves to account for this, but we are assured by philologists that it originated so long back as the time of the building of the Tower of Babel, where there was so much confusion and outcry every night amongst the workmen for sacks to put their tools in that the word was never forgotten, but has been handed down from generation to generation. Be this account true or false, certain it is that sacks have been the cause of great uproar and contention wherever they have been commercially employed.

Our attention has been drawn to this subject by the circumstance that the corn and flourfactors and the railway authorities in France are at the present time in the throes of an agitation respecting sacks, similar to what occurred in London some five-and-forty years ago, of which we shall speak at large presently. It appears that since the adoption of free trade in France, in imitation of England, the grain and flour trade in the former country has assumed so much importance that the number of sacks required for the transmission of those articles, whether by rail or water, is enormously increased. These are supplied, on hire, by the railway directors, who obtain them from the makers. A guarantee is required by the borrowers for the safe return in good condition of the whole number obtained; but, notwithstanding this, a great many are still lost in one way or the other, and the difficulty is to know on whom to fix the loss. This is specially the case in the foreign trade to so great an extent that the parties interested are puzzled to know how to remedy the evil. In this emergency the principal sack manufacturing firm in Paris—Messrs. Pernet and Chêne—who are the largest lenders of sacks and whose establishment is near the Paris corn market, has proposed the formation of a company, or an association for carrying on the general manufacture of sacks and all other fabrics made from hemp, flax, jute, &c., such as sacks, tents, tarpaulins, &c., and for the letting of sacks on hire to millers, corn and flour factors, and others requiring them. The importance of this institution in France may be seen when we state that the weight of the materials employed in the manufacture of sacks alone amounted to one hundred millions of kilogrammes, or 98,214 tons, chiefly flax,

hemp, and jute. The sacks from these are nearly all employed for the conveyance of grain, flour, and all kinds of agricultural produce, besides large quantities of guano, phosphates, and other artificial and chemical manures, which are constantly being sent by railway and water. Large numbers of these are annually lost or seriously damaged in the transit from place to place, and the directors have great difficulty in recovering the value; for, although the borrowers engage to return them safe and sound, the loss cannot in some cases be assigned to the right party. By the establishment of the association, therefore, they will be better able to protect the sacks let out on hire from depreciation than by a private individual or company.

We have referred above to the loss of sacks in the London trade, both corn and flour, and its history is so remarkable as to form quite a romance in commerce. We must, however, go back fifty years to obtain a correct notion of the matter. At that period, before steam flour-mills were invented, a large portion of the flour consumed in the metropolis was made in the country, especially in Norfolk, Suffolk, Lincolnshire, and other counties nearest to the place of consumption. These millers had, we may say, no control over their sacks with flour sold in London. As soon as they were emptied they became a kind of public property, and were appropriated by any one who chose, or were able to lay hold of them. This misappropriation of an almost unprotected description of property was carried to a length that would astonish a miller of the present day, the very system employed to secure their due and timely return to the miller being the greatest means and cause of their loss. In explanation, we may state, that public collectors took upon themselves the ostensible task of collecting sacks of all kind, but especially those belonging to millers. They professed to give receipts for them to the bakers and others to whom the flour was sold, with the names of the persons to whom they belonged. Some of these collectors undoubtedly were honest men, but others were far from sustaining that character. Sacks by the ton were cut up and sold to the paper-makers in the neighbourhood of the metropolis, and to the makers of bung-cloths for brewers and others requiring them. Great numbers were sold to uscrupulous millers, or let to them on hire; and, as to the general body of millers, it was almost an understood thing that everybody got hold of every other body's sacks for working in the mill. In going into one of

these establishments in the neighbourhood of London you would probably see a large miscellany of these articles all marked with the owners' names, but which were never sent out, and therefore had no chance of being restored to the mill they came from. We recollect one country miller who was so notorious for this species of misappropriation, to which he added a very pompous address, that he obtained the title of *Count Sacks*: we suppose after the name of Marshal Saxe, the famous warrior. We also remember a case in which a country miller meeting a neighbouring grist, addressed him thus: "I hear, friend P., that thou hast got some of my sacks in thy mill?" "Very likely;" was the rejoinder, "but in this case I go upon the principle of an eye for an eye, and a tooth for a tooth: perhaps you have got some of mine?" "No, I have none of thine, friend P." However, friend P. took an early opportunity of calling at the friend's mill and found plenty of his own sacks, on which, of course, he laid an instant embargo.

Another common mode of misappropriation was the following: A flour factor having a demand for flour of a particular mark, and having no immediate opportunity of obtaining them at the price he could afford, had only to apply to a collector, and, at a day's notice, he could have as many as he wanted, paying a certain price for them. This, in one respect, might not be the worst kind of fraud, so far as the sacks were concerned, because they got into circulation, and there was a chance of their reaching the rightful owner; but, on the other hand, the flour put into them was most probably of an inferior description, and the consequence was, the character of the miller suffered by the transaction; but, as we have stated, the paper millers and bung-cloth makers were the greatest dealers in this contraband trade. The writer knew one case in which 35 cwt. of sacks, chiefly new ones, were thus cut up and sold to a bung-cloth maker in one lump. Mind, we are speaking of what occurred nearly fifty years ago, and, of course, cannot apply to the present practice of the class of traders in question. We may say with the poet, "Our's are a sweeter set of saints, I trow;" and, as a help, most of the country millers who still send flour to London charge them regularly with the flour. But, on the other hand, London is now chiefly supplied by its own steam mills, which have shut out a large number of those country millers who formerly supplied it. Be this as it may, the losses of the millers at the period referred to became so constant, so enormous, and so daring, that the country millers were at their wits' ends to know what course to take, when an accidental circumstance pointed out a plan which, if it could have found general support from the great body of millers, would have fully remedied the evil. The following is the circumstance referred to:

A country miller, who was selling four or five hundred sacks of flour weekly in London, engaged an agent for its sale, and, after the affair was arranged, he said: "Well, and now about sacks; what is your plan for securing their safe and speedy return?" "I suppose," was the reply, "that you will employ the regular sack collectors." "Ah, that's the point. I believe that our losses are chiefly sustained in that mode of collecting them. We have ourselves been compelled to purchase new sacks to the number of 16,500 in the course of three years and a-half, and have not, after all, a full working stock at command. This evident robbery must be put an end to, otherwise not only will the entire profits of the trade be absorbed, but the capital itself will follow them. You must therefore think the matter over, and any plan you propose to adopt, if feasible, shall have our strenuous support." Thus addressed, the agent, after consideration, proposed the following plan: To employ his own private collector, who should strictly avoid taking the sacks of any other miller, on pain of dismissal; that he should have a regular account of all flour delivered, and give receipts to the bakers for those sacks returned; that the agent should keep a regular debtor and creditor account of sacks against the bakers, the collector giving him immediate notice if any have been taken away by other collectors; that written notices, signed by the miller himself, should be given to each and all the public collectors, to avoid taking the sacks in question, on pain of a prosecution, which, if, after two or three instances, they should disregard, would then be commenced against them. Written notices were also given to bakers purchasing the flour, by the private collector, signed by the principal, not to allow the public collectors to take his sacks. Such was the plan adopted, and we shall now show how it operated.

In carrying out this plan, although he was fully supported by his employer, the agent found that he had thrust his head into a nest of hornets. He soon convinced himself that the collectors were the men with whom he would have to cope as the principal delinquents, and against these men, with the exception of two, he was compelled in turn to commence prosecutions. One of them was taken before a magistrate three times before he would desist; another was twice arraigned; a third, who was also a wharfinger, having, after three warnings which he laughed to scorn, taken a number of the prohibited sacks, was served with a notice of action in the Court of King's Bench, being at the head of the trade, and therefore worthy of a more respectable process than an appearance in a police court. This he also derided, and challenged the agent to proceed with his action, which he would certainly defend. His idea was that as the business of sack collecting was an established fact, those who followed it had a sort of "vested right" in it, that no private arrangement could set aside, or prevent his collecting any sacks that came in his way; the agent therefore made a special point of endeavouring to bring this "vested right" gentleman to his senses by having to defend himself in the highest court of law in which it could be tried. This case was looked at with great interest by the other collectors; for if he could have established his point it would at once have enabled them also to set the prosecutor at defiance; but they "reckoned without the host."

On going to his lawyer and stating the case to him for the purpose of his entering a defence to the action, the man of law asked him in a quiet manner, "Have you then taken the sacks in question after receiving a written notice and warnings?" "Yes," he replied; "and they are now in my warehouse, packed, ready to be delivered to the owner." "Well then," was the rejoinder, "take my advice, which at any rate you must believe to be disinterested, carry the sacks back to the baker from whom you obtained them, as you say that both the private collector and the wharfinger will not take them from you, having orders from the prosecutor to that effect; then go to the lawyer for the prosecution and pay all the expenses already incurred, and give a written promise that you will not in future interfere with his client's sacks. I know the party well, they are wealthy people, and having *right* on their side they will spare no expense or trouble in supporting it. I will see his lawyer, and will undertake to stop the prosecution if you follow the course I have proposed. But if you persist in defending the action it will cost you hundreds of pounds before you have done with it. And besides, it would be monstrous if a miller, or any other party, had not a good right to conduct his business and secure his own property by whatever plans he thinks proper. I therefore warn you that if you persist in your intention the consequences will be very serious indeed."

This advice, so perfectly disinterested, had its desired effect. The sacks were returned to the baker from whom they were obtained, and who, in fact, was as much to blame as the collector. The expenses, too, were paid, which was the unkindest cut of all; a written assurance given that the sacks in question would not in future be interfered with; and the "vested right"—proved to be a vested wrong—was blown to atoms.

The success of the agent in collecting the sacks of his employer with so much regularity, and in the prosecutions which he instituted, without, however, carrying them to the extent he would have done had not the delinquents succumbed, drew the attention of the millers generally to the possibility of establishing an Association for the protection of sacks belonging to millers supplying London with flour from the country or otherwise. Nothing, in fact, could prove more successful than the plan adopted by the agent after a few cases had been taken before the magistrate; and the case with the delinquents was found to be hopeless. Some of the bakers declared that the collectors would "swear over the prohibited sacks, but would not touch one of them;" and after five years' trial of it, at the end of which the agent gave up his commission, his employer made him a present of two hundred pounds, and stated that during that period, instead of having to purchase five thousand sacks a year, he had not purchased a single sack, and had always a sufficient stock for every purpose, all of them having his own mark upon them, for it was a rule strictly adhered to that no stray

sacks should be admitted into the mill. The millers therefore—but chiefly those in the country, who were the greatest sufferers—were anxious to form an "Association for the Protection of Sacks," and the agent was requested to draw up a plan, which he did, and it was in full operation for about two years, at the expiration of which it was given up, for reasons which will be stated presently.

It was in contemplation to extend and modify the plan by having a "Sack Depôt," to which all sacks belonging to the members of the Association were to be conveyed, and there sorted and packed ready for delivery to the wharves and other places, for restoration to the owners. It is worthy of remark that very few of the town millers joined the Association, for reasons best known to themselves, but which may be guessed at from what is known. It was notorious, indeed, that, like "Count Sacks" and "The Friend," it was a common practice for millers in the country as well as in town to have their stocks of "working sacks," or such as were used in the mill only, made up wholly, or to as great an extent as possible, of "stray sacks," which were never suffered to go out with flour or otherwise. Now the facility for the London millers to replenish their stocks of "working sacks" would be wholly destroyed by the proposed association, and therefore most of them declined joining it. A few prosecutions were instituted by it, the most important one of which was against a marine-store dealer in the Old Kent-road, on whose premises were discovered by the police officers an immense number of millers' sacks, cut up and packed ready to be sent to a paper-mill. This man was tried at the Old Bailey sessions, and found guilty of receiving goods knowing them to have been stolen. The original delinquent was not prosecuted, there being no direct evidence against him; but the police were on the alert, and would probably have found sufficient proof of his guilt. He was, however, warned by one of his friends that evidence would probably be soon forthcoming, which so alarmed him that, being at the time in bad health, he took to his bed, and died in the course of a week. The marine-store dealer was sentenced to a term of imprisonment. In another case a collector was detected in selling sacks to a greengrocer, and was taken before the magistrate, to whom he confessed his offence, pleaded poverty, and engaged, if the prosecutor would forego any further proceedings, he would relinquish sack-collecting, and go to sea, which had been his former course of life for some years. His offer was accepted, and he thankfully left the court.

There is no doubt that if the Association had been supported as it ought to have been, it would in time have effected a complete revolution in the mealing trade, so far as the sacks were concerned. But it had scarcely been well established before a circumstance occurred to break it up, and things reverted to their former channel. It was as follows: The agent referred to in the first part of this history, received an intimation from his wharfinger that a barge load of flour in sacks having his employers' mark upon them, had passed his wharf and gone up the river. The agent immediately wrote to his principal to know whether he had sold any flour, and received a reply that he had not, and that if the sacks bore his mark, they were stolen or surreptitiously obtained, and made use of by some one who had no right to them; and he charged his agent to use every means to discover where they were landed, and to whom the flour belonged. It was several days before he could obtain the information, when his own wharfinger, happening to call at a neighbouring wharf, discovered on one of the floors the identical sacks, in number one hundred, and filled with flour made from wheat at a mill at Deptford. On inquiring further, he learned that the flour belonged to a baker in the Minories, who had purchased the wheat in Mark Lane and sent it to the mill. The agent immediately wrote again to his employer stating the circumstances, and received an order to commence proceedings against the baker. In the meantime the agent had called upon the latter and demanded to know how he had obtained the sacks, &c. The baker refused to give him any information about it, and told him flatly that he might take what steps he pleased, as he was prepared to defend himself. He was accordingly served with a notice of action in the Court of King's Bench; and now another person came forward most unexpectedly, to put a stop, if possible, to the prosecution, though the case was so clear against him that

there was no doubt of a conviction, if it had been allowed to proceed. The following were the facts:

Amongst the Norfolk millers—eighteen of the largest of whom had joined the Association—was one whose shipments of flour amounted to from three to five thousand sacks per week, partly made at his own mills, but the greater part either purchased of other millers or ground for him at mills near London or elsewhere. To this man the baker in the Minories was a considerable customer, and the latter appealed to him to prevail on the prosecutor to stay the proceedings against him on his sending the sacks to the proper wharf. Although the affair was in the hands of the solicitor to the Association, the prosecutor was prevailed on to yield; but so disgusted was he with the whole transaction that he instantly withdrew from the Association, and his example was followed by all the Norfolk millers, who saw plainly enough that there was no disposition to remedy the evils of the trade, of which the case in hand was as clear as daylight against the delinquent. It was believed, in fact, that the flour had been made from wheat belonging to the miller who thus interfered, and that he had done so with the view of screening his own share in the affair, there being no apparent motive why he should do so, as a leading member of the Association, and always acting as chairman, and foremost in urging on prosecutions in every other case.

The withdrawal of the Norfolk millers from the Association gave the death-blow to the institution, and the collection of the millers' sacks in the metropolis fell again into the hands of the old collectors; with what results the millers themselves could have told if they were still living; but we believe that most of the millers and the sack collectors are dead, and very few indeed of those in the flour trade at that time are living. It is a remarkable and significant fact that, of the eighteen Norfolk millers who joined the Association in 1834, thirteen had failed within seven years after. What share the loss of sacks might have claimed in this remarkable result, it is impossible to say; but it cannot be doubted that it must have lessened the profits materially, and thus contributed to the failures. Certain it is that by the introduction and extension of steam-power applied to grinding corn, which took place about the same time, the Norfolk millers were shut out from the London trade, and we believe most of those millers who formerly ground for that trade, now send their flour northward, to Hull, Newcastle, &c. The repeal also of the duties on foreign corn has materially tended to make a change in the supply of flour to the London market. The millers in London and its vicinity can now supply themselves, and *do so*, with foreign wheat of excellent quality quite as cheaply, and, in general, more so than those at a distance from the metropolis can purchase at the local markets that of native growth. Not only so, but they can take the month's credit on it in Mark-lane, convert it into flour in a day or two, and into money in a week if necessary. It therefore requires but little capital to conduct a mill working by steam in London or its immediate neighbourhood compared with what a similar concern in the country absorbs. The payments for wheat in the latter case are most frequently expected the following market-day; added to which is the delay in getting the flour to London; though this is materially done away with where the mill is within reach of a railway. But, as we have stated, the Norfolk millers have found a better market in the north of England, and we believe the bulk of the flour, beyond the local consumption, is sent thither.

With respect to the sack collecting, most of those who still send flour from the country put it into unmarked sacks, which are charged to the factors or bakers to whom the flour is sent or sold. The town millers have mostly their own collectors, although some employ one or two of the public ones to pick up such stray sacks as they may come across. But with all their care, their loss is still about five per cent.; as to that of the millers who brand their sacks instead of sending them out plain and charged for with the flour, we have no means of learning the amount; but it is to be hoped that former proceedings have not entirely lost their influence, and that a better supervision is exercised over the collection now, in consequence of the exposure of the means by which sacks were lost under the former system.

THE PRICE OF WHEAT SEVENTY YEARS SINCE.

[From *The Sun*, October, 1800.]

There never was a subject on which calm discussion was more required than on that of the present high prices of provisions, and particularly of wheat. We never knew one in which people more violently persisted in erroneous opinion. One man asserts that scarcity alone is the cause of the high price, without any aggravation from collateral causes; while another more erroneously, and perhaps wickedly, denies that there is any real scarcity, and imputes the price to speculation and monopoly. There is no source of error more common than that of representing us the sole cause that which, together with many other circumstances, produces the effect.

From the year 1750 to the year 1770, the average balance received annually for wheat exported, amounted to about £600,000. From the year 1770 to 1790, the average balance paid for the same article imported, amounted to about £300,000. From 1790 to the present time, the balance has been constantly increasing against us, and is now at least double what it was on an average from 1770 to 1790. This clearly shows that the consumption of Wheat, whether arising from a more numerous population, or from any other cause, has increased in a much greater degree than the means of producing it. In addition to this fact, it is well ascertained that there is this year a deficiency in the crop of wheat. In thrashing it does not yield so well as it promised. These are the principal causes of the high price: a general consumption more than equal to our ordinary produce; and the produce of the year less than a common crop. The practices of dealers may, and we believe in some instances have tended to aggravate the evil, but their influence in producing high price is exaggerated. To assert, as some of our journalists have done, that "there is no scarcity," is the effect of ignorance, or of malicious intention.

A great cry has been raised against monopolists, forestallers, &c., and high authority has given too much sanction to this clamour. Look at the number of convictions for forestalling, and the delusion is manifest; for no person will say that the judges did not set out upon their circuits with quite sufficient abhorrence of this crime, and quite sufficient inclination to punish it, wherever it was detected. Mr. Waddington, one of the *friends of the people*, has done full, even more mischief than he can be aware of—not merely because he speculated in hops, but because so gross an instance of monopoly, and of raising an artificial price, was detected and exposed in him, that from that time whenever any article of provision has been raised to a very high price, the people have always considered it as artificial, and occasioned by the same practices.

But many of those who give up the idle clamours against monopolists, impute much of the high price of wheat and flour to the speculations of the farmer and the miller. We have before stated that, in a season of scarcity, many persons in possession of corn, ought to keep it in store. There is no article in which it is so essential to the community that the price should be fixed in exact proportion to the supply. An arbitrary price fixed too high in proportion to the stock on hand, deprives a great proportion of the people of this important article of food; an arbitrary price fixed too low creates an undue consumption, and produces a famine. Farmers were never supposed to have hoarded more upon speculation than in the last year, and yet the old stock of corn was never so nearly exhausted on the appearance of the new crop as in the present year.

Those who look to the miller as the source of the evil, tell us, as a proof, that the price of flour, on a particular day, was higher than it ought to have been, compared with the price of wheat; they talk as if they thought the wheat that was bought one day was ground the next: they forget that the trade of a miller is necessarily a trade of speculation; that he grinds to-day the wheat he bought perhaps six months ago;

and therefore, though the price of flour may in some degree be regulated by the price of wheat, it cannot be governed by it. It may be said that the trade of a miller ought not to be a trade of speculation; that he should be prohibited from becoming a purchaser, and should be paid at a certain rate for grinding. The answer is, that it is impossible to fix the rate; that what would be an enormous profit to one man, would drive another, with different machinery and under different circumstances, out of the trade.

The miller probably gains enormously upon some of his purchases, little upon others, and upon some he loses. The question, in a mercantile point of view is, are his profits exorbitant upon the whole? True it is, that he makes the most profit when corn is dearest: in times of abundance there is a competition of sellers; all they look for is a living profit; in times of scarcity there is a competition of hoarders, all looking for a high price. This is the nature of all trade. In the article of corn, if in the times of scarcity it produces the evil of a high price, it produces also the good of a sparing consumption.

We are as hostile as any persons to the real monopolist—to the person who is mischievous and wicked enough to endeavour to create an exorbitant and artificial price in the articles of human sustenance, bearing no relation to the supply. But the more we abhor and detest such a character, the more anxious we are to prove what we know to be the fact, that such characters are not common, and the more desirous we are that just men, acting in the fair line of their business, should not be confounded with them. To confound them will have the effect of driving the best men out of the trade.

To whatever cause we ascribe the high price of wheat and of bread, the poor call loudly upon us for our assistance. Some measure that has the effect of a temporary increase of the wages of labour must also be adopted. The high price puts the food of the people out of the reach of many of the labouring classes of society. Such a situation of things cannot arise without the mischievous malignity of the ill-disposed endeavouring to raise mobs, and excite them to riot, by imputing it to causes from which they know it does not spring.

We shall be happy if Parliament can devise any adequate remedy for the evil. Bounties on importation may be given; non-consumption agreements entered into, and many alleviations may be found; but without a diminished use of wheaten bread in all the classes of the community, and a considerable extension of our corn land, the evil, though perhaps mitigated for the present, will recur again. But the difficulties of the present year should claim the first consideration of Parliament. Whenever it deliberates upon this interesting and important question, we trust we shall see the attention of all persons anxiously directed to one and the same object; to relieve the wants, and not to inflame the minds of the people.

SUGAR FROM BEET-ROOT.—Now let us see (keeping as clear as possible from technical terms) what happens to the beet-root, when it is brought to the factory. The usual plan of operation is to wash the roots well, so as to free them from clay and dirt, and then to place them within the clutches of circular saws, making over 1,000 revolutions a minute, by which they are torn to pieces and reduced to pulp. This latter is then packed in linen bags, and subjected to the action of an hydraulic press, by which the juice is all squeezed out, and the pulp becomes a cake. This not only forms the beet-bread—so valuable for feeding purposes—but, if not required for that end, can also be used for making brandy and vinegar; or, what is still more remarkable—paper, it being found by paper manufacturers to be superior to rag pulp. So that, whatever may be the defects in the beet process, incapability of utilisation is not one of them.—*Food Journal*.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

MEETING AT OXFORD.

MACHINERY IN MOTION.

We continue our notices of some of the various implement stands in the endeavour to do justice to the many deserving exhibitors who by their mechanical skill and enterprise added so largely to the general interest of that portion of the showyard. To attempt to enumerate or point out the special advantages of the thousands of implements shown would be utterly impossible. We can only make such brief commentaries as our notes, after inspection, have suggested. We commence with the machinery in motion, which always drew the largest share of curious visitors.

Most of the machines at work deserve a passing notice, although some of them were working miscellaneous objects, somewhat foreign to agriculture.

Nalder and Nalder, of Wantage, had two finishing thrashing machines to prepare grain ready for market, fitted with their patent screen to regulate the quantity of tail corn. Also, one of their malt screens, capable of screening 30 quarters an hour, as in use at Barclay & Perkin's and other large breweries.

Marsden, of Leeds, had two stone-breakers at work; one, Blake's American stone-breaker, 10 ft. by 7 ft., has a revolving screen for breaking and separating McAdam's road metal: it was employed breaking about 100 tons of limestone per day, at 1½d. per ton, and the machine will break the hardest stone at a cost of 3d. per ton. Another machine, made by Marsden, suitable for road metal or fine crushing, has jaws 12 inches by 3 inches, and is used for breaking quarry chips, chips for road metal, or for fine-crushing emery, cement, or coprolites.

Walworth and Co., of Bradford, had several of their smut machines and wheat cleaners working, also a flour-dressing machine with revolving cylinder and external brushes. One improved smut machine, fitted with separator and powerful exhaust fans on the most scientific principle, was guaranteed to clean 110 bushels of wheat per hour.

Hancock and Foden, of Sandbach, had a 4-horse and a 6-horse power steam engine at work driving a corn-driving mill, and a fixed thrashing machine adapted for large occupations.

Whitmore and Binyon, of Wickham Market, had some of their improved steam engines driving grinding mills with meal elevators.

Marshall and Co., of Gainsborough, made a very creditable display of steam engines, among which were five portable engines of various power. Their fixed 10-horse engine took the third prize in the competitive trials, and their 4-horse engine, which was highly commended, ran six minutes longer time than any other vertical engine. The grinding mill at work also took a third prize in competition. Some thrashing and dressing machines and circular saw benches completed the principal objects shown.

Foster and Co., of Lincoln, had two good finishing thrashing machines, set in motion by an 8-horse and 10-horse portable steam engines of their make.

Davey, Paxman, and Davey, of Colchester, had at work a 4-horse vertical fixed engine with a boiler on a new principle, with special facilities for quickly removing fire-box and for heating water, driving corn-drying ma-

chines by steam-heated cylinders, the blast passing through the chamber while the corn is kept in complete agitation.

Robey and Co., of Lincoln, had a vertical steam engine with patent field boiler commended by the judges. It is constructed with steam jacketed cylinder, and fitted with patent variable governor expansion gear. There were engines of different power driving grinding mills and thrashing machines. The portable combined double-blast thrashing and finishing machine of this firm, fitted with Riley's patent wrought angle-iron frame, improved straw shakers, barley awner, patent revolving screen, and self-feeding apparatus, was honoured with a silver medal.

Ruston and Procter, of Lincoln, had six of their steam-engines employed for different purposes. Their other objects shown were sawing benches, corn mills, thrashing machines and straw elevators.

Holmes and Sons, of Norwich, besides an 8-horse engine, horse gear, and oilcake breakers submitted to trial, had a straw elevator, the combination of the horse gear with which renders it easy of removal for stacking at any part of the stack, thus saving labour. This firm also had a good collection of seed, corn, and manure drills and manure distributors. A 13-row lever-drill, by adjusting the width of the levers, can be varied to any distance, so that a great quantity of seed or grain can be deposited per acre.

Riches and Watts, of Norwich, had a large number of grist mills, which attracted attention—especially Felton's American mill now made by them, also some hay collectors, and a vertical 4-horse steam engine of their own make.

Among the few American implements shown, Childs and Co., of Mark-lane, exhibited one which can be used either as a smutter to remove the smut, or as a decorticator to both remove the smut and thoroughly hull wheat, rice, and other grain; also an aspirator for dressing all kinds of grain and rice, by the combination of coarse and fine riddles and exhaust.

Clayton and Shuttleworth, of Lincoln, depended chiefly upon their engines, which carried off the highest prizes in each class. They worked some thrashing machines and straw elevators.

Whitehead, of the Albert Works, Preston, exhibited several of his drain-pipe, tile, and brick-making machines, which have met the approval of the judges at many of the Society's shows. These varied in price according to work and requirements. In one of these tried 129½ lbs. of clay was screened by hand-power in the short space of one minute, with a screen of three-sixteenths of space between the bars. There were also fifty-nine two-inch tiles made in the same length of time. It carried off a prize, as stated in our last number.

Pinfold, of Rugby, produced some stone and steel grist mills; and although his brick and tile machines were not entered for trial, one was tested by the judges and carried off the first prize for a power machine, which cuts the clay by the traveller, and is adapted to make a large number of bricks or drainpipes daily.

Page, of Bedford, was another exhibitor of clay-crushing rollers, brick presses, and pipe and tile making machines, a very strong double-end machine worked by an excentric, and suited for steam power, being commended by the judges.

The only other brick and tile machine to be noticed was Calcutt's, manufactured by C. Lampitt, of Banbury, which when worked by a 6-horse power engine will prepare the clay and make 20,000 to 25,000 bricks in ten hours.

Hodgkin, of Liverpool, had in action several of the useful machines made by Lawson and Sons, of Leeds, for dressing flax, suited for scutch mill owners or large or small farmers. They were driven by one of Ransome's portable engines. These machines took both the prizes for hand and steam power breakers and cleaners.

Barrows and Stewart, of Banbury, exhibited besides a variety of thrashing machines and elevators, and the necessary apparatus to steam cultivation. Smith's perfected four-wheeled windlass with steel wire rope was highly commended by the judges.

Humphries, of Pershore, had one of Clayton's engines driving two or three single and double blast thrashing machines.

Thomas, of Cardigan, exhibited new combined grinding and crushing mills for making fine or coarse meal for household and feeding purposes. These were worked by one of Marshall's 5-horse portable engines.

Brown and May, of Devizes, had eight engines in the yard, one fixed and the others portable.

Richmond and Chandler, of Salford, pride themselves specially on the excellence and serviceable quality of their chaffcutters, for which they again carried off the two first prizes, although run close on this occasion by the firm of Ficksley, Sims, and Co. The Salford house exhibited no less than nineteen of these machines, of different prices, and with certain specialities and new improvements. In one the old form of lever and weights are abolished, and spiral springs on each side the mouthpiece are substituted, thereby increasing the pressure on the feed as it becomes thicker, and the steel mouthpiece is also of an improved form, so as to render choking impossible. Another new implement shown was a litter-cutter, for cutting straw into long lengths for bedding. By the addition of change wheels it may be adapted for cutting chaff. Bean and oat mills, root-washers, and sets of horse gear were the other articles shown.

Coleman and Morton, of Chelmsford, entered horse gear for competition, and some oilcake breakers. They also had on their stand a miscellaneous collection of useful implements including cultivators, potato diggers, manure and water carts. A patent steerage horse hoc, made to take ten rows, with a new method of adjusting the draught, was entered as a new implement.

Hunt and Pickering, of Leicester, made a very fine and extensive display of useful implements. To say nothing of horse power gearing, grist mills, corn crushers, cake breakers, and turnip cutters, they entered several cheese presses, and some serviceable ploughs and horse hoes. Their mowers and reapers for two horses were described to have some improved features. The mower is adapted to cut equally well upon ridge and furrow as upon flat meadow land, and the cutting steel parts are an important improvement. Another form has the back-delivery reaping attachments, so as to make it a complete combined machine. A light and simple reaper, adapted for back, side, and swathe delivery, cuts breadth of five feet.

Ball and Son, of Rothwell, drew attention by their fine collection of waggons and carts. Some of their harrows were characterised by improvements, and their sack-holders appeared to be simple and useful contrivances.

Samuelson and Co., of Banbury, contented themselves with exhibiting reapers and mowers, the specialities of which are well known, and Gardner's turnip cutters.

Southwell and Co., of Rugeley, exhibited a great many

improvements and novelties in chaffcutters, cake breakers, turnip slicers and pulpers, cheese presses and stools, and mills, besides cultivators and rollers, the specialities of which we have no space to enumerate.

Nicholson, of Newark, brought forward eight vertical engines of moderate horse power, some of the smaller ones being specially adapted for driving chaff-cutters, churns, and suchlike. He also entered several cake crushers and breakers for trial. This maker was also strong in hay-making machines and horse-rakes, winnowers, and other useful farm implements.

Wallis and Stevens, of Basingstoke, had two portable steam-engines on the ground working thrashing machines and elevators or stackers. They also exhibited a number of their ploughs and patent harrows, with teeth ranging from 5½ inches to 12 inches in length.

Turners, of Ipswich, had two fixed and three portable engines in the yard, besides a good assortment of various crushing mills, cake breakers, flour mills, and other articles of their manufacture.

The stand of Mellard's Trent Foundry, of Rugeley, was principally noticeable for its dairy appliances, especially cheese presses and curd mills. Pugh's improved self-acting cheesemaking apparatus for cutting, gathering, pressing, and vatting of curds is simple in construction, economizes labour, and produces more and better curd than by handmaking. This firm entered also several very good corn mills, chaff-cutters, oilcake breakers, and root pulverizers in the trials. An improved double-action haymaker was also shown, which is a strong and serviceable machine, with backward and forward motion, and a simple method of raising and lowering the tine barrels.

Gray and Co., of Uddingston, brought forward no less than six improved ploughs, described in the catalogue as "new implements." They are double furrow ploughs, with the exception of one—a triple furrow, which, it is stated, can be worked on light soils with three horses.

McKenzie and Sons, of Cork, obtained high commendation for a very useful article—their patent mower and reaper knife-grinder and rest, which was brought out in America a short time ago, and is now largely in use in this country. It combines in one implement a knife-grinder, common grindstone, and a knife rest. The knife is held in position by a small pinching screw; a convex stone block, worked by a crank, acts on one side each of two sections in an oblique reciprocal motion. It grinds from point to end, requiring only a boy to manage the whole thing. Their turnip and mangold sower, which gained a silver medal at Manchester last year, is well known.

Tye, of Lincoln, besides corn mills, coprolite mills, elevators, and all mill utensils, had an eight-horse portable engine.

The old-established and well-known seed-houses made large and handsome displays of roots, seeds, and forage plants, the stands of Sutton and Sons, Thomas Gibbs and Co., and J. Carter and Co. being especially noticeable.

The following corrections have been received:—

The Fixed Steam-engine Trials.—The time run by Marshall, Sons, and Co., of Gainsborough, with the Ten-horse power Engine, was 2 hours 42 minutes. The figures in our report were transposed.

Crushers for Steam or Horse-Power.—Corbett and Sons, of Wellington, Salop, did not go to trial.

Bone Mills.—The Beverley Company roller was a single not a double one, and the total turned out by that machine 3 cwt. 3½lbs.—viz., dust 1 qr. 23lbs., ¼-inch 3 qrs. 5lbs., ½-inch 3 qrs. 25½lbs., rough 3 qrs. 6lbs.

THE BIRMINGHAM HORSE SHOW,
IN BINGLEY HALL.

Although the Hall was not packed quite so full as we have seen it, still there were plenty of animals gathered together to have made a good show, provided they had been of the right sort. Unhappily this was not the case, and we looked for good horses even as the parched up country has in many places gasped and thirsted for summer showers, which many a tiller of the soil knows to his cost have been by far too few. Nevertheless there were some plums in the pudding, and as the hall was nicely ventilated, and the custom of mixing up larking with business abolished, together with another wearisome failure, that of bringing the horses in class after class before the judges and the public, it was altogether an agreeable and interesting meeting. On first entering the yard we were told that it was rather strange that the three judges of hunters were Northamptonshire men—for the neat residence in stone and slate that you glide by on the right after leaving Rugby for Birmingham is well known as once the residence of Mr. Oldacre, the London saddler and purchaser of horses—and before leaving the yard that it was still more curious that the chief prizes should find their way to Wansford in England, which is also in the same county. We do not for a moment say that there was any unfair leaning to the grass country and to a fellow-sportsman, but we think that such a remarkable coincidence should be avoided for the future, as some of the exhibitors were not particular in picking phrases when giving vent to their feelings, laying the emphasis on an expressive word as strong as ever Keeley the actor did in one of his parts,

"This is the scene the painter drew,
Here's the rock and there the *blasted* yew."

But in the ladies' horses, when Mr. Elliott and Major Barlow were judging, was the sensation scene of the play! where after a lengthy deliberation they awarded the plating-looking unmannerly Squire from Wansford the blue riband, in preference not only to one or two others but to Mr. Jones's neat blood-like bay by Artillery, as nice a horse for the purpose, in manners, form, action, and temper, as one would wish to see—a verdict that deservedly brought forth hisses, and that was enough to choke Mr. Jones or any other man from exhibiting again. We believe, as many did, that the bay was the horse Major Barlow went for, and if so, we think that he ought to have stood out for his opinion as he would for his country, or at any rate he should have called in a third party—some known judge of horses for general purposes, and not one whose qualification is his having given so many thousands for such a horse, like the gentleman who on the strength of his having parted with £50 for a Cochin China cock was appointed a judge of poultry, and soon after locked up by his friends. Surely after such a decision there ought to be a court of appeal, or at least the ladies for the future allowed to judge for themselves as they could not fall into such a mistake, or give greater dissatisfaction. The four-days' show commenced on Tuesday, the 16th of August, Captain Clarke, Messrs. Oldacre, and Elliott, proceeding a little after nine with the thorough-bred stallions; the Captain taking a rather passive part throughout, while the other two seemed to go well together. There was nothing among the thorough-breds up to Dalesman of last year, comprising as they did

Legislator by Voltigeur, a short horse of no substance, and his toes in; Laughing Stock by Stockwell, an over-topped deformity, a Flatcatcher, and as untrue a made horse throughout as we ever wish to see, and this we say in the face of all the prizes he has taken from the time Mr. Cookson started him with the Royal £100 at Newcastle, and we have plenty to back us in our opinion. What the judges can see in him but beef we cannot comprehend, but we have set our pen against him from the first, as we did against Beechwood, Master of Arts, and a host of others, as we well recollect it was thought at the time to be a bit of presumption on our part to differ with practical men, as it was with Mr. Oldacre in '67, when he put False Alarm before Scottish Chief, and the wooden Master of Arts and Voyageur before Mountain Dew and other horses that could move. Of course a man who watches show after show, and who has given up his time to the love of the thing, as well as heard the opinions of some of the best men in the country over horses both on form and action, cannot know anything about it; while some lad just out of his teens, who has escaped drawing corks or serving out sugar, through picking up a little dog Latin during a six-month's stay or so at Camden Town, can bounce into a ring and disqualify a horse, though a couple of most potent-grave and reverend seniors beg to differ with him! Surely we are an easy-going people, when we know what mistakes doctors make, even when we can point out where the pain is ourselves. "But we are diverging," as the diner-out said when he mistook the canal for the towing-path. The next on the list was Professor Airy by Mathematician, a neatish topped horse of no substance, and not in appearance a hunter sire. Bertie by Newminster we had our say about as a hunter sire at Wakefield, as we had of the leggy Alcibiades by Cossack when he won at Islington, and that some say is like his sire, and that we say just about as much as Tom Sprung was like Tom Sayers, the most civil of boxers, being a fine big-boned man, while the other was gipsy-like and wiry. Then Idler by the Flying Dutchman is deficient of bone; and Sincerity by Red Hart we have given a portrait of in our Oxford and Wakefield reports, while Carlton by Stockwell, belonging to the same stable, was an abscutee, as were all Mr. Casson's other entries, in consequence of the death of his father. Hercules by Kempton could not belong to the crew, as his dam Polly by Hereford, a very handsome hackney mare that took a second for brood mares at Oxford, is not in the Stud Book. The last on the list was Jupiter by Weatherbit, who when a yearling was the hero of the ring at one of the Middle Park sales according to "Nunquam Dormio," who thus describes him: "The interest of the whole affair culminates as the brother to Neptunus the finest furnished yearling we ever set eyes upon, paces slowly round with an extraordinary long powerful stride. There was a strong competition, and Mr. Jackson became his owner for 620 guineas;" but here Jupiter was unnoticed, and the shuffling going Professor Airy beats him for a place. Laughing-stock is second, and Sincerity first—having now played first, second, and third at Birmingham, Wakefield, and Oxford, he and Laughing-stock holding the same places as they did at Wakefield, were Mr. Elliott, also, acted as a judge. Jupiter takes somewhat

after his sire and Neptune, but is not so round in the barrel or so powerful and muscular in his frame, nor has he the beautiful limbs of the old horse, but then he has not Weatherbit's weakness behind the shoulder to such an extent. He is a lathy wiry horse of fair form that we are not in love with, but we would just as soon or sooner send a mare to him with the chance of breeding a hunter, as we would to Laughing-stock, Professor Airy, Alcibiades, Idler, or Legislator, as there are six of one and half-a-dozen of the other. Laughing-stock is more likely, perhaps, to get weight carriers, if like gets like; as in that case they will have quite enough to do to carry themselves.

Let us now pass on to the hunters exceeding fifteen hands and a half, up to fifteen stone with hounds; and, taking them as a lot, there was not a first class passenger among them. We are not speaking of under-ground swells that will not bear the light, and that can cut a dash for fourpence, or of the short distance gentlemen who settle down into the second class when they get out of their own county, but of the genus genuine, who can go the pace and distance from end to end. The first horse, the Yankee, from Wansford, is a strong beast, but lacks quality, and is over at his shoulder-points, with his forelegs under him, and these he does not get away in his walk; although he seemed to use them better in his gallop from what we could see in a circus. Then, Tipperary was a very coarse-looking gentleman when he took a prize here as a four-year-old, but he has fined a bit, and is a good-shaped horse barring his head; and the society he was now in suited him. Widmerpool, the third prize, is a compact hunting-like horse on a short leg, with great power, but with his jowl set too far into his neck. The Don, from the same stable, is lengthy, of good form in top and limbs, but does not look of a hardy constitution, although he can move; while Major Barlow's Fox and Mr. Sankey's bay were not without breed and hunting characteristics. Next came the fifteen hands and a half hunters, without condition as to weight, which, like last year, was the class of the show. Among the lot were Mr. Lucy's beautiful mare Heroine, the first at Islington this year, as well as Golden Hue, that played second to her—a mare that Lords Portsmouth and Coventry, together with Mr. Chaplin, thought better than the gig horse who won the Badsworth hunt cup at Wakefield; but here Messrs. Oldacre and Elliott won't look at her, as she is drafted one of the first, without even putting her through her paces, though this class is without condition as to weight; and the Heroine is as neat a light hunter as ever stepped; while Golden Hue, who is cramped in his forehead and not near so free a mover, they keep in and award a third prize, as they can afford to do, having got rid of the Heroine. "But," says some 'cute gentleman, "what limbs Golden Hue has to the mare!" and we grasp them and find the difference mere hair splitting. Major Barlow's neat lengthy mare Brumette fares much the same as the Heroine; while one really nice horse and a goer, Mr. Dilke's Genial Boy, comes in for a commendation. Mr. Richards' Ashwell, a thoroughbred colt, that we spoke well of last year, with the exception of being a little throaty, when first in the four-year-olds; is now a gelding, and came in for a high commendation. The second prize, Highflyer, is of fair form and breed, and can move; while the winner, Mr. Percival's Granby by Gemma di Vergy, dam by Belzoni, bred by Mr. Watson, of Dorsley, Totness, where we have seen many a good one, is a deep level-topped horse of quality, as his pedigree would lead one to expect, hardy looking, with a nicely-proportioned length of leg, but rather light of bone for his top, and he did not move at all freely. Tres-ace, a big, narrow, lathy, chesnut horse of breed, that was second to Topstall

last year, was not noticed. The hunters not exceeding fifteen and a-half were a poor lot, and we doubted whether the judges would award a prize, as the best, Coxcomb, who took two prizes at Islington, is but a neat hack or ladies' horse. The gentleman up caused a little amusement when taking him over the gorse bar for the first time by making a patent safety of the pommel; however, he did it very cleverly the second time without such aid. On our asking a friend by our side whether that was the way he held on, he replied, very quietly, "Not in public." The four-year-olds were not grand, and we thought Mr. Holmes was more deserving of the prize in this class than where he was second to Granby; but not so much with his highly-commended bay by Planet, who seemed a little tucked up in his back ribs and peacocky in his quarters, as with Prudence, a wiry-looking wear-and-tear black. The first-prize, Walton, can move, and was of fair form, while Doctor de Jongh was not exactly of the hunter-stamp, though with plenty of quality, and Mr. Roots' commended, that Mr. Oldacre kicked into a scramble of some sort round the ring, and then got off, and looked at, was a thick-set, bad-shouldered cob, with nothing of the hunter about him. In a fair lot of three-year-olds the first and second two-year-olds of last year took the same places; the first, a chesnut colt by Saxon, looking anything but well done by, while the filly by the Lawyer could not be in better trim. The third had a good forehead; and Blankney, out of a favourite mare of Mr. Chaplin's, was rather high on the leg. The others we noticed were Mr. Frost's Comet and Mr. Richards' Tommy Dodd. In the two-year-olds Mr. Richards was again to the fore, playing first and third with a deep good-limbed thoroughbred colt by Morocco, out of a Fingal mare, and a nice-formed one of not so much substance, but a free mover, by Lacydes. The second was a long narrow colt of no depth by Hurrah, while the commended, a chesnut with four white legs, pleased us better than the highly-commended, whose shoulders were not quite right.

The second day commenced with the roadsters and hacks exceeding fifteen hands with Major Barlow and Mr. Elliott in the judgment seat. Mr. Holmes won easily with a well-made brown, cobby-hack, of great power, that could move; the second, The General, being a lathy thoroughbred looking horse, with gingerly dancing action. The next lot, the weight-carrying hacks, were very poor with the exception of half-a-dozen; the blue riband going to Alonzo, a bay of some character with a drooping quarter, and by no means perfect in form; but he moved strong and well, beating a very handsome red roan hack, Redpath, from Charleotte Park, where they go for beauty as well as form, as we never saw an ugly one from that quarter. Mr. Elliott rode the two, pulling Alonzo together and making the bay look twice the horse under him, that he did with his groom up; but as he did not get the mouth of Redpath he showed to less advantage with the judge than he did with his neatly got-up attendant. The third was a useful one of Mr. Holmes', and we think second at Beverley. The next best were Mr. Wilde's Brown Bess, from Bridgnorth, and Mr. Prest's, of Stretford's Rufus. Mr. Hornsby's old mare Beda won it last year, but now was shown in a ladies' class, with her stable companion Odd Trick; but we think both would have fared better as gentleman's hacks. In the cobs under fourteen hands, after a little rattling the dice turned up in favour of Chicken Hazard, a good topped, very stylish pony of thirteen two, with that peculiar straight, marching, hesitating action, although we thought the chances were six to four in favour of Mr. Marlett's fashionable gentleman-Starlight, a much better goer, though a trifle slack in his back. The second, Cleveland, a strong, well-made

one, from Thurgarton Priory, with power and action, would have looked none the worse if the gentleman in the red waistcoat had paid a little more attention to his nag's toilet. The Colonel was perhaps more of the cob cut than either, and took up the same position as he did last year. The next was the sensation class that we alluded to in the beginning, where the Squire of Wansford, as a lady's horse, was put over the heads of Mr. Jones' bay; Mr. Badham's Eclipse; Major Quentin's Burnt Sienna, a second prize taker at Islington; Mr. Garnett's Elegance, well known on the London boards; Mr. Hobson's Artist; and Mr. Richards' Shambally, who figured as the prize hunter not exceeding fifteen two last year. The commended Baron, a chesnut from Wansford, was more to our fancy than his stable companion, but as a charger, and not a lady's horse, Mr. Badham's old grey Major, who is as well-known in the ring as the gentleman in the white hat and crape that steered him, must have nearly filled the stocking with prize money by this time, as his victories are as numberless as the stars. He again played the conqueror in ladies' horses not exceeding fifteen hands, with Lady Jane as his second, an iron grey of a good figure; but a skittish young lady of a queer temper, that was continually kicking up her heels. The commended was a pretty weed from Cowbridge; while old Beda and her young man could not keep step together, lost their tempers, and were bowed out by the master of the ceremonies. Miss Davy, of Leamington, showed a rather taking grey mare by Cregane, an Irish stallion shown at Wakefield, and Mr. Hobday a neat black hack called Robin Hood. The harness horses exceeding fifteen hands high were not up to much, with the exception of the winner, Greenfield, who is a lengthy, short-legged, stylish-looking horse, for Mr. Browning's grey was rather common-looking, and Mr. Thorne showed a bay with a rather waspy middle, that was a capital mover, going oily and well. In the next lot in harness exceeding thirteen hands and a-half and not exceeding fifteen hands, there were not many of anything like the first water; the Princess being a clever mare, with nothing extraordinary about Mr. Blyth's second, but why Leybourne is continually passed over as a gig-horse we should like to know, as the way he carries himself, with his beautiful action makes up for a little lightness in his back ribs. Many of these horses in harness had not their numbers. With nothing worth mentioning to oppose him, Mr. Holmes won in harness pairs with a couple of dark browns, fine looking horses, but they did not pull well together, going in a sheepish sort of way, with their tails tucked in and their eyes and ears working backwards and forwards, evidently not more at home in the circus than some couples of ladies and gentlemen when making their first appearance in a public coffee-room in this country. For horses or ponies Mr. Thorne was awarded the prize for the best appointed tandem, neither the leader or wheeler being remarkable for anything good. To our mind, Mr. Tyler's turn out, with two rather varmint-looking bay ponies, well in hand, was by far the best, but the prize invariably goes to horses here upon this reasoning: "Would you not rather sit behind horses than little bits of twisting ponies?" There were a great many ponies, but as with the horses the ordinary ones prevailed, and the beautiful were few and far between. But is not this the same with all things, and it has often struck us, as we dare say it has many before, when gazing out of some hotel window at the people passing, that if war were declared between the ugly and the handsome, how the good-looking ones would soon be routed. Of course, we should be neutral, unless the ugly mugs insisted on our leading them on. We have no time to notice the little fry, but cannot pass

over such as Mr. Horsby's sweet little chesnut, Lady Mary, that any lad would fall in love with; Mr. Eatou's Beauty, Mr. Adderley's Vulcan, Mr. Bower's Jemmy, and Captain Brooke's Fatty. In the cob stallions the tug of war was between St. George, the Islington and Oxford prize cob, and Mr. Milward's Sleaford hero, Don Carlos, over which the Louse divided, and Mr. Graham, of Yardley, was called in to decide, who gave it in favour of Don Carlos, a verdict that we should quite agree with, provided the Don was as good behind as he is before.

The agricultural and dray horses do not muster in great numbers in Bingley Hall, but what there are of them are generally good. In the agricultural stallions the first-prize two-year-old at Oxford not qualified to compete as Clydesdale or Suffolk, Nonpareil, a very deep well-made horse, on a short leg, with not the best head or eye, beat the well-known Clydesdale, Young Lofty, about the handsomest cart horse we ever saw; while the gandy coloured York Champion, the second at Oxford, was third. There was a solitary and very moderate specimen of a Suffolk exhibited by Mr. Beale Brown. There were four four-year-olds, the third at Oxford in mares and foals, a grey, Nelly by name, being the first, and a useful active looking bay of Mr. Bullivant's second, while Mr. Brierly's chesnut Warwick, the second at Wakefield in a capital class, was nowhere! In dray horses it will be seen that Mr. Brierly beat the Midland Railway Company, who exhibited a couple of very fair specimens.

P R I Z E L I S T .

JUDGES.—F. Oldaker, London.
 Captain Clarke, Spratton.
 J. Elliott, Towcester.
 Major Barlow, Woodbridge.
 J. Burberry, Stratford-on-Avon.
 R. Swale, Wolverhampton.

Thorough bred stallions for getting hunters.—First prize, £30, J. Casson, Burgh-by-Sands, Carlisle (Sincerity); second, £10, J. Moffat, Kirklington, Carlisle (Laughing Stock); third, £5, W. Robinson, Bonhill, Tamworth (Professor Airy).

Hunters exceeding 15 hands 2 inches, equal to 15 stone, 5 years old and upwards.—First prize, £30, T. Percival, Wansford, Northampton (The Yankee); second, £10, Westley Richards (Tipperary); third, £5, Westley Richards (Widmerpool).

Hunters exceeding 15 hands 2 inches, without condition as to weight, 5 years old and upwards.—First prize, £30, T. Percival (Granby); second, £10, G. Holmes, Beverley (High-flyer); third, £5, H. Spencer Lucy, Warwick (Golden Hue). Highly commended: Westley Richards (Ashwell). Commended: C. F. Dilke, Coleshill (Gemal Bay).

Hunters not exceeding 15 hands 2 inches high.—First prize, £20, Major Quentin, Cheltenham (Coxcomb); second, £10, F. Blakeway, Stourbridge (Surprise).

Hunters four years old.—First prize, £20, A. Newman, Winchcomb, Gloucester (Walton); second, £10, W. H. Hoey, Leamington (Doctor de Jough); third, £5, C. Milward, Moseley (black gelding). Highly commended: G. Holmes (bay). Commended: W. Root, Leamington.

Three years old colts or fillies, for hunting purposes.—First prize, £20, Westley Richards (chesnut colt); second, £10, T. Argyle, Tamworth (Jenny). Commended: G. Mitchell, Burton-on-Trent (Blankney).

Two years old colts and fillies, for hunting purposes.—First prize, £15, Westley Richards (bay colt); second, £10, J. Mordaunt, Staple Hill, Warwick (chesnut colt); third, £5, Westley Richards (bay colt). Highly commended: T. Jones, Shrewsbury (brown). Commended: G. J. Mitchell, Burton-on-Trent (chesnut colt).

Hacks, roadsters, and cobs exceeding 15 hands high.—First prize, £15, G. Holmes (brown gelding); second, £10, F. G. Haines, Ealing (The General); third, £5, J. Gilman, Birmingham.

Weight carrying hacks, exceeding 14 hands and not exceeding 15 hands 2 inches.—First prize, £15, G. Wilkes, Birmingham (Alonzo); second, £10, H. Spencer Lucy, Warwick (Redpath); third, £5, G. Holmes (brown mare).

Cobs not exceeding 14 hands high.—First prize, £15, Capt. J. S. Ballard, Cowbridge (Chicken Hazard); second, £10, R. Milward, Thurgarton Priory, Notts (Cleveland); third, £5, H. E. Williams, Handsworth (The Colonel). Commended: C. Martlet, Newark (Starlight).

Ladies' horses, exceeding 15 hands high.—First prize, £15, T. Percival (The Squire); second, £5, F. B. Jones, Cheltenham (bay). Highly commended: T. Percival (The Baron).

Ladies' horses, not exceeding 15 hands high.—First prize, £15, G. D. Badham, Sudbury (Major); second, £5, W. H. Harrison, Oxendon, Northampton (Lady Jane). Commended: R. N. Hooper, Cowbridge (The Hart).

Harness horses exceeding 15 hands high.—First prize, £15, C. J. Shaw, Edgbaston (Greenfield); second, £5, J. A. Browning, Birmingham (Grey mare).

Harness horses exceeding 14 hands and not exceeding 15 hands high.—First prize, £15, H. J. Buck, Shrewsbury (Princess); second, £5, T. W. Blyth, Evesham (Bay gelding).

Pairs of harness horses.—Prize, £20, G. Holmes, Beverley. Tandems, horses or ponies.—Prize, £5, G. Thorne, Birmingham.

Ponies in harness, not exceeding 14 hands high.—First prize, £10, Capt. W. J. Brooke, Weedon (Patty); second, £5, G. Clewents, Birmingham (Sultan). Highly commended, E. Steventon, Swan Village (Brown).

Ponies not exceeding 13 hands high.—First prize, £10,

J. Horusby, Grantham (Lady Mary); second, £5, J. Thomas, Cardiff (Minnie).

In harness.—First prize, £10, W. King, Leighton Buzzard (Tommy); second, £5, J. Cooke, Banbury (Prince of Wales). Commended, J. Eaton, Southwell, Notts. (Beauty).

Ponies, not exceeding 12 hands high, to carry children.—First prize, £10, F. Bower, Birmingham (Jemmy); second, £5, R. M. Hamer, Stratford-on-Avon (Kingeraft). Commended, F. Bower (Leominster).

Pairs of ponies, in harness.—First prize, £10, Major Quentin, Cheltenham (Lothair and Corisande); second, £5, — Male, Leamington (Robin Hood and Little John).

Stallions, for getting cobs or ponies.—First prize, £15, R. Milward (Don Carlos); second, £5, H. Roundell, Otley (Sir George).

Dray horses, four years old and upwards.—First prize, £15, C. W. Brierly, Manchester (Champion); second, £5, Midland Railway Company (Captain).

Agricultural horses, four years old and upwards.—First prize, £15, A. H. Thursby, Leamington (Nelly); second, £5, J. Bullivant, Birmingham (Gilbert).

Stallions.—First prize, £30, W. Wynn, Grafton, Alcester (Nonpareil); second, £10, the Earl of Beauchamp, Worcester (Young Lofly); third, £5, J. Manning, Wellingboro' (Young Champion).

NORTH AND EAST RIDINGS OF YORKSHIRE AGRICULTURAL SOCIETY.

The Scarbro', Hackness, and North and East Ridings Agricultural Society has just held its annual show. Partly no doubt from the prevalence of foot and mouth disease, and partly from similar gatherings being fixed for the same day, the show of horned cattle in number and in quality was far below what it has been in previous years. The entries on Friday, taken altogether, numbered a little over 800; last year they exceeded 1,000.

The two years old heifers made up the only class among the Shorthorns in which there was a good competition, Mr. Hornby, of Ganton, taking the leading prize against four other breeders. Major Stapylton, of York, took the leading bull prize with the five years old Lord Wetherby, and was awarded also the first prize for bull calves. The two years old bull prize went to Mr. Robert Fisher, of Beverley, and the three years old to Mr. Frank, Fylingdales. The first prize for aged heifers was given to Lord Feversham's Columbia, and the first honour for heifers under two years went to Mr. Hornby. There was a fair show of sheep. The pigs made up a good show, and most of the classes were well filled. The display of horses was a pretty large one, and formed, as usual, the chief feature of the show.

JUDGES.—Cattle, sheep, and pigs: P. Spencer, Claybrook, Lutterworth; F. J. Empson, Bonby, Barton-on-Umber; W. Jobson, Batelaud, Hexham. Hunting and nag horses: R. Walker, Somerby, Brigg; J. E. Bennett, Bosworth Grange, Rugby; W. S. Atkinson, Barrowby Hall, Woodlesford, Leeds. Coaching and agricultural horses: J. W. Arnett, Ugham, Morpeth; A. Turnbull, Cresswell, Morpeth; W. Wood, Hahrough, Cleby.

The following list contains their principal awards:

CATTLE.

SHORTHORNS.

Bull of any age.—First prize, Major Stapylton, York; second, D. Hartley, Westerdale.

Bull above one and under two years old.—First prize, R. Fisher, Beverley; second, Earl Feversham, Hemsley.

Bull calf, under twelve months old.—First prize, Major Stapylton; second, Earl Feversham.

Cow or heifer above three years old, in calf or milk.—Prize, Earl Feversham.

Heifer not exceeding two years old.—First prize, T. Hornby, Ganton; second, Major Stapylton.

Bull above one and under three years old.—First and second prizes, T. Frank, Whitby.

Cow or heifer above three years old, in calf or milk.—Prize, T. Frank.

Heifer not exceeding three years old, in calf or milk.—Prize, T. Hodgson, Scarbro'.

Heifer not exceeding two years old.—First prize, T. Hornby; second, J. M. Crosby, Scarbro'.

CATTLE OF ANY BREED.

Dairy cow.—Prize, G. Chapman, Seamer.

COTTAGER AND MILK SELLERS' PRIZE.

Milk cow.—First prize, Thos. Cole, Scarbro'; second, G. Chapman.

SHEEP.

Two shear or aged ram.—First prize, E. Riley, Beverley; second, J. W. Sharpe, Hull.

Shearling ram.—First prize, E. Riley; second, W. Brown, Holme-on-Spalding-Moor.

Pen of three shearling rams.—First prize, E. Riley; second, J. J. Simpson, Hunmanby.

Pen of five shearling gimmers.—First prize, W. Brown; second, E. Riley.

Pen of five Leicester ewes.—First prize, R. Tindall, Pickering; second, S. Staveley, Driffield.

Pen of five Leicester gimmaer lambs.—First prize, W. S. Gray, Whitby; second, Mrs. E. D. Nestfield, Scarbro'.

Ram adapted to a moor or mountain district.—First prize, W. Rudsdale, Danby End, Yarm; second, C. Smith, Westerdale.

Pen of three ewes adapted to a moor or mountain district.—First prize, C. Smith; second, W. Rudsdale.

Fat ewe or wether.—First prize, R. Tindall; second, W. Brown.

PIGS.

Boar of large breed.—First prize, J. and H. Sugdon, Beverley; second, M. Gibson, Scarbro'.

Sow of large breed, in milk or pig.—First prize, J. Thompson, Seamer; second, G. G. Bilton, Scarbro'.

Boar of small breed.—First prize, G. Mangels, Ripon; second, G. Sedgwick, York.

Sow of small breed, in pig or milk.—First prize, G. Mangels; second, T. Boggett, Ilwethorpe.

Three store pigs, of any breed, of the same litter, and from four to nine months old.—First and second prizes, M. Harrison, Scarbro'.

Boar of large breed, not exceeding twelve months old.—First prize, W. Rudsdale, Yarm; second, G. Chapman, Seamer.

Sow of large breed, not exceeding twelve months old.—First prize, W. Rusdale; second, G. Chapman.
 Boar of small breed, not exceeding twelve months old.—First prize, G. Chapman; second, J. Windle, Pickering.
 Sow of small breed, not exceeding twelve months old.—First prize, W. Wardell, East Ayton; second, G. Chapman.
 Store pig, the property of a cottager or working man.—First prize, G. Chapman; second, G. Scoter, East Ayton.
 Extra stock.—Prize, D. Berryman, Ruston.

H O R S E S.

HUNTERS.

Stallion, thoroughbred.—First prize, W. Shaw, Shipton; second, G. Lamplough, Driffield.
 Brood mare, with foal at her feet.—First prize, J. Robinson, Thirsk; second, G. Ringrose, Ganton.
 Yearling gelding or filly.—First prize, Sir G. Cholmley, Bridlington; second, R. Catley, York.
 Two-year-old gelding.—First prize, Charles Elsley, York; second, J. Cattle, Malton.
 Two-year-old filly.—First prize, J. F. Leighton, Osgodby; second, J. Robinson.
 Three-year-old gelding.—First prize, E. D. Nesfield, Scarborough; second, Sir G. Cholmley.
 Three-year-old filly.—First prize, Sir G. Cholmley; second, R. Jackson, Middlesbro'.

COACHING HORSES.

Stallion.—First prize, G. Holmes, Beverley; second, H. R. W. Hart, York.
 Brood mare, with foal at her foot.—Prize, J. S. Darrell, West Ayton, Sherburn.
 Yearling gelding or filly.—First prize, E. Piercy, Garton, Driffield; second, J. Jackson, Scarborough.
 Two-year-old gelding or filly.—First prize, G. Hopper, Yedmandale, Ayton; second, J. Taylor, Burton Agnes.
 Three-year-old gelding or filly.—First and second prizes, T. Darrell.

ROADSTERS.

Stallion.—First prize, R. Waters, Gilling; second, W. Poad, Raston, Sherburn.
 Brood mare, with foal at her foot.—First prize, W. Major, Sledmere; second, J. F. Morris, Scarborough.
 Yearling gelding or filly.—First prize, C. Crosby, Brompton; second, G. Knowlson, Thormanby.
 Two-year-old gelding or filly.—First prize, T. B. Wilson, Folkton, Ganton; second, W. Snowdon, Slingsby.
 Three-year-old gelding or filly.—First prize, T. N. Kendall, Pickering; second, W. Snowdon.

Mare or gelding of any age.—First prize, W. and G. Lovel, Norton, Malton; second, W. Stevenson, Cottingham, Hull.

AGRICULTURAL HORSES.

Stallion.—First prize, J. Braithwaite, Eberston, Hesleron; second, Francis Simpkin, Welton, Brough.
 Brood mare, with foal at her foot.—First prize, Mrs. E. Smith, Bampton, Bridlington; second, W. A. Wood, Sutton Forest.
 Yearling gelding or filly.—First prize, R. Davison, Bampton; second, John Petch, Scarborough.
 Two-year-old gelding or filly.—First prize, J. Jackson, second, J. S. Darrell.
 Pair of horses, of either sex, worked during the summer.—Prize, R. Tindall, Kirby Misperton, Pickering.

PONIES.

Mares or Horses, under two years old, not to exceed 14 hands 2 inches high.—First prize, W. Simpkin; second, J. S. Darrell.
 Mares or Horses, under eight years old, not to exceed 13 hands high.—First prize, H. Walker, Scarborough; second, Col. J. D. Astley, Scarborough.
 Extra stock.—First prize, Jas. Barwich, Scarborough; second, W. Peacock, Scarborough.

SPECIAL PRIZES.

Hunting gelding or mare, of any age, open to the district only.—Prize, G. Ringrose, Ganton.
 Hunting mare or gelding, five years old.—Prize, J. S. Darrell, West Ayton, Sherburn.
 Hunting gelding or mare, four years old, the property of a tenant farmer residing within the district.—Prize, T. Darrell, West Ayton.
 Ladies' hackney gelding or mare of any age.—Prize, Sir G. Cholmley, Bridlington.
 Harness gelding or mare, not less than three but under eight years of age.—Prize, W. Stephenson, Cottingham.
 Roadster, of any age up to 14 stone.—Prize, J. Robson, Old Malton.

LEAPING PRIZES.

Horses, of any age, sex, or breed.—Prize, T. Youdan, Ganton.
 Ponies, of any age, sex, or breed.—Prize, T. J. Bodger, Sherburn.
 The luncheon took place at one o'clock, and was attended by a numerous company. Mr. E. S. Cayley, of Wyedale, one of the vice-presidents, took the chair in the absence of Lord Londesborough.

PENISTONE AGRICULTURAL SOCIETY.

The seventeenth annual exhibition of the Penistone Society has been held. The amount of prizes given was in money nearly £250, besides fourteen silver cups for the best stock on the ground. The entries for horses were not numerous, only numbering forty-three; but the quality, as a whole, was very fair. With the exception of seven jumpers, they were all for agricultural purposes. Both the mares and geldings were a good class, while the foals were excellent. Of cattle there were 39 entries, but for quality they were the best lot here ever shown. Bulls were excellent, and the shorthorn cows were exceedingly good. Sheep comprised 46 entries; taken, as a whole, they were a very good class. Pigs, too, were of a fair class throughout, though small in number.

JUDGES.—Cattle and Sheep: G. H. Sanday, Holme Pierrepont, near Nottingham; J. Rooth, Stretton, Alfreton, Derbyshire; W. Mellows, High Melton, near Doncaster. Pigs and Horses: F. W. Addey, Upper Cudworth, near Barnsley; Charles Speight, Millhouses, near Sheffield; J. Sheard, New House, Huddersfield.

CATTLE.

Shorthorned bull.—First prize and silver cup, T. Statter, jun., Standhill, Whitefield, Manchester; second, Mrs. Packman, Tupton Hall, Chesterfield.

Shorthorned yearling bull.—First prize, J. Sunderland, Bilingley, near Barnsley; second, T. Statter, jun.
 Shorthorned bull-calf.—First prize, G. Mann, Scawby Hall Doncaster; second, J. Mann, Sprotbrough, Doncaster.
 Shorthorned cow or heifer in calf or milk.—First prize, T. Hopkinson, Woodthorpe, Tupton; second, T. Statter, jun.
 Cow for dairy purposes.—First and second prize and silver cup, W. Marsh, New House, Penistone.
 Two-year-old shorthorned heifer.—First prize, Crawshaw and Blakeley, Dewsbury; second, J. S. Stanhope, Cannon Hall.
 Two-year-old shorthorned heifer.—First and second prize, J. Burgon, Hall Royd, Silkstone.
 One-year-old shorthorned heifer.—First prize and silver cup, T. Statter, jun.; second, Crawshaw and Blakeley.
 One-year-old shorthorned heifer.—Prize, J. Marsh, Cudley, Penistone.
 Shorthorned heifer calf under 12 months old.—First prize, Crawshaw and Blakeley; second, R. Lowe, Shire Green.
 Shorthorned heifer calf under 12 months.—Prize, W. Marsh.

SHEEP.

Ram of any age.—First prize and silver cup, T. H. Hutchinson, Manor House, Catterick; second, J. Dransfield, Oxspring House.
 Shearing ram.—First and second prizes, T. H. Hutchinson,

Shearling ram.—Second prize, Elizabeth Birks, Edge Hill, Penistone.

Top lamb bred in 1870.—First prize, T. H. Hutchinson; second, J. Dransfield.

Top lamb bred in 1870.—First prize, E. Birks; second, W. Parkin, Hunshelf.

Pen of three ewes having suckled lambs in 1870.—First prize, T. H. Hutchinson; second, J. Winder, Newton, Doncaster.

Pen of three ewes having suckled lambs in 1870.—First prize, J. Sharpley, Scholehill; second, J. Mills, Whitefield, Ox-spring.

Pen of three shearling gimmers.—First prize, silver cup, and second prize, T. H. Hutchinson.

Pen of three shearling gimmers.—First prize and silver cup, F. Fisher, Gawber Hall, Barnsley; second, J. Sharpley, Scholehill.

Pen of three ewe lambs bred in 1870.—First prize, J. Winder, Newton; second, T. H. Hutchinson.

Pen of three ewes bred in 1870.—First prize, W. Parkin; second, J. Sharpley.

PIGS.

Boar of large breed.—First prize and silver cup, P. Eden, Cross-lane, Salford; second, R. E. Duckering and Sons, Northorpe, Lincolnshire.

Boar of small breed.—First prize, P. Eden; second, R. E. Duckering and Sons, Northorpe.

Sow of large breed in-pig or with litter suckling.—First prize and silver cup, R. E. Duckering and Sons; second, P. Eden.

Sow of middle breed in-pig or with litter suckling.—First prize, R. E. Duckering and Sons; second, P. Eden.

Sow of small breed in-pig or with litter suckling.—First prize, R. E. Duckering and Sons; second, P. Eden.

Store pig of large breed.—Prize, R. E. Duckering and Sons.

Store pig of middle breed.—First and second prizes and silver cup, C. F. Hallas, Huddersfield.

Store pig of small breed.—First prize, R. E. Duckering and Sons; second, C. F. Hallas.

COTTAGE LABOURERS' CLASS.

Store pig of any breed.—First prize, G. Ramsden, Penistone; second, J. Holland, Thurlstone; third, C. Webb, Stainborough.

HORSES.

Gelding or mare for agricultural purposes.—First prize, J. Dransfield; second, J. Haigh, Pale Hill, Thurgoland.

Brood mare for agricultural purposes, with a foal.—First prize, T. Makin, South Milford; second, W. Branley, Amcotts, Doncaster.

Foal of 1867, gelding or filly, for agricultural purposes.—First prize, S. Barker, Marr, Doncaster; second, T. Statter, jun.

Foal of 1868, gelding or filly, for agricultural purposes.—First prize, T. Duckett, Bentley, Doncaster; second, T. Wilkinson, Ardsley.

Foal of 1869, colt or filly, for agricultural purposes.—Prize, S. Silverwood, Cawthorne.

Foal of 1870, colt or filly, for agricultural purposes.—First prize, T. Makin, Beckfield House; second, T. Statter.

THE ROYAL DUBLIN SOCIETY.

THE HORSE AND SHEEP SHOW.

The most successful event of the year in Ireland has been the annual horse and sheep show held by the Royal Dublin Society in its extensive premises Kildare-street. It has brought together the finest horses from every direction that Ireland can boast of. The few words uttered by Sir John Power and others at the Royal Agricultural Society's banquet in Kilkenny in 1833, when its show was held there, were taken up with spirit by the leading noblemen and gentry, and culminated in the first Irish horse show in April, 1864, when 370 horses appeared in competition. The progress the horse shows have made since will be best understood by reference to the following table:

Year.	Entries.
1864	370
1865	No show
1866	303
1867	358
1868	368
1869	452
1870	493

But it is not in numbers that the exhibition shows its merits, but in the increasing value of the young stock annually brought forward; as those must acknowledge that have kept a close watch on the progress made, contrasting the style, quality, and condition of the first with the succeeding shows, of which that under notice yields abundant proof, as it is universally acknowledged that never before were horses shown in such good working condition.

The first section included stallions "best calculated to improve and perpetuate the breed of sound stout thoroughbred horses, weight-carrying hunters, and horses for general stud purposes," in which eighteen were entered. His Excellency Earl Spencer was put first for General

Hess, occupying the same position as he did last year; Mr. F. H. Power, Mallow, comes second with Citadel, bred by Lord Derby, by Stockwell out of Sortie, by Melbourne; a high commend goes to St. George Mansergh, Tipperary, for Joco; and commends go to Mr. Power, the owner of the second prize horse, for Robin, bred by Baron Rothschild, R. L. Moore's Little Stag, and Thos. Lindsay's Pathfinder, the second at last year's show. There were many good horses besides those placed, amongst which were Mount Palatine, Monarch of the Glen, Tom King, Master George, and Artillery—the prize horse of 1866—a little out of form, but still one of the finest horses in Ireland. In the next section, for thoroughbred sires, calculated to get carriage, troop horses, or roadsters, Strood, the prize horse of 1869, was the only one entered, and he gets the prize; while, singular to say, that in the next section for thoroughbred sires, calculated to get roadsters, hacks, or harness-horses, Kinnaird, the property of Captain Morgan, Athy was again the only one entered, but passed over for want of competition. This was blowing hot-and-cold, for Kinnaird was placed second last year, and is still a good horse for the purpose. A very fine horse—Cleveland—the property of W. E. Fitzsimons, Mount Forest, Gorey, was entered by some mistake among the agricultural horses. He was bred by Mr. Riddell, Great Stanton, Yorkshire, by Wonderful Lad out of Georgina by Master George; and the judges were so much pleased with him as to recommend a special prize medal. Hunters, not less than five years old: The first section for weight-carriers equal to 14 stone and upwards numbered 65, which contained many superior animals. Mr. Richardson, Laimbeg House, Lisburn, was deservedly put first for a grand and very powerful brown gelding by Domino, out of a mare by East of the Barons. C. M. Coyne owns a bay mare by Zouave, dam by Leander, which came in second. She

has good action, but greatly below the first prize in power. S. Bruce, Bennetsbridge, Kilkenny, was placed third with Caprice by Dough, dam by Regulator, an active, well-backed chestnut mare; and a fourth goes to Captain Cosby, Stradbally Hall, for Carriek, bred by Earl Carriek, Mount Juliet. Mr. Belf's Lady Spencer, Captain Studdert's chestnut gelding, F. King's Queen of Trumps, Captain Tuthill's La Montagne, and a host of others unplaced, were taking horses, with capital action and many equal to the requirements named in the section. Five-year-old hunters, equal to 13st. 7lb. up to 14st., numbered no less than 70. Captain Chaplin, A. D. C., The Castle, Dublin, is first for his bay gelding Pioneer by Pilot, dam by Dounfuen; Joseph Mulcell, Ternon Boyle, second, for C. Ranger by Chit Chat; J. Murphy, Whiteleas, Kildare, third, for Roscommon by Tom Steele; the fourth went to Daniel Dunn's Rambler by Arbutha; an H. C. goes to Thos. Turbitt, Owenstown, for his half-bred hunter, winner of the Ward Hunt Cup, 1870, and a commend to C. Bury, Woodville, Robertstown, for Dove, by Cheerful Horn. Many horses in this section went well over the high leap, the first prize going to Captain Ross, Scot's Greys, for a really clever hunter by Mallet dam by Navarino. Hunters 5 years old, equal from 11st. to 12½st., numbered 40. Captain Chaplin, A. D. C., The Castle, Dublin, was placed first for Tarquin by Harkaway, dam by Frey. He is a powerful horse, with a great body, short back, and well set on his limbs. The second was W. W. Tenant's Eden by Eden, dam Sheela by Birdcatcher. He is a capital fencer, and took the second prize over the high leap. The third prize went to Rev. F. Fitzpatrick, Mohill, for Telegram by Pantaloon, dam by Irish Birdcatcher; a capital horse and fine jumper. C. E. Walker, Moyalty, Meath, came in third for Shrimps by M. D. An H. C. went to Michael Flood, and a commend to R. N. Bate, Purdysburn, for his chestnut gelding by Zouave, dam Eugena. The show of young horses was most creditable, with scarcely an exception. Of four-year-old colts, equal to 13st. 7lb. and upwards, there were 42 entries. J. Morrin won the first prize, and the Dublin Citizens' £100 Challenge Cup, open to horses from 4 to 6 years old, the property of *bona fide* tenant-farmers, whose occupations do not exceed in value £500 per annum, to which the Society adds £20. The second goes to D. A. Mortimer, Mullagh; the third to Robt. Smyth, Emyvale; and a commendation to H. M. Richardson Rossfad, Ballycassidy. Of four-year-old fillies up to some weight there were six entries. The prizes were: first, Thos. Bradley, M.D., Kells Grange, Kilkenny; second, Thos. Connolly, M.P., Castletown; third, Samuel Ridgeway, Geashill; fourth, A. A. Lawder, Drainsna. Of three-year-old colts up to from 11st. to 13st. 7lbs. there were 43 entries: the first prize went to Mr. Archdell, Crocknaerieve; second, D. A. Mortimer, Lake View Mullagh; third, Robt. Smyth, Emyvale; with R. M. Richardson and David Rogerson commended. Four-year-old fillies equal to the same weight numbered 16 entries: first, A. E. Connolly, Bleakhall-st., Dublin; second, R. E. Baillie, Dundalk; third, N. M. Archdall; H. M. Richardson commended. The three-year-old colts numbered 22: first, Dr. Shiel, Ballyshannon; second, Gerald Fitzgibbon, Merrion-square; third, N. M. Archdall, Crocknaerieve; fourth, W. J. Perry, Bleak-rock, Dublin. Of three-year-old fillies there were nine: the first prize withheld; second, Wm. Woodhouse, Frankford; third, Major Frend, Feathard Tip. Two-year-old colts, 12 entered: first, Allan Pollock, Lismany; second, Wm. Armitage Moore, Cavan; third, Lord Clanmorriss. Two-year-old fillies, 6 entered: first, Major Looyd, Monaghan; second Mrs.

Corbally, Swords; third and fourth withheld. Yearling colts, 8 entered: first, C. W. Wise, Cahir Tip; second, Allan M'Donogh, Curragh-camp; third, P. F. Casey, Raheny, Dublin. Yearling fillies, 1 entered: first prize, Baptiste G. Graham, Kesh, Co. Fermanagh. Ladies' mares, 15 entered, were all great beauties. The Misses Turbet, Owenstown, taking the prizes for two half-bred mares, Rose and Kitty. Park horses, 9 entries; first, Peter Lalouette, Princes-street, Dublin; second, Allan M'Donogh, Curragh Camp. Weight-carrying cobs and roadsters, 18 entered: first, C. W. Wise, Cahir Tip; second, Rev. R. D. Faulker, Hollymount, Mayo; third, Mark Colgan, Enfield; highly commended David Rogerson, Roundtown; commended B. C. Russell, Hazlepatch. Cobs or roadsters, 14 to 15 hands high, calculated to carry 13 to 15 stone, 14 entries: first, Patrick Breen, Gorey; second, Wm. Walpole, Ballacolla; third, Bernard Sweeny, Castlereagh, Roscommon. Cobs or roadsters, under 15 hands high, calculated to carry under 13 stone; 12 entries: First, Jno. Wallis, Donnycarney, Dublin; second, James Maher, Enfield; third, David Rutledge, Tuam; highly commended, D. H. Plunket-Johnstone, Dalky; commended, Capt. Humphrey, Strabane. Harness horses or mares, bred in Ireland; 11 entries: First, Capt. Coote, Castleknock, Dublin; second, Thos. S. Palmer, Merrion-square, Dublin; commended, Allan K. Algie, Hollymount, Mayo. Ponies; 17 entries: First, Dermot Cole, Kinnegad, and the Austin £5 Cup; second, Capt. Tuthill, Nass; third, Miss Lane, Shannon; highly commended, N. J. Harrison, Clonard, Kilkenny; commended, J. K. Rogerson, Olney, Roundtown. Ponies under 12 hands high: First, J. F. Bewley, Black Rock; second, Peter Noon, Roebuck Park, Dundrum; third, R. H. Morrison, Leeson Park, Dublin; highly commended, L. Keogh, Queen-street, Dublin. The smallest pony in the yard: W. Brown, Dalkey. Broodmares—Thorough-bred mares, or having had foals in 1869 or 1870; 10 entries: First, C. L. Ellison, for Blue Bonnet, by Young Melbourne, dam by Teddington; second, Thos. N. Wade, Shrubbery, Killock, for Martha, by Windfall, dam by Launcelot; third, Thos. Connolly, M.P., Castletown, Celbridge, for Barbara, by Barbarian, dam by Birdcatcher; commended, Sir Percy Nugent, for Cascade, by Artillery, dam Crystal, by Crosier. Mares calculated to produce weight-carrying hunters, in foal or having had foals in 1869 or 1870; 20 entries: First, Robt. G. Cosby, Stradbally Hall; second, Jno. Morrin, Dunshaughlin; third, Robt. Bodkin, Armagh, Co. Galway; fourth, Thos. Lindsay, Derry Bog House, Co. Down; highly commended, Joseph Reeves, Athgarvan.

The first section of cart horses contained but three stallions over four years old. The Earl of Luan, Castlebar House, Mayo, exhibited a very powerful Suffolk stallion, which was put first, and also awarded the Royal Agricultural Society's £50 challenge cup, but after wearing the cards for the first day, a veterinary examination declared him unsound, and the honours were transferred to the second prize, Sir Patrick Wallace, the property of Messrs. Mooney, Cruiline, and Co., Dublin. The Earl's horse is a grand one in all his points, but was not active on his fore legs. Sir Patrick Wallace is a well-framed powerful horse of great substance, grand fore hand and quarters well ribbed, clean limbed, and active. At the show of last year, the judges declared this horse, and all shown with him, as wanting in merit, although two out of three of the judges were the same on both occasions. Four stallions under four years old made up the next section, but unevenly matched as to age, two of them being a year older than the other two; Peter O'Mally, Santry, getting the first place for Orphan, a yearling, and half-brother by the sire's side to the prize horse

in the aged section; S. Rait Kerr, Edenderry, and W. Pallon, V. S., Kilkenny, being second and third respectively, for two two-year-olds, Lanark and Tenant Right, both imported Clydesdales of good promise. Four fillies under five years old made up the next section, in which Gerald Rice, Grange Raheny, took the first prize with Jess, half-sister to the prize stallion. She occupied the same position last year as a three-year-old, and is a full bred Clydesdale of great power and symmetry. The second went to Mr. Archdall, of Crocknauerie, for Brown Bess, a very handsome four-year old Clydesdale. The Messrs. Mooney had an H. C. for Nora Creina, a fine dark-brown two-year-old filly, and full sister to the prize horse Sir Patrick Wallace: she held the same position last year as a yearling. Of agricultural brood mares there were but two imported Clydesdales, one S. R. Kerr's Bell, the other C. L. Ellison's Bonnet, which were placed in the order named.

According to general expectations the show of sheep was a good one, numbering 141 entries in all the classes and sections; but the show of pure Leicesters was not, in too many cases, in purity of type equal to what we should have as breeding stock. This class of sheep, to which almost all other breeds owe so much, was continued to Thos. Marris, The Chase, Uleby; J. G. A. E. Gould, Poltimore, Exeter—the only exhibitors from England; Wm. Owen, Blesinton; W. R. Meade, Ballymartle, Balinhassig, Cork; Seymour Mowbray, Killeary, Monrath; J. G. A. Perrin, Chantilly, Co. Dublin. The Messrs. Gould's sheep are strong animals, but coarsely bred; while Mr. Marris' were much neater, higher bred, and very even. However, in the thirteen entries which made up the section for shearling rams, the judges seemed to have forgotten all former precedent, and run on size and weight, giving the Messrs. Gould the leading prizes, Wm. Owen a third, W. R. Meade a fourth, S. Mowbray an H. C., with Marris' very neat rams unnoticed. In rams of any other age there were but ten entries, where the judges preferred the lesser weighted rams, giving Mr. Marris the first and third place and an H. C., Mr. Meade the second, and Mr. Owen a commendation; but the Messrs. Gould did not exhibit in this class. From the high position Messrs. Owen and Meade have occupied for many years, and the pains and expense they go to in introducing rams from the most renowned English breeders, and the symmetry of their sheep, they should certainly stand higher. In the section for pens of three-shearling rams, which is unquestionably a very trying one on breeders, there were seven entries—Mr. Marris two pens, Messrs. Gould one, Mr. Owen one, Mr. Meade two, and Mr. Mowbray one. Mr. Marris takes the first and third prizes, and Messrs. Gould the second; Mr. Meade an H. C., and Mr. Owen a commendation. Of shearling ewes there were but four pens, of five each. Mr. Marris two, Messrs. Gould one, and Mr. Mowbray one. Messrs. Gould take first, and Mr. Marris the second and third places, and S. Mowbray was highly commended. Mr. Mowbray was the only exhibitor of ewes that had reared lambs in 1870, which of course gave him a walk over.

The Border Leicester class came next in order, and were well represented; twelve very fine shearling rams made up the first section, where Mr. Thomas Robertson, Narraghmore, Kildare, stood first, for an exceedingly nice one, with good wool, good ends, back, and ribs, and in prime working condition. Captain Cosby, Steadbally Hall, Queen's County; R. F. Franks, Jerpoint Hill; and Loftus H. Bland, Blandsfort, taking the prizes in the order named. In aged Border rams there were but two exhibitors, Mr. Bland, and Earl Fitzwilliam, from his Irish demense, Coollattin Park, Wicklow; Mr. Bland taking more than the lion's share, the noble Earl getting the

third place. Mr. Bland had one of the finest rams of this pen-filling breed in the show, but by some mistake he was entered in a wrong section, although the judges did not like leaving him out in the cold, and recommended him a special-prize medal. Seven pens of shearlings of three each made up the next section, and a splendid one it was, Messrs. Bland, R. H. Franks and Robertson taking the honours respectively. The next section was for shearling ewes, of which there were four pens of five each, Messrs. R. F. Franks, Bland, and Colonel Leslie, Castle Leslie, Glessingh, being the only exhibitors, who take their places in the order named. Of ewes that reared lambs in 1870, Mr. Bland and Lord Fitzwilliam were the only exhibitors, with a pen each, and they divided the premiums.

This variety of sheep, though rams, have been introduced from time to time to cross with other, has not been bred to any extent in Ireland. In size and symmetry it is fully equal to any breed, and its wool is only equalled by the Roscommon in length and lustre, while the prize shearling ram clipped 23½ lbs. of wool in April last. Mr. Caleb Goring is the principal, if not the only breeder of Lincolns in Ireland; he exhibits eight out of eleven shearling rams, one of them the Oxford second prize. He exhibits three out of five aged rams, two out of four pens, of three each, of shearling rams; he is equally strong in the ewe sections, and takes all the money prizes offered in the class.

The next variety of sheep is that which has got such notoriety as the Roscommons, but which owes its excellence to the importation of the pure Leicester sort, encouraged and fostered by the old Farming Society of Ireland, formed in 1800, when the Dublin Society thought well of devoting its time and energies and cash to silk and woollen manufactures, and even became retailers of those goods; and to the Farming Society of Ireland we are mainly indebted for the introduction of improved Shorthorns, Longhorns, and Southdowns as well as Leicesters.

The show of Rosecommon sheep, at length accorded a separate class, has been most creditably represented. Eight magnificent fellows competed in the one-shear section. Mr. Roberts, Farn, Strokestown, leads off with Xenophon, a worthy son of last year's prize ram XXX; scarcely inferior were Mr. R. Flynn's second and Mr. Wm. Cotton's third prizes. Twelve Grand Sultans made up the aged ram section; Mr. J. Blood Smyth, Fedamore, Limerick, was put first for a grand ram bred by Mr. Roberts, and that was first at this show in 1865, and at the Tralee Royal and Cork and Limerick local shows 1869; Mr. Roberts and Mr. Flynn coming in second and third. In the next section there were five pens of three each of shearling rams; Mr. Roberts, W. Cotton, and R. Flynn taking the honours respectively. In shearling ewes there were four pens; Cox Cotton first, Wm. Cotton second, and J. Blood Smyth third. Of ewes that reared lambs in 1870 there were but three pens of five each; Wm. Cotton one, and R. Flynn two, who shared the money.

In the short-wooled class the beautiful Southdowns have disappeared altogether from our shows, and more the pity; so the Shropshire Downs had it all to themselves, and so had Mr. C. W. Hamilton, who took all the prizes except a fourth, which went to Mr. Morris for a shearling ram.

The show of wool was small, 11 parcels of 3 fleeces being staged, in 5 sections; the prize being a large silver medal in each section. The awards were: for Leicester wool, Seymour Mowbray; Border Leicester, Robert Cotton; Lincoln, Mrs. Rooney (hogget); ditto, Robert Cotton H. C. for wether; other Long-wool, William Cotton; ditto, Mrs. Rooney commended; Shropshire Down, Robert Cotton.

First day, high leap over hurdles trimmed with gorse 4½ feet high. First class for five-year-old hunters carrying 14 stone. Twenty-four entries were made for this leap, many of them coming out from the lighter weight carrying classes; the jumping on the whole was good: first prize to Captain Ross, Scots Greys, Curragh Camp, for his hunter by Mellit, dam by Navarino, and the prize horse in his section; second to W. W. Tennant's Mobarrene Tip for Eden, by Eden, dam Sheelah by Birdcatcher; this horse was the second prize in the section open for horses to carry 11 to 12st. 7lb., but carried 14 stone to the leap. The second class for leaping was for five-year-old hunters carrying 13st. 7lb. and upwards, hurdles 4½ feet high: first prize, R. Flynn's four-year-old filly, Annie, by Mayboy, dam by the Dean; second, Arthur A. Lawder's four-year-old filly, Fawn, by Roebuck, dam by Small Hopes. The third class was open for ladies' horses, weight carrying cobs, roadsters, &c., carrying 15 stone and upwards, over hurdles 4 feet high: first prize, David Rogerson's bay cob, no pedigree; second, Bernard Sweany's Cock Robin, by Tom Steele. The fourth class was for ponies 12 to 14 hands high, over hurdles 3 feet high: prize to J. K. Rogerson, Olney, for bay mare; no pedigree. The fifth class was for ponies under 12 hands high: prize to R. H. Morrison, Leeson Park, for bay mare; no pedigree.

Second day, over stone wall, commencing at 4½ feet high, to be progressively increased to, but not exceed 6 feet high. The fencing was admirably contested by 19 horses, till there remained but three that cleared the wall satisfactorily at its full height, viz., Mr. Low's Jack Spring, Captain Morgan's Chatterbox by Chit-chat, and Mr. Joseph Kilgannon's Surprise, the prize was awarded, in the first instance, to Captain Morg m's Chatterbox, from the superior way in which he flew over the wall, but on going to the scales his rider was under the required weight of 12 stone, as was also the rider of Surprise, so the prize fell to Mr. Low's Jack Spring, and no second prize was awarded.

The third day's business was principally devoted to the wide leap, over a hurdle, trimmed with gorse 2½ feet high on the taking-off side, with 12 feet of water. Twenty-nine horses came to the scratch for the prizes of £10 and £5. All but two jumped the obstacles, but at the finish the judges were so well pleased with the performance of Mr. Low's Jack Spring, and Mr. Flynn's Valeria, that they awarded each a first prize, and Mr. Russell's Limerick Lass was recommended the second honour. Limerick Lass performed in grand style till the last two rounds, when her fore part came in contact with the hurdle.

On the last day, Friday, a sweepstakes of 10s. each, with £3 added, was competed for over a hurdle trimmed with gorse, which was won by Mr. Richard Flynn, on his four-year-old filly Annie, the winner of the four and a-half feet hurdle leap in the second-class, and thus ended the finest horse show yet held in Ireland, and the sports connected with it.

The arrangements were excellent, and reflect great credit on the Committee of Management; but there are two things which require consideration before the next year's show, viz., that the veterinary inspection of sires and brood mares take place before they are submitted to the judges, or, at least, before the awards are made public. If this had been the case Lord Lucan's magnificent Suffolk Punch would not have won the first prize card and ribbon in his class, and that of the Royal Agricultural Society's Challenge Cup for the first day. The other is that it is not fair when prizes are open to young and aged horses to weight them equally over hurdles and stone walls; had the horses been weighted according to age Captain Morgan's Chatter Box, a four-

year-old gelding, a most perfect jumper, and made the first prize for his splendid performance over a six feet high stone wall, would not be disqualified because his rider was 10 lbs. light of 12 stone, the prescribed weight.

The judges were:

THOROUGHERED AND OTHER SIRES AND BROOD MARES.—Captain Archdall, M.P., Castle Archdall, Kesh; Major Barlow, Hasketon, Woodbridge Suffolk; W. Kennedy, Geganstown, Brannoxtown.

HUNTERS.—Major Borrowes, Gilttown, Newbridge; H. Briscoe, Tinvane, Carrick-on-Suir; R. Watson, Ballydarton, near Bagnalstown.

YOUNG HORSES SUITABLE FOR HUNTERS.—D. Beatty, J.P., Ennisceorthy; Hon. W. Arbuthnot, Hatton, Montrose, N. B.; W. Dunne, Collinstown, Clondalkin; Captain R. Bernard, Forenaughts, Naas; R. S. Fetherston H., J.P., Knockview, Killucan; R. B. P. Perse, Moyode Castle, Athenry.

LADIES' HORSES AND HARNESS HORSE OR MARE BRED IN IRELAND.—J. Devenish, Rush Hill, Drumsna; Lieutenant-Colonel Hillier, Constabulary Depot, Phoenix Park; Major Wilkin, Castleknock Lodge, Castleknock.

WEIGHT-CARRYING COBS AND ROADSTERS AND PONIES.—R. Moore, J.P., Killashee, Naas; H. M. Richardson, Rossfad, Ballycausidy; Major D'Arcy, J.P., Castlepark, Ballinasloe.

AGRICULTURAL HORSES.—Hon. H. Massy, Clarina, Limerick; N. M. Archdall, Croeknacreeve, Ballinamallard; J. Simson, Cloona Castle, Hollymount.

JUMPING PRIZES.—Sir C. E. Kennedy, Bart., Johnstown, Rathcoole; B. R. P. Perse, D.L., Moyode Castle, Athenry; L. Morrogh, 5, Great Denmark-street, Dublin; S. A. Reynell, J.P., Archerstown, Killucan; Sir J. Power, Bart., Kilfane, Thomastown; Major Wilkin, Castleknock.

VETERINARY SURGEONS.—D. Paley, Stephen's Green; T. D. Lambert, William-street; M. Murphy, Parkgate-street.

AUSTRALIAN EXPORTATIONS. — The purchase of Master Buttery (13311), the first prize bull at the Royal Chelmsford Show for 1,200 gs. was the talk of the colony for many years; but his career in Melbourne was not of long duration. Since his time, Shorthorn breeders have looked to Mr. R. McDougall for their best blood, as he is known to be a pedigree man. Ten years ago he exported largely, and has from time to time had valuable bulls sent out to him. Last year he sold a large portion of his herd, upwards of 100 head, for an average of over 60 gs., and this season Mr. McDougall has made a short visit here for the purpose of buying some of the best Booth bulls for the selected portion of his herd. Negotiations for Mr. Carr's young pure Booth bull Earl of Clare fell through, but Mr. McDougall had previously bought from Mr. Booth, of Warlaby a white bull calf Field-Marshal Booth for 800 gs., of great promise, and by Commander-in-Chief, from Lady Mirth, who is out of the same dam as the celebrated prize cow Lady Fragrant. He also bought Shaw Farm (26790), who has been in service at Her Majesty's Majow Farm, and is of the same family as the 1,000 gs. Patricia. Mr. Dudding's first prize bull calf, Robin Hood, at the Royal and Yorkshire Shows was bought for 150 gs.; he is by Mr. Foljambé's Robin, from Countess of Wragby, by Booth's Sir Roger, dam of Countess of Yarborough, the second prize yearling heifer. The first prize Hereford bull calf at Oxford also goes out with these Shorthorns; bred by Mr. Taylor, of Showle Court, he is by Triumph, from Hazel 3rd, and called Oxford Lad. They left Gray's by the Anglesey last week, in charge of their owner. Some young bulls have also been sent out to Mrs. Clark Irving's stations near Sydney. Seven years ago the late Mr. Clark Irving purchased some stock of Mr. Jonas Webb and other breeders, including some of the Cambridge Rose tribe. The three bulls now exported are of Bates blood; two of them were bred by Mr. J. P. Foster, of Killahow, and are both sons of Lord Dunmore's 2nd Duke of Collingham, and from dams one of Lord Spencer's Florentia family, and the other from Caroline 5th, of the Kirklevington Craggs tribe, for which Mr. Foster gave 205 gs. at the Didmarton sale. The third bull, Famous Gwynne, was bought at Mr. Chas. Howard's sale for 110 gs.

WHAT TO TALK ABOUT.

The off, or second season has set in. Beyond the fixtures which appear in our list, will be many a more local gathering, where there will be something to see and something to talk about. And the outside, or more general interest of these anniversaries goes to centre the rather on what is said than what is shown. By the time we have run through the Western, the Royal, the Yorkshire, and a few other leading exhibitions, we come to know the crack stock of the year tolerably well by sight and hand; and neighbour Brown may manage to beat neighbour Jones without creating any great sensation out of their own immediate circle. But even a sheep sale or a ploughing match will often serve as the occasion to draw out an M.P. or a leading landlord, if it should not give a straightforward tenant the chance of expressing his opinions. It is only to be hoped that the most may be made of such openings, and that people will not rest content with the expression of stale platitudes; such as how the interest of everybody is identical with the interest of everybody else—how every man who sits under his own squire is certain sure to farm under the best landlord in England—or, how it is very improper to broach agricultural politics at agricultural meetings.

If only fitly handled, there are many questions which would promise to pay for a little closer examination when owner and occupier meet each other, as it were, on their own common grounds. Without ever descending to personalities, there is nothing more wholesome than driving the nail home, as there is nothing more absurd than tacitly assuming a man is going to do better simply because he has been doing wrong so long, and nothing more idle than passing over abuse from the fear that the mention of it may be unpalatable to some offender in the company. When the young lady asked the young gentleman if he could spell such a very long word as opportunity the abashed youth began gradually to realise the fact of what a tongue-tied simpleton he was.

Still it is necessary to proceed with some discretion, and fortunately the key-note has already been struck. A reverend man and, moreover, a reverend landlord has been kind enough to indicate the course which should be taken, the tone which should be observed at the celebration of these festivals. He has gone yet further, and laid down in a few broad lines the relative duties of Landlord and Tenant. Thus early, at the very outset of the proceedings, it is scarcely possible to overestimate the value of such advice, when coming from such a quarter; and we accordingly took care to give in our last number the address of the Reverend Brodie Innes when speaking for "the Landlords of the Country" at the dinner of the Morayshire Farmers' Club. It may even be worth while to dwell a little longer on this, the more especially as the name of the Duke of Richmond was introduced, and the district stands deservedly high for the system of cultivation pursued. Mr. Innes, then, in classifying the features of his discourse, says, firstly: "The best thing a landlord could do was always, and in every way, with a due regard to his own rights, to accommodate himself to and consider the interests of his tenants—to hold them together, to come and see them at such meetings, to see them at their own farms, and to be amongst them as much as possible. These were things which he considered to be landlords' duties." This may, perhaps, sound a little vague; as, when given in detail, attending

agricultural dinners, and visiting the tenants on their farms, although no doubt very excellent things in their way, would seem to confine landlords' duties within a somewhat limited scope. Again, it is clearly very desirable that the two should see something of each other, but a landlord who is amongst his tenants "as much as possible," that is who is continually over-looking them, is apt to become in reality an intruder, and his interference to do more harm than good. An occasional ride over the estate, when the owner of the soil may see and judge for himself how it is worked and what is wanted, should be productive of a deal of good, but any man who is always busying himself about another man's business is, in any state of life, but too often in the way. Secondly, or on the other side, Mr. Innes cautions his hearers "they should all try to make the most of the points on which they agreed, and to make the least of those points in which their interests might probably appear to differ; and if there were differences, to keep them at home, and say as little about them as possible, or, according to the old Scotch proverb, to wash their dirty linen in the house." And here we arrive at the grand deduction that the best thing the farmers can say at these meetings is to say—nothing whatever! If they altogether agree with what the landlords have said there can naturally be no necessity to say anything more; and if they do not they had better keep their differences at home, or, as Mr. Innes elegantly puts it, wash their dirty linen in the house. And all this being interpreted means to say—there are no public questions which concern the farmer, that he has no rights to assert, no grievances to complain of, about which he should have the impertinence to speak in any company of his fellows. Was there such rubbish as this ever uttered? The Reverend Brodie Innes says "they must stick to their class, to their interests as tenant-farmers;" and how must they do so? By doing and saying nothing. Does the reverend gentleman imagine that any great principle was ever recognized, any great wrong ever redressed without the expression of popular opinion upon it? He is astonished to see there are "a great many farmers who are ready to join in the cry of injuries which do not touch themselves, who said there were certain evils over Scotland in one way or other, and they would like to protest, like to petition Parliament, and to try to get them removed. When they came to ask if they themselves suffered from these evils, they admitted they did not, but they knew somebody in the neighbourhood, or a good way off, that did." And what then? If, as Mr. Innes advises, these men are to stick to their class, surely it is all to their credit that they wage war against evils, even though these do not affect themselves but only their class. Was ever a more mean selfish doctrine sought to be inculcated! Let us take as a case the crying evil of the day, the damage done by game: if a tenant wash his dirty linen at home, that is, if he dare complain to his landlord, it is about equal main and chance as to his receiving notice to quit, or getting any redress. If, on the other hand, he himself should make a public matter of his "injuries," he is only the more certainly courting his own ruin. He becomes a marked man, not merely with his own, but with all the landlords in the district. An evil such as this is only to be effectually attacked by washing not the tenant's but the landlord's very dirty linen in public—to be "cried"

down, to be "protested" and "petitioned" against by those who "stick to their class," though they do not suffer themselves, but know of some, far or near, who do.

Still it is well to be warned in time of the consequences, and Mr. Brodie Innes, in conclusion, says, impressively: "If the landlords seeing, perhaps, here and there, occasion for difference on some points, were to unite as a class against the tenant-farmers of Scotland, and say they would stick to their own class as against tenants, what would the result be?" Well, we repeat, What would the result be? If the landlords, seeing there were differences which required proper adjustment, still refused to go into these, though the tenants as a class asked that such matters should be fairly settled, the

result, as Mr. Innes appears to imply, would be that the tenant-farmers of Scotland would be turned out of their farms. Was there ever such rubbish as this? or, if the threat does not amount to thus much, what does it mean? What could the landlords of Scotland unite to do *against* the tenant-farmers of Scotland, when they "protested" against abuses, and "petitioned" for rights which would insure the land being maintained in a better state of cultivation?

Mr. Innes regretted to see so few of the landlords of Scotland present at the dinner; but if these gentlemen were to take their cue from him it was, perhaps, quite as well that they kept away.—*Mark Lane Express*.

LOCAL TAXATION.

The Select Committee of the House of Commons appointed to inquire and report whether it is expedient that the charges now locally imposed on the occupiers of rateable property should be divided between the owners and occupiers, and what changes in the constitution of the local bodies now administering rates should follow such division, have considered the matters to them referred, and have come to the following resolutions, which they have agreed to report to the House:

1. That your committee, without pledging themselves to the view that all rates should be dealt with in the same manner, are of opinion:

(a.) That the existing system of local taxation, under which the exclusive charge of almost all rates leviable upon rateable property for current expenditure as well as for new objects and permanent works is placed by law upon the occupiers, while the owners are generally exempt from any direct or immediate contributions in respect of such rates, is contrary to sound policy.

(b.) That the evidence taken before your committee shows that in many cases the burden of the rates, which are directly paid by the occupier, falls ultimately, either in part or wholly, upon the owner, who, nevertheless, has no share in their administration.

(c.) That in any reform in the existing system of local taxation, it is expedient to adjust the system of rating in such a manner that both owners and occupiers may be brought to feel an immediate interest in the increase or decrease of local expenditure, and the administration of local affairs.

(d.) That it is expedient to make owners as well as occupiers directly liable for a certain proportion of the rates.

(e.) That, subject to equitable arrangements as regards existing contracts, the rates should be collected, as at present, from the occupier (except in the case of small tenements, for which the landlord can now, by law, be rated), power being given to the occupier to deduct from his rent the proportion of the rates to which the owner may be made liable, and provision being made to render persons having superior or intermediate interests liable to proportionate deductions from the rents received by them, as in the case of the income-tax, with a like prohibition against agreements in contravention of the law.

2. That your committee have examined many witnesses, and received at their hands very conflicting opinions as regards the proportion in which the burden of rates at present falls relatively on owners and occupiers.

3. That in the event of any division of rates between the owner and occupier, it is essential that such alterations should be made in the constitution of the bodies

administering the rates as would secure a direct representation of the owners adequate to the immediate interest in local expenditure which they would thus have acquired.

4. That justices of the peace should no longer act *ex officio* as members of any local board in which such direct representation of owners has been secured.

5. That the great variety of rates levied by different authorities, even in the same area, on different assessments, with different deductions, and by different collectors, has produced great confusion and expense; and that, in any change of the law as regards local taxation, uniformity and simplicity of assessment and collection, as well as economy of management, ought to be secured as far as possible.

6. That the consolidation into one rate of all local rates collected within the same area is a matter of great importance; and that your committee concur in the resolution of the Select Committee on Poor-rates Assessment, 1868, which recommended one consolidated rate, viz., "that a demand note should be left with each ratepayer on the rate being made, stating the amount of the requisitions, the rate in the pound for each purpose, and the period for which the rate is made, the rateable value of the premises, the amount of the rate thereon, and of each payment" of the instalments of the rates.

7. That whilst it is necessary to make provision for limiting, as far as practicable, the disturbance of existing contracts, it would be, on many grounds, undesirable, and almost impracticable, to extend the exemption of property held under leases from the operation of the proposed changes until the expiration of such leases.

8. That the exclusion of the owners of property held under long leases from the right of voting for local authorities, after the proposed changes had taken effect in respect of other property, would lead to much inconvenience and confusion, while, on the other hand, it would be inadmissible to allow them to vote unless they acquired an immediate interest in the rates.

9. That the difficulties of the case would be equitably met by exempting the owners of property held under lease from the proposed division of rates for a period of three years, and by providing that after the expiration of that time the occupiers of such property should be entitled, equally with all other occupiers, to deduct from the rent the proportionate part of the rates to which the owner may become liable, power being given to the owner at the same time to add to his rent a sum equivalent to the like proportionate part of the rates, calculated on the average annual amount of the rates paid by the occupier during the three years above referred to.

10. That by the terms of the reference to them, your

committee were limited to the question of the division of the charges on rateable property between the owners and occupiers, and what changes in the constitution of local bodies administering rates should follow such division; and they have consequently been precluded from entering upon the inquiry of the relations of local and imperial taxation, and the nature of the property liable to the same.

11. That your committee are of opinion that the inquiry on which they have been engaged forms only one branch of the general question of local taxation, and that other considerations, besides those which have been submitted to their investigation, should be previously taken into account in any general measure giving effect to the above recommendations.

15th July, 1870.

The committee was thus composed: Mr. Hunt, Mr. Ayrton, Sir Massey Lopes, Mr. Acland, Mr. Corrance, Mr. Rathbone, Mr. Pell, Mr. George Gregory, Sir William Tite, Mr. Fielden, Sir Hedworth Williamson, Mr. William Henry Smith, Mr. Backhouse, Mr. Wheelhouse, Mr. St. Aubyn, Colonel Brise, Sir James Lawrence, Mr. Birley, Mr. Walter, Mr. Charles Sedly, jun.; Mr. Goschen (Chairman).

The witnesses examined were: Messrs. D. P. Fry, F. J. Cochrane, Tom Taylor, F. B. Garnett, H. A. Hunt, T. H. Earle, G. A. Webb, C. S. Read, M.P., J. Lambert, H. Pownall, W. H. Wyatt, F. H. Glossop, Genge Andrews, Rogers, Squarey, Sir S. Waterlow, Captain F. L. Dashwood, Dr. W. N. Hancock, Sir T. Thwaites, J. Caird, Hayward, Grant, Innes, May, W. Middleton, T. Aveney, and Dudley Baxter.

LOCAL TAXATION.

The Central Chamber of Agriculture called a public meeting at Oxford on the Wednesday in the Show week for the purpose of discussing the subject of local taxation. Colonel Tomline, chairman of the Chamber, was to have taken the chair at the "banquet," but having met with an accident he was unable to do so, and Sir Massey Lopes occupied his place. Sir George Jenkinson, owing to unforeseen circumstances, could not attend the meeting; Colonel North, M.P., was also absent; Mr. F. S. Corrance, M.P., who had promised to attend, did not appear; and Mr. Barnett, M.P., was unavoidably kept away. The attendance generally was very poor, and the chairman, in opening the business, regretted the smallness of the company.
